

# Queensland Floods Commission of Inquiry

## Statement of Michael Francis Birchley

September 2011  
Vol. 1

QFCI

Date:

6/10/11

Jm

Exhibit Number:

747

**QUEENSLAND FLOODS**  
**COMMISSION OF INQUIRY**

**STATEMENT OF MICHAEL (MIKE) FRANCIS BIRCHLEY**

I, **MICHAEL (MIKE) FRANCIS BIRCHLEY**, of c/- 400 George Street Brisbane in the State of Queensland, Assistant Director-General, Regional Service Delivery, Department of Environment and Resource Management, solemnly and sincerely affirm and declare:

**Requirement from Queensland Floods Commission of Inquiry**

1. I have seen a copy of a letter dated 29 August 2011 from the Commissioner, Queensland Floods Commission of Inquiry to me requiring a written statement under oath or affirmation, which is attachment **MFB-01** ("Requirement") and which details the topics my statement should cover. For the purposes of the Requirement, the Commissioner has advised that "mine", "mines" and "mining" should be taken to include coal seam gas operations.

**Role**

2. I am currently the Assistant Director-General, Regional Service Delivery Division within the Office of the Environmental Regulator Business Group in the Department of Environment and Resource Management (DERM). I was appointed to this position in a permanent capacity on 28 June 2011. Prior to the appointment I was acting in the position from 3 January 2011. From 1 October 2011 to 2 January 2011 I was in my then substantive role of Regional Services Director, South West Region and I reported directly to the then Assistant Director-General, Regional Service Delivery Division, Mr [REDACTED].

**Item 1: A brief overview of the role and responsibilities of the Department of Environment and Resource Management (DERM) as to the regulation of mining operations in Queensland, including mining dams**

3. The current laws that govern environmental management of Queensland's mining industry commenced in January 2001. Under these arrangements, the administering authority under the *Environmental Protection Act 1994* (EP Act) (which is currently DERM but before March 2009 was other departments) assumed responsibility for environmental impact assessment and administration of environmental authorities, as well as compliance, auditing and monitoring relating to the environmental management of mining.
4. The EP Act incorporates the environmental management regulation of mining activities. This legislation creates environmental impact assessment processes and heads of power for government decision-making implemented by the administering authority.

5. The EP Act and subordinate legislation governs the roles and responsibilities of DERM in the environmental regulation of mining activities in Queensland. The stated objective of the EP Act is to protect Queensland's environment while allowing for development that improves the total quality of life, both now and in the future, in a way that maintains the ecological processes on which life depends. This is referred to as ecologically sustainable development.
6. Authorities are issued with conditions that may authorise a level of environmental harm to occur whilst seeking to protect overall environmental values. Both the EP Act and environmental authorities require companies to develop and implement a range of environmental management documents to ensure that authorised activities are carried out in a manner that minimises unexpected environmental impacts.
7. Dams that form part of mining activities are regulated by DERM for two primary purposes:
  - (a) to ensure dam design, construction and operation is carried out in a manner that does not threaten the community's safety or environment through collapse or failure; and
  - (b) to ensure management of dam contents, including releases, does not result in adverse impacts on the environment through contamination.
8. Accordingly, dams that store hazardous wastes are regulated under environmental authorities. There are a number of conditions on environmental authorities in relation to such dams, including requirements that they be designed and constructed to stated standards, be certified in their design and construction, and be annually inspected for integrity. Dams may or may not be authorised to release in emergency events or under certain environmental conditions.

**Item 2: The involvement of DERM in granting environmental authorities to operators of mines under the Environmental Protection Act 1994 (Qld)**

9. The environmental approvals process is administered in accordance with the EP Act. This process may also occur in conjunction with the tenure process for mining activities under the *Mineral Resources Act 1989* and *Petroleum and Gas (Production and Safety) Act 2004* as an applicant must have applied for or currently hold a relevant resource authority prior to lodging an application for approval under the EP Act.
10. The holder of a mining tenement cannot carry out any mining activities on site unless those activities are authorised by an environmental authority for the relevant tenement. Therefore, the applicant for a mining tenement must also apply for an environmental authority. All applications for environmental authorities and mining tenements for new mining projects must be made on the approved application form and lodged with the Department of Employment, Economic Development and Innovation (DEEDI).

## *Environmental Impact Statement*

11. Major mining and petroleum projects may undergo an environmental impact statement (EIS) assessment process as part of the considerations by DERM as to whether an environmental authority should be granted.
12. If the project is determined by the Coordinator-General to be of state or national significance then the proponent may be required to prepare an EIS under either the *State Development and Public Works Organisation Act 1971* (SDPWO Act) administered by DEEDI, or the *Environment Protection and Biodiversity Conservation Act 1999 (Cwlth) Act* (EPBC Act) administered by the Commonwealth Department of Sustainability, Environment, Water, Population and Communities.
13. If a project is not determined by the Coordinator-General to be a significant project then a proponent may be required, or may voluntarily apply, to undertake an EIS process as set out in Chapter 3 of the *EP Act*. The purpose of an environmental impact assessment is to assist the mining industry in achieving ecologically sustainable development, meet environmental management responsibilities and to encourage community comment and participation in the process. See attached "DERM Information Sheet (mining) Environmental Impact Statements" (exhibit **MFB-02-01**) for further information.
14. The "DERM Guideline (Mining), The environmental impact statement (EIS) process for level 1 mining projects" (exhibit **MFB-02-02**) provides comprehensive information to project proponents on the Chapter 3 EIS process.
15. Proponents for mining and petroleum projects may alternatively apply to DERM to voluntarily prepare an EIS where they have not made an application for a tenement and an environmental authority and therefore a formal assessment level decision has not been made. Information about the voluntary application process can be found in the "DERM Information sheet Voluntary Preparation of an EIS" (exhibit **MFB-02-03**).
16. The proponent is responsible for drafting the terms of reference (TOR) and subsequently advertising the draft terms of reference. The applicant must also make any required amendments following receipt of submissions on the draft TOR prior to the administering authority deciding on the final TOR to be used in the EIS process. The proponent is also responsible for the development and advertising of the draft EIS and making any amendments following the receipt of submissions on the draft EIS, prior to the administering authority issuing the EIS assessment report.
17. To assist a proponent to develop a TOR for their project's EIS, DERM has published a generic Terms of Reference (exhibit **MFB-02-04**) which sets out the range of matters that might need to be addressed in the EIS.
18. The EIS Assessment Report must include matters set out in section 59 of the EP Act. If the environmental management plan proposed for the project is determined to be adequate and draft Environmental Authority conditions have

been finalised and included in the Assessment Report, then the project can proceed to the public objection phase of the approval process.

### ***Environmental Authorities***

19. Under Chapter 5 (Mining activities) and Chapter 5A (Other Environmental Authorities) of the EP Act, a mining project is either a level 2 or a level 1 environmentally relevant activity depending on whether it does or does not comply with criteria in the *Environmental Protection Regulation 2008* (EP Reg). Each mining project requires an environmental authority under the EP Act.
20. DERM completes the assessment of submitted applications for all environmental authorities. Level 1 application documentation must include an Environmental Management Plan (EM Plan). The purpose of an EM Plan is to provide information to support the application for an environmental authority and propose environmental protection commitments to assist the administering authority prepare the draft environmental authority for the project and in setting specific conditions for the mining activity.
21. Applicants for environmental authorities for code compliant level 2 mining projects must include enough information (such as a description of the proposed project and the likely environmental impacts) to demonstrate that they can comply with the conditions of the relevant code of environmental compliance and operate within the criteria. A copy of the "Code of Environmental Compliance for Mining lease projects" is provided at attachment **MFB-02-05**. If, however, an applicant believes they cannot comply with the conditions but will operate within the criteria, and feel their operation will still be a level 2 mining project, they may apply to have additional conditions included in their environmental authority. The resulting environmental authority for the level 2 mining project will be non-code compliant.

### ***Coordinator-General Report***

22. Projects declared as state significant pursuant to the SDPWO Act are subject to the discretionary powers of the Coordinator-General to impose conditions on a project, specify when those conditions take effect and determine which entity is to have jurisdiction for the imposed conditions. Accordingly DERM may be required to impose conditions from the Coordinator-General's Report. The EP Act reflects the requirement for the administering authority to include 'imposed conditions' in an environmental authority. This requirement does not prevent DERM from including additional conditions within an environmental authority provided they are not inconsistent with the Coordinator-General's conditions.

### ***Public notification***

23. During the assessment period for both the EIS and conditioning of the environmental authority, public notification provisions pursuant to the EP Act may be triggered. If this is the case, stakeholders and the public have the opportunity to make a submission on an application. In deciding to grant an

environmental authority for which a valid submission has been made, the assessing officer and delegate must consider those submissions.

### *Deciding applications*

24. When making any decision under the EP Act, including whether to issue an environmental authority, the department must consider the “Standard Criteria” (MFB-02-06) as specified in Schedule 4 of the EP Act. Furthermore, parts 2 and 3 of the EP Reg (MFB-02-07) stipulate requirements for all environmental management decisions and additional regulatory considerations with respect to potential emissions from proposed activities.

### *Public Objections, Planning and Environment Court and Land Court*

25. An entity has a right to object about an application for environmental authority, a draft environmental authority or a condition included in the draft. If a properly made objection exists following the objection period specified by the EP Act, the administering authority under the EP Act (currently DERM) is obliged to refer the application to the Land Court for an objections decision.

### **Item 3: The means by which DERM regulates compliance with environmental authorities granted to operators of mines**

26. DERM is responsible for enforcement action in response to non-compliance and exercises its discretion to take enforcement action in accordance with its Enforcement Guidelines (MFB-03-02). The Enforcement Guidelines set out the considerations for implementing an enforcement response and the use of the tools provided for in the EP Act, which include environmental evaluations, environmental protection orders, direction notices, clean-up notices, cost recovery notices, emergency powers, emergency directions to release a contaminant and transitional environmental programs. Other enforcement tools include warning letters, penalty infringement notices, prosecution, restraint orders, enforcement orders and suspension of authorities or cancellation.
27. DERM’s compliance approach is set by the “Compliance Strategy 2010-14” (MFB-03-01), which specifies the principles that guide DERM’s compliance activities. These principles are that DERM will:
- (a) ensure that regulatory clients understand their obligations;
  - (b) encourage voluntary compliance with those obligations;
  - (c) work with the regulated community to improve performance;
  - (d) monitor compliance with DERM’s legislation; and
  - (e) take consistent and proportionate enforcement responses where necessary.
28. DERM’s Enforcement Guidelines (MFB-03-02) set out the principles that govern when DERM will take enforcement action and the nature of that action. The guidelines apply to decisions to commence a prosecution as well as to take other types of enforcement action such as the use of a statutory tool.

29. DERM's Annual Compliance Plan sets out the proactive compliance activities that DERM will undertake in a given year, and include strategic compliance projects that target activities or issues that have been identified as carrying a high risk to the environment or natural resources. The annual compliance plans for 2009-10 and 2010-11 are attachments **MFB-03-03** and **MFB-03-04** respectively. The Annual Compliance Plan 2011-12 is currently awaiting Ministerial approval.
30. DERM's frontline EP Act compliance officers (known as 'Environmental Officers') are located within regional offices and are part of the Regional Service Delivery Division of the department. These Environmental Officers are responsible for responding to and managing all potential breaches of Environmental Authority conditions which do not require court action to resolve. There are four regions covering Queensland including South East Region, South West Region, Central West Region and North Region (refer to map **MFB-03-05**). Each Region is headed by a Regional Services Director who reports directly to my position.
31. These officers' roles include compliance activities such as inspections and audits, issuing notices and directions to ensure compliance and reviewing monitoring data against environmental standards. These officers are also involved in regulatory environmental assessment activities such as considering proposals to change or upgrade environmental management infrastructure in order to achieve compliance with an EA and stipulating specific environmental conditions. In addition, officers provide education and advice.
32. DERM has also played a lead role in establishing the Liquefied Natural Gas (LNG) Enforcement Unit, which comprises specialist officers with expertise in groundwater management, environmental compliance and case management. Officers from DEEDI specialising in land access and gas safety also form part of this multidisciplinary unit. The unit is also supported by centralised business units involved in assessments and approvals, technical operations, policy support and development.
33. DERM has undertaken approximately 178 audits and inspections on the mining industry in the last 12 months. A further 67 were undertaken in relation to gas extraction activities.
34. The frontline staff undertaking compliance activities within the Regional Service Delivery Division are supported by centralised business units from DERM's Environment and Natural Resource Regulation Division. These business units are the Compliance and Investigations Unit and the Litigation Unit.
35. The Compliance and Investigations Unit has a number of roles in regulating mine operators' compliance with environmental authorities although it should be noted that the Unit's role extends beyond mining to include the whole range of DERM's regulatory responsibilities. Following escalation of a compliance matter from a regional office, this unit investigates serious breaches of environmental authorities, for which prosecution or other court action is the appropriate response and prepares briefs of evidence following those investigations.

36. The Unit also provides support to regional officers who regulate mines by developing procedural guides, templates and other material to support both the use of statutory tools under the *EP Act* and other compliance responses (such as the issue of penalty infringement notices). Copies of the current procedural guides, templates and other material are attached at exhibits **MFB-03-06** to **MFB-03-94**. Copies of superseded procedural guides, templates and other material that were current at some stage since 1 October 2007 are attached at exhibits **MFB-03-95** to **MFB-03-106**.
37. The Litigation Unit is responsible for prosecutions and Planning and Environment Court matters involving DERM. Its role in regulating compliance with environmental authorities granted to operators of mines is to review briefs of evidence submitted by the Compliance and Investigations Unit and provide advice on sufficiency of evidence, prospects of success and likely penalty range. The Litigation Unit also provides legal advice as required in relation to specific cases of non-compliance.
38. In addition to its on-ground compliance activities, DERM has developed administrative processes that require self assessment and statutory declarations of compliance performance by environmental authority holders, such as:
- (a) Annual Returns requiring a statement of compliance against Environmental Authority conditions; and
  - (b) Plans of Operations that require auditing against residual rehabilitation liability for the purpose of determining an appropriate level of financial assurance.
39. The EP Act contains offence provisions relating to the provision of false and misleading information.

**Item 4: The role of DERM in granting transitional environmental programs to operators of mines**

40. Transitional environmental programs (TEPs) are specific programs that, when complied with, achieve compliance with the EP Act for an activity by reducing environmental harm, detailing the transition of the activity to an environmental standard or detailing the transition of the activity to comply with a condition of a development approval, an environmental authority or code of environmental compliance. The requirements for TEPs and the process for assessing and approving them is set out in chapter 7, part 3 of the EP Act. In the event a TEP is proposed to extend beyond a 3 year period, public notification requirements are triggered.
41. If an approved TEP authorises the holder of the TEP to do or not do something, the holder may do or not do that thing despite anything in a regulation, an environmental protection policy, an environmental authority held by the holder of the TEP, a development approval, a standard condition of a code of environmental compliance for a chapter 4 activity or an accredited environmental risk management plan.

42. Draft TEPs may be submitted voluntarily by a mine operator, or DERM may require an operator to submit a draft TEP. In either case, the draft TEP is prepared by the operator. DERM's role is to assess the draft TEP against the requirements of the EP Act and either approve the TEP, approve the TEP with conditions, or refuse to approve the TEP. Prior to making its decision, DERM may also (and as a matter of practice often does) enter into discussions with the proponent of a draft TEP and suggest amendments to the draft TEP.
43. Mine operators typically voluntarily submit TEPs to DERM when they are seeking authorisation to discharge water from the mine site in circumstances where the discharge is not authorised by the environmental authority. Many TEP applications were received by the department following the 2010/2011 wet season.
44. DERM typically requires mine operators to submit a draft TEP where DERM becomes aware that there is a non-compliance at the mine site that will require a significant amount of time and/or investment by the operator to rectify.

#### *Assessing draft TEPs*

45. Once a draft TEP is submitted to DERM there is often a discussion between the environmental officer involved in the matter and the mine operator about the contents of the draft TEP. This is an opportunity for DERM to raise any concerns with the draft document, and for the operator to take steps to address those concerns before DERM makes a decision about the draft TEP.
46. DERM has produced guidance material to assist environmental officers in assessing draft TEPs. (Exhibits **MFB-04-01** and **MFB-04-02**)

#### **Item 5: DERM's actions in response to the Hart Report on Fitzroy River Water Quality Issues recommendations numbers 1, 2, 3, 4, 5, 10, 11, 12 and 13**

47. The Hart Report on Fitzroy River Water Quality Issues is attachment **MFB-05-01**.
48. This report, completed in November 2008, contains a review of the situation regarding water quality in the Fitzroy River resulting from the discharge of 138 GL (gigalitres) of mine-affected floodwater from the Ensham Resources Pty Ltd (Ensham) coal mine located near Emerald in Central Queensland in 2008.
49. The Terms of Reference (ToR) for this review were to advise the Premier of Queensland on:
  - (a) any short and long-term risks to human health, aquatic ecology, agriculture and industry that could result from the mine-affected floodwaters discharged from the Ensham coal mine, and how these should be managed;
  - (b) the scope of the water quality and biological monitoring program to be undertaken by the EPA to assess the potential impacts of the mine-affected floodwater discharge from Ensham coal mine;
  - (c) any changes that might be made to conditions of Environmental Authorities

- (for mining activities) and associated statutory documents under the EP Act in order to ensure that the impacts of discharges of mine-affected waters in Central Queensland are appropriately managed and monitored; and
- (d) Any other matters that might be of relevance to this issue.

50. The department is in the process of finalising a report on the implementation of both the 'Hart report' in consultation with the Fitzroy Water Quality Advisory Group. Further information relevant to water quality issues in the Fitzroy catchment can be found on the department's Fitzroy River website: <http://www.fitzroyriver.qld.gov.au/>

51. Action taken in response to the recommendations of Professor Hart's report that are of particular interest to the Inquiry are as follows.

***Recommendation 1: Environmental Protection Agency (now the Department of Environment and Resource Management; DERM) to undertake a review of procedures for granting a Transitional Environmental Program***

52. The department reviewed the procedures for granting a Transitional Environmental Program and on 1 January 2009, a new Environmental Protection Regulation 2008 (Attachment **MFB-05-02**) came into effect. This defined the issues that must be considered when deciding whether to approve a Transitional Environmental Program. These include:

- (a) impacts from contaminants entering the environment including the cumulative impacts;
- (b) the order of occupancy between the person carrying out the activity and the affected person;
- (c) the capacity of the receiving environment to accept contaminants while protecting the environmental values;
- (d) risk management of the way in which contaminants are released;
- (e) the need to monitor to ensure discharges meet the terms of the program; and
- (f) the potential toxic effects of likely contaminants.

***Recommendation 2: A process for random audits of laboratories used by mining companies for analysing trace concentrations of heavy metals***

53. The new water license conditions (Attachment **MFB-05-03**), developed by the department in concurrence with coal mining companies, are intended to improve the certainty of trace metal results reported by coal mining companies. Mining companies are now required to use analytical methods accredited by the National Association of Testing Authorities (NATA). Determinations and analysis of water quality are to be performed by an appropriately experienced and qualified operator and done in accordance with methods prescribed in the latest edition of the departments *Water Quality Sampling Manual* shown in Attachment **MFB-05-04**. Additionally, samples are to be collected from authorised monitoring locations and be representative of the water body.

**Recommendation 3: Environmental Protection Agency to include Professor Hart's review comments in the Fitzroy water quality monitoring project and include a longer timeline for the study**

54. The department has provided funding to the Fitzroy Basin Association (FBA), to design an integrated monitoring program for the Fitzroy Basin under the project name *Fitzroy Partnership for River Health*. This partnership aims to deliver an ongoing monitoring program that assesses Fitzroy river health and provide longer timeframes for water quality studies. More details of this program are available online at <http://riverhealth.org.au/> and in Attachment **MFB-05-05**.

**Recommendation 4: Expand the Environmental Flows Assessment Program in the wet season following the major releases of 2008 to measure effects of higher salinity on fish spawning and recruitment**

55. The department expanded its Environmental Flows Assessment Program (Attachment **MFB-05-06**) in the wet season of 2008/2009 to include an assessment of the affects of higher salinity on fish spawning and recruitment.

56. Surveys were done at four sites:

- (a) Nogoia River at Glenlees, which is upstream Fairbairn Dam on 20 November 2008;
- (b) Mackenzie River at Riley's Crossing, which is downstream of the Comet River junction on 1 December 2008;
- (c) Mackenzie River at Honeycomb, which is downstream of Bingegang Weir on 26 November 2008 and 2 December 2008; and
- (d) Comet River at the Comet Weir on 1 December 2008. Freshwater flows returned water quality to normal and precluded any further surveys.

57. There were no sightings of fish spawning in the surveys performed and fish sample volumes overall were too small to form an objective view about the effects of higher salinity water. The low fish numbers could be due to many varying factors and one-off sampling results should be interpreted with caution. Information about fish trends in the Fitzroy Basin are incorporated into the ecological assessment reports for the Fitzroy Basin Water Resource Plan (WRP) 10 year review which has resulted in the current draft plan. See attachments **MFB-05-07** and **MFB-05-08**

**Recommendation 5: Bio-security Queensland study of health of fish in weirs to be repeated and enhanced**

58. Bio-security Queensland undertook two sampling projects on fish health. Results have been presented in a report that is currently being peer reviewed. Further fish health studies will be included in future monitoring programs.

**Recommendation 10: *Develop an emergency water management plan to improve water quality in the Nogoa-Mackenzie-Fitzroy River system between storages. This plan will need to be innovative and not constrained by the current restrictive Resource Operations Plan rules.***

59. Substantial natural inflows throughout the system which occurred within two months of the release of Professor Hart's report returned water quality conditions of the Nogoa-Mackenzie-Fitzroy River system to normal.
60. The contingency plans that form part of the Drinking Water Quality Management Plans, which are Attachment **MFB-05-09**, are required under the new provisions of the *Water Supply (Safety and Reliability) Act 2008* and are intended to ensure that emergency water quality issues are addressed by drinking water providers such as Local Governments.
61. Since 2008, the installation of automatic salinity loggers by the department has increased monitoring efficiency and advanced the surveillance of water-quality conditions within the Fitzroy Basin. The department's "Procedural Guide 2.10 - Mine Industry Incidents" (**MFB-05-019**) was created to provide the essential guidance on roles, responsibilities and tactical responses for incidents in the mining industry where contaminants have been released to the environment. Additionally, Section 320C of the EP Act (which is yet to commence and commences on 5 October 2011) now stipulates community notification of any emergency situation relating to water quality management.
62. Furthermore, the Fitzroy Water Resource Plan and its subordinate Resource Operations Plan (Attachment **MFB-05-10** and **MRB-05-11**) provide for environmental flows to maintain good water quality in the river between the storages and downstream over the longer-term.

**Recommendation 11: *For the review of the Fitzroy Water Resource Plan, the department is to consider a more equitable balance between consumptive use and the environment, and to include the provision of a state owned contingency allocation.***

63. The new draft Fitzroy Basin Water Resource Plan (FB WRP) was released in December 2010. This is Attachment **MFB-05-12**. While the new draft plan aims to ensure an appropriate balance between consumptive use and the environment, it does not provide for State-owned contingency allocations from major storages. The Overview Report for the FB WRP (S1.5.5) (Attachment **MFB-05-07**) gives the reasons, which are fundamentally:
  - (a) A State-owned contingency allocation would provide little or no benefit in mitigating water quality issues well downstream of any storage and would not assist with problems that may occur with water quality in un-supplemented streams. For example, it is estimated that a volume of some 90,000 ML (megalitres) from Fairbairn Dam would be required to address a serious water quality issue in the Fitzroy Barrage at Rockhampton. To successfully flush and dilute poor quality water in the barrage would necessitate releasing this total volume at rates of over 10,000 ML per day (approximately 20 days travel over 625 km);

- (b) It would be very expensive to acquire a significant allocation from an existing water supply scheme, and
  - (c) There would be impacts on the local economy since significant quantities of water would no longer be available for consumptive use.
64. The limited benefits of state-owned contingency allocations come with high costs. The establishment of tradable water allocations however, does allow the government to acquire such contingency allocations in the future if this was considered appropriate. The alternative of the government granting itself a contingency allocation at no cost would come with significant impacts on existing water allocation holders and have an adverse impact on an established water market. With regards to new infrastructure, any contingency allocation would either come at significant cost to the project or reduce the volume available for new water supplies.
65. It is still possible for an entity to gain access to any short or long term water supplies in order to support an environmental mitigation activity through the permanent acquisition or seasonal assignment of water allocation.
66. The new draft plan (Schedule 6) will provide for the continuation of the Seasonal Baseflow and First Post Winter Flow management strategies which are intended to support good water quality. It is proposed to provide more flexibility in the infrastructure operating rules of the Fitzroy Basin Resource Operations Plan (the ROP) to allow releases from storages in emergency circumstances, as was the case in 2008 when discharges from the flooded Ensham mine created issues for downstream water supplies. The Fitzroy ROP is due for review after the approval of the new Fitzroy WRP and is planned to be finalised within 2–4 years.

***Recommendation 12: Government to consider the appointment of a lead agency as a 'river health caretaker', to prepare a catchment management plan and a co-ordinated monitoring and assessment program***

67. The Department of Environment and Resource Management is the lead agency for natural resource management and the support of catchment based natural resource management groups. The department is presently supporting the development of a monitoring and assessment program for the Fitzroy Basin, the *Fitzroy Partnership for River Health*, which is being co-ordinated by the Fitzroy Basin Association.

***Recommendation 13: Develop a set of Emergency Response Principles relevant to the mining industry to be applied in future situations similar to the "Ensham" emergency of 2008.***

68. The department developed policy principles relevant to emergency situations within the mining industry that pertain to contaminant releases to the environment. The principles were developed in consultation with key stakeholders, including members of the Fitzroy Water Quality Advisory Group, and have been incorporated into the department's "Procedural Guide 2.10 - Mine Industry Incidents" (MFB-05-019). State-wide training on the Guide was conducted for departmental staff in 2010 and 2011.

