

potentially affecting properties and closing some roads across the city.

LAS, ERG and RRG have patrolled the following hot spot locations to ensure that gullies and creeks are clear of debris that could inhibit flow with early reports indicating most locations are clear:

Rocklea  
Norman Creek/Deshon Street  
Breakfast Creek  
Zillman Waterholes  
Enoggera Creek  
Ithaca Creek  
Pound Drain  
Hemmant Drain  
Kedron Brook  
Cannery Creek  
Wynnum  
Beck Street, Paddington  
Castlemaine/Caxton Street, Paddington  
Newstead  
Long Street, Kenmore  
Trenton Street, Kenmore  
Perrin Creek  
Lota  
Sandgate

### **Brisbane River**

#### **High Tides**

High tide tomorrow, including the expected run off from the creeks, is expected to be 1.65m AHD (2.89m tide level). "High tide - Salt water over road" signs are still displayed in the known locations of king tide inundation. LAS will continue to monitor.

#### **Dam Release**

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall.

The dam will increase its releases starting Monday morning with the objectives of keeping the combined flows in the lower Brisbane river to 4000m<sup>3</sup>/s which will cause a predicted level of 2.5m AHD (3.74m tide level) at the Brisbane City gauge approximately Wednesday.

Based on the expected schedule of release the effects will result in inundation in low lying areas including habitable areas.

BoM have been contacted and will model the predicted flows to provide greater accuracy in predictions to allow Council to assess impacts on habitable areas. Please note that these levels are dependant on the forecast rainfall over the next two days and will be re-assessed each day.

FIC will model the likely areas (streets and suburbs) impacted from these flows with results being available approximately 1400HRS (10 Jan 2011).

## **BMTMC**

**BRISBANE CITY - GEORGE STREET 11:25 PM 09/01/2011 update from**  
<http://highload.131940.qld.gov.au/>