69. In addition, the EP Act has been amended in response to community concerns that the operators of mines and coal seam gas activities should be required to notify adjacent landholders of any chemicals spills or discharges that have the potential to impact on the landholders. Section 320C of the EP Act (which has yet to commence and which commences on 5 October 2011) requires any person operating a facility who becomes aware of an event that causes or threatens material environmental harm, to give written notice of the event, its nature and the circumstances in which it happened to persons on affected land. The Department will release a guideline explaining the new requirements and the duty to notify of environmental harm, in due course prior to 5 October 2011.

**Item 6: The process by which the Final Model Water Conditions for Coal Mines in the Fitzroy Basin were drafted, relevant parties were consulted, and the terms were negotiated, finalised and amended (all relevant meeting minutes, internal and external reports, briefing notes and memoranda should be attached to the statement)**

70. On 16th October 2008, the then Minister for Sustainability, Climate Change and Innovation the Hon. Andrew McNamara, announced that the then Environmental Protection Agency (EPA) would undertake a study of the cumulative impact of mining on the health of the Fitzroy River. The project plan for the Study is included at (MFB-06-01).

71. Prior to that announcement, on or around 16 October 2009, the Premier, the Hon. Anna Bligh, signed a letter of reply (MFB-06-01a) to the then President of the Queensland Resources Council (QRC), [REDACTED] which included the words-

*"I have requested that relevant Ministers direct their departments to undertake a specific study 'Review of Water Quality Arrangements for Mines Discharging Water into the Fitzroy River System'. I have attached the terms of reference for this study."*

72. The EPA was then given the task of completing the Study in keeping with the Terms of Reference. As the study required the analysis of existing mine water discharges, the EPA wrote to each coal mine operator in the Fitzroy Basin, asking the operator to submit electronic water quality results for all mine water discharges over the previous 5 years. The proforma letter used for that purpose is provided at (MFB-06-01b).

73. On 11 May 2009, Cabinet considered and adopted the Department of Environment and Resource Management (DERM) report entitled, Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin <<http://www.fitzroyriver.qld.gov.au/pdf/cumulativeimpactassessment.pdf>> (MFB-06-01c) and supported the three recommendations in the report which were for DERM to:

- (a) develop appropriate conditions in environmental authorities for mine water discharges;
- (b) develop local water quality guidelines; and

- (c) develop a model for assessing cumulative impacts across the region.
74. In relation to recommendation 1 the report noted that the aim of that recommendation was to, *“standardise environmental authority conditions relating to water discharges so that consistent and appropriate conditions exist across the Fitzroy River Basin.”*
75. The report also noted that, *“The aim is to work with mining companies to achieve this by convening a small working group comprising DERM and mining company technical specialists that would consider how discharge limits are set, what limits are acceptable and what this should be based on, when discharges may occur and what monitoring should occur. This is to occur by the end of June 2009.”*
76. And that, *“The preferred option for implementing changes is via voluntary agreement with mining companies. If this is not possible, then it may be necessary to implement changes after requiring and reviewing an environmental audit or by changes to the EP Act to allow for the immediate review and amendment of coal mining authority conditions using the issues identified in this study. Changes to environmental authorities are to occur by the end of December 2009.”*
77. The Government’s decision on Recommendation 1 formed the basis for DERM commencing a project to work with Fitzroy Basin mining companies to agree to and implement a set of standardised environmental authority conditions for water and wastewater management issues on coal mine sites, including:
- (a) on-mine water management,
  - (b) wastewater discharges to rivers and streams, and
  - (c) water quality monitoring of wastewater discharges and the rivers and streams receiving waste discharges.
78. The project proposal and work plan for the project (**MFB-06-02**) reflected the intended completion date of 31 December 2009 for the amendment of the water and wastewater conditions in environmental authorities for all coal mines in the Fitzroy Basin.
79. The deadline given by the then Minister Jones and Minister Swarten for finalisation of the draft conditions was 30 June 2009  
<<http://www.cabinet.qld.gov.au/mms/StatementDisplaySingle.aspx?id=64797>>  
(**MFB-06-02a**) and this deadline was also reflected in the project plan.
80. The attached draft briefing note (**MFB-06-03**), dated 5 June 2009, prepared for the Associate Director General Terry Wall, notes that in relation to Project 1:
- (a) DERM met with mining company and Queensland Resources Council (QRC) representatives on 28 May 2009 (preparatory notes for that meeting are provided at **MFB-06-04**); and
  - (b) The project team had met that week to prepare new draft discharge conditions for distribution to mining companies, prior to a full-day workshop scheduled in Brisbane for 18 June 2009 when the conditions would be discussed in detail.

81. The draft briefing note also indicated that:
- (a) a small working group of three DERM representatives and three industry representatives would be formed at the conclusion of the workshop to refine the conditions based on DERM's mandate and industry comment; and
  - (b) a final version of draft conditions would be developed by 30 June 2009 and then discussed with individual mines, site by site, for implementation by December 2009.
82. The first draft of the model conditions was developed by a team of DERM employees, including [REDACTED] – a specialist in stream water quality and ecology. These draft model conditions are provided at **MFB-06-05**.
83. On 18 June 2009, DERM's set of draft conditions was workshopped with technical representatives from coal mining companies and the QRC. The workshop was facilitated by [REDACTED], formerly of the University of Central Queensland.
84. The notes from the workshop (**MFB-06-06**) indicate that it was agreed that DERM would incorporate comments from the workshop into Version 1.1 of the model conditions by close of business on 24 June 2009, and that that this new draft set of conditions would be distributed to the working group members for further refining.
85. It was also agreed that the version revised by the working group needed to go back to the wider group present at the workshop for further comment. The draft "Model Water Conditions for Coal Mines in the Fitzroy Basin" as at 30 June 2009 is provided at **MFB-06-07** and the final set of model conditions that were adopted is provided at **MFB-06-08**.
86. The package of administrative support and guidance material provided to DERM staff to use in the amendment of water conditions in environmental authorities for individual coal mines in the Fitzroy Basin included:
- (a) a flowchart outlining the process for amending environmental authorities (**MFB-06-09**);
  - (b) the final set of model conditions;
  - (c) a checklist for making an assessment level-decision for amending a non-standard environmental authority under the *EP Act* (**MFB-06-10**);
  - (d) a proforma EA/ Development Assessment (DA) Assessment Report crafted specifically to deal with amendment of water conditions for a coal mine (**MFB-06-11**);
  - (e) a proforma Coordinated Assessment Committee Report used to make recommendations on the 'assessment level' for the amendment of a coal mine environmental authority (**MFB-06-12**);
  - (f) a proforma Notice of Decision – Amendment Application (**MFB-06-13**);
  - (g) a checklist for Environmental Impact Statement 'triggers' for the proposed amendment (**MFB-06-14**);
  - (h) A DERM document entitled, Conditions for Coal Mines in the Fitzroy Basin - Approach to Discharge Licensing (**MFB-06-15**);
  - (i) A proforma letter to send to the operators of individual mines in the Fitzroy Basin (**MFB-06-16**).

86b As is shown in the flowchart (**MFB-06-09**), the process taken by DERM in dealing with individual mining companies in the Fitzroy Basin was that:

- (a) The proforma letter (with attachments **MFB-06-08**, **MFB-06-09** and an amendment application form) was sent to the operator of each coal mine in the Fitzroy Basin, requesting submission of an environmental authority amendment application to DERM, in accordance with section 240 of the EP Act, by 1 September 2009;
- (b) Pre-lodgement meetings were then arranged between DERM staff and representatives of each mine (where possible, each of these meeting was attended by the DERM Project Manager, DERM Regional Manager and DERM's Chief Scientist, Water Quality);
- (c) During the pre-lodgement meetings, DERM offered mining companies the opportunity to submit a business case with their application, setting out if and why its new water conditions should differ from the model conditions;
- (d) On receipt of completed amendment applications from mines, DERM staff prepared EIS Trigger Checklists and Assessment Level Decision recommendations for the Coordinated Assessment Committee;
- (e) After DERM made its Assessment Level Decision and EIS Decision for each application, in accordance with section 246 of the EP Act, the amendment application was assessed by DERM in accordance with section 256 – 258A of the EP Act;
- (f) Prior to making its final decision on the application, DERM would provide each mine operator with a final draft set of environmental authority conditions and seek feedback from mining companies;
- (g) After DERM made a decision to grant the amendment application a copy of the environmental authority was given to the applicant in accordance with s258 of the EP Act; and
- (h) Using the approach outlined above, environmental authorities for some 40 coal mines in the Fitzroy Basin were amended by 24 December 2009.

87. In August 2009, DERM established a new website <<http://www.fitzroyriver.qld.gov.au/>> as a way of sharing information about water quality in the Fitzroy Basin. This information included regular updates on progress with the DERM project to amend the water management conditions in environmental authorities for all coal mines in the Fitzroy Basin.

88. On 11 August 2009, at the request of Minister Jones then the Minister for Climate Change and Sustainability, DERM called the first meeting of the Fitzroy Water Quality Advisory Group (FWQAG) (**MFB-06-16a**) to address future management of water quality in the Fitzroy River Basin. The role established for the group was (amongst other things) to advise the Government on implementing the recommendations of the DERM report, "Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin", including the recommendation to amend the water conditions in environmental authorities for coal mines in the Fitzroy Basin. A media release about the new group and the new web site can be found at <<http://www.cabinet.qld.gov.au/MMS/StatementDisplaySingle.aspx?id=65699>> (**MFB-06-16b**)

## *2011 Review of Fitzroy Water Conditions*

89. Condition W39 of the Model Water Conditions for Coal Mines in the Fitzroy Basin (with reference to **MFB- 06-05**) forecast an agreed process of review of the model conditions following a process of monitoring and, in particular, development of local water quality guidelines. On 3 November 2010, DERM met with QRC and industry representatives to discuss the model conditions. A copy of the correspondence and meeting record is provided at **MFB-06-17**. While some changes were made to the model conditions at this time, item 7 of the meeting record outlines the decision to undertake a review in mid 2011 once more monitoring data was available to inform it.
90. A Terms of Reference (ToR) was developed for the 2011 Fitzroy Model Water Conditions Review to provide a structured overview of the review objectives, considerations and process. A copy of the ToR is provided at **MFB-06-18** and it outlines an industry consultation process consisting of two staggered DERM internal workshops on 9/10 May and 9 June 2011 (minutes and action items provided at **MFB-06-19** and **MFB-06-20**) and two staggered DERM, QRC and Industry workshops on 31 May and 29 June 2011 (minutes and action items provided at **MFB-06-21** and **MFB-06-22**). The consultation was structured in this way to clarify focal points for the review and provide opportunities for consideration of arguments, exchange of different points of view and informed debate about outcomes.
91. As outlined in the ToR, following the industry consultation phase of the 2011 review, the working draft of the model conditions was distributed to members of the Fitzroy Water Quality Advisory Group and DERM representatives attended a meeting of the group on 7 July 2011 to present likely key changes to the model conditions and to invite comment. The only comments received through that group were from the Fitzroy Basin Association whose comments are attached at **MFB-06-23**.
92. Following final consideration of comments received, a briefing note requesting approval from the General Manager – Strategic Implementation, Coal and Coal Seam Gas was prepared requesting approval of the proposed reviewed model conditions and progression of a briefing note to the Minister to inform her of the review outcomes (refer to attachments **MFB-06-24a** to **MFB-06-24d**). The General Manager approved the changes to the model conditions on 3 August 2011.
93. In order to expedite both industry and internal understanding of the Model Condition changes ahead of the next wet season, DERM provided an industry training session on 25 August 2011, which also included a number of internal DERM attendees. A copy of that training presentation is provided at **MFB-06-25**.

**Item 7: A description of the activities DERM was involved in during the 2010/2011 wet season regarding the grant of transitional environmental programs to operators of mines**

94. A list of water management related TEPs granted to mines between 1 December 2010 and 23 Aug 2011 is provided as attachment **MFB-07-01**. A version of this list was published on the DERM website and updated on a weekly basis throughout 2011.
95. A total of 110 TEPs or amendment to existing TEPs were approved between 1 December 2010 and 23 August 2011.
96. The great majority of water management related TEP activity as a result of the 2010/2011 wet season related to coal mines in the Bowen Basin (92 of the 110 TEPs granted). While other mining operations such as CSG operations, metalliferous mines and coal mines in other parts of the state were affected it was on a considerably smaller scale than the Bowen Basin coal mines. As such, a detailed account of TEP activities relating to Bowen Basin coal mines is presented below.

***Bowen Basin Coal Mines***

97. Prior to the onset of the 2010/2011 wet season the department engaged mining companies across the Bowen Basin and carried proactive compliance inspections of 20 high risk sites identified from the 43 active coal mines in the Fitzroy Basin in an effort to establish their level of preparedness for the upcoming wet season. These inspections and associated discussions also allowed the department to assess the risk of operations discharging mine affected water outside of Environmental Authority (EA) conditions.
98. At this time, a number of mines were invited to submit Transitional Environmental Programs (TEP) to reduce the risk of non-compliant discharges and to develop a detailed release strategy that would provide the best outcome for the environment and community downstream of the mine.
99. While some companies did take the opportunity to submit an application for a TEP, the majority of companies did not submit TEPs until January 2011. The department responded by meeting with those companies who intended to submit TEPs to discuss release strategies and to expedite approvals prior to the wet season.
100. Following initial heavy rains throughout November 2010 and at the beginning of December 2010 the department formally invited mining companies to submit TEPs for immediate consideration (Attached **MFB-07-02** – Letter from D.Brown, ADG, RSD). The advice provided to mining companies clearly indicated that the department would assess all flood and weather related TEPs as quickly as possible.
101. To further expedite the TEP process, the department in consultation with the QRC developed and circulated a template of a streamlined TEP to industry for

use by mine operators. The template detailed the correct format and type of information required by the department in order to make a decision on a TEP in order to assist mining operators to progress their TEP applications in a swift and efficient manner (Attached **MFB-07-03**).

102. The department deployed significant resources to the task of processing TEP applications through the wet season and, together with the streamlined application, enabled the majority of TEPs to be processed within three to five days (the assessment period for a TEP in accordance with the *EP Act* is typically 20 business days).
103. Between 9 December 2010 and 23 August 2011, the department dealt with 109 applications for new and amended TEPs to allow discharges of mine affected water from coal mines in the Bowen Basin. On all occasions the department engaged directly with mining companies to assist them to develop conditions for discharge of water including flow triggers, end of pipe Electrical Conductivity (EC) limits, downstream EC values and monitoring requirements.
104. To assist in the development of appropriately conditioned TEPs for mine water releases, regional staff consulted extensively with the department's Environment and Resource Sciences Division in addition to experts located across the state in the field of aquatic ecosystem health and toxicology. Mining companies were also urged to engage external expert consultants to avoid assessment delays as a result of providing inadequate information.
105. Over the Christmas period staff worked for long hours, including over weekends and on public holidays, to ensure that TEPs were processed expeditiously and appropriately to ensure that any risks to the environment were properly managed and mine sites were able to take advantage of the large flows in the Fitzroy River system.
106. The department engaged extensively with mining companies in the development of TEPs for the discharge of mine affected water from Coal Mines in the Bowen Basin and the assessment of TEP applications was afforded the highest priority by all staff in an effort to expedite the approval process and avoid undue delays to flood recovery efforts at those mines.

**Item 8: DERM's role, and an overview of activities undertaken between 1 October 2007 and 23 August 2011, with respect to any non-compliance with an environmental authority or transitional environmental program by an operator of a mine**

107. DERM's role in relation to regulation of mining in relation to non-compliance with an Environmental Authority or TEP is described in items 1-4 of this statement
108. A list of non-compliance activities undertaken between 1 October 2007 and 23 August 2011 in relation to water management at mine sites is attached as **MFB-08-01**.

109. The list has been compiled from data held in multiple offices across the state and some of the data also comes from Environmental Protection Agency records prior to the amalgamation with the Department of Natural Resources and Water to form the Department of Environment and Resource Management.
110. Additionally, the water management non-compliance actions had to be manually identified and extracted from the greater pool of non-compliance actions that have occurred as these figures have not previously been reported on a separate basis.
111. Given the difficulties in obtaining the data and the short timeframe imposed by the Commission, it is possible that the records may include some inaccuracies and may be incomplete in some areas. However, this is the best and most accurate data the department can provide in the timeframe allowed.

**Item 9: How DERM gathers information about the effect of releases of water from mines (including from dams at a mine site)**

112. Conditions placed on the relevant EAs require the holder to monitor water quality both upstream and downstream from their operations. All releases of mine-affected water are monitored against certain water quality parameters and discharge triggers and the data must be collected and provided to the department within specified time periods listed on the EA.
113. In addition DERM gathers data on the status of the receiving environment prior to any release occurring. The baseline or receiving environment data assists in determining if there are impacts from a release. This is achieved through various means including:
  - (a) Baseline studies which are required as part of the application to gain approval (such as Environmental Impacts Statement / environmental management plans);
  - (b) Routine monitoring in accordance with the requirements of the Environmental Authority to establish the un-impacted condition of the receiving environment prior to any release taking place so that an assessment of the level of impact arising from a release can be made; and
  - (c) DERM also conducts pre wet season inspections on high risk mine sites to establish the baseline conditions at and surrounding the mine prior to any release.
114. Mines are required under conditions of the applicable EA to monitor the receiving environment surrounding a mine site at all times (even when releases are not occurring) to develop a baseline dataset of environmental values in the area. This data is used to design conditions for other mines in the basin and to increase understanding of the regional environment and the broader impact of mine sites, specifically in relation to aquatic ecosystems.
115. Mine operators are required to provide notification of incidents, such as releases which are outside the limits in their Environmental Authority, to DERM

as required by the conditions of their Environmental Authority and the notification requirements of the EP Act.

116. On notification of a non-compliant release DERM undertakes a site inspection as soon as possible after being notified. Where access is restricted, DERM has at times utilised helicopters to access site releases.
117. As part of the inspection DERM will undertake sampling and monitoring of the release and the receiving environment to establish the level of impact.
118. The conditions of the environmental authority may require the mine operator to conduct investigations in the event of a contaminated water release from the mine in accordance with the ANZECC (2000) methodology to establish the potential for environmental harm.
119. Conditions placed on TEPs require the holder to monitor all releases of mine affected water for those characteristics nominated by the EA but with additional requirements to monitor the receiving environment, and to a greater extent, to ensure environmental harm does not result from the releases. TEPs issued across the 2010/2011 wet season were conditioned to require monitoring downstream of mine sites and to cease any active release if water quality parameters were reached. This ensured the cumulative impact of a number of simultaneous releases was taken into consideration.
120. The department undertakes regular monitoring of streams as part of an ongoing monitoring program. This monitoring program includes a network of gauging stations that monitor real time flow in all major and some minor watercourses across the Bowen Basin along with water quality at a number of critical sites.
121. This monitoring was augmented during the 2010-11 wet season by manual sampling undertaken in a number of key areas throughout the Condamine and Fitzroy river systems. This enabled the department to independently monitor water quality, develop an additional dataset of water quality to use when making decisions about mine water releases and to more appropriately measure the impacts of such releases.
122. In some of the more recent environmental authorities issued in North Queensland, mining companies are being required through conditions in their environmental authority to install gauging stations to both identify flow regimes and also to assist in assessing impacts of any release

**Item 10: DERM's role as to the assessment, regulation and communication of the effect of releases of water from mines (including from dams at a mine site)**

123. Section 320 of the *EP Act* requires that releases that cause or threaten to cause environmental harm that have not been authorised through an environmental authority or transitional environmental program must be notified to DERM as soon as reasonably practicable. An amendment act was recently passed to

additionally require this notification to be provided the occupier of the relevant land.

124. Further, DERM has a general practice of including, as a conditions of environmental authority, a requirement that any releases which are not in accordance with environmental authority conditions must be notified to DERM as soon as reasonably practicable or no later than a specified time period (e.g. 24 hours after becoming aware of the release). Specifically notification is generally required of:
- (a) any release of contaminants to waters;
  - (b) any event where environmental harm (excluding environmental nuisance) has been caused or may be caused;
  - (c) any non-compliance with any condition of this environmental authority other than in relation to a release of contaminants;
  - (d) when the level of the contents of any regulated dam reaches the mandatory reporting level; or
  - (e) when a regulated dam will not have available storage to meet the design storage allowance on the 1 November of any year.
125. DERM officers may also attend certain incidents in the field and conduct an investigation in to the event. DERM's investigations may result in enforcement action being taken against the company which will be in accordance with DERM's Enforcement Guidelines.
126. As part of incident notification procedures, if a community within a Local Government area may potentially be impacted by the incident, it is common practice for DERM response staff to contact the responsible Local Government. Recommendations will be made to the Local Government and plans may be developed in-liaison with relevant Local Government personnel.
127. For CSG activities, impact to Local Government drinking water supplies are regulated by the *Water Supply (Safety and Reliability) Act 2008*. Where there is the potential for contaminants to adversely affect public drinking water supplies, for both surface and groundwater situations, the Office of the Water Supply Regulator, DERM and relevant water authorities and users will be contacted. Responsibilities of relevant stakeholders are as follows:
- (a) Office of the Water Supply Regulator, in conjunction with Queensland Health, may provide; public health advice and direction, interpretation of laboratory results and advice on safe levels of contaminants;
  - (b) Water supply authorities are responsible for water impoundments, water treatment and supply; and
  - (c) Stakeholders within the likely affected downstream areas are to be notified of the incident and precautionary actions.
128. In the event that an incident occurs or affects a landholder's property, DERM staff will make contact with the landholder. Contact will also be made if an incident has not impacted, but threatens to impact a landholder.

129. DERM Incident management personnel maintain an emergency contact listing with up to date details of Local Government contacts, as well as key contacts across the Department to assist with incident response.
130. DERM also provides and facilitates ongoing communication activities relating to mine discharges and river system water quality through websites, media and various key groups such as the Fitzroy Water Quality Advisory Group.

**Item 11: DERM's role, and an overview of activities undertaken between 1 October 2010 and 23 August 2011, with respect to the effect of releases of water from mines (including from dams at a mine site) on:**

131. Much of DERM's role and activities in relation to the effect of releases of water from mines has been covered in previous items. A few issues specific to each sub heading are included for completeness.

**a. drinking water quality downstream**

132. The EP Act and the subordinate *Environmental Protection (Water) Policy 2009* (EPP Water) provides for drinking water values for Queensland waters. Accordingly, the protection of these values must be demonstrated prior to any authority being granted authorising a contaminant release to surface waters. Conditions of the environmental authority will provide quality limits and environmental monitoring to ensure that discharge quality is sufficient to protect drinking water values.
133. During the 10/11 wet season, DERM staff liaised with Queensland Health on a regular basis to ensure that any authorised or un-authorised discharges from mine sites were managed to ensure the protection of drinking water quality.
134. TEPs issued during or as a result of the 10/11 wet season also considered the effects of any mine site release on drinking water and were conditioned to ensure that the discharge was managed in such a way as to ensure the protection of drinking water supplies.
135. Where a discharge from a coal seam gas activity is deemed to have a material impact on a raw drinking water supply source, an approved coal seam gas recycled water management plan under the *Water Supply (Safety and Reliability) Act 2008* will also be required to prove that the treatment process, and supporting management arrangements, will consistently deliver water of the quality required to protect public health in drinking water supplies. Alternatively an Exclusion Decision under the *Water Supply (Safety and Reliability) Act 2008* may be required. In administering the *Water Supply (Safety and Reliability) Act 2008*, DERM liaises with Queensland Health to ensure that public health is not at risk as a result of the discharge.

**b. the downstream environment and ecology (as far as, and including, the Great Barrier Reef Marine Park)**

136. The department's water monitoring activities have been detailed in previous items and, as such, will not be repeated here.
137. The effects of releases of water from mine sites are assessed prior to the grant of environmental authorities or transitional environmental programs. In applying to receive approval to discharge to a surface water, applicants must prepare information to support the application which identifies the environmental values, water quality objectives and management intent (that is, the goals to be achieved in terms of meeting water quality objectives and protecting environmental values) of the surface water. This framework is provided in the EPP Water. Applications must be able to demonstrate that the management intent for the receiving water will be met despite the discharge occurring. The application must also be accompanied by a detailed impact assessment, including water quality modelling to demonstrate the nature and extent of impacts to surface waters.
138. All applications for environmental authorities and TEPs submitted for the approval of discharge to surface waters must be assessed by DERM against the requirements of the EP Act which includes the EPP Water, including an impact assessment to ensure that environmental values of any surface water will be protected. In conducting these regulatory assessments, DERM has developed a number of decision support tools including the guideline "Protecting Environmental Values from CSG Water Discharged to Surface Waters" (2010, **MFB-11-01**), Conditions for Coal Mines in the Fitzroy Basin – Approach to Discharge Licensing (June 2010, **MFB-11-02**) and the Operational Policy "Waste water discharge to Queensland Waters" (2007, **MFB-11-03**) and associated procedural information (**MFB-11-04** and **MFB-11-05**). DERM has also prepared an "*Interim Decision Support Matrix Release of water produced in association with Coal Seam Gas activities to surface waterways*" (2010, **MFB-11-06**) which informs assessments and resultant authority conditions
139. The approach used by the department throughout the 2010-2011 wet season aimed to be consistent with state/national water quality guidelines e.g. The Queensland Water Quality Guidelines (2006), ANZECC/ARMCANZ Guidelines for Fresh and Marine Water Quality 2000, the Australian Drinking Water Quality Guidelines and the October 2010 released Draft for Consultation – Establishing Environmental Values, Water Quality Guidelines and Water Quality Objectives for Fitzroy Basin Waters. .
140. Strict controls and limitations are placed on authorities as conditions such as limits upon the volumes discharged, timing of discharge and required dilution and mixing zones for discharges. Conditions also include comprehensive contaminant monitoring programs for discharge quality which is supplemented by detailed receiving environment monitoring programs.
141. Releases of water from a dam at a mine site can be authorised by the conditions of an EA or via specific permission under a TEP. Regardless of the

statutory instrument, for releases of water from a dam at a mine site to be authorised, the assessment procedure described above would apply.

**c. quality of water used for agricultural purposes**

142. The use of waters for agricultural purposes is considered an environmental value under the EPP Water, and as such impacts on this value must be assessed as per the framework described above.

**Item 12: Details of any of the following that DERM is aware of occurring during the period 1 October 2010 and 23 August 2011 related to the discharge of water from any mine site:**

143. A table identifying known non-compliance issues over the period in question that had the potential to impact on an environmental value is provided as attachment **MFB-12-01**. Again, due to the time constraints placed on the department by the Commission there is a possibility of inaccuracies or omissions but it is the best available data that could be supplied by the department in the time frame allowed.

144. It should be noted that although a non-compliance issue may have had the potential to impact adversely on an environmental value this does not necessarily mean that this occurred. For completeness, all issues that had the potential to impact on an environmental value have been included in the table.

145. Further information specific to the currently elevated salinity levels in the Fitzroy river system and relevant to items 12a to 12e are supplied in the following paragraphs.

146. The department has observed that salinity (measured by Electrical Conductivity) in all water courses in the Fitzroy basin has increased following the 2010/2011 wet season. The high rainfall resulted in extensive recharge to the groundwater in the Fitzroy basin which increased contribution of groundwater to base flows in streams high in the catchment. At times, the salinity of this water is quite high (in excess of the EC 2500 micro Siemens per centimetre (uS/cm)). As a consequence, salinity in base flows in the larger streams of the Fitzroy catchment is higher than has been experienced in recent years when there was little or no groundwater contribution to stream flow.

147. The department does not believe that discharges from mine sites as a result of the 10/11 wet season have contributed significantly to the currently elevated electrical conductivity of the Fitzroy river system. Discharges from mine sites have been closely monitored in accordance with conditions set on both EAs and TEPs to ensure water quality downstream of mines remains within acceptable limits.

**a. adverse effect on drinking water quality**

148. This rising salinity is currently causing some minor issues in drinking water supplies in the lower Mackenzie and Fitzroy Rivers. The electrical conductivity (EC) in the Fitzroy Barrage, which supplies drinking water to Rockhampton and the Bedford Weir, which supplies drinking water to Tieri, Middlemount, Blackwater, and Bluff has risen to levels above 600uS/cm. At these levels part of the population are able to detect taste difference to the water normally supplied from these storages.

**b. adverse effect on any plant or animal species**

149. There is no evidence to suggest that any plant or animal species has been adversely impacted by the increased salinity in waterways across the Fitzroy river system.

**c. adverse effect on any industry or agriculture**

150. Whilst there have not been major impacts on electricity generation there has been some minor inconvenience and increased costs on electricity generation at the Stanwell power station. An increase in salinity in the raw water supply results in fewer cycles for cooling water. Consequently, to achieve the same levels of electricity generation increased volumes of cooling water sourced from the Fitzroy River are required.

151. The department has been informed that Stanwell Corporation have been able to handle the increase in salinity in their raw water through a temporary amendment to their Development Approval (DA). The amendment allows Stanwell to use larger volume of below down water at the same time not exceeding their current water quality discharge limits.

**d. adverse effect on the environment**

152. There is no evidence that rising EC in stream flow in the Fitzroy river system or mine water discharges across the state as a result of the 10/11 wet season have had any adverse impact on the environment. The department has investigated a number of breaches of conditions of both EA's and TEP's and has concluded that in the majority of cases there is no evidence that environmental harm has resulted from any non compliant release. There is still one investigation ongoing in the North West of the state and the department is currently reviewing the brief of evidence.

**e. adverse effect on public health**

153. Where salinity has risen in drinking water supplies in the lower Mackenzie and Fitzroy Barrage, there is some concern in particular for those people who are on low sodium diets and kidney dialysis in Tieri, Middlemount, Blackwater, Bluff and Rockhampton. Bio-medical services of the Central Queensland Health Service District have also reported that adjustments have had to be made to

dialysis and other equipment as a result of the associated increase in hardness of water.

154. As mentioned earlier in this statement, the department believes that the major cause of this increase in salinity and hardness is the increasing contribution of groundwater to stream flows rather than the effects of mine discharges.

**Item 13: DERM's role and activities regarding the flood preparedness of mines in Queensland:**

**a. generally**

155. As a regulator DERM's compliance activities are designed to strategically review the performance of individual regulated entities in a risk based way.

156. DERM's compliance approach is discussed previously, but it is useful here to reiterate activities undertaken around wet season cycles that are aimed at ensuring mine water management is undertaken by registered entities in as effective a way as possible.

157. DERM has and is undertaking pre wet season compliance programs to evaluate water management preparedness ahead of the coming wet season. This primarily involves evaluating past season performance, measures taken following and preparedness ahead of the next wet season in terms of having available dam storage capacity to meet the minimum design storage allowance on the 1 November of any year.

158. EAs include requirements for companies to prepare Water Management Plans that outline the overall mine water management strategy for their site. The EAs require an annual review of these plans to ensure learnings from past wet season performance are incorporated into forward plans and preparations for future wet seasons.

159. EAs also include dam structural design, construction and operation requirements relating to mine sites that are commensurate with flood risks given their locations, including:

- (a) certified hazard assessment required for all dams;
- (b) must be designed to prevent floodwaters from entering the dam, wall failure and overtopping up to and including a specified flood event based on AEP;
- (c) certified design plans, high risk dams reviewed by DERM technical experts;
- (d) having a marked "mandatory reporting level" above which DERM must be notified immediately, and actions put in place to prevent or minimise environmental harm
- (e) ensuring the dam is inspected at least annually by a suitably qualified and experienced person and provide the report to DERM;
- (f) undertaking reviews annually about the effectiveness of the dam during the preceding wet season and modifying the water management system accordingly
- (g) monitoring of water quality within the dam prior to the wet season; and

(h) maintaining a register of dams and relevant information.

**b. specific activities undertaken in advance of the 2010/2011 wet season**

160. In late 2010, information from the Bureau of Meteorology indicated that there was a 70-80% chance that the 2010/2011 wet season in Queensland might exceed median rainfall values. In response the department developed and implemented summer season preparedness and response plans for mining areas likely to be impacted by the wet season (Attachments **MFB-13-01**, **MFB-13-02**). This plan included a series of targeted mine-site inspections. The purpose of the plans was to:
- (a) identify all regulated water storage facilities that were at risk of unauthorised discharge;
  - (b) outlined the approach adopted to prepare for the wet season; and
  - (c) outline emergency response arrangements to incidents.
161. Prior to this, since the 2008/2009 summer season, the department had been working closely with mining companies to improve on-site water management systems and reduce the impacts of releasing mine affected water.
162. Specific activities to assist with preparedness in advance of the 2010/2011 wet season included the development and implementation of consistent and appropriate discharge conditions for coal mines as recommended by the '*Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin*' report. The agreed conditions were developed in accordance with the department, the QRC and technical experts from Fitzroy Basin coal mines and have been discussed in detail in item 6 of this statement.
163. Mines that identified they could not move immediately to the new standards were provided opportunities to include transitional conditions until such time they could comply. Where companies felt the existing conditions were not appropriate to manage site water, they were invited to apply for TEP's and/or amend conditions at their request.
164. Numerous inspections were undertaken by departmental officers across the state during 2010 leading up to the 2010/2011 wet season. The inspections focused on higher risk sites and had an emphasis on water management. Risk assessments for various sites are contained in the summer season preparedness and response plans mentioned earlier.
165. Mine operators are required under the conditions of the EA to conduct an annual inspection of all hazardous storages at each mine site prior to each wet season. The inspections focus on structural integrity and capacity requirements. These reports for mine sites were reviewed by DERM to ensure that any remedial measures recommended in the report were implemented.
166. During 2010 DERM monitored meteorological observations and forecasts both prior to and during the 2010/2011 wet season to adjust operational planning and resource allocation appropriately to minimise the risk of contaminated water releases from mines and maintained constant contact with the key mine sites.

166a. DERM developed a '*CSG Discharge Response Plan*' in December 2010 (MFB-13-03) which aimed to ensure a professional, consistent and timely initial response by DERM to major CSG discharge events from CSG project sites in DERM's South West and Central West Regions by setting out roles and responsibilities within DERM when responding to a major CSG discharge event.

**c. specific activities planned to occur in advance of the 2011/2012 wet season**

167. All regions throughout the state have planned a series of pro-active inspections for mine sites identified as higher risk of inundation or unauthorised release of mine affected water. These inspections will focus on establishing whether the mine in question is able to operate within the conditions of its Environmental Authority and/or Transitional Environmental Program and will obviously be focussed on water management. Where non-compliance was previously identified, the operators of the mine were required to implement, or commit to implement, actions to bring the site into compliance and these will also be reviewed as part of the inspection program.

168. DERM is currently engaging with mine operators from a number of mine sites on a range of works designed to minimise the risk of contaminated water releases in the 2011/2012 wet season. DERM will also act on any water management issues arising from the compliance inspection program that is currently being undertaken.

169. DERM are currently undertaking the annual review of the Mine Discharge Response Plans in preparation for the 2011/12 wet season. Regional staff are also ensuring equipment and staff are available to respond in the event of a mine discharge.

170. Mine operators are required to conduct an annual inspection of all hazardous storages at each mine site prior to the wet season. The inspections focus on structural integrity and capacity requirements. These reports will be reviewed by DERM as required to ensure that any remedial measures recommended in the report will be implemented.

171. DERM will monitor meteorological observations and forecasts both prior to and during the upcoming wet season to adjust operational planning and resource allocation appropriately to minimise the risk of contaminated water releases from mine sites in North Region and maintain constant contact with the key large mine sites.

172. As the coal mines in the Bowen Basin were some of the most severely impacted in the 10/11 wet season, the department's Central West Region have developed a *Central West Region – Coal Mine Water Inspections Project Outline* (Attached MFB-13-15). The aim of the program is to establish the current water management status of Central West coal mines (particularly those in the Fitzroy river system) leading into the 2011/2012 wet season and identify those mines that may be of high risk in relation to potential uncontrolled discharges of mine affected water. Officers will use a guide *Proactive Compliance Inspection –*

Standard Operating Procedure (Attachment **MFB-13-16**) developed specifically for the inspection program to ensure information is targeted and collected in a useable format.

173. A total of 30 coal mines will be inspected as part of this program. The program will focus on overall site water management particularly, storage capacity, water quality, water management plans and systems in place (including contingencies), proposed or planned infrastructure upgrades to improve water management systems including treatment and identification of any potential non-compliances with EA conditions.
174. The criteria for determining which sites have been included in the program for the 2011/12 wet season include:
- (a) coal mines that required a TEP during the 2010/2011 wet season; and
  - (b) coal mines that had non-compliances with environmental approvals during the 2010/2011 wet season; or
  - (c) coal mines that have been identified as high risk by the departmental Project Manager due to on-going water management issues.
175. The program is scheduled to commence on 6 September 2011 and is due for completion prior to the end of this wet season. A final report will be developed summarising the outcomes, findings and actions taken as a result of the program.
176. In addition to the pro-active inspection programs being implemented across the state, the department, in consultation with the Queensland Resources Council and other interested stakeholders has completed a review of the *Fitzroy Model Water Conditions*. More detailed information on this has been provided at item 6 of this statement.
177. Since the 2010/2011 wet season, regional officers have been liaising with industry and encouraging mines with outstanding concerns in relation to water management and compliance with EA conditions to proactively apply for a TEP. The department has reiterated that the TEP's must detail the actions being undertaken by the mine operator to identify water management issues and improve site infrastructure to enable compliance with their environmental approvals and EP Act.
178. Written correspondence to all CSG companies drafted requiring wet season planning including a status report of all dams and stormwater ponds and an emergency or contingency strategy or plan which includes procedures for:
- (a) situation responses including protocols for water level management;
  - (b) the identification of potentially impacted stakeholders and communication methodologies;
  - (c) investigation, monitoring and reporting of releases;
  - (d) post release impact assessment and remediation;
  - (e) staff training and awareness of contingency plans;
  - (f) notification procedures for the department and local government; and
  - (g) identification of the minimum amount of information that will be provided as part of notification in the event of a release.

**Item 14: The interaction during floods or times when mines are releasing water arising out of or related to floods between DERM and:**

**a. operators of mines**

179. Examples and a detailed description of interaction between the department and mine operators have been provided as part of the responses to other items in this statement. As such, they will not be repeated for this item.
180. During the wet season DERM maintain close contact with key mine sites to continually assess and reassess the potential for any discharge and to ensure all authorised and un-authorised discharges were being managed wherever possible to minimise the potential for unacceptable impacts on the environment and downstream water users.

**b. downstream landholders**

181. During discharge events DERM maintains contact with potentially impacted downstream landholders and where necessary other potentially affected stakeholders (for example traditional owners and local authorities) to advise of the release.
182. When negotiating TEPs that may impact on downstream landholders, DERM ensures these potentially affected landholders and downstream water users are contacted as part of the process by either DERM or the mining operator.
183. Where any incidents, un-authorised releases or release of contaminants occur that may impact on downstream water users, DERM ensures all potentially affected parties are contacted and made aware of the situation and the measures being taken to control the issue.
184. The broader community is kept informed of mine discharges and other related issues through various media and key stakeholder groups as required.

**c. emergency management personnel at both the State and local level**

185. DERM staff liaise with emergency management personnel as required where an event or incident has occurred that has resulted in the activation of local or state disaster management arrangements.

**d. other government agencies including the Department of Employment, Economic Development and Innovation, the Great Barrier Reef Marine Park Authority and the Queensland Parks and Wildlife Service.**

186. DERM notifies and liaises with other key government agencies as circumstances require. For example, Queensland Health is notified in circumstances where drinking water or public health may be impacted, DEEDI is notified where there may be impacts to livestock and issues relating to abandoned mines, and QPW would be notified where there may be impacts on protected areas.

187. During discharge events DERM maintains contact with these government agencies to provide advice on the release so that any appropriate management measures can be implemented if required.

188. Extensive liaison and consultation has occurred with DEEDI on the impacts of the 2010/2011 wet season on coal mines and the effects that stored water may be having on operational capacity.

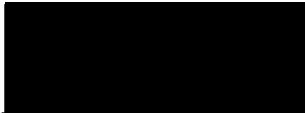

I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of the *Oaths Act 1867*.

Signed

Michael Francis Brennan

Taken and declared before me, at Brisbane this 5th day of September 2011

.....  
Solicitor/Barrister/Justice of the  
Peace/Commissioner for Declarations

Our ref: Doc 1683651

29 August 2011

Mr Michael Birchley  
Assistant Director-General  
Regional Service Delivery  
Department of Environment and Resource Management  
GPO Box 2454  
BRISBANE QLD 4001

### REQUIREMENT TO PROVIDE STATEMENT TO COMMISSION OF INQUIRY

I, Justice Catherine E Holmes, Commissioner of Inquiry, pursuant to section 5(1)(d) of the *Commissions of Inquiry Act 1950* (Qld), require Mr Michael Birchley to provide a written statement, under oath or affirmation, to the Queensland Floods Commission of Inquiry, in which the said Mr Birchley:

- provides all information in his possession and identifies the source or sources of that information;
- makes commentary and provides opinions he is qualified to give as to the appropriateness of particular actions or decisions and the basis of that commentary or opinion;

in respect of the following:

1. a brief overview of the role and responsibilities of the Department of Environment and Resource Management (DERM) as to the regulation of mining operations in Queensland, including mining dams
2. the involvement of DERM in granting environmental authorities to operators of mines under the *Environmental Protection Act 1994* (Qld)
3. the means by which DERM regulates compliance with environmental authorities granted to operators of mines
4. the role of DERM in granting transitional environmental programs to operators of mines
5. DERM's actions in response to the Hart Report on Fitzroy River Water Quality Issues recommendations numbers 1, 2, 3, 4, 5, 10, 11, 12 and 13

6. the process by which the Final Model Water Conditions for Coal Mines in the Fitzroy Basin were drafted, relevant parties were consulted, and the terms were negotiated, finalised and amended (all relevant meeting minutes, internal and external reports, briefing notes and memoranda should be attached to the statement)
7. a description of the activities DERM was involved in during the 2010/2011 wet season regarding the grant of transitional environmental programs to operators of mines
8. DERM's role, and an overview of activities undertaken between 1 October 2007 and 23 August 2011, with respect to any non-compliance with an environmental authority or transitional environmental program by an operator of a mine
9. how DERM gathers information about the effect of releases of water from mines (including from dams at a mine site)
10. DERM's role as to the assessment, regulation and communication of the effect of releases of water from mines (including from dams at a mine site)
11. DERM's role, and an overview of activities undertaken between 1 October 2010 and 23 August 2011, with respect to the effect of releases of water from mines (including from dams at a mine site) on:
  - a. drinking water quality downstream
  - b. the downstream environment and ecology (as far as, and including, the Great Barrier Reef Marine Park)
  - c. quality of water used for agricultural purposes
12. details of any of the following that DERM is aware of occurring during the period 1 October 2010 and 23 August 2011 related to the discharge of water from any mine site:
  - a. adverse effect on drinking water quality
  - b. adverse effect on any plant or animal species
  - c. adverse effect on any industry or agriculture
  - d. adverse effect on the environment
  - e. adverse effect on public health
13. DERM's role and activities regarding the flood preparedness of mines in Queensland:
  - a. generally, and
  - b. specific activities undertaken in advance of the 2010/2011 wet season
  - c. specific activities planned to occur in advance of the 2011/2012 wet season
14. the interaction during floods or times when mines are releasing water arising out of or related to floods between DERM and:
  - a. operators of mines
  - b. downstream landholders

- c. emergency management personnel at both the State and local level
- d. other government agencies including the Department of Employment, Economic Development and Innovation, the Great Barrier Reef Marine Park Authority and the Queensland Parks and Wildlife Service

For the purpose of this Requirement, "mine", "mines" and "mining" should be taken to include coal seam gas operations. All relevant government policies and procedures relevant to topics 2 to 14, above, should be attached to the statement.

Mr Birchley may also address other topics relevant to the Terms of Reference of the Commission in the statement, if he wishes.

The statement is to be provided to the Queensland Floods Commission of Inquiry by Monday 5 September 2011.

The statement can be provided by post, email or by arranging delivery to the Commission by emailing [info@floodcommission.qld.gov.au](mailto:info@floodcommission.qld.gov.au).

---

Commissioner  
Justice C E Holmes

## Environmental impact statements (EIS)

---

### What is the purpose of an environmental impact statement (EIS)?

The purpose of an EIS is to:

- assess the potential adverse and beneficial environmental, economic, and social impacts of the project;
- provide information to the public about the project and its impacts;
- obtain input from the community and stakeholders about the project, its impacts and management;
- assess management, monitoring, planning and other measures proposed to minimise any adverse environmental impacts of the project;
- consider feasible alternative ways to carry out the project;
- assist the administering authority<sup>1</sup> to decide an environmental authority application;
- give information to other State and Commonwealth authorities to help them make informed decisions; and
- propose an environmental management document for the project such as an environmental management plan (e.g. an environmental management plan (exploration permit or mineral development licence) as applicable for mining projects).

### When do I need to prepare an EIS?

A proponent will be required to prepare an EIS under the *Environmental Protection Act 1994* (EP Act) if the administering authority or the Minister for the Department that administers the EP Act decides an EIS is appropriate for a mining project, based on criteria in the guideline 'Deciding the level of impact assessment for the mining industry'.

If the project is determined to be of state or national significance then the proponent may be required to prepare an EIS under either the *State Development and Public Works Organisation Act 1971* or the *Environment Protection and Biodiversity Conservation Act 1999* (Cwlth).

Note: If the proponent of a project considers that their project might require an EIS, they may apply to the administering authority to prepare a voluntary EIS along with payment of the prescribed fee. For further information refer to the [information sheet](#) 'Voluntary Preparation of an EIS' and [application form](#) 'Application to prepare a voluntary environmental impact statement' on the administering authority website [www.derm.qld.gov.au](http://www.derm.qld.gov.au) about voluntary preparation of an EIS.

An EIS process is initiated when the proponent submits a draft terms of reference and pays the EIS assessment fee.

---

<sup>1</sup> The Department of Environment and Resource Management is the administering authority under the *Environmental Protection Act 1994*.

## What is the role of the project proponent?

The proponent:

- prepares draft terms of reference, including proposing who are the affected and interested persons and how they will be consulted
- makes payment of the prescribed fee
- notifies affected persons and interested parties of the draft terms of reference
- summarises comments, prepares written response to comments and redrafts terms of reference and provides these to the administering authority
- undertakes relevant studies and prepares an EIS in accordance with the terms of reference decided by the administering authority
- develops the environmental management document for the project
- publishes an EIS notice advising submissions on the EIS will be accepted by the administering authority
- reviews and responds to public submissions on the EIS.

## What is the role of the public?

The public's role is to critically analyse and provide advice on the proposed terms of reference and EIS to ensure an open and transparent EIS process.

The terms of reference proposed by the proponent and decided by the administering authority will include appropriate mechanisms for informing and consulting the affected and interested parties and the community.

The public can play a significant role by providing comments on the draft terms of reference and EIS to assist in determining an application for an environmental authority for a mining project and deciding conditions.

## What is the role of the administering authority?

The administering authority:

- reviews the draft terms of reference prepared by the proponent
- places advertisements inviting comments on the draft terms of reference
- receives comments on draft terms of reference and provides copies to the proponent
- decides and publishes final terms of reference for the EIS
- determines if the submitted EIS meets requirements of the terms of reference
- accepts all submissions on the EIS and provides copies to the proponent
- prepares an EIS assessment report
- reviews the environmental management document prepared by the proponent
- coordinates input from other government agencies for an EIS process under the *Environmental Protection Act 1994*.

## When is an EIS process complete?

The EIS process is completed when the administering authority gives the EIS assessment report to the proponent. The EIS assessment report will:

- assess the adequacy of the EIS in meeting the requirements of the terms of reference
- assess the adequacy of any environmental management document prepared in association with the EIS
- make recommendations on the suitability of the project
- recommend any conditions on which any approval required for the project may be given.

The administering authority may accept an EIS prepared under another Act (for example the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*) as an EIS for the purposes of the *Environmental Protection Act 1994*.

## Further information

For further information refer to the guideline 'Terms of reference and preparation of an environmental impact statement'.

Advice and support are available:

- through a state-wide network of regional offices of the administering authority;
- on the administering authority website at [www.derm.qld.gov.au](http://www.derm.qld.gov.au); and
- by contacting Permit and Licence Management on 1300 130 372.

## Disclaimer

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Department of Environment and Resource Management should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

## 1 Introduction

Chapter 3 of the *Environmental Protection Act 1994 (EP Act)* prescribes an environmental impact statement (EIS) process. This EIS process applies in the following circumstances (s. 37 of EP Act):

- 1) an EIS requirement is in force in relation to an application for an environmental authority (mining activities) and a relevant mining activity for the application is, or is part of, the project; or
- 2) an EIS has been required for the project under an Act as follows for which it has, under the Act, been decided or required that this part applies to the preparation of the EIS—
  - (i) the *Environment Protection and Biodiversity Conservation Act*,
  - (ii) the *State Development and Public Works Organisation Act 1971*;
  - (iii) another State Act or another Commonwealth Act; or
- 3) the voluntary preparation of an EIS for the project has been approved by the chief executive<sup>1</sup> under part 2 of the EP Act; or
- 4) the project is of a type prescribed under a regulation for which approval by a Commonwealth or State authority is required.

A proponent may apply to the chief executive to voluntarily prepare an EIS for a project (s. 70 of EP Act). However, an application to voluntarily prepare an EIS can not be made for a project if:

- an EIS requirement is in force for an application under the EP Act relating to the project; or
- the *Environment Protection and Biodiversity Conservation Act* requires the project to be assessed under that Act and the EIS process has not been decided as an accredited process under the *Environment Protection and Biodiversity Conservation Act*; or
- an EIS or similar statement, however called, must be prepared for the project under another State Act and that Act does not allow the EIS or statement to be prepared under the EIS process.

## 2 Definition of affected persons and interested persons

A person is an 'affected person' for a project (s. 38 of EP Act) if the person is:

- 1) any of the following under the *Native Title Act 1993* (Commonwealth) for the operational land or for an area that includes any of the land:
  - a) a registered native title body corporate;
  - b) a registered native title claimant;
  - c) a representative Aboriginal/Torres Strait Islander body; or
- 2) a relevant local government for the operational land; or
- 3) a person mentioned below for the operational land or any land joining it:
  - a) a registered proprietor - for freehold land;
  - b) a person recorded in the register as the registered holder of the interest - for land that is held from the State for an estate or interest less than fee simple and for which the interest is recorded in a register mentioned in the *Land Act 1994* (Land Act), s. 276;
  - c) a holder of, or an applicant for, the tenement - for land subject to a mining claim, mineral development licence or mining lease;

<sup>1</sup> The Department of Environment and Resource Management is the chief executive under the *Environmental Protection Act 1994*.

## The EIS process for level 1 mining projects

- d) a holder of the resource authority – for land subject to a relevant resource authority for an environmental authority (chapter 5A activities);
- e) a trustee of the land - for land under the Land Act or the *Nature Conservation Act 1992* (NC Act) for which there are trustees;
- f) a grantee of the land - for Aboriginal land under the *Aboriginal Land Act 1991* (AL Act) that is taken to be a reserve because of s. 87(2) or 87(4)(b) of that Act;
- g) a trustee for the land - for DOGIT land under the ALA or the *Torres Strait Islander Land Act 1991*;
- h) a relevant local government - for land held under a lease under the *Local Government (Aboriginal Lands) Act 1978*, s. 3;
- i) a grantee of the land – for Torres Strait Islander land under the *Torres Strait Islander Land Act 1991* that is taken to be a reserve because of s. 84(2) or 84(4)(b) of that Act;
- j) a trustee of the land - for land under a lease from the State under the *Aborigines and Torres Strait Islanders (Land Holding) Act 1985* that has been excised from land granted in trust for Aboriginal or Torres Strait Islander purposes under the Land Act;
- k) the State - for land that is any of the following:
  - unallocated State land;
  - a reserve under the Land Act for which there is no trustee;
  - a national park, national park (Aboriginal land), national park (scientific), national park (Torres Strait Islander land), national park (recovery) or forest reserve under the NC Act;
  - a conservation park under the NC Act for which there are no trustees;
  - a State forest or timber reserve under the *Forestry Act 1959*;
  - a State controlled road under the *Transport Infrastructure Act 1994*;
  - a fish habitat area under the *Fisheries Act 1994*;
- l) another person prescribed under a regulation.

At the beginning of the EIS process, the proponent may nominate those persons with an interest in the project (interested persons). Interested persons may include a local community progress association, a local/state/national environmental action group, or affected land users other than landholders. The interested persons should be identified on a 'project by project' basis and will vary for each project. It is important that the proponent follows a thorough and systematic process to identify any person who might have a substantial interest in the project or its impact.

Representatives of both interested and affected persons should participate in the community reference group or stakeholder panel set up for the community consultation program for the project. Further information on community consultation and its role in issue identification is contained in the guideline 'Issue identification and community consultation.'

### 3 Purpose of the EIS

The purpose of an EIS is to (s. 40 of EP Act):

- assess the potential adverse and beneficial environmental, economic and social impacts of the project;
- assess the management, monitoring, planning and any other measures proposed to minimise any adverse environmental impacts of the project;
- consider feasible alternative ways to carry out the project;
- give enough information about the identified impacts and management measures to the proponent, Commonwealth and State authorities and the public;

## The EIS process for level 1 mining projects

- prepare or propose an environmental management plan for the project;
- help the administering authority<sup>2</sup> decide an environmental authority application for which the EIS is required;
- give information to other Commonwealth and State authorities to help them make informed decisions;
- meet any assessment requirements under the *Environment Protection and Biodiversity Conservation Act* for a project that is, or includes, a controlled action under that Act; or a bilateral agreement;
- allow the State to meet its obligations under a bilateral agreement.

### 4 Description of the EIS process

#### 4.1 Voluntary preparation of an EIS

A proponent may apply to voluntarily prepare an EIS for a project (s. 70 of EP Act). In that case the application must be on the approved form, be accompanied by the prescribed fee<sup>3</sup> and be supported by enough information to allow the chief executive to decide whether an EIS is appropriate for the project. That is, the application must contain the following:

- (a) a description of the project including proposed ancillary activities such as accommodation for workers, transport of product, and power supply and proposed methods for waste management (e.g. tailings dam requirements);
- (b) a description of the operational land;
- (c) a list stating the name and address of each person the proponent proposes as an interested person for the project;
- (d) a list of the names and addresses of the affected persons for the project;
- (e) a statement of how the proponent proposes to consult with the affected and interested persons;
- (f) a list (if any) of environmental relevant activities for which an aggregate environmental score is stated;
- (g) the proposed source of water for the project; and
- (h) proposed post mining land use including any non-beneficial land capability that will remain.

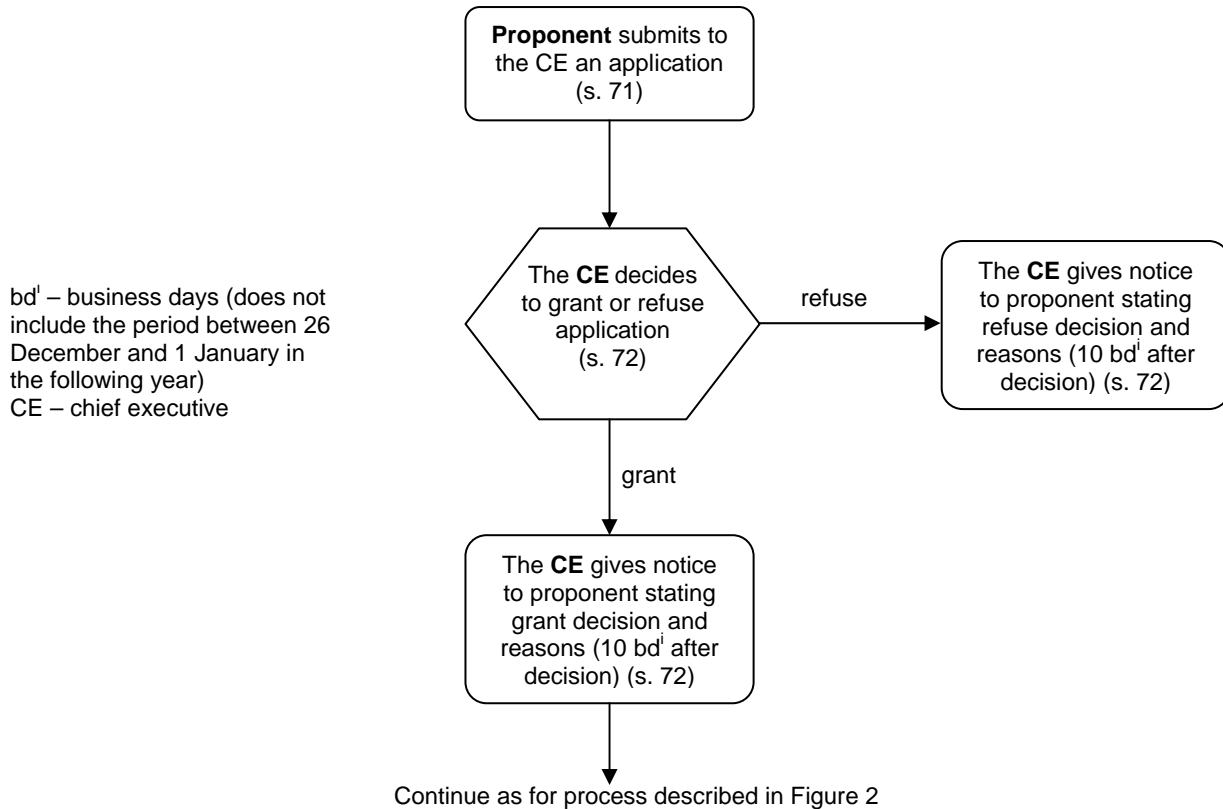

If available, the chief executive encourages submission of a draft or outline environmental management plan (EM Plan) at this stage, or any existing feasibility studies. Also, the proponent must show that they have authority to enter the land to which the project relates, to carry out the necessary studies for the EIS.

Figure 1 (see next page) shows the process for applying to voluntarily prepare an EIS. If the application is approved by the chief executive, the general EIS process prescribed in the EP Act and discussed in the sections following should then be followed.

<sup>2</sup> The Department of Environment and Resource Management is the administering authority under the EP Act.

<sup>3</sup> An application fee must be paid at the time of submitting the voluntary EIS application. The fee as of 1 January 2011 is \$500 which may be adjusted for inflation in August each year. For the latest fee please check the chief executive website on <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)> or call 1300 130 372.

Figure 1 - Application to voluntarily prepare an EIS

## 4.2 The terms of reference stage

Figure 2 is a flow chart detailing the EIS process prescribed in the EP Act. The entity required to carry out each step is identified in bold.

The EIS process commences when the proponent submits draft terms of reference (TOR) to the chief executive. The draft TOR must be submitted in an approved form and be accompanied by the prescribed fee<sup>4</sup>. If an application to voluntarily prepare an EIS has not previously been made for the project, the following information should accompany the draft TOR (s. 41 of EP Act):

- a written description of the project and the operational land;
- a list stating the name and address of each person the proponent proposes as an interested person for the project;
- a statement of how the proponent proposes to consult with the interested persons; and
- a list of the names and addresses of the affected persons for the project.

<sup>4</sup> An EIS assessment fee of \$120 000 must be paid at the time of submitting the draft TOR. The fee is current as of 1 January 2011 and may be adjusted for inflation in August each year. For the latest fee please check the chief executive website on <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)> or call 1300 130 372.

## The EIS process for level 1 mining projects

The guideline 'Generic terms of reference for environmental impact statements' provides more detail and an example of a generic 'terms of reference' for a mining project. The chief executive prepares and publishes a terms of reference notice for public notification of the draft terms of reference. The notice states the following information (s. 42 of EP Act):

- a description of the project and the operational land;
- that the proponent has prepared draft terms of reference for the EIS;
- where or how the draft may be obtained;
- that anyone may make written comments to the chief executive about the draft terms of reference;
- the comment period during which comments may be made;
- another matter prescribed under the Environmental Protection Regulation 2008.

The comment period is decided by the chief executive and must be at least 30 business days.

The proponent must give all identified affected and interested persons a copy of the terms of reference notice.

Anyone can make comments on the draft terms of reference to the chief executive. Within 10 business days after the comment period ends, the chief executive must give the proponent a copy of all comments received.

The proponent must then prepare the following:

- a written summary of the comments;
- a response to the comments;
- proposed amendments to the terms of reference as a result of the comments received.

It is suggested that the summary and response to comments is presented in a tabular form for easy reference. The proponent must provide the above information to the chief executive within 20 business days of receiving copies of the comments. However a longer period of time can be agreed between the proponent and the chief executive. The chief executive then prepares and publishes the final terms of reference based on the response from the proponent and gives to the proponent a copy within 20 business days.

It should be noted that the finalised terms of reference cease to have effect if an EIS is not submitted by the proponent within two years of the terms of reference being published.

### 4.3 The EIS submission stage

The proponent gives the completed EIS to the chief executive. It is intended that the assessment of the environmental management document (environmental management plan (EM Plan) as relevant to the application for an environmental authority), be assessed in parallel to the EIS. Therefore, submission of the environmental management document as part of the EIS is required (part of the terms of reference).

At this stage, the chief executive must decide whether to allow the EIS to proceed to the public notification stage (s. 49 of EP Act). For the EIS to be allowed to proceed, it must adequately address the published terms of reference. It should be noted that the proponent may apply to the Minister for a review in the event that the chief executive refuses to allow the EIS to proceed.

The proponent will be advised on a 'project by project' basis of the number of copies of the EIS required by the chief executive. Additional copies will be needed to make available for the public to purchase upon request. Multiple copies are required by the chief executive to distribute to staff and advisory bodies involved in the assessment process. The chief executive may provide copies directly to affected parties (e.g. landholders) who would otherwise have to pay for copies. Also, the chief executive will make copies available for inspection at the chief executive head office in Brisbane and relevant regional offices.

It is recommended that the proponent make copies of the EIS available free to interested/affected parties.

## The EIS process for level 1 mining projects

Once the proponent is notified by the chief executive that the EIS can proceed, the proponent must publish an EIS notice and give a copy of the EIS notice to each affected and interested person. The EIS notice must be in the approved format and state the following (s. 52 of EP Act):

- a description of the project and the operational land;
- where the submitted EIS may be inspected;
- where copies of, or extracts from, the submitted EIS may be obtained;
- that anyone may make a submission to the chief executive about the submitted EIS;
- the submission period during which submissions may be made;
- how to make a properly made submission;
- another matter prescribed under the Environmental Protection Regulation 2008.

The submission period will be set by the chief executive and must be at least 20 business days.

It is recommended that all material relating to the EIS is posted on the proponent's web site. The chief executive web site may also link to this site. The chief executive will accept all properly made submissions if they comply with the following criteria (s. 55 of EP Act):

- are written;
- are signed by for each person who made the submission;
- states the name and address of each signatory;
- are made to the chief executive; and
- are received on or before the last day of the submission period.

#### 4.4 The EIS assessment stage

The chief executive provides the proponent with a copy of all the submissions received on the EIS within 10 business days after the submission period ends. The proponent must then consider the submissions, prepare a response to the submissions, and make any necessary amendments to the submitted EIS. It is suggested that a summary of submissions and the response is provided in tabular form for easy reference.

Section 56 of the EP Act requires that the proponent provide the above information to the chief executive within 20 business days of receiving copies of the submissions. However a different period of time can be agreed between the proponent and the chief executive (s. 56(3)(a) of the EP Act).

At this stage the chief executive must decide whether to allow the submitted EIS to proceed (s. 56A of EP Act). The chief executive may allow the submitted EIS to proceed if they consider the proponent's response to the submission is adequate and the proponent has made appropriate amendments to the submitted EIS because of the submission. Note that the proponent may apply to the Minister for a review in the event that the chief executive refuses to allow the EIS to proceed. The chief executive must prepare and give an EIS assessment report to the proponent. The chief executive will consider the final terms of reference for the EIS, the submitted EIS, all properly made submissions and any other submission accepted by the chief executive, the proponent's response, and the standard criteria and other matters as prescribed under a regulation in preparing the EIS assessment report. The EIS assessment report will (s. 59 of EP Act):

- describe how well the EIS has addressed the final terms of reference (and make any appropriate recommendations to repair deficiencies or supplement the information provided);
- determine the adequacy of the proposed environmental management plan for the project (and make any appropriate recommendations for improving the document);
- make recommendations about the suitability of the project;

## The EIS process for level 1 mining projects

---

- recommend any conditions (not just conditions under the *Environmental Protection Act 1994*, but relevant conditions of any other type) that assessment of the EIS suggests should be applied to the project if it were to proceed; and
- contain another matter prescribed under a regulation.

### 5 Public notification and public access to terms of reference and the EIS

The terms of reference notice and EIS notice must be published at least once in a newspaper circulating in the locality of the operational land for the project. The chief executive may prescribe another way of advertising the notices, including for example posting on a web site.

On payment of the appropriate fee, any person may ask the proponent for a copy of the draft terms of reference or the submitted EIS. The appropriate fee for copies should be included in the terms of reference notice or EIS notice when published.

### 6 Use of advisory bodies

The legislation allows the chief executive to seek relevant advice, comment or information from any person during the EIS process (s. 62 of EP Act). For this purpose, an advisory body is defined as an individual or organisation providing advice to the chief executive within the extent of their expertise. As such, advisory bodies provide advice to the chief executive and do not have a decision making role in respect of the EIS process. However, they may have a decision making role in approvals under legislation which they administer.

The option to use advisory bodies is in line with the chief executive's aim to ensure the final terms of reference and the EIS assessment report are comprehensive, and reflect the interests and requirements of all key agencies and stakeholders. Members of the advisory body will be individuals with specific expertise and may be selected from the following on a project by project basis:

- departments of Commonwealth and State government;
- local government authorities;
- statutory authorities and academic institutions;
- private organisations, community groups (including environmental groups) and special interest groups (including recognised landowners organisations).

It is important that those agencies that may need to give approvals for the project are consulted so that the issues are adequately covered in the EIS and appropriate conditions are nominated in the EIS assessment report.

All consultation with any advisory body must be done within the time frames prescribed in legislation.

## 7 Amendments to the EIS

The proponent may amend or replace the submitted EIS. For a mining project, the amendment can be made at any time until a draft environmental authority is given to the proponent. However, to avoid the submissions being made on aspects that have already been changed, no EIS may be amended during the period that public submissions are allowed.

The proponent must notify the chief executive of the amendment in writing and pay the prescribed fee<sup>5</sup>.

## 8 Related guidelines

This guideline outlines the EIS process prescribed in the EP Act. It should be read in conjunction with related guidelines including:

- [Mining industry regulatory framework](#)

describes the mining industry environmental management framework including the *Environmental Protection Act 1994*, *State Development and Public Works Organisation Act 1971*, and *Sustainable Planning Act 2009* and how these interrelate.

- [Level 1 mining and exploration projects](#)

describes the requirements for applying for an environmental authority for level 1 mining projects and the process for assessing and approving the application.

- [Issue identification and community consultation](#)

contains details on identifying issues and best practice consultation.

- [Generic terms of reference for the \[enter project name\] project environmental impact statement](#)

this template and guideline outlines the content and criteria for preparing the EIS and includes a generic terms of reference for mining activities.

## 9 Glossary

Advisory body	Individuals or organisations invited by the chief executive to provide advice or information during the EIS process.
Affected person	As defined in s. 38 of the <i>Environmental Protection Act 1994</i> .
Comment period	Time period during which comments on the draft terms of reference will be received by the chief executive.
Controlled action	An action, decided by the Commonwealth Minister for the Environment, which will have significant impact on a matter of national environmental significance. A controlled action requires approval from the Commonwealth under Part 3 of the <i>Environment Protection and Biodiversity Conservation Act 1999</i> . (see EPBC Act for definitions)
EIS assessment report	A report from the chief executive about the submitted EIS describing whether the EIS meets the terms of reference and making recommendations on the project.

<sup>5</sup> An application fee must be paid at the time of submitting the EIS amendment application. The fee as of 1 January 2011 is \$10 000 and may be adjusted for inflation in August each year. For the latest fee please check the DERM website on [www.derm.qld.gov.au](http://www.derm.qld.gov.au) or call 1300 130 372.

## The EIS process for level 1 mining projects

EIS requirement	An EIS requirement for an application means that an EIS has been required under the <i>Environmental Protection Act 1994</i> for the application.
Environmental impact statement (EIS)	A document that assesses the potential adverse and beneficial impacts (environmental, economic and social) of the project, proposes measures to manage potential impacts, looks at alternatives to the project and provides information to decision-makers.
Environmental management document	Includes an environmental management plan.
Interested person	Person(s) nominated by the proponent that have an interest in the project.
Operational land	The land on which the project is to be carried out.
Proponent	The person who proposes the project.
Public notification	Notification through newspaper advertising of the terms of reference or EIS advising that submissions may be made.
Submission period	Time period during which submissions on the EIS will be received by the chief executive.
Terms of reference	Provides advice on the structure and scope of the environmental impact statement.

# Information sheet

## Voluntary Preparation of an EIS

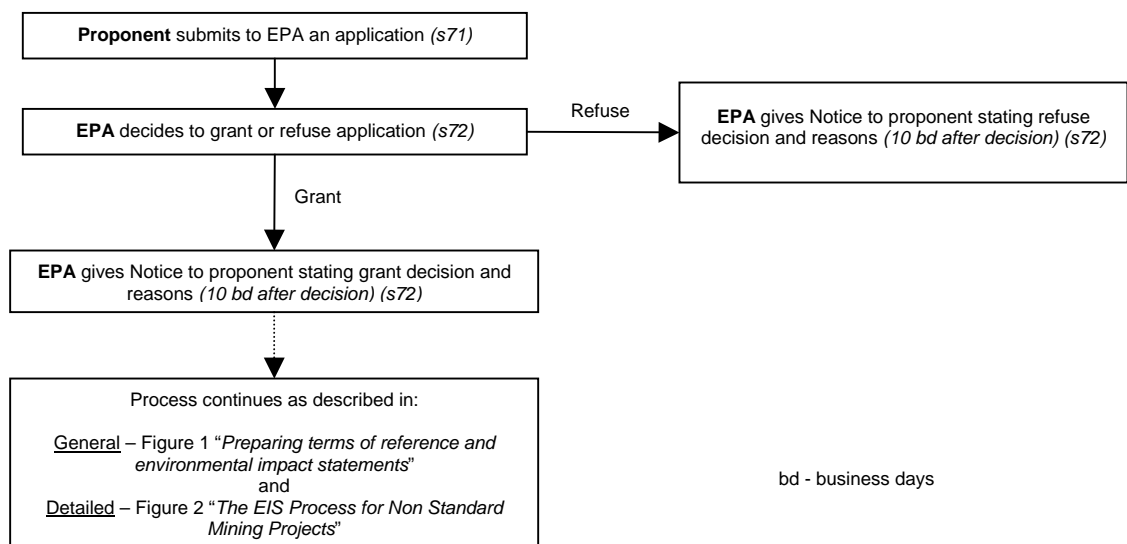

This information sheet explains the process under Part 2, Chapter 3 of the Environmental Protection Act 1994 for applying to undertake a voluntary Environmental Impact Statement.

### Overview

The *Environmental Protection Act 1994* (EP Act) allows a proponent to voluntarily prepare an Environmental Impact Statement (EIS) for a project if it is believed by the proponent to be appropriate to do so. However, an application to voluntarily prepare an EIS cannot be made for a project if:

- 1) an EIS requirement has already been made as part of the assessment level decision in relation to an application for an environmental authority (mining activities); or
- 2) the project has been designated a "controlled action" that must be assessed under the *Commonwealth Environment Protection and Biodiversity Conservation Act 1999* and the process described in the EP Act has not been accredited under the Commonwealth Act; or
- 3) an EIS (or similar document) for the project is required to be prepared under another State Act and that Act does not allow the EIS to be prepared under the EP Act.

If proposing to prepare a voluntary EIS for a project, the proponent needs to apply to the chief executive of the Environmental Protection Agency (EPA) for approval under s71 of the EP Act. Figure 1 shows the process for applying to voluntarily prepare an EIS. The general EIS process prescribed in the EP Act and discussed in the EPA Guideline "*Preparing terms of reference and environmental impact statements*, EPA 2003" should then be followed if the application is approved by the EPA.

**Figure 1 - Application to voluntarily prepare an EIS**

**Information to be provided with application**

When applying to prepare a voluntary EIS under the EP Act, the proponent must make the application in the approved form, pay the prescribed fee and supply sufficient information to allow the EPA to decide whether an EIS is appropriate for the project. This information must include (but not be limited to):

- a description of the project including proposed ancillary activities such as accommodation for workers, transport of product, power supply and proposed methods for waste management (eg. vegetation destroyed, dredge spoil, tailings dam requirements); and
- a description of the operational land/waters; and
- a list stating the name and address of each person the proponent proposes as an interested person for the project; and
- a list of the names and addresses of the affected and interested persons (as defined in ss 38 and 39 of the EP Act respectively) for the project; and
- a statement of how the proponent proposes to consult with the affected and interested persons; and
- a list (if any) of environmental relevant activities to be carried out on site; and
- the proposed source of water/fill for the project; and
- information/documentation that shows that the proponent has authority to enter the land to which the project relates, to carry out the necessary studies for the EIS; and
- if for a mining activity, the proposed post mining land use including any non-beneficial land use that will remain.

As an application to voluntarily prepare an EIS can not be made for a project if the project has been designated a “controlled action”, it is requested that the proponent also provide either:

- written confirmation from the Commonwealth that the project is not a controlled action requiring assessment under Commonwealth Environment Act; or
- a written statement advising why the proponent believes that the project need not be referred to the Federal Environment Minister for a decision on whether approval is required under the Commonwealth Environment Act (with reference to the EPBC Administrative Guidelines on Significance). In doing so, the proponent accepts that if the project is subsequently declared a controlled action requiring assessment under the Commonwealth Environment Act, the voluntary EIS process will cease and the proponent will be responsible for fees and charges to start and progress any other assessment process.

The EPA also encourages submission of a preliminary terms of reference (TOR) and draft or outline Environmental Management Plan (or Environmental Management Plan Overview Strategy if a mining project) with the application to voluntarily prepare an EIS (or any existing feasibility studies that have been completed) to assist in the assessment of the application. The submission of the preliminary TOR are for discussion purposes and would not initiate the EIS process under s41 of the EP Act.

## Application forms

The following applicable application forms are available from the EPA's website [www.epa.qld.gov.au](http://www.epa.qld.gov.au).

## **Background**

<Insert background information about the project here (approximately one page or less). Provide basic facts and avoid subjective terms. Dot points can be included for clarity.>

THIS PAGE PROVIDES SUPPORTING INFORMATION ONLY AND IS NOT PART OF THE GENERIC TERMS OF REFERENCE, WHICH START ON THE NEXT PAGE.

**(DELETE THIS PAGE FROM YOUR PROJECT'S DRAFT TOR)**

## Introduction

This document provides generic terms of reference (TOR) for an environmental impact statement (EIS) in the approved form that must be used for the submission of draft TOR under section 41 of the *Environmental Protection Act 1994* (EP Act). It has been written for direct use by mining projects. However, it can be readily adapted to most petroleum projects and their associated activities.

This document is intended to help proponents and consultants understand the scope of information required for dissemination to the public and by regulatory agencies when assessing a proposal.

The version of the generic TOR on the Department of Environment and Resource Management's (DERM) website is reviewed and updated periodically to incorporate improvements in best environmental management practice. Before using the version on the website, proponents should contact the Environmental Impact Assessments Branch of DERM to see whether a new version is being prepared.

This document has been released in a format that proponents can edit. **However, proponents should only edit the content. To be in the approved form, the draft TOR submitted by a proponent for an EP Act EIS must use the fonts, heading styles and spacing of this document.** Not all issues will apply to all proposals. It is intended that proponents will compare the document against their intentions, and delete those parts that are irrelevant and make appropriate changes to those parts that are relevant in order to develop TOR that are project and site specific.

This document does not represent government policy, nor is it intended to establish mandatory requirements for government and industry. This document includes issues that are not restricted to DERM's jurisdiction with the aim of providing an all-encompassing set of issues likely to be raised when preparing an EIS. Therefore, it is recommended that proponents and consultants contact relevant Queensland Government agencies at an early stage for additional information on project-specific issues not administered by DERM.

## Related guidelines

Other DERM guidelines are available on the DERM website <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)>.

## Important note:

While every attempt has been made to ensure that this generic TOR addresses all of the major issues associated with resource proposals and associated processing of materials, it may not be exhaustive. It should not be interpreted as excluding from consideration matters deemed to be significant but not incorporated in them, or matters currently unforeseen, that emerge as important or significant from environmental studies, or otherwise, during the course of preparation of an EIS.

## Contacts

Further information about this document is available by contacting the Environmental Impact Assessments Branch of the Environment and Natural Resource Regulation Division in DERM's Brisbane office on telephone 1300 130 372.

**It is strongly recommended that the environmental impact statement (EIS) follows the heading structure of these terms of reference to facilitate cross-referencing. Through experience, this structure has been found to be the best option.**

# CONTENT OF THE ENVIRONMENTAL IMPACT STATEMENT (EIS)

## Executive summary

The executive summary conveys the project's most important aspects and options to the reader in a concise and readable form. Use plain English and avoid the use of jargon and obscure terms. The structure of the executive summary should follow that of the EIS, and focus strongly on the key issues and conclusions.

## Glossary of terms

Provide a glossary of technical terms, acronyms and abbreviations before the main text of the EIS.

## 1. Introduction

Explain why the EIS has been prepared and what it sets out to achieve—in particular, the level of detail required to satisfy assessment of the approvals being sought. Define the audience of the EIS.

### 1.1 Project proponent

Provide details of the project proponents, including details of any joint venture partners.

### 1.2 Project description

Provide and illustrate a brief description of the key elements of the project. Summarise any major associated infrastructure requirements. Detailed descriptions of the project should follow in section 3.

### 1.3 Project objectives and scope

State the objectives that have led to the development of the project and briefly outline the events leading up to the project's formulation, including alternatives, envisaged time scale for implementation and project life, anticipated establishment costs and actions already undertaken within the project area.

Describe the current status of the project and outline the relationship of the project to other developments or actions that may relate, whether or not they have been approved. The consequences of not proceeding with the project will also be discussed.

### 1.4 The EIS process

The purpose of this section is to clarify methodology and objectives of the EIS under the relevant legislation.

#### 1.4.1 Methodology of the EIS

Describe the EIS process steps, timing and decisions to be made for relevant stages of the project. Provide a brief description of studies or surveys that have been undertaken to help develop the project and prepare the EIS. Describe any baseline studies or investigations used in the EIS that were undertaken before the EIS process started. Outline how the consultation process (which will be described in detail in section 1.5) integrated with the other components of the impact assessment, including the stages, timing and mechanisms for public input and participation.

The information in this section is required to ensure:

- relevant legislation is addressed
- readers are informed of the process to be followed
- stakeholders are aware of any opportunities for input and participation.

#### 1.4.2 Objectives of the EIS

Having described the methodology of the EIS, make a succinct statement of the EIS objectives. The EIS's structure can then be outlined as an explanation of how the EIS will meet its objectives. The reader should be able to distinguish the EIS as the key environmental document providing advice to decision-makers considering approvals for the project.

While the terms of reference guide the scope of the EIS studies, they should not be seen as exhaustive or limiting. It is important for proponents and their consultants to recognise that there cannot be complete knowledge in advance of undertaking an EIS of what the EIS studies may find.

**If it transpires while preparing the EIS that previously unforeseen matters not addressed in the terms of reference are found to be relevant to assessing potential impacts of the project, those matters will be included in the EIS.**

**Also, it is essential that the main text of the EIS addresses all relevant matters concerning environmental values, impacts on those values and proposed mitigation measures. No relevant matter will be raised for the first time in an appendix or the draft environmental management plan (EM plan).**

**The EIS assessment's depth and scope will be proportional to the values impacted and the scale of the impacts. When considering whether an impact is or is not significant, the proponent will take account of both the intensity of the impact and the context in which it would occur.**

The EIS is a public document. Its purpose is not only to provide information to regulatory agencies, but also to inform the public about the project's scope, impacts and mitigation measures. As such, the main text will be written in plain English avoiding jargon as much as possible. Additional technical detail may be provided in appendices. The main text will not assume that a reader would have prior knowledge of the project site and it will not be necessary for the reader to have visited the site to understand the issues involved in the project.

In brief, the EIS objectives are to provide public information on the need for and likely effects of the project, to set out acceptable standards and levels of impacts (both beneficial and adverse) on environmental values, and demonstrate how environmental impacts can be managed through protecting and enhancing environmental values. A key aspect of the EIS is discussing options and alternatives and their likely relative environmental management outcomes.

The role of the EIS in providing the project's draft EM plan will also be discussed, with particular reference to the EM plan's role in providing management measures that can be carried over into conditions that would attach to any approvals, environmental authorities and permits for the project.

### **1.4.3 Submissions**

The reader will be informed about how and when public submissions on the draft EIS can be made, and how they will be addressed and taken into account in the decision-making process.

## **1.5 Public consultation process**

An appropriate public consultation program is essential to the impact assessment. This section will outline the methodology that will be adopted to identify and mitigate social and economic impacts of the project. Provide information about consultation that has already taken place and its results.

Submitting a list of affected persons and interested persons, as well as a statement of how the proponent proposes to consult with those persons, is a statutory requirement of the EIS process under section 41 of the *Environmental Protection Act 1994*. Similar requirements, though non-statutory, are usually applied to EIS processes under other Queensland legislation.

The public consultation program should provide opportunities to educate and involve the community. It may include interviews with individuals, public meetings, interest group meetings, producing regular summary information and updates, and other means to encourage and facilitate active public consultation.

The public consultation process should identify broad issues of concern to local community and interest groups and should continue from project planning through commissioning, project operations and final decommissioning. Refer to the DERM guideline Issue Identification and Community Consultation.

## **1.6 Project approvals**

### **1.6.1 Relevant legislation and policy requirements**

Explain the legislation and policies controlling the approvals process. Make reference to the Queensland *Environmental Protection Act 1994*, *Sustainable Planning Act 2009* and other potentially relevant Queensland laws. Include any requirements of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*.

Identify all environmentally relevant activities that would be undertaken at the project site, including those that would otherwise require a development approval if the project was not covered by an environmental authority for a mining or petroleum activity.

If any potentially relevant legislation (such as the *Water Act 2000* for taking water, the *Nature Conservation Act 1992* for protected wildlife, or the *Vegetation Management Act 1999* for land clearing) is not applicable, this section of the EIS will explain why.

Describe local government planning controls, local laws and policies applying to the development, and provide a list of the approvals required for the project and the expected program for approval of applications. The description should include any requirements for workers' camps or villages.

This information is required to assess how the legislation applies to the proposal, which agencies have jurisdiction, and whether the proposed impact assessment process is appropriate.

## **1.6.2 Planning processes and standards**

Discuss the project's consistency with existing land uses or long-term policy framework for the area (for instance, as reflected in local and regional plans), and with legislation, standards, codes or guidelines available to monitor and control operations on site. Refer to all relevant state and regional planning policies. This information is required to demonstrate how the proposal conforms to state, regional and local plans for the area.

## **1.7 Accredited process for controlled actions under Commonwealth legislation**

Projects that are undergoing an EIS under a State statutory process may also be controlled actions under the Commonwealth's *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). In which case, the Commonwealth may accredit Queensland's EIS process for the purposes of the Commonwealth's assessment under Part 8 of the EPBC Act. When a state EIS process has been accredited, it will be necessary for the TOR to address potential impacts on the matters of national environmental significance identified in the 'controlling provisions' when the project was declared a controlled action.

The matters to be addressed in the EIS are set out in Schedule 4 of the Commonwealth's Environment Protection and Biodiversity Conservation Regulations 2000. Provide a stand-alone report as a separate chapter of the EIS that fully addresses the matters relevant to the controlling provisions.

## **2. Project need and alternatives**

### **2.1 Project justification**

Describe the justification for the project, with particular reference to the economic and social benefits, including employment and spin-off business development that the project may provide. Discuss the status of the project in a regional, state and national context.

### **2.2 Alternatives to the project**

Describe feasible alternatives, including conceptual, technological and locality alternatives to the project, and discuss the consequences of not proceeding with the project. Summarise the comparative environmental, social and economic impacts of each alternative, with particular regard to the principles of ecologically sustainable development (ESD). Discuss alternatives in sufficient detail to enable an understanding of the reasons for preferring certain options and courses of action and rejecting others.

Explain the interdependencies of the project's components, particularly how each of any industrial developments, or various combinations of industrial developments, and any infrastructure requirements relate to the viability of the proposal. Should water supply, power, transport and/or storage infrastructure be included as part of the project, describe and provide a rationale for such infrastructure.

This information is required to assess how the scope of the project was derived, and to ensure that the ESD principles and sustainable development aspects have been considered and incorporated during the scoping and planning of the project.

### 3. Description of the project

Describe the project through its various stages, such as construction, operation and decommissioning. This information is required to allow complete assessment of a project from planning to its end-of-life. It also allows identification of approvals that may be required and how they may be managed through the life of the project. Maps or figures showing the position of features or boundaries will use latitudes and longitudes on the GDA94 datum. These latitudes and longitudes will also be used in the text to describe the locations of any features (such as discharge points) or boundaries that may be relevant to subsequent approvals.

#### 3.1 Location

##### 3.1.1 Regional context

Describe the regional context of the project and illustrate it on maps at suitable scales.

##### 3.1.2 Local context

Describe the local context of the project and include real property descriptions of the project site and adjacent properties. Provide maps at suitable scales that show the precise location of the project area, and in particular:

- the location and boundaries of land tenures, in place or proposed, to which the project area is or will be subject
- the location and boundaries of the project footprint showing all key aspects including excavations, stockpiles, areas of fill, watercourses, plant locations, water storages, power and water supply lines, buildings, roads, railways, bridges, weirs, culverts, hardstands, car parks, etc
- the location of any proposed buffers surrounding the working areas.

Include a rectified aerial photo enlargement (preferably A3 size) to illustrate components of the project in relation to the land and mining tenures, and natural and built features of the area.

#### 3.2 Construction

Describe the extent and nature of the project's construction phase. Describe the type and methods of construction, the construction equipment to be used and the items of plant to be transported onto the construction site. Describe any staging of the project and illustrate site boundaries, development sequencing and timeframes.

#### 3.3 Operations

Describe the location and nature of the project's operational phase, and illustrate the description as required with maps, diagrams and artist's impressions. Operational issues to be addressed will include, but not necessarily be limited to:

- a description of plant and equipment to be employed
- the capacity of plant and equipment
- chemical and physical processes
- chemicals to be used.

Provide concept and layout plans highlighting proposed buildings, structures, plant and equipment associated with the processing operation. Describe the nature, sources, location and quantities of all materials to be handled, including the storage and stockpiling of raw materials.

Provide indicative process flow-sheets showing material balances for the processing plant, and the anticipated rates of inputs, along with similar data on products, wastes and recycle streams.

[Note: sections 3.3.1 to 3.3.5 have been developed with particular applicability to mining projects. For proposals related to other industries they may be adapted or omitted as appropriate.]

##### 3.3.1 Tenements and tenures

Describe and illustrate any existing mining tenements, petroleum, geothermal and greenhouse gas tenures and licences overlying and adjacent to the project site, and any proposed applications required for this project.

##### 3.3.2 Resource base and mine life

Summarise the results of studies and surveys undertaken to identify the mineral and natural resources required to implement the proposal (further detail will be provided in section 4.2.1.2 Geology). Describe the required location, volume, tonnage and quality of natural resources (such as land, water, timber, energy, etc). Provide specific details of the following:

- the proposed mine life and an outline of the coal/mineral resource base, including the total thickness of seams or extent of the ore body
- the planned recovery of resources
- locations of any resources that would be sterilised by the planned activities
- the quantity of coal/mineral to be mined annually, including any proposed ramping of production or staging of development.

### **3.3.3 Mining methods and equipment**

Provide specific details of the following:

- the mining type and methods to be used, including the major equipment to be used in the various components of the operation
- the use of different techniques in areas of different topographic or geo-technical character
- chemicals to be used, including hydraulic fluids used and released in underground operations.

The description will refer to, and be complemented by, the figures previously presented in section 3.3.1 showing the locations of key aspects of the project. Additional figures will be provided if required.

### **3.3.4 Mine sequencing**

Provide specific details of the following:

- the proposed sequence and timing of mining of each seam/ore body within the mining lease;
- the physical extent of excavations, location of stockpiles of overburden and/or coal/mineral reject to be handled during the project's operation or left after mining ceases, including the rate of throughput of stockpiles of product, reject and overburden
- typical cross sections of the mine workings showing voids, surface profiles and geological strata
- the proposed progressive backfilling of excavations
- the area disturbed at each major stage of the project.

### **3.3.5 Workforce**

Outline the workforce numbers to be employed by the project during its various phases, such as construction, commissioning, operation and decommissioning. Make comment on the anticipated basis of employment, such as permanent, contract, etc. A detailed profile of the workforce will be provided in the society section of the EIS.

### **3.3.6 Workforce accommodation**

Describe where personnel will be accommodated. In particular, describe and illustrate the number, size, locations and management of any workers camps or villages. The consequent impacts of constructing new or expanded accommodation will be addressed in the appropriate sections of the EIS even if the accommodation will be operated by a contractor.

### **3.3.7 Processing and products**

Describe the quantities and characteristics of the products that would be produced on an annual basis. Provide indicative process flow-sheets showing material balances for the processing plant, and the anticipated rates of inputs, along with similar data on products, wastes and recycle streams.

### **3.3.8 Ongoing evaluation and exploration activities**

Describe the extent and nature of any proposed ongoing exploration or geological or geo technical evaluation within the project area that may be required over the life of the project.

## **3.4 Product handling**

Describe and show on plans at an appropriate scale the proposed methods and facilities to be used for product storage and for transferring product from the processing plant to the storage facilities and from the storage facilities to the transport facilities. Discuss any environmental design features of these facilities including bunding of storage facilities.

## 3.5 Infrastructure requirements

Describe with concept and layout plans, requirements for constructing, upgrading or relocating all infrastructure associated with the project. Show the locations of any necessary infrastructure easements on the plans, including infrastructure such as roads, rail (and the rail corridor), level crossings, conveyors, bridges, jetties, ferries, tracks and pathways, dams and weirs, bore fields, power lines and other cables, wireless technology (such as microwave telecommunications), and pipelines for any services, whether underground or above.

### 3.5.1 Transport—road/rail/air/ship

Provide an overview of the arrangements for the transportation, importation or exportation of plant, equipment, materials, products, wastes and personnel during both the construction and operational phases of the project. Describe the use of existing facilities, including common user transport infrastructure, and all requirements for the construction, upgrading or relocation of any transport-related infrastructure.

### 3.5.2 Energy

Describe all energy requirements, including electricity, natural gas, and/or solid and liquid fuel requirements for the construction and operation of the project. Show the locations of any easements on the infrastructure plan. Energy conservation will be briefly described in the context of any Commonwealth, Queensland and local government policies.

### 3.5.3 Water supply and storage

Provide information on proposed water usage and storage by the project, including the quality and quantity of all water supplied to, or captured at, the site. In particular, describe the proposed and optional sources of water supply such as mine dewatering, capture of overland flow, taking from a watercourse, bores, coal seam gas water and associated pipelines, and any surface storages such as dams and weirs, municipal water supply pipelines.

Estimate the average and maximum rates of supply from each source for each phase of the project's life. Any proposed water conservation and management measures should be described.

Describe any approvals and water allocations the project may need under the *Water Act 2000* for water supply and storage.

Estimate potable water demand for the project, including the temporary demands during the construction period. Provide details of any existing water supply, including town water, which would meet the requirements. If water storage and treatment is proposed on site for use by the site workforce, describe the method of treatment and storage. Describe any waste streams from water treatment, and assess the potential impacts of disposal in the appropriate sections of the EIS.

### 3.5.4 Stormwater drainage

Provide a description of the proposed stormwater drainage system and the proposed disposal arrangements, including any off-site services. Illustrate the description with figures with contours at suitable intervals (one metre contours in areas of low relief) showing drainage pathways and the locations and discharge points of sediment detention basins, and any other stormwater quality improvement devices.

### 3.5.5 Sewerage

Describe, in general terms, the sewerage infrastructure required by the project. If it is intended that industrial effluent or relatively large amounts of domestic effluent are to be discharged into an existing sewerage system, provide in section 4.4 Waste an assessment of the capacity of the existing system to accept the effluent. For industrial effluent, this should detail the physical and chemical characteristics of the effluent.

### 3.5.6 Telecommunications

Describe any impacts on existing telecommunications infrastructure, such as optical cables and microwave towers, and identify the owners of that infrastructure.

### 3.5.7 Accommodation and other infrastructure

Describe any other developments directly related to the project not described in other sections, such as:

- camps, townships or residential developments
- fuel storage areas
- equipment hardstand and maintenance areas
- technical workshops and laboratories.

## 3.6 Waste management

Provide an inventory of all wastes to be generated by the project during the construction, operational and decommissioning phases of the project. In addition to the expected total volumes of each waste produced, include an inventory of the following per-unit volume of product produced:

- the tonnage of raw materials processed
- the amount of resulting process wastes
- the volume and tonnage of any re-usable by-products.

Provide schematic diagrams, which for the operational phase may be simplified versions of those provided in section 3.3, for each distinct stage of the project. These should indicate the processes to be used and highlight their associated waste streams. This applies to all waste outputs—solid, liquid and gaseous—including recycling efforts such as stockpiling and reusing topsoil. The schematic diagrams, or an associated table, will cross-reference the relevant sections of the EIS where the potential impacts and mitigation measures associated with each waste stream are described. Describe the physical and chemical characteristics, and the variability of composition and generation rates of each waste material.

Each subsection on waste management will assess how the proposed methods for waste management at each stage of the project achieve the highest possible level on the waste management hierarchy with regard to the principles in the Environmental Protection (Waste Management) Policy 2000.

Describe how the project would achieve natural resource use efficiency (such as minimum use of energy and water, and minimum footprint on used land), integrated processing design, co-generation of power and by-product reuse as shown in a material/energy flow analysis. This information is required to enable the resource management agencies and other stakeholders to assess the efficiency of resource use, and allocation issues.

### 3.6.1 Air emissions

Describe in detail the quantity and quality of all air emissions (including particulates, fumes and odours) from the project during construction and operation. Particulate emissions include those that would be produced by any industrial process or disturbance by wind action on stockpiles and conveyors, or by transportation equipment such as trucks or trains, either by entrainment from the load or by travel on unsealed roads.

### 3.6.2 Excavated waste

Describe the materials to be excavated as waste. Also, describe and illustrate the location, design and methods for constructing dumps for waste rock and any subsoil that will not be replaced in rehabilitation.

Estimate the tonnage and volume of waste rock and subsoil to be excavated during the various stages of operation. Estimates will be made for each separate rock and soil type. Describe the expected proportion and source of waste rock that is mineralised but currently uneconomical for processing.

Describe the chemical and physical properties of the waste rock and subsoil, and assess the properties that affect their erosion and leaching potential. Undertake the characterisation of the waste in accordance with the Assessment and Management of Acid Drainage guideline of the Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland series (DME, 1995), and any other applicable best practice guidelines. The characterisation of waste rock and subsoil will include, but not necessarily be limited to: sulfides; metals; pH, conductivity and chloride of slurry samples; the Net Acid Producing Potential (NAPP), and Net Acid Generation (NAG) potential of the mined waste.

Discuss the potential for acid, neutral or alkaline drainage from waste dumps. Characterise the potential quality of leachate from the mined waste under field conditions, including contaminants such as sulfate, pH, chloride, iron, major cations and anions, and any chemical species in sufficient quantity that is likely to cause environmental harm including nuisance. Provide cross-references in this section to those sections of the EIS that assess in detail the potential impacts of any direct or indirect discharge of leachate on downstream sensitive environments or users of receiving waters.

Use the estimated amounts and characteristics of excavated waste to develop appropriate measures for dealing with that waste, including designs for waste dumps, and alternatives for excavated waste disposal such as in-filling of voids, off-site options and treatment of contaminated soil. Assess the likely performance of the proposed waste disposal options with particular regard to:

- segregating and encapsulating sub-economic but mineralised rock and/or potentially acid-forming rock
- managing surface drainage and sub-surface leachate both during operations at the mine and after mining ceases (note: avoid placing dumps across drainage lines that would pond water behind the dump and cause infiltration)

- slope profiles and the stability and erosion potential of waste dumps
- the intended land use after mining ceases, and the land management and maintenance requirements for the subsequent landholder.

Illustrate the location and cross-sections of the proposed dumps on maps, drawings and diagrams relative to topography and other natural features of the area.

### **3.6.3 Tailings or fine rejects**

Describe the methods and materials that would be used to produce tailings waste (tailings should be understood to include any fine reject material). State whether the methods to be used to produce and treat tailings would be novel or established. For novel methods, describe the testing undertaken to determine if the method would be suitable for the proposed use. For established methods, provide examples of where the method has been, or is being, used and assess the equivalence of those examples to the proposed use.

Estimate the annual production of tailings waste at the various stages of the project.

Describe how the methods used to produce and treat tailings would be in accordance with the waste management hierarchy and the tailings management principles in the Tailings Management Guideline of the Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland series, (DME, 1995).

Describe in detail the likely physical and chemical characteristics of the tailings waste and the likely chemical characteristics of waste water from the pressing plant, the decant water from any tailings storage facility (TSF), and the pore water and leachate from any dump containing tailings.

Describe and illustrate the proposed locations of any pits, dams, bunds or dumps that would be used for the disposal of tailings.

Describe and illustrate the proposed design of any TSF, including any cells for non-flowable tailings within waste rock dumps (note: a shear strength of greater than 1000 pascals would generally be required of pastes suitable for dry tailings stacking, while pastes with lower shear strength must be contained in a regulated dam. However, the slumping and plastic properties of any tailings considered for disposal by dry stacking will be derived from tests on representative samples and reported in the EIS). Describe the source, and assess the suitability, of the materials to be used to construct containment systems. Describe any proposed staging of the construction for any TSF or disposal cells and demonstrate that the design has been produced by a suitably qualified and experienced engineer.

Conduct, and report on, a risk assessment and describe how it has been used to derive the design storage allowance for any regulated dams. Assess whether the proposed design and methods of disposal would minimise the potential hazards and risks, particularly in relation to the potential impacts of failure caused by mass release from structural failure or contaminant release from overflow. Also, assess whether the proposed design maximises site efficiency, such as by minimising the footprint.

If some form of co-disposal of fine and coarse rejects is proposed, describe the range of proportions, size fractions and mixing method that would produce a stable deposit.

Describe the proposed discharge locations and conditions for any TSF. Describe the flow path any discharge would take, illustrated on contour maps, and provide an overview of the potentially affected receiving environment with particular regard to downstream sensitive ecosystems or users of receiving waters. Discharge should be taken to mean any planned or unplanned overflow or release, any leachate, or any potentially contaminated runoff leaving a TSF. Assess in detail the potential impacts of any discharge on downstream sensitive environments or users of receiving waters in the appropriate sections of the EIS and cross-reference to them in this section.

Describe the proposed monitoring network and regime that would be used to detect any leak from the TSF.

Describe the proposed measures to be used to decommission any TSF or dump used for the disposal of tailings. Assess any legacy issues for the subsequent landholder.

### **3.6.4 Solid waste disposal**

Describe the quantity and quality of solid wastes (other than waste rock, subsoil and tailings addressed in other sections) and the proposed methods of their disposal. Describe the proposed location, capacity and suitability of any landfill that would receive solid waste from the project. Describe and illustrate any proposed on-site landfill, including its dimensions, volume and method of construction.

### **3.6.5 Liquid waste**

Describe the origin, quality and quantity of wastewater and any immiscible liquid waste that would be produced by the project other than that addressed in previous sections. Give particular attention to the capacity of wastes to generate acid, and saline or sodic wastewater. A water balance for the project and processing plant is required to

account for the estimated usage of water.

The EIS will consider the following effects:

- groundwater from excavations
- rainfall directly onto disturbed surface areas
- run-off from roads, plant and industrial areas, chemical storage areas
- drainage (run-off plus any seepage or leakage)
- seepage from other waste storages
- water usage for:
  - process use
  - dust suppression
  - irrigation
  - domestic purposes
- evaporation
- domestic sewage treatment – disposal of liquid effluent and sludge
- water supply treatment plant – disposal of wastes.

### **3.7 Rehabilitation and decommissioning**

Describe the options, strategic approaches and methods for progressive and final rehabilitation of the environment disturbed by the project. Develop a preferred rehabilitation strategy that would minimise the amount of land disturbed at any one time, and minimise the residual loss of land with ecological or productive value. Show the final topography of any excavations, waste areas and dam sites on suitably scaled maps.

Evaluate the compliance of the strategies and methods for progressive and final rehabilitation of disturbed areas with the objectives of the Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland (DME, 1995) and DERM's guideline Rehabilitation Requirements for Mining Projects. In particular, the strategies and methods will have the following objectives:

- Mining and rehabilitation should aim to create a landform with the same or similar land use capabilities and/or suitability it had prior to the disturbance, unless other beneficial land uses are pre-determined and agreed.
- Mine wastes and disturbed land should be rehabilitated so that it is self-sustaining or to a condition where the maintenance requirements are consistent with an agreed post-mining land use.
- Surface and ground waters that leave the lease should not be degraded compared to their condition prior to the commencement of mining operations. Current and future water quality should be maintained at levels that are acceptable for users downstream of the site.

Describe the means of decommissioning the project by removing or reusing plant, equipment, structures, buildings, concrete footings and foundations, hardstand areas, storage tanks and wharfage. Describe the proposed methods for stabilising the affected sites. Discuss options and methods for the disposal of wastes from the demolition of plant and buildings in sufficient detail for their feasibility and suitability to be assessed.

Describe any proposals to divert creeks during operations and, if applicable, the reinstatement of the creeks after operations have ceased. Rehabilitation will involve the re-establishment of vegetation communities along watercourses similar to the pre-cleared regional ecosystems in those areas. Where dams are to be constructed, describe proposals for the management of these structures after the completion of the project. Also, describe the final drainage and seepage control systems and long-term monitoring plans. Describe and illustrate where final voids and uncompacted overburden and workings at the end of mining would lie in relation to flood levels up to and including the 'probable maximum flood level' based on the Bureau of Meteorology's 'probable maximum precipitation' forecast for the locality.

The description of topsoil management will address minimising topsoil storage times (to reduce fertility degradation) and the transportation, storage and replacement of topsoil to disturbed areas.

Detail of the impacts of the preferred rehabilitation strategy will be discussed in the appropriate subsections of section 4 (Environmental values and management of impacts) particularly with regard to issues such as final landform stability (section 4.2.2), rehabilitation of plants (section 4.9.2) and the long-term quality of water in any final voids (section 4.5.2). Implications for the long-term use and fate of the site will also be addressed, particularly

with regard to the on-site disposal of waste and the site's inclusion on the Environmental Management Register or the Contaminated Land Register.

## 4. Environmental values and management of impacts

The functions of this section are to:

- Describe the existing environmental values of the area that may be affected by the project. Environmental values are defined in section 9 of the *Environmental Protection Act 1994*, environmental protection policies and other documents such as the Australian Water Quality Guidelines for Fresh and Marine Waters (ANZECC & ARMCANZ, 2000). Environmental values may also be derived following recognised procedures, such as described in the ANZECC & ARMCANZ 2000 guidelines. Environmental values will be described referring to background information and studies, which will be included as appendices to the EIS.
- Describe the potential adverse and beneficial impacts of the project on the identified environmental values.
- Describe any cumulative impacts on environmental values caused by the project, either in isolation or by combination with other known existing or planned development or sources of contamination.
- Propose environmental protection objectives and commitments. All environmental protection commitments must be measurable and auditable.
- Examine viable alternative strategies for managing impacts. These alternatives will be presented and compared in view of the stated objectives and standards to be achieved. Discuss available techniques, including best practice, to control and manage impacts to the nominated objectives. This section will detail the environmental protection measures to be used in the planning, construction, operations, rehabilitation and decommissioning stages of the project and any associated works. Measures will prevent, or where prevention is not possible, minimise environmental harm and maximise social, economic and environmental benefits of the project. Preferred measures will be identified and described in more detail than other alternatives.
- Describe any computational model used to make predictions of impacts and/or outcomes of mitigation measures. The description will address the inputs, assumptions, limitations, sensitivities, accuracy and precision of the model.

Any maps or figures showing the position of features or boundaries will use latitudes and longitudes on the GDA94 datum. Latitudes and longitudes on the GDA94 datum will also be used in the text to describe the locations of any features (such as discharge points) or boundaries that may be relevant to subsequent approvals.

Environmental protection objectives may be derived from legislative and planning requirements that apply to the proposal including Commonwealth strategies, state planning policies, local authority strategic plans, environmental protection policies under the *Environmental Protection Act 1994*, and any catchment management plans prepared by local water boards or land care groups. Special attention will be given to those mitigation strategies designed to protect the values of any sensitive areas and any identified ecosystems of high conservation value within the area of possible proposal impact.

This section will address all elements of the environment, (such as land, water, coast, air, waste, noise, nature conservation, cultural heritage, social and community, health and safety, economy, hazards and risk) in a way that is comprehensive and clear. To achieve this, the following issues will be considered for each environmental value relevant to the project:

- Environmental values affected: describe the existing environmental values of the area to be affected including values and areas that may be affected by any cumulative impacts (refer to background studies in appendices – note: such studies may be required over several seasons). Explain how the environmental values were derived, such as by citing published documents or by following a recognised procedure to derive the values.
- Impact on environmental values: describe quantitatively the likely impact of the project on the identified environmental values of the area. The cumulative impacts of the project must be considered over time or in combination with other (all) impacts in the dimensions of scale, intensity, duration or frequency of the impacts. In particular, address any requirements and recommendations of the Great Barrier Reef Marine Park Authority, relevant state planning policies, environmental protection policies, national environmental protection measures and integrated catchment management plans.
- Cumulative impacts on the environmental values of land, air and water and cumulative impacts on public health and the health of terrestrial, aquatic and marine ecosystems must be discussed in the relevant sections. This assessment may include air and watersheds affected by the project and other proposals competing for use of the local air and water sheds.
- Where impacts from the project will not be felt in isolation to other sources of impact, it is recommended that the proponent develop consultative arrangements with other industries in the project's area to undertake cooperative monitoring and/or management of environmental parameters. Describe such arrangements in the EIS.

- Environmental protection objectives: describe qualitatively and quantitatively the proposed objectives for enhancing or protecting each environmental value. Include proposed indicators to be monitored to demonstrate the extent of achievement of the objective as well as the numerical standard that defines the achievement of the objective (this standard must be auditable). The measurable indicators and standards can be determined from legislation, support policies and government policies as well as the expected performance of control strategies. Include objectives for progressive and final rehabilitation and managing contaminated land.
- Control strategies to achieve the objectives: describe the control principals, proposed actions and technologies to be implemented that are likely to achieve the environmental protection objectives; include designs, relevant performance specifications of plant. Details are required to show that the expected performance is achievable and realistic.
- Environmental offsets: Information is required to show that measures have been taken to avoid and minimise potential adverse impacts of the project. Environmental offsets may be proposed to counterbalance any remaining loss of environmental values, consistent with the specific-issue offset policies under the framework of the Queensland Government Environmental Offset Policy 2008 and the draft *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) offsets policy.
- Monitoring programs: describe the monitoring parameters, monitoring points, frequency, data interpretation and reporting proposals.
- Auditing programs: describe how progress towards achieving the objectives will be measured, reported and whether external auditors will be employed. Include scope, methods and frequency of auditing proposed.
- Management strategies: describe the strategies to be used to ensure the environmental protection objectives are achieved and control strategies implemented, such as by a continuous improvement framework, including details of corrective action options, reporting (including any public reporting), monitoring, staff training, management responsibility pathway, and any environmental management systems and how they are relevant to each element of the environment.
- Information quality: information given under each element will also state the sources of the information, how recent the information is, how any background studies were undertaken (e.g. intensity of field work sampling), how the reliability of the information was tested, and what uncertainties (if any) are in the information.

It is recommended that the final TOR and the EIS follow the heading structure shown below. The mitigation measures, monitoring programs, etc identified in this section of the EIS will be used to develop the environmental monitoring program for the project (see section 5).

## 4.1 Climate

Describe the rainfall patterns (including magnitude and seasonal variability of rainfall), air temperatures, humidity, wind (direction and speed) and any other special factors (e.g. temperature inversions) that may affect management of the project including air quality within the region of the project. Discuss extremes of climate (droughts, floods, cyclones, etc) with particular reference to water management at the project site. Address the vulnerability of the area to natural or induced hazards, such as floods and bushfires. Consider the relative frequency and magnitude of these events together with the risk they pose to management of the project.

The potential impacts due to climatic factors will be addressed in the relevant sections of the EIS. The impacts of rainfall on soil erosion will be addressed in section 4.2. The impacts of storm events on the capacity of waste containment systems, such as site bunding, stormwater management and tailings dams, will be addressed in section 4.5 with regard to contamination of waterways and in section 4.4 with regard to the design of the waste containment systems. The impacts of winds, rain, humidity, and temperature inversions on air quality will be addressed in section 4.7.

### 4.1.1 Climate change adaptation

Climate change, through alterations to weather patterns and rising sea level, has the potential for long-term impacts on developments. Most developments involve the transfer to, or use by, a proponent of a community resource in one form or another, such as granting a non-renewable resource or the approval to discharge contaminants to air, water or land. Therefore, it is important that the project design be adaptive to climate change so that community resources are not depreciated by projects that would be abandoned or require costly modification before their potential to provide a full return to the community is realised. Consequently, the EIS will assess the project's vulnerabilities to climate change and describe possible adaptation strategies for the activity including:

- a risk assessment of how changing patterns of rainfall and hydrology, temperature, extreme weather and sea level (where appropriate) may affect the viability and environmental management of the project
- the preferred and alternative adaptation strategies to be implemented

- a commitment to undertake, where practicable, a cooperative approach with government, other industry and sectors to address adaptation to climate change.

DERM recognises that predictions of climate change and its effects have inherent uncertainties, and that a balance must be found between the costs of preparing for climate change and the uncertainty of outcomes. Nevertheless, proponents will use their best efforts to incorporate adaptation to climate change in their EIS and project design.

## 4.2 Land

### 4.2.1 Description of environmental values

Describe the existing environment values of the land area that may be affected by the project. Define and describe the objectives and practical measures for protecting or enhancing land-based environmental values, describe how nominated quantitative standards and indicators may be achieved, and how achieving the objectives will be monitored, audited and managed.

#### 4.2.1.1 Topography

Describe and illustrate the topography of the project site and the surrounding area, and highlight any significant features shown on the maps. Such features would include any locations subsequently referred to in the EIS (such as noise sensitive locations) that are not included on other maps in section 4.2. Maps will have contours at suitable increments (at least every metre in areas of low relief), shown with respect to Australian Height Datum (AHD) and drafted to the GDA 94 datum.

#### 4.2.1.2 Land use

Describe and illustrate land uses in and around the project area in relation to current land tenures, show the location of existing dwellings, and make particular mention of any land with special attributes. Include any surrounding land or marine areas that could be affected by the project. Show the location of any native title applications or determinations. Describe and illustrate the zoning of land in and around the project area according to any existing town or strategic plan.

#### 4.2.1.3 Geology and geomorphology

Provide a description, map and a series of cross-sections of the geology of the project area. Describe the geomorphology of the project site and the surrounding area. Make particular reference to the physical and chemical properties of surface and sub-surface materials and geological structures that could have an influence on, or be influenced by, the project's activities. Describe geological properties that may influence ground stability (including seismic activity, if relevant), occupational health and safety, rehabilitation programs, or the quality of wastewater leaving any area disturbed by the project. Describe known sites of palaeontologic significance and address the potential for significant fossil finds in locations where the age and type of geology is such that significant specimens may be uncovered during construction or operations. Describe any sites of geomorphological significance, such as lava tubes or karst.

#### 4.2.1.4 Mineral resources and ore reserves

[note: section 4.2.1.3, Mineral resources and ore reserves, is specifically for mining projects. It should be omitted for proposals related to other industries.]

Provide a summary of the results of studies and surveys undertaken to identify and delineate the mineral resources and ore reserves within the project area (including any areas underlying related infrastructure).

Report the mineral resources (measured, indicated or inferred) and ore reserves (proved or probable) in accordance with the Australasian Code for Reporting of Mineral Resources and Ore Reserves (the JORC Code – available at <[www.jorc.org/main.php](http://www.jorc.org/main.php)>) and the principles outlined in the Australian Guidelines for the Estimating and Reporting of Inventory Coal, Coal Resources and Coal Reserves (available at <[www.jorc.org/pdf/coalguidelines.pdf](http://www.jorc.org/pdf/coalguidelines.pdf)>) and include the modifying factors and assumptions made in arriving at the estimates. Describe in detail the location, tonnage and quality of the mineral resources and ore reserves within the project area. For coal projects, the description it should be presented on a 'seam by seam' basis.

In addition, provide appropriately-scaled maps showing the general location of the project area, and in particular:

- the location and areal extent of the mineral resources to be developed or mined
- the location and boundaries of mining tenures, granted or proposed, to which the project area is, or will be subject
- the location of the proposed mine excavation(s)
- the location and boundaries of any project sites
- the location and boundaries of any other features that will result from the proposed mining, including waste/spoil

dumps, water storage facilities and other infrastructure

- the location of any proposed buffers, surrounding the working areas
- any part of the resource not intended to be mined and any part of the resource that may be sterilised by the proposed mining operations or infrastructure.

#### **4.2.1.5 Soils**

Conduct a soil survey of the area that would be affected by the project in accordance with section 6.1 Compilation of Land Resources Inventory (LRI) – Pre Mining Studies, of the Land Suitability Assessment Techniques in the Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland (DME, 1995). Undertake soil tests and laboratory analyses of representative samples down the soil profile, with particular reference to the physical and chemical properties of the materials that will influence erosion potential, storm water run-off quality, rehabilitation and agricultural productivity of the land. For pipeline routes, undertake the analysis and classification at least to the depth of excavation. Provide geotechnical information on the soils' stability and suitability for construction of project facilities.

Describe, map and illustrate soil types and profiles according to the Australian Soil and Land Survey Field Handbook (National Committee on Soil and Terrain, 2009), Guidelines for Survey Soil and Land Resources (McKenzie et al, 2nd Ed., 2008) and Australian Soil Classification (Isbell, 2002).

For land where acid sulfate soils (ASS) may be present, undertake an investigation in accordance with the guidelines and methods published by the Queensland Acid Sulfate Soils Investigation Team (QASSIT) and the Queensland Acid Sulfate Soils Management Advisory Committee (QASSMAC). The management of ASS will address the State Planning Policy 2/02: Planning and Managing Development Involving Acid Sulfate Soils.

#### **4.2.1.6 Land suitabilities**

Provide an Agricultural Land Class map of the project site and the surrounding area according to the Planning Guideline: the Identification of Good Quality Agricultural Land (DPI/DHLGP, 1993). Highlight any good cropping land.

Describe and map the land use suitabilities, and their classes, of the potentially affected area in accordance with the Land Suitability Assessment Techniques in the Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland (DME, 1995).

Show the location of any cropping land in the vicinity of the site, highlighting any strategic cropping land, and describe the crops commonly grown on the land, including any rotations.

#### **4.2.1.7 Contaminated land**

Describe and illustrate the nature and extent of any areas listed on the Environmental Management Register (EMR) or the Contaminated Land Register (CLR) under the *Environmental Protection Act 1994*, and any existing potentially contaminated sites that are not on the registers but the history of the site suggests may be present.

Conduct a preliminary site investigation consistent with DERM's Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland. If the results of the preliminary site investigation indicate potential or actual contamination, conduct a detailed site investigation progressively managed in accordance with the stages outlined in Appendix 5 of the Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland. The results of the site investigations should be summarised in the EIS and provided in detail in an appendix.

#### **4.2.1.8 Infrastructure**

Describe and show on suitably-scaled maps the location and owners or custodians of all infrastructure and easements on the potentially affected land, including roads and road reserves, railways and rail reserves, stock routes, and power lines. Indicate the locations of any buried gas or water pipelines, power lines, or telecommunication cables. Describe the environmental values affected by the existing infrastructure.

#### **4.2.1.9 Environmentally sensitive areas**

Describe and show on suitably-scaled maps the proximity of the project to any category A or B environmentally sensitive areas under the Environmental Protection Regulation 2008. In particular, indicate if the land affected by the project is, or is likely, to become part of the protected area estate, or is subject to any treaty.

#### **4.2.1.10 Landscape character**

Describe in general terms the existing character of the landscape that will be affected by the project. Comment on any changes that have already been made to the natural landscape since European settlement. This section should 'set the scene' for the description of particular scenic values in the following section on visual amenity, the difference being that this section describes the general impression of the landscape that would be obtained while

travelling through and around it, while the visual amenity section addresses particular panoramas and views (e.g. from constructed lookouts, designated scenic routes, etc) that have amenity value.

#### 4.2.1.11 Visual amenity

Describe existing landscape features, panoramas and views that have, or could be expected to have, value to the community whether of local, regional, state-wide, national or international significance. Information in the form of maps, sections, elevations and photographs is to be used, particularly where addressing the following issues:

- identifying elements within the proposal and surrounding area that contribute to their image of the town/city as discussed in the any local government strategic plan - city image and townscape objectives and associated maps
- major views, view sheds, existing viewing outlooks, ridgelines and other features contributing to the amenity of the area, including assessment from private residences in the affected area along the route
- focal points, landmarks (built form or topography), gateways associated with project site and immediate surrounding areas, waterways, and other features contributing to the visual quality of the area and the project site
- character of the local and surrounding areas including character of built form (scale, form, materials and colours) and vegetation (natural and cultural vegetation) directional signage and land use
- identification of the areas of the project that have the capacity to absorb land use changes without detriment to the existing visual quality and landscape character
- the value of existing vegetation as a visual screen.

#### 4.2.2 Potential impacts and mitigation measures

Define and describe the objectives and practical measures for protecting or enhancing the land-based environmental values identified through the studies outlined in the previous section. Describe how nominated quantitative standards and indicators may be achieved, and how the achievement of the objectives will be monitored, audited and managed.

##### 4.2.2.1 Resource utilisation **[MINING PROJECTS ONLY]**

With regard to resource stewardship, analyse the effectiveness of the mining proposal in achieving the optimum utilisation of the mineral resources within the project area and consider its impacts on other resources. Demonstrate that the mining proposal will ‘best develop’ the mineral resources within the project area, minimise resource wastage and avoid any unnecessary sterilisation of these or any other of the state’s coal, mineral, and petroleum (including gas and coal seam methane) resources that may be impacted upon or sterilised by the mining activities or related infrastructure.

Describe how the company plans to manage low grade or currently uneconomic deposits or excavated material to ensure that this potential future resource is not sterilised. Also describe measures to ensure the minimal dilution of mineralised but currently sub-economic waste rock by non-mineralised waste rock. Provide details and maps of expected residual or remnant resources within the project area including any low grade stockpiles, tailings and currently uneconomic material.

##### 4.2.2.2 Land use and suitability

Assess the potential for the project’s construction and operation to change existing and potential land uses of the project site and adjacent areas. Detail the proposed land use options after mining ceases, including the suitability of the area to be used for primary production, industry, or nature conservation. Assess the factors favouring or limiting the establishment of those options compared to land use and suitability prior to construction of the project and assess the potential liabilities for long-term management.

Assess the potential environmental harm caused by the project on the adjacent areas currently used for agriculture, urban development, recreation, tourism, other business. Assess the implications of the project for future developments in the impact area, including constraints on surrounding land uses. Propose mitigation measures for any potentially adverse impacts on stock route operations during the construction and operational phases of the development. If the development adjoins or potentially impacts on good quality agricultural land, assess the potential for land use conflict. Investigations will follow the procedures set out in the planning guideline The Identification of Good Quality Agricultural Land (DPI & DHLGP, 1993), which supports State Planning Policy 1/92: Development and the Conservation of Agricultural Land.

Assess incompatible land uses, whether existing or potential, adjacent to all aspects of the project, including essential and proposed ancillary developments or activities and areas directly or indirectly affected by the construction and operation of these activities. Propose measures to avoid or mitigate adverse impacts.

### 4.2.2.3 Subsidence **[UNDERGROUND MINING ONLY]**

Provide comprehensive surface subsidence predictions taking into account factors such as topographic variations and geological complexities, with a full description of the methodology and including an assessment of the accuracy and precision of the predictions. Show the results of the predictions on maps with one metre contour increments and a scale appropriate for assessment of surface subsidence impacts. Propose detailed mitigation measures for any significant impacts that would result from subsidence.

### 4.2.2.4 Land disturbance

Develop and detail a strategy that will minimise the amount of land disturbed at any one time. The strategy will address progressive rehabilitation and final decommissioning with particular regard to the impacts in the short, medium and long-term timeframes. Describe the methods to be used for managing disturbed land, including backfilling, covering, re-contouring, topsoil handling and revegetation. However, a description of erosion and sediment control could be deferred to section 4.2.2.6. Any proposals to disturb land that would impede or divert overland flow or waterways, and any subsequent reinstatement, during construction or operations will be first described in this section. However, the potential impacts of interfering with flow on the quantity and quality of water resources, the final drainage and seepage control systems, and any long-term monitoring plans will be assessed and described in section 4.5.

In addition to assessing the operational phase of land disturbance, address the ultimate changes following implementation of the decommissioning and rehabilitation plan described in section 3.7. Detail the proposed long-term changes that will occur to the land after mining ceases compared to the situation before mining commences. Those changes will be illustrated on suitably scaled maps with contours at intervals sufficient to assess the likely drainage pattern for ground and surface waters (however, the assessment of the impacts on drainage and water quality will be provided in the water resources section of the EIS). Assess the proposed mitigation measures for land disturbance to be used on decommissioning the site in sufficient detail to decide their feasibility. In particular, address the long-term stability of final voids and spoil dumps, safety of access to the site after surrender of the lease, and the residual risks that will be transferred to the subsequent landholder.

Rehabilitation success criteria for land disturbance will be proposed in this section while rehabilitation success criteria for revegetation will be proposed in the section on ecology.

If geological conditions are conducive, the proponent should consider the possibility that significant fossil specimens may be uncovered during construction or operations and propose strategies to protect the specimens and alert the Queensland Museum to the find.

### 4.2.2.5 Land degradation or contamination

Assess the possible degradation or contamination of land that could result from any aspects of the project. The assessment should not be limited to activities that would result in the land being entered on the EMR or the CLR. Rather, it should include any activity that could have a detrimental impact on land. Matters to be considered include:

- the long-term use for dust-suppression of water with sufficient dissolved salts to affect soil condition
- disposal to land of any waste water
- waste rock disposal;
- tailings disposal
- disturbance of acid sulfate soils
- spills at chemical and fuel storage areas.

Propose measures that would prevent or remediate any degradation or contamination of land due to the proposed activities. Also, propose any measures required for the management and possible remediation of any existing contamination on the site.

For activities that may disturb acid sulfate soils, also propose management measures that would prevent the contamination of groundwater or surface water. The proposed management measures will be in accordance with the State Planning Policy 2/02: Planning and Managing Development Involving Acid Sulfate Soils and the guidelines published by the Queensland Acid Sulfate Soils Investigation Team (QASSIT) and the Queensland Acid Sulfate Soils Management Advisory Committee (QASSMAC).

Assess any activities or proposed contamination that would result in the land being newly entered on the EMR or the CLR. Also assess the consequences, particularly for the subsequent landholder, of any intention to leave the site on either register when mining ceases. Prepare a site management plan for any land remaining on the EMR or the CLR, and describe when, how and by whom it will be implemented.

#### **4.2.2.6 Erosion and stability**

For all permanent and temporary landforms, possible erosion rates and management techniques should be described. For each waste rock and soil type identified, erosion potential (wind and water) and erosion management techniques will be outlined. An erosion-monitoring program, including rehabilitation measures for erosion problems identified during monitoring, will also be outlined. Develop and describe mitigation strategies that would achieve acceptable soil loss rates, levels of sediment in rainfall runoff and wind-generated dust concentrations.

The report will include an assessment of likely erosion and stability effects for all disturbed areas such as:

- areas cleared of vegetation
- waste dumps
- stockpiles
- dams, banks and creek crossings
- the plant site, including buildings
- access roads or other transport corridors
- water supply pipeline and electricity transmission corridors.

Methods proposed to prevent or control erosion will be specified and will be developed with regard to (a) the long-term stability of waste dumps and voids; (b) preventing soil loss in order to maintain land capability/suitability, and (c) preventing significant degradation of local waterways by suspended solids. The mitigation measures will address the selective handling of waste rock and capping material to maximise long-term stability of final landforms in regard to slumping and erosion both on and below the surface. Erosion control measures will be developed into an erosion and sediment control plan for inclusion in the EM plan.

#### **4.2.2.7 Landscape character**

Describe the potential impacts of the project on the landscape character of the site and the surrounding area. Make particular mention of any changes to the broad-scale topography and vegetation character of the area, such as due to spoil dumps, excavated voids and broad-scale clearing.

Provide details of measures to be undertaken to mitigate or avoid the identified impacts.

#### **4.2.2.8 Visual amenity**

Assess and discuss the visual impact of the project on particular panoramas and outlooks. Assess the extent and significance of the changed skyline including views from places of residence, work, and recreation, from road, cycle and walkways, from the air and other known vantage points day and night, and during all stages of the project. Illustrate the visual impacts of the project structures and associated infrastructure using appropriate simulation. Use sketches, diagrams, computer imaging and photos to portray the near views and far views of the completed structures and their surroundings from visually sensitive locations.

Provide detail of how impacts on visual amenity would be mitigated or avoided.

#### **4.2.2.9 Lighting**

Assess the potential impacts of lighting during all stages of the project particularly regarding:

- the effects of night operations, maintenance or increased vehicular traffic on residents
- changed habitat conditions for nocturnal animals
- the attraction of animals to lights at night.

Propose measures to mitigate or avoid all potential impacts due to lighting.

### **4.3 Transport**

The transport section of the EIS will have separate subsections describing infrastructure associated with the various modes of transport, such as road, rail, pipeline, conveyor, air and sea.

#### **4.3.1 Description of existing infrastructure and values**

Provide details of the proposed use of existing infrastructure to transport materials, products or wastes to and from the project site. Provide details of any assets within the jurisdiction of any transport authority that could be impacted by the project. Also provide details, either in the transport section of the EIS or by cross-reference to other sections, of the environmental values that would be affected by the altered use of existing transport infrastructure or the

construction of new or altered infrastructure.

For road, rail or conveyor transport, separately describe in detail and illustrate the existing networks that would be used by the project. Describe and illustrate any stock routes potentially affected by the project.

In relation to air transport, describe the existing air fields and associated infrastructure that would be used by the project.

In relation to importing or exporting materials and products, identify any port that would be used by the project. Provide details of those ports, including: the berths to be used; the size and types of vessels that the berths can accommodate; the typical turnaround time for vessels; and the associated infrastructure that moves and stores material between the ships and the rail and/or road networks.

#### **4.3.2 Potential impacts and mitigation measures**

For each mode of transport and each phase of the project, the EIS will describe the:

- proposed construction, realignment, structural alteration, or changed use of any access and haul roads, conveyor easements, rail loops and load-out facilities, and rail crossings (over or under the track) used by any transport associated with the project
- expected volumes and weights of materials, products, hazardous goods or wastes
- types of vehicles, rolling stock, vessels and craft to be used
- likely number and timing of trips.

Provide sufficient information to make an independent assessment of how transport infrastructure will be affected by each phase of the project at a local and regional level. Similarly, provide sufficient information to make an independent assessment of how transport used by the project will impact on environmental values. In both cases, the impacts along the whole length of each affected route will be discussed and measures proposed to avoid or mitigate the impacts.

Details will be provided of the:

- results of any modelling of transport impacts
- assessment methodology used, including a summary of consultation undertaken with transport authorities regarding the scope of the impact assessment and methodology to be used
- base data assumptions, including an assessment of the current condition of the affected network and its performance
- possible interruptions to transport operations
- risks of spills of products or hazardous materials during transport, prevention measures to be used, and the requirements for dealing with any spills.

Assess any impacts on stock routes due to the project's activities. Propose mitigation measures for any disruptions to movement of travelling stock on stock routes. Outline, and cross-reference to more detailed descriptions with the EIS, the impacts of transport associated with the project on amenity, human health and ecological values as a result of dust, noise, vibration, and any other environmental effects.

The assessment of road impacts will be in accordance with the latest version of the Department of Transport and Main Road's Guidelines for Assessment of Road Impacts of Development, available from the website: <[www.mainroads.qld.gov.au](http://www.mainroads.qld.gov.au)>. Provide details of any heavy or oversized loads, including the number and type of vehicles, with a description of the likely timing and routes of those loads highlighting any vulnerable bridges or other structures along the proposed routes. Also provide details of the likely traffic to be generated by workforce personnel and service providers.

In relation to road impacts, the EIS will include an assessment of impacts on:

- the safety, efficiency and condition of road operations and assets, including driver fatigue
- any existing or proposed pedestrian cycle networks
- any existing public transport networks (assets and services)
- watercourses and overland flows, and their interaction with the current and future road network (note: impacts on water values due to transport infrastructure will be outlined in the transport section of the EIS and cross-referenced to a detailed assessment in the water resources section).

The assessment of impacts on the rail network itself, or on environmental values affected by changes in rail traffic,

such as due to dust, noise or vibration, will also consider the following matters:

- the likely size of trains and the number of train paths needed to move materials, products or wastes to or from the project site
- new or altered rail transport infrastructure to meet demand from the project
- impacts on rail freight and other transport services (e.g. variability on existing train path availability)
- impacts on passenger transport and services
- impacts at interface points with other private and public transport pathways such as roadway level crossings or occupational crossings (i.e. those crossings which form part of private access pathways to and from residential or business sites)
- the requirements for any approvals needed for rail crossings by roads or other infrastructure.

Assess the impacts of the construction and operation of any conveyors. The direct impacts on any other transport infrastructure, such as those due to road or rail crossings, will be addressed in the transport section of the EIS, while the impacts on other matters (such as ecology, noise, etc) will be addressed in the appropriate sections of the EIS, but cross-referenced in the transport section.

In relation to the importation or export of materials and products, identify any aspects of the project that will increase the shipment of materials through any port. Provide details of the likely size and number of additional vessels that would use the port.

Assess any impacts on any port due to the import or export of materials or products, including the need for:

- new coastal works, such as berth construction or alteration, land reclamation, etc
- any dredging for shipping channels and swing basins
- new or altered stockpile areas
- new, altered, or increased use of existing, infrastructure to handle materials between ships and road or rail transport.

Also assess any impacts on nearby areas due to the handling or storage of materials at ports, including dust, noise or lighting.

Assess any potential impacts of the project on water traffic in rivers and dams.

In relation to air transport, describe the new, and/or altered air fields and associated infrastructure that would be needed for the project. Describe the likely additional number of flights, frequency, timing (particularly any increase in night arrivals or take-offs), and size of aircraft. Describe any features of the project that could impact on air transport, such as the placement of waste dumps, stacks or flares beneath flight paths.

Assess any impacts on environmental values due to the need to redevelop or construct new airfields; and any impacts on amenity due to increased air traffic. The proposal and assessment should have regard to State Planning Policy 1/02: Development in the Vicinity of Certain Airports and Aviation Facilities. Assess any potential impacts on air safety, including the raising of landforms or the construction of stacks, flares or lighting within flight paths.

If the works that could result in impacts, or the associated mitigation works for identified impacts, are the responsibility of the proponent then the EIS will fully assess those impacts, detail the mitigation works and carry the environmental protection commitments forward into the project's EM plan.

If the proponent will not be responsible for the works associated with the impacts (for example, dredging at a port), the EIS will clearly identify the entity that will be responsible and what approvals would be needed. Nevertheless, in this case, the EIS will provide enough assessment of the likely impacts of all associated activities for the regulatory authorities to have confidence that approval of the project, subject to this EIS process, would not have unacceptable flow-on impacts due to necessary works farther down the transport chain.

Describe detailed measures to avoid or mitigate impacts on each transport mode. The mitigation measures will ensure the safety, efficiency and condition of each mode is maintained. These mitigation measures are to be prepared by the proponent in close consultation with the relevant transport authorities. Any residual impacts that cannot be avoided will be identified and quantified.

Mitigation strategies must include:

- consideration of any transport authority's works program and forward planning
- proposed construction plans of all required transport infrastructure works in accordance with relevant and

accepted authority standards and practices

- the responsible parties for any works
- estimates of costs
- details on the timing of the works
- a summary of relevant approvals and legislative requirements needed to implement mitigation strategies and transport infrastructure works required by the project.

Also consider public transport requirements and links to, or development of pedestrian and cycle networks.

## **4.4 Waste**

This section will complement other sections of part 4 of the EIS by providing technical details of waste treatment and minimisation, with proposed emission, discharge and disposal criteria, while other sections describe how those emissions, discharges and disposals would impact on the relevant environmental values. The purpose of this format is to concentrate the technical information on waste management into one section in order to facilitate its transfer into the EM plan.

### **4.4.1 Description of environmental values**

Briefly describe the existing environment values that may be affected by the project's wastes. Refer to each of the waste streams described in section 3.6 and provide references to more detailed descriptions of the relevant environmental values in other sections of part 4 of the EIS.

### **4.4.2 Potential impacts and mitigation measures**

The purpose of this section is to bring together a description of the preferred methods (and discuss any alternatives) to be used to deal with waste streams and outline their impacts. The full description of the magnitude and nature of impacts on particular environmental values due to managing waste will be provided in the relevant sections of part 4 of the EIS.

Define and describe the objectives and practical measures for protecting or enhancing environmental values from impacts by wastes. Assess the management measures against the waste hierarchy, describe how nominated quantitative standards and indicators may be achieved for waste management, and how the achievement of the objectives will be monitored, audited and managed.

As part of the description, and except where issues related to waste have been addressed in section 3.6 (in which case reference will be made to the appropriate subsection), provide details of each waste with regard to:

- operational handling, storage, treatment, disposal and fate of all wastes
- any methods and locations to be used to transport and dispose of wastes off the project site
- hazards associated with the handling and storage of wastes
- the potential level of impact on environmental values
- proposed discharge/disposal criteria for liquid and solid wastes
- measures to ensure stability of the dumps and impoundments
- methods to prevent seepage and contamination of surface water or groundwater from stockpiles and/or dumps
- design criteria to be used to ensure that waste containment and/or storage facilities perform satisfactorily
- market demand for recyclable waste
- waste minimisation processes
- measures to ensure wastes does not attract or propagate pests, disease vectors or vermin, and do not impact on public health
- decommissioning of the site.

Consider the physical, geo-mechanical and chemical properties of waste rock in both fresh and weathered forms when determining their suitability for constructing stable slopes and developing measures to avoid acid generation from waste rock dumps and backfilling operations. Provide a detailed description of tailings disposal facilities stability, capping and rehabilitation, including hydraulic performance of the tailings disposal facilities during operation and post-decommissioning.

[This paragraph for gold mineral processing only] Describe options for removing or reducing cyanide from the

waste streams entering tailings storage, and develop a preferred option. Provide predictions of the concentrations of cyanide, in total and in relevant chemical species, resulting from the preferred option for all components of the waste streams, including settled solids and supernatant effluent in tailings storage facilities.

Having regard to the Environmental Protection (Waste Management) Policy 2000 (EPP(Waste)), indicate the results of investigating the feasibility of using waste minimisation and cleaner technology options during all phases of the project. Apply waste minimisation and treatment, and cleaner production techniques, to gaseous wastes, particularly methane, nitrogen oxides, sulfur oxides, particulates and carbon dioxide. Pay particular attention to measures that will maximise energy efficiency and minimise internal energy consumption in the project.

Detail cleaner production waste management planning especially how these concepts have been applied to prevent or minimise environmental impacts at each stage of the project. Provide details on natural resource use efficiency (such as energy and water), integrated processing design, and any co-generation of power and by-product reuse as shown in a material/energy flow analysis.

## 4.5 Water

### 4.5.1 Description of environmental values

Describe the existing resources and environmental values of water that may be affected by the project. Environmental values will be defined according to the *Environmental Protection Act 1994*, Environmental Protection (Water) Policy 2009 (EPP(Water)), the Australian Water Quality Guidelines for Fresh and Marine Waters (ANZECC & ARMCANZ, 2000), the Queensland Water Quality Guidelines 2009 (DERM, 2009) and the guideline Establishing Draft Environmental Values and Water Quality Objectives (EPA, 2002). Make reference to Queensland Wetland Mapping and any available Aquatic Conservation Assessments produced by DERM. Include estuarine and marine waters if they could be impacted by the project. The definition of waters in the EPP(Water) includes the bed and banks of waters, so this section will address benthic sediments as well as the water column.

Develop and describe suitable water quality and resource indicators for measuring environmental values, and objectives that would protect the identified values.

Describe and illustrate the surface watercourses, overland flow, palustrine and lacustrine wetlands, estuaries and marine waters. The description will include suitably scaled maps of catchments, watercourses, drainage pathways, wetlands, or sources of water supply (such as farm dams) potentially affected by the project, whether on or off the project site. Describe, with supporting photographs, the geomorphic condition of any watercourses likely to be affected by disturbance or stream diversion. The results of this description will form the basis for the planning and subsequent monitoring of rehabilitation of the watercourses during or after the operation of the project.

Describe the hydrology of watercourses and overland flow in the project area and any downstream locations potentially affected by the project.

Provide details of the likelihood and history of flooding, including the extent, levels and frequency of floods in and around the project site. Flood studies will include a range of annual exceedance probabilities for potentially affected waterways, based on observed data if available or use appropriate modelling techniques and conservative assumptions if there are no suitable observations. The flood modelling assessment will include local flooding due to short duration events from contributing catchments on site, as well as larger scale regional flooding including waterways downstream.

Describe present and potential users and uses of water in areas potentially affected by the project, including municipal, agricultural, industrial and recreational uses of water.

Describe the quality of surface waters in the area potentially affected by the project with an outline of the significance of these waters to the river catchment system in which they occur (note: impacts on coastal water quality will be discussed in section 4.6 (Coastal environment)). The description will be based on a monitoring program, with sampling stations located upstream at reference sites that would not be impacted and downstream of the project. Monitoring will include sites closest to the proposed discharge points and at downstream locations that would be below any mixing zone. Sites will include permanent and semi-permanent water holes, known aquatic habitat, weirs or reservoirs. Available complementary stream-flow data will also be obtained from historical records to help interpretation. Describe seasonal variations in water quality and variations with flow. Monitoring of ephemeral streams will primarily focus on all times of natural flow. Measure a range of physical, chemical and biological parameters relevant to the potential environmental harm on any affected creek or wetland system. This will include but not necessarily be limited to water quality indicators likely to be affected by the project such as electrical conductivity, dissolved metals, turbidity, suspended sediments and pH. Biological indicators will include macroinvertebrate surveys undertaken at appropriate locations according to best practice methods. All sampling will be performed in accordance with the Monitoring and Sampling Manual 2009 (DERM, 2009) or the most current edition.

Describe the quality, quantity and significance of groundwater in the project area and any surrounding area

potentially affected by the project's activities.

Describe the nature and hydrology of the aquifers of the potentially affected area, including:

- geology and stratigraphy
- aquifer type – such as confined, unconfined, karst or perched
- depth to, and thickness of, the aquifers
- the significance of the resource at a local and regional scale
- depth to water level and seasonal changes in levels
- groundwater flow directions (defined from water level contours)
- groundwater yield
- groundwater quality
- interaction with surface water
- interaction with saline water
- possible sources of recharge
- vulnerability to pollution.

The description will include a survey of existing groundwater supply facilities (bores, wells, or excavations) to the extent of any potential impacts. Include and analyse the following information:

- location of potentially affected bores or wells
- pumping parameters
- draw down and recharge at normal pumping rates
- seasonal variations (if records exist) of groundwater levels.

Develop and describe a network of observation points and a monitoring program that would satisfactorily monitor groundwater resources both before and after commencement of operations. The data obtained from the groundwater survey will be sufficient to enable specification of the major ionic species, pH, electrical conductivity, total dissolved solids and any potentially toxic or harmful substances.

#### **4.5.2 Potential impacts and mitigation measures**

For all phases of the project, this section of the EIS will:

- assess potential impacts on the water resource environmental values identified in the previous section
- define and describe the objectives and practical measures for protecting or enhancing water resource environmental values
- describe how the achievement of the objectives will be monitored, audited and managed.

Describe and illustrate with maps, plans and cross-sections any proposal to divert creeks or undertake other in-stream works. Assess the potential impacts of in-stream works on hydrology and water quality, and propose measures for avoiding or mitigating the impacts and stabilising and rehabilitating any works.

Assess the hydrological impacts of the project, particularly with regard to the various components of flow that may be impacted by the project. The EIS will address: changes to catchment size or characteristics; changes to the direction or quantity of runoff in the local catchment and to accumulated downstream flows; scouring and erosion; and the consequent impacts of any subsidence. Any consequential impacts of changes to water flow or groundwater recharge on ecosystems and wildlife will be addressed in the ecology section of the EIS. When flooding levels will be affected, model the afflux and illustrate the predictions with maps. Describe and illustrate how an operating pit would be protected from flooding, and address the flood protection level of any final void without the need to maintain levees.

Describe the options for supplying water to the project, and assess the consequential impacts in relation to any water resource plan, resource operations plan and wild river declaration that may apply. Water allocation and water sources will be established in consultation with DERM. Where a licence or permit will be required under the *Water Act 2000* to take water or interfere with the flow of water, provide sufficient information and assessment for the administering authority to consider the suitability of approving any necessary works under the *Water Act 2000*. Similarly, provide sufficient assessment to consider any approval for waterway barrier works under the *Fisheries Act 1994*.

Describe in detail the proposed water management controls, addressing surface and ground water quality and quantity, drainage patterns and sediment movements. Describe and illustrate: the locations, catchments, footprints, cross-sections and method of construction of any dams on the site; their flood immunity; the quality of water or waste water they would contain, and indicate their hazard category. Provide the design storage allowances for sediment dams and process or waste water dams, and demonstrate that the design has been produced by a suitably qualified and experienced engineer using current best practice. Propose measures to manage sediment dams and process or waste water dams and their discharge, and to decommission and rehabilitate the dams when their use ends.

Assess the potential impacts on local and downstream water quality due to any controlled discharges from the site. Describe the proposed quality, quantities and locations of waste water discharges. Use stream flow data in combination with proposed discharge rates to estimate in-stream dilution and water quality. Compare the predicted contaminant levels to the water quality objectives and provide an assessment of the assimilative capacity of the receiving waters. Assess options for controlled discharge under times of natural stream flow that would ensure that adequate flushing of waste water is achieved. Assess the acute and chronic potential impacts of discharges including the cumulative impacts with other discharges from other projects or industry.

Describe any proposed no-release water systems, assess the management and fate of contaminants, and propose mitigation measures for any potential impacts.

Describe and assess proposed measures to manage any leachate or seepage from tailings storages, either during operations or following decommissioning of the mine and its rehabilitation. Describe monitoring programs that will assess the effectiveness of management strategies for protecting water quality during the construction, operation and decommissioning of the project.

Conduct a risk assessment, based on conservative water quality estimates and hydrology, for uncontrolled emissions to water due to system or catastrophic failure, assess the potential impacts of such emissions on human health and natural ecosystems, and provide detailed measures to avoid or minimise impacts.

Assess the potential impacts on local groundwater resources and quality, and define the extent of the area where groundwater resources are likely to be affected by the proposed operations. Assess the potential impacts of the operations on groundwater draw-down, depletion or recharge, and propose management options to monitor and mitigate these effects. Assess the likely response of the groundwater resource after operation of the project, including the impacts of groundwater inflow to any residual void. Assess the potential impacts on the local ground water regime due to altered porosity and permeability from any land disturbance, such as subsidence. Assess the potential for project operations or residual effects to contaminate groundwater resources. Propose measures to avoid, mitigate and remediate any impacts on groundwater resources or quality.

## **4.6 Coastal environment**

### **4.6.1 Description of environmental values**

Describe the existing coastal environment that may be affected by the project in the context of coastal resources and values identified in the State Coastal Management Plan and any applicable Regional Coastal Management Plans. When necessary to avoid duplication, cross-reference other sections of the EIS where coastal values, such as ecology or scenic amenity, are addressed.

Provide an assessment of physical and chemical characteristics of sediments within the littoral and marine zone potentially affected by the project.

Describe the physical processes of the littoral and marine environment, including currents, tides, freshwater flows and their interaction in relation to coastal morphology and the assimilation and transport of contaminants entering marine waters from, or adjacent to, the project area.

Develop and describe suitable indicators for measuring coastal values, and objectives that would protect the coastal resources and values.

### **4.6.2 Potential impacts and mitigation measures**

Identify actions associated with the project that are assessable development within the coastal zone and would require approval under the *Coastal Protection and Management Act 1995*.

Assess the potential impacts that may be caused by the project on coastal processes, resources and values.

Compare the magnitude of the potential impacts to the objectives, and develop management measures that would avoid or mitigate the impacts to meet the objectives. Describe how the mitigation measures are in accordance with applicable coastal management plans, state planning policies (such as State Planning Policy 2/02 – Planning and Managing Development Involving Acid Sulfate Soils), and the Department of Employment, Economic Development and Innovation's series of fisheries guidelines.

Detail a monitoring program that would audit the success of mitigation measures, and describe corrective actions to be used if monitoring shows that objectives are not being met.

## **4.7 Air**

### **4.7.1 Description of environmental values**

Describe the existing air environment and airshed that may be affected by the project. Discuss the background levels and sources of contaminants including suspended particulates, oxides of sulfur or nitrogen, greenhouse gases, odorous compounds and any other relevant constituent, whether major or minor, of the air environment that may be affected by the project.

Provide sufficient data on local meteorology and ambient levels of contaminants to establish a baseline for later studies and for the modelling of air quality environmental impacts within the airshed. Parameters will include air temperature, wind speed and direction, atmospheric stability, mixing depth and other parameters necessary for input to the models.

Describe and illustrate the locations of existing residences, places of work, schools, etc, agricultural or ecologically significant areas that could be impacted by emissions from the project.

Describe the environmental values, appropriate indicators and air quality objectives for the potentially affected air environment according to the Environmental Protection (Air) Policy 2008 (EPP(Air)). Assess whether any air quality objectives are needed in addition to those in the EPP(Air).

### **4.7.2 Potential impacts and mitigation measures**

Describe all the project's potential sources of emissions to air and expected composition of the emissions. The description will include oxides of sulfur or nitrogen, volatile organic compounds, carbon monoxide and dioxide, particulates (including dust, PM10, and PM2.5), trace metals, odours and any toxic, persistent and/or hazardous substances that would be emitted by the project. Also, specify the oxygen content of the flue gases. Present the concentrations of all components of emissions at standard temperature and pressure, and provide the mass emission rate, exit velocity, volume flow rate and temperature at exit.

Provide a separate air emission inventory of any offsite activities directly associated with the project, including fugitive emissions such as from rail or road transport of product or waste.

Use a recognised atmospheric dispersion model to predict the fate of all significant emissions. Use estimates of emission rates based on actual measurements from samples taken from similar facilities, preferably full-scale facilities operating elsewhere or otherwise from experimental or demonstration-scale facilities. Where this is not possible, use published emission factors and/or data supplied by manufacturers of process and control equipment. State all input parameters, data sets and assumptions used in the modelling in the main text of the EIS or an appendix. The model inputs will be as detailed as possible, reflecting any variation of emissions with time and including at least a full year of representative hourly meteorological data. Provide stack parameters such as stack height, diameter, temperature, exit velocity and volume flow rate.

If there is no single atmospheric dispersion model that is able to handle the different atmospheric dispersion characteristics exhibited in the project area (such as sea breezes, strong convection, terrain features, temperature inversions and contaminant re-circulation), apply a combination of acceptable models.

Provide contour maps of predicted ground level concentrations and frequency contour plots for typical and maximum emissions under the expected range of meteorological conditions including the worst case. The averaging period for ground-level concentrations of contaminants modelled will be consistent with the relevant averaging periods for air quality indicators and goals in the Environmental Protection (Air) Policy 2008 and the National Environmental Protection (Ambient Air Quality) Measure. For example, the modelling of sulfur dioxide must be conducted for 1-hour, 24-hours and annual averaging periods.

Compare the predicted ground level concentrations to the air quality objectives, and best practice national and international source emission standards. Describe any situations where people, ecosystems or an agricultural use would experience concentrations above an objective. Assess the human health risk associated with emissions from the project for all contaminants whether or not they are covered by the National Environmental Protection Council (Ambient Air Quality) Measure or the Environmental Protection (Air) Policy 2008. Assess potential impacts of emissions on ecosystems or agricultural uses of the environment.

Assess the potential cumulative impacts or interaction between the emissions from the project and other emissions in the airshed. For example, it may be necessary to evaluate whether nitrogen oxides and volatile organic compounds emissions from the project and other sources within the region would contribute to the generation of photochemical smog, or whether sulfur dioxide emissions would acidify rain or dew.

Describe airshed management and the contribution of the project to airshed capacity in view of existing and future users of the airshed for assimilation and dispersion of emissions.

If odour could be an issue, conduct odour impact assessment according to the DERM guideline Odour Impact Assessment from Developments.

Identify worst case emissions that may occur at start-up, shut-down or during 'upset' operating conditions. If these emissions are significantly higher than those for normal operations, it will be necessary to evaluate the worst-case impact, as a separate exercise to determine whether any planned buffer between the project and neighbouring sensitive receptors will be adequate

Describe the pollution control equipment and pollution control processes to be employed on the premises and the features of the project designed to suppress or minimise emissions, including dusts and odours. Describe the backup measures to be incorporated that will act in the event of failure of primary measures to minimise the likelihood of plant upsets and adverse air impacts.

Assess how the proposed emission control processes accord with the management hierarchy for air emissions in the EPP(Air).

Describe how the air quality objectives would be achieved, monitored and audited, and how corrective action would be taken when needed.

#### **4.7.2.1 Greenhouse gases**

Provide an inventory of projected annual emissions for each relevant greenhouse gas, with total emissions expressed in 'CO<sub>2</sub> equivalent' terms. Estimate emissions from upstream activities associated with the proposed project, including the fossil fuel based electricity to be used. Briefly describe the methods used to make the estimates. The Australian Department of Climate Change's National Greenhouse Accounts (NGA) factors (2009) can be used as a reference source for emission estimates and supplemented by other sources where practicable and appropriate. Coal mining projects will include estimates of coal seam methane to be released as well as emissions resulting from such activities as transportation of products and consumables, and energy use by the project.

Assess the potential impacts of the project on the state and national greenhouse gas inventories and propose greenhouse gas abatement measures, including:

- a description of the proposed measures (alternatives and preferred) to avoid and/or minimise greenhouse gas emissions directly resulting from activities of the project, including such activities as transportation of products and consumables, and energy use by the project
- an assessment of how the preferred measures minimise emissions and achieve energy efficiency
- a comparison of the preferred measures for emission controls and energy consumption with best practice environmental management in the relevant sector of industry
- a description of any opportunities for further offsetting greenhouse gas emissions through indirect means.

Means of reducing greenhouse gas emissions could include such measures as:

- minimising clearing at the site (which also has imperatives besides reducing greenhouse gas emissions)
- using less carbon-emitting transport modes or fuels
- integrating transport for the project with other local industries such that greenhouse gas emissions from the construction and running of transport infrastructure are minimised
- maximising the use of renewable energy sources
- co-locating coal seam methane use for energy production with coal extraction
- carbon sequestration at nearby or remote locations.

Include a specific module to address greenhouse abatement in the draft environmental management plan. That module will include:

- commitments to the abatement of greenhouse gas emissions from the project with details of the intended objectives, measures and performance standards to avoid, minimise and control emissions
- periodic energy audits with a view to progressively improving energy efficiency
- a process for regularly reviewing new technologies to identify opportunities to reduce emissions and use energy efficiently, consistent with best practice environmental management
- any voluntary initiatives such as projects undertaken as a component of the national Greenhouse Challenge Plus program, or research into reducing the lifecycle and embodied energy carbon intensity of the project's processes or products

- opportunities for offsetting greenhouse emissions by renewable energy uses
- commitments to monitor, audit and report on greenhouse emissions from all relevant activities and the success of offset measures.

## **4.8 Noise and vibration**

### **4.8.1 Description of environmental values**

Describe the existing environmental values that may be affected by noise and vibration from the project. Environmental values and acoustic objectives for noise-sensitive receptors are defined in the Environmental Protection (Noise) Policy 2008 (EPP(Noise)).

If the proposed activity could adversely impact on the noise environment, undertake baseline monitoring at a selection of sensitive receptors potentially affected by the project. Sensitive receptors are defined in the EPP(Noise). Illustrate the locations of sensitive receptors on a suitably-scaled map. Describe the results of any baseline monitoring of noise and vibration in the proposed vicinity of the project, including long-term measured background noise levels that take into account seasonal variations.

Report the daily variation of background noise levels at nearby sensitive receptors, with particular regard to detailing variations at different periods of the night. Monitoring methods will adhere to accepted best practice methodologies, relevant DERM guidelines and Australian Standards, and any relevant requirements of the Environmental Protection Regulation 2008 and the Environmental Protection (Noise) Policy 2008.

Describe any current activities near the project area that may cause a background level of ground vibration (for example major roads, quarrying activities, etc).

Develop and describe suitable indicators for measuring noise, and objectives that would protect the environmental values from significant noise and vibration impacts.

### **4.8.2 Potential impacts and mitigation measures**

Using a suitable acoustic model, predict the likely generation of noise for different times of day under a range of climatic conditions, including the expected worse case. Describe the predictions using suitable indicators, and illustrate the predicted noise contours on suitably-scaled maps showing the locations of noise sensitive receptors. Assess the potential impacts of noise and vibration at all potentially sensitive receptors in comparison to the objectives and standards to be achieved. Give particular consideration to emissions of low-frequency noise; that is, noise with components below 200Hz. The assessment of noise impacts will include matters raised in the document *The Health Effects of Environmental Noise – Other Than Hearing Loss* published by the enHealth Council, 2004 (or later editions), ISBN 0 642 82304 9. Assess the potential environmental impacts of noise and vibration on terrestrial and marine animals and birds, including migratory species. Assess potential noise impacts on any nearby protected areas addressing amenity as well as impacts on animals. Provide information on blasting that might cause ground vibration or fly rock on, or adjacent to, the site with particular attention given to places of work, residence, recreation, worship and general amenity. Discuss the magnitude, duration and frequency of any vibration and assess the potential impacts on sensitive receptors. Reference will be made to the DERM guideline: *Noise and Vibration from Blasting*.

Assess potential off-site noise and vibration impacts that could arise due to increased road or rail transportation directly resulting from the project.

Define and describe practical measures for protecting or enhancing environmental values from impacts by noise and vibration, including details and illustrations of any screening, lining, enclosing or bunding. Provide a discussion of timing schedules for construction and operations with respect to minimising environmental nuisance and harm from noise and vibration. Also, describe how the achievement of the objectives will be monitored, audited and corrective action taken when needed. Describe how any complaints about noise or vibration would be managed and reported.

## **4.9 Ecology**

### **4.9.1 Description of environmental values**

Describe the existing ecological values that may be affected by the project. Address those ecological values in terms of:

- terrestrial and aquatic ecosystems, and their interaction
- biological diversity
- the existing integrity of ecological processes, including habitats of threatened or near threatened species
- the integrity of landscapes and places, including wilderness and similar natural places.

The description of the ecological values of the areas likely to be affected by the project will be illustrated by maps, diagrams and photographs. The description will start by addressing the ecology of the regional area and progress to a detailed description of the project site and any localities that could be affected by project related activities, including downstream and down-wind areas that could be significantly impacted by emissions. The description of ecological values will account for seasonal changes.

For all locations that may be affected by any aspect of the project, provide suitably-scaled maps of terrestrial vegetation based primarily on field surveys with descriptions of the mapped ecosystems and any items of special interest. Map adjacent areas to illustrate interconnectivity, including any larger scale interconnections between areas of remnant or regrowth vegetation where the project site includes vegetation that facilitates animal movement between those other areas. Field surveys will use the Queensland Herbarium methodology and proformas in the latest version of the publication *Methodology for Survey and Mapping of Regional Ecosystems and Vegetation Communities in Queensland* (EPA, 2005), and survey a minimum of three sites, each at least 50 m by 10 m, within each defined (standard system) vegetation community.

The vegetation description and mapping, produced from aerial photographs and field surveys, and having a minimum scale of 1:10 000, will cover at least the following matters:

- location and extent of vegetation types using DERM's regional ecosystem type descriptions in accordance with the Regional Ecosystem Description Database
- category A or B environmentally sensitive areas under the Environmental Protection Regulation 2008
- any areas of state, regional or local significance identified in an approved Biodiversity Planning Assessment produced by DERM
- critical habitat within the meaning of the *Nature Conservation Act 1992*
- vegetation mapped as essential habitat
- remnant or regrowth vegetation, particularly essential regrowth habitat, high value regrowth, or a regrowth watercourse
- sensitive or important vegetation types, including riparian vegetation and any marine littoral and subtidal zone
- in-land or coastal wetlands
- wildlife breeding or roosting areas
- sites in, or adjacent to, areas containing important resting, feeding or breeding sites, or flight paths for migratory species listed under the Convention of Migratory Species of Wild Animals, and/or bilateral agreements between Australia and Japan (JAMBA), Australia and China (CAMBA), or Australia and the Republic of Korea (ROKAMBA)
- sites adjacent to nesting beaches, feeding, resting or calving areas of species of special interest, such as marine turtles and cetaceans
- sites containing common species that represent a distributional limit and are of scientific value or contain feeding, breeding, resting areas for populations of echidna, koala, platypus and other species of special cultural significance
- sites containing high biodiversity that may be dependent for their long-term survival or function on connectivity with other nearby areas of habitat
- a site containing other special ecological values, for example, high habitat diversity and areas of high endemism
- bat roosting and breeding caves, including existing structures such as adits and shafts
- habitat of threatened or near threatened animals
- the condition of vegetation and its habitat value, particularly in relation to the conservation of any threatened and near threatened plant and animal species, assemblages or community types
- a complete list of species present at each site
- the relative abundance of plant species
- species of protected plants highlighting those listed as threatened or near threatened under the Nature Conservation (Wildlife) Regulation 2006
- any other plant communities or species of conservation, cultural, commercial or recreational significance
- areas that may have low resilience to environmental change

- location and abundance of any pest, weed or exotic species
- any areas that would be subject to the *Vegetation Management Act 1999*.

Plants that could not be identified during the survey will be submitted to the Queensland Herbarium for identification. Specimens of plant species of conservation significance, including those listed as protected plants under the Nature Conservation (Wildlife) Regulation 2006, other than common species, will be submitted to the Queensland Herbarium with sufficient information to enable their lodgement as voucher specimens.

The plant and animal surveys will address species structure, assemblage, diversity and abundance. Surveys will be sufficient to identify, or adequately extrapolate, the plant and animal values over the range of seasons, particularly during and following a wet season. In tropical areas, a major part of the survey effort will be undertaken between 1 February and 31 March, assuming the wet season follows a typical pattern. The survey will account for the ephemeral nature of watercourses traversing the project area, and seasonal variation in animal populations. Existing information on plants and animals may be used to supplement new survey work provided that the existing data are still current and have been derived from previous surveys at the site that were consistent with current best practice methodologies. Methodologies used for plant and animal surveys will be specified in the appendices to the EIS.

Undertake a comprehensive vertebrate animal survey of the project area at a sampling intensity that supports the scale of vegetation mapping (i.e. 1:10 000 or better). Surveys of terrestrial wildlife will be conducted in a manner that is sensitive to effects of seasonality and the different activity patterns and habitat use by species under different seasonal conditions.

Describe the terrestrial and riparian animals occurring in the areas affected by the project, noting the broad distribution patterns in relation to vegetation, topography and substrate. The description of the animals present or likely to be present in the area will address:

- a list of animal species, their diversity and abundance
- the existence of any threatened, near threatened or otherwise noteworthy species or communities in the study area, including discussion of range, habitat, breeding, recruitment, feeding and movement requirements, and current level of protection (such as any requirements of protected area management plans)
- any species that are poorly known but suspected of being threatened or near threatened
- habitat requirements and their sensitivity to changes
- movement corridors and barriers to movement
- the use of the area by migratory birds, nomadic birds, bats, and arboreal and ground-dwelling animals
- feral, pest or exotic animals.

In addition to the species found in the field survey, provide an indicative list of all other known or likely species within a 100 km area around the project site and the local bioregion, highlighting any threatened or near threatened species. Correlate the occurrence of animals of conservation significance to mapped vegetation units or habitats to facilitate the development of measures for their protection. Indicate how well any affected communities are represented and protected elsewhere in the province where the site of the project occurs.

Describe the aquatic plants and animals occurring in the areas affected by the project, noting the patterns and distribution in the waterways and any associated wetlands, lacustrine and marine environments. The description of the plants and animals present or likely to be present in the area will at least include:

- fish species, mammals, reptiles, amphibians, crustaceans and aquatic invertebrates occurring in the waterways within the affected area, and/or those in any associated lacustrine and marine environment
- any threatened or near threatened marine species and their habitat
- aquatic plants
- aquatic and benthic substrate
- habitat downstream of the project, or potentially impacted due to currents in associated lacustrine and marine environments.

Provide a description to order or family taxonomic rank of the presence and nature of any stygofauna occurring in groundwater likely to be affected by the project. Sampling and survey methods should follow best practice, such as that published by the Western Australian Environmental Protection Authority – Guidance for the Assessment of Environmental Factors no.54 (December 2003) and No. 54a (August 2007), or any more recent publication that supersedes that guideline.

Develop and describe suitable indicators for measuring ecological values, and objectives that would protect the environmental values from significant adverse impacts.

#### 4.9.2 Potential impacts and mitigation measures

Assess the potential impacts on the ecological values of the area arising from the construction, operation and decommissioning of the project including clearing, salvaging or removal of vegetation. Cover terrestrial and aquatic (marine and freshwater) environments, including any potentially impacted benthic and inter-tidal communities, seagrass beds and mangroves. Assess the potentially significant environmental impacts on any plants and animals, whether on or off the project site, due to any alterations to the local surface and ground water environment.

Specifically assess any potential impacts on a category A or B environmentally sensitive area and propose measures to avoid impacts.

If available, provide electronic shapefiles in a format compatible with ArcGIS indicating the boundary of the project area and detailing the extent of proposed vegetation clearing in relation to surrounding vegetation both within the project area and in any off-site area to be used for project related infrastructure.

Assess the indirect impacts on remaining vegetation, such as those due to edge effects, reducing vegetation area below a viable size, or reductions in connectivity. Similarly, indirect impacts on animals should be assessed, such as the reduction of a habitat area below a viable size or increased predation due to reduced cover. Short-term and long-term effects should be considered with comment on whether the impacts are reversible or irreversible.

Describe the potential impacts on stygofauna of any changes in the quality, level or quantity of groundwater, and describe any mitigation measures that may be applied.

Assess the capacity of the environment to assimilate discharges or emissions. Assess the potential impacts due to chronic, low-level exposure to contaminants or the bio-accumulation of contaminants.

Assess the potential impacts on animals of wastes at the site, particularly those related to any form of cyanide or other toxicants in supernatant water of a tailings storage facility. Propose measures to prevent harm to wildlife.

Describe and assess the potential impacts of any actions of the project that require an authority under the *Nature Conservation Act 1992*, and/or would be assessable development for the purposes of the *Vegetation Management Act 1999*. The assessment and supporting information should be sufficient for the administering authority to decide whether an approval should be granted and developing recommended conditions.

Propose practical measures for protecting or enhancing ecological values, and assess how nominated quantitative standards and indicators may be achieved for nature conservation management. In particular, address measures to protect or preserve any threatened or near threatened species.

Describe measures that would adequately mitigate potential impacts on habitats that would inhibit animal movement, propagation or feeding patterns, or change food chains. Specifically address any obligations imposed by Queensland or Commonwealth legislation or policy or international treaty obligations, such as JAMBA, CAMBA or ROKAMBA. Assess the need for buffer zones and the retention, rehabilitation or planting of movement corridors, and propose measures that would avoid waterway barriers or mitigate their construction and operation. Assess works in a waterway considering Waterway Barrier Works Development Approvals, Queensland Primary Industries and Fisheries Fish Habitat Management Operational Policy FHMOP 008, 2009.

Identify and quantify any potential net loss of environmental values. Propose environmental offsets that would counterbalance the remaining loss of environmental values. Proposed environmental offsets will be consistent with the requirements set out in any applicable specific-issue offset policies under the framework of the Queensland Government's Environmental Offset Policy (2008). Specific-issue offset policies that will be considered are:

- Policy for Vegetation Management Offsets, DERM, 2009
- Mitigation and Compensation for Works or Activities Causing Marine Fish Habitat Loss: Departmental Procedures, Fish Habitat Management Operational Policy, Queensland Department of Primary Industries, FHMOP 005, 2002
- Offsets for Net Benefit to Koalas and Koala Habitat, EPA, 2006.

Propose detailed measures to remove and control the introduction or spread of weeds and feral or pest animals. This should include a risk assessment of high biosecurity risk species and their sites, and the development of threat mitigation plans for them, such as clean down and inspections at high risk sites. The biosecurity management strategies will include mitigation measures relevant to protecting any potentially affected primary production areas. When determining control strategies, reference will be made to the latest Biosecurity Queensland's Annual Pest Distribution Survey data, published biosecurity management strategies, local government pest management plans and any applicable model local laws dealing with locally declared pest plants

and animals. Develop management strategies to ensure no new marine pests are introduced as a result of the project's activities. Include all management measures for pest plants and animals in a biosecurity management plan, which will form part of the project's draft EM plan.

Propose measures for the progressive rehabilitation of disturbed areas, including rehabilitation success criteria that would be used to measure the progress. Describe how the achievement of the objectives would be monitored and audited, and how corrective actions would be managed. Proposals for the rehabilitation of disturbed areas will incorporate, where appropriate, provision of nest hollows and ground litter.

## **4.10 Cultural heritage**

### **4.10.1 Description of environmental values**

Describe the existing cultural heritage values that may be affected by the project. Unless an exemption applies under s86 of the *Aboriginal Cultural Heritage Act 2003*, an Indigenous cultural heritage study must be undertaken in accordance with the requirements of Part 6 of that Act.

An historical cultural heritage study will also be undertaken of the known and potential historical cultural heritage values of the affected area. The study will, as a minimum, include a desktop analysis and an archaeological investigation (such as a physical investigation) of the area potentially affected by the project.

The desktop component of the study will, as a minimum, review the following sources for information on historical cultural heritage values within the region of the project site:

- the Queensland Heritage Register, for places already protected under the *Queensland Heritage Act 1992*
- local government heritage registers, lists or inventories
- results of previous cultural heritage studies conducted within the region of the project.

The scope of the archaeological investigation will be based upon the results of the desktop analysis. The archaeological investigation is to be conducted by an appropriately qualified person, as required by the *Queensland Heritage Act 1992*, and will address all types of historical cultural heritage places located within the project area, including built, archaeological and cultural landscape values.

The discovery and protection of any previously unidentified archaeological artefacts or archaeological places during the course of the historical cultural heritage study must comply with Part 9 of the *Queensland Heritage Act 1992*.

### **4.10.2 Potential impacts and mitigation measures**

Define and describe the objectives and practical measures for managing, protecting or enhancing cultural heritage values that may be affected by the project. Describes how practices may be implemented to appropriately manage those values, and how the achievement of the objectives will be monitored, audited and managed.

#### **4.10.2.1 Indigenous cultural heritage**

Unless an exemption applies under s86 of the *Aboriginal Cultural Heritage Act 2003*, the potential impacts on Indigenous cultural heritage values in the vicinity of the project must be managed under a cultural heritage management plan (CHMP) developed and approved under Part 7 of that Act. Development of the CHMP will follow the guidelines gazetted under section 85 of the *Aboriginal Cultural Heritage Act 2003*. DERM's EIS Coordinator must be made aware of the progress of the CHMP approval process and of any related issues that should be addressed in the EIS assessment report.

#### **4.10.2.2 Non-Indigenous historical cultural heritage**

The potential impacts on non-Indigenous historical cultural heritage values and their avoidance or mitigation will be addressed in a management plan. The historical heritage management plan will specifically address identified values and provide a process for managing yet undiscovered values should they become apparent during development of the project.

The development of a historical heritage management plan will be negotiated with DERM and any other relevant stakeholders.

The historical heritage management plan will as a minimum address the following issues:

- processes for mitigating, managing and protecting identified historical cultural heritage values during excavations of the construction, operational, rehabilitation and decommissioning phases of the project
- processes for reporting, as required by section 89 of the *Queensland Heritage Act 1992*, the discovery of any archaeological artefact not previously identified in the historical cultural heritage study
- procedures for collecting any artefact material, including appropriate storage and conservation

- historical cultural heritage awareness training or programs for project staff.

The training will be provided during the site induction, and will address the legislative requirements and practical measures for the recognition, reporting and preservation of cultural heritage material. A plain English manual summarising the training will be given to all site workers for their future reference.

The historical heritage management plan will be incorporated into the project's draft EM plan.

## **4.11 Social values**

The description of social and cultural values potentially impacted by the project, and the assessment of the impacts on those values, will be conducted in consultation, through the EIS Coordinator, with the Social Impact Assessment Unit of the Department of Infrastructure and Planning. The proponent will engage at the earliest practical stage with stakeholders and potentially affected parties to discuss and explain the project, and to identify and respond to issues and concerns regarding social impacts. The stakeholder engagement processes will continue throughout the EIS and contribute to the identification of social and cultural values and to the assessment of impacts.

### **4.11.1 Description of existing social values**

Define the social and cultural values within the project's area of influence, including the local, district, regional and state level as appropriate, taking into account the:

- potential for social and cultural impacts to occur
- location of other relevant proposals or projects
- location and types of physical and social infrastructure, settlement and land use patterns
- social values that might be affected by the project, including integrity of social conditions, liveability, social harmony and wellbeing, and sense of community
- Indigenous social and cultural characteristics, such as areas under native title rights or application.

Undertake a targeted baseline study of the people in the project's social and cultural area to identify social values that may be impacted by the project. The social baseline study will be based on qualitative, quantitative, and participatory methods supported by stakeholder engagement processes. It will reference relevant data contained in local and state government publications, reports, plans, guidelines and documentation, including regional plans and any available community plans.

The social baseline study should describe and analyse a range of demographic and social statistics determined relevant to the project's social and cultural area including:

- total enumerated population and the full time equivalent transient population
- existing or anticipated major population trends and changes irrespective of the project
- family structures
- age and gender distributions
- education, including schooling levels
- measures of community safety, health and wellbeing
- cultural and ethnic characteristics
- Indigenous population including age and gender
- personal and household income
- labour force by occupation and industry
- housing tenure type and landlord type for rental properties
- housing availability:
  - private ownership: number and percentage of houses for sale
  - rental market: size, vacancy rate and seasonal variations
  - availability of social housing
- housing costs:
  - private ownership: typical costs of houses for sale in project area and monthly housing repayments with percent of dwellings in each category published by the Australian Bureau of Statistics (ABS)

- rental: weekly rent with percent dwellings in each category published by the ABS
- housing affordability separately for private ownership and rent
- household and family type
- disability prevalence
- the social and economic index for areas, index of disadvantage—score and relative ranking
- types and prevalence of crime, including domestic violence
- any other indicators determined through the community engagement process as relevant.

The social baseline study should also take account of and address issues such as:

- the social infrastructure including community and civic facilities, services and networks (for definition see South East Queensland Plan 2005–2026 Implementation Guideline No.5, <[www.dip.qld.gov.au/resources/guideline/Implementationguideline5.pdf](http://www.dip.qld.gov.au/resources/guideline/Implementationguideline5.pdf)>)
- settlement patterns including the names, locations, size, history and cultural aspects of settlement in the social and cultural area
- identity, values, lifestyles, vitality, characteristics and aspirations of communities in the social and cultural area, including Indigenous communities
- land use and land ownership patterns including:
  - the number of properties potentially directly or indirectly affected by the project
  - rural properties, farms, croplands and grazing areas including on-farm activities near the proposed activities
  - properties used for other primary, secondary or tertiary industries
  - residential acreage properties
  - townships or other relatively small block residential areas
- the number of families potentially directly or indirectly affected by the project including Indigenous traditional owners and their families, property owners, and families of workers either living on the property or workers where the property is their primary employment
- use of the social and cultural area for forestry, fishing, recreation or tourism
- Indigenous cultural use of plants and animals.

#### **4.11.2 Potential impacts and mitigation measures**

Describe the stakeholder engagement processes and summarise their outcomes, including the response of Indigenous and non-Indigenous communities to the project.

Assess and describe the type, level and significance of the project's beneficial and adverse impacts on social and cultural values identified in the social baseline study and address issues raised in the stakeholder engagement processes. Assess the cumulative potential beneficial and adverse impacts of the project in relation to other major projects or known proposals in the social and cultural area. Discuss whether impacts would be felt at a local, regional or national level.

Assess the impacts in sufficient detail for local and state authorities to make informed decisions about the project's potential effect on their business and social infrastructure. If the project is likely to result in a significant increase in the population of the area, then the proponent should consult the relevant state authorities and summarise the results of the consultations in the EIS.

Provide separate profiles of the expected workforce for the construction, operational and decommissioning phases of the project that describe the:

- numbers and variations of personnel to be employed
- skills base of the required workforce
- likely sources of personnel, such as local, regional, national or overseas.

Provide an outline of the proponent's and contractors' recruitment schedules and their policies for recruitment of workers; describe initiatives for local employment business opportunities; and address the recruitment of Indigenous workers, people from culturally and linguistically diverse backgrounds and people with a disability. Outline training that would be provided to increase the skills levels of workers.

Assess the social and cultural impacts of recruiting and training the construction or operational workforces from within the host community and of bringing in workers from outside.

Estimate the population growth due to the proposal, directly, indirectly (such as due to service industry growth) and cumulatively with other projects, providing detail on gender, age and any other relevant cohorts. Assess the potential impacts on:

- demographic patterns
- local, regional and state labour markets for separate occupational groupings of the workforce, particularly highlighting any potential skill shortages
- disruptions to existing lifestyles
- health and social wellbeing of families and communities
- social dysfunction, including use of alcohol and drugs
- crime and violence.

Assess the potential impacts of the project on vulnerable groups including women, children and young people, the aged and people with a disability.

Describe the social impacts of changes in land use, the alienation of property and loss of connection with the land, including the impacts and stresses associated with relocations.

Assess the impacts of construction and operational workforces, their families, and associated contractors on land, housing and accommodation availability and affordability. Assess the capability of existing housing and rental accommodation, including public housing, to meet any additional demands created by the project including direct impacts on disadvantaged groups and Indigenous people.

Estimate how much service revenue and wages from the project would be likely to flow to the project's social and cultural area, and assess the beneficial and adverse impacts of that financial inflow.

Describe the transport operations that would be used to move staff between their residences, dormitory camps and work sites. Modes of transport should be described in section 4.3, but this description should address the mix of privately-owned, public or chartered transport operators. Assess the potential social impacts of transport operations on the local and regional communities, including any road safety issues.

Propose measures, developed in consultation with relevant local authorities, state government agencies and stakeholders that would avoid, mitigate or offset any short, medium or long-term adverse impacts, particularly those on:

- housing affordability and availability, including the rental market, in the social and cultural area
- demographic changes in the profile of the region
- the capacity of social infrastructure to meet community needs, particularly in the areas of health, welfare, early childhood education and care, other education and training, policing and emergency services
- provision of education, training and employment opportunities for women, people with a disability, and Indigenous peoples.

Describe consultation with local and state authorities and stakeholders about their acceptance of proposed mitigation strategies and how practical management and monitoring regimes are proposed to be implemented.

Provide a draft social impact management plan that promotes an active and ongoing role for impacted communities and local authorities through the project life cycle. The draft plan should cover:

- an overview of the project
- all proposed mitigation measures and benefit strategies
- action plans to implement mitigation measures and benefit strategies
- assignment of accountability and resources for mitigation measures and project benefits
- practical mechanisms to monitor and adjust mitigation measures and action plans
- ongoing updates to stakeholders on activities and commitments
- mechanisms to respond to public enquiries and complaints
- mechanisms to resolve disputes with stakeholders

- stakeholder engagement processes including periodic review mechanisms.

## **4.12 Health and safety**

### **4.12.1 Description of values**

Describe the existing community values for public health and safety that may be affected by the project. Provide maps showing the proximity of the project to any potentially affected places of human residence, work or recreation including, but not necessarily limited to, kindergartens, schools, hospitals, aged care facilities, office buildings, factories and workshops. Projects that could discharge contaminants, even accidentally, into water bodies should identify and describe any downstream extraction for potable use. For projects proposing air emissions, and/or those with the potential to emit odours, identify and describe nearby and other potentially affected populations. Pay particular attention to those sections of the population, such as children and the elderly who are especially sensitive to environmental health factors.

### **4.12.2 Potential impacts and mitigation measures**

Assess the potential impacts on the community in terms of health, safety, and quality of life from project operations and emissions, including odour, dust and noise. Assess potential impacts on public health in the short and long term, and the cumulative impacts on public health either in isolation or by combination with other known existing or planned sources of contamination. The assessment should address the potential contamination not only of public water supplies but also of private water sources such as rainwater tanks with roof collection.

Assess the potential extent of contamination and public health risk should an extreme meteorological event, flood or catastrophic failure cause the release of toxic material from such infrastructure as tailings dams or chemical store. Describe strategies to notify relevant stakeholders during such an event.

Assess the project's potential for providing disease vectors. Propose measures to control mosquito and biting midge breeding, including measures to be used for any residual ponding after mining ceases, such as due to subsidence. Assess any proposed use of recycled water for its potential to cause infection by transmitting bacteria and/or viruses by contact, dispersion of aerosols, and ingestion (including via use on food crops). Similarly, the use of recycled water should be assessed for its potential to cause harm to human health via water supply or the food chain due to contaminants such as heavy metals and persistent organic chemicals.

Define and describe the objectives and practical measures for protecting or enhancing health and safety community values. Describe how nominated quantitative standards and indicators may be achieved, and how the achievement of the objectives will be monitored, audited and managed.

## **4.13 Economy**

### **4.13.1 Description of potentially affected economies**

Describe the existing local, regional or national economies that may be affected by the project, including:

- appropriate statistics of economic activity, such as gross regional product and aggregate regional income
- trends in relevant economic indicators
- industries and businesses that could be beneficially or adversely affected by the project, their current and historical contribution to local, regional or national economies, and their current input costs
- the economic value of existing resources that could be impacted or sterilised by the project
- local, regional and national governments' aspirations, objectives, strategies and policies for the economic and industrial sectors that may be affected
- economic viability
- historical descriptions of large-scale resource developments and their effects in the region.

The economic impact statement should include estimates of the opportunity cost of the project and the value of ecosystem services provided by natural or modified ecosystems that would be disturbed or removed during development.

### **4.13.2 Potential impacts and mitigation measures**

Provide an assessment from national, state, regional and local perspectives of the direct and indirect economic benefits and impacts of the project. Describe the methods used, assumptions and sensitivity of the assessment.

At a level of detail appropriate to the scale of the project, the assessment will consider:

- the separate phases of the project, such as construction, operation and after ceasing operations

- the effects of this project on the local and regional economies, including goods and services supplied to, or received from, local or regional markets
- the long and short-term beneficial (such as job creation) and adverse impacts (such as increased labour costs, or competition with local small business) that are likely to result from the development
- impacts on the economic value of existing resources
- stimulus, catalytic or second-order effects
- cumulative effects of the project in relation to other economic development opportunities
- a benefit-impact table that disaggregates the benefits and impacts or costs
- the potential, if any, for direct equity investment in the project by local businesses or communities
- the cost to all levels of government of any additional regulatory function or infrastructure provision
- implications for future economic development in the locality (including constraints on surrounding land uses and existing industry)
- the potential economic impact of any major hazard identified in section 4.14
- the distributional effects of the project including proposals to mitigate any negative impact on disadvantaged groups
- the value of lost opportunities or gained opportunities for other economic activities anticipated in the future
- economic impacts on local property values.

The assessment must consider the Local Industry Policy – A Fair Go for Local Industry (Qld Gov., 2008).

Consider the impacts of the project in relation to energy self-sufficiency, security of supply and balance of payments benefits.

Define and describe the objectives and practical measures for avoiding or mitigating impacts or enhancing economic benefits. Describe how nominated quantitative standards and indicators may be achieved for economic management, and how the achievement of the objectives will be monitored, audited and managed.

#### **4.14 Hazard and risk**

Describe the potential hazards and risk to people and property that may be associated with the project as distinct from hazards and risk to the natural environment, which should be addressed in other sections of the TOR. When addressing natural hazards, particularly in regard to places where people work and live (such as a mine's accommodation camp), the EIS should consider the principles of natural hazard management in State Planning Policy 1/03 (SPP1/03), Mitigating the Adverse Impacts of Flood, Bushfire and Landslide, even if the development is exempt development under the Sustainable Planning Act 2009. SPP1/03 may not be applicable as a statutory instrument for exempt development, but it contains information that guides best practice for all development.

##### **4.14.1 Description of values**

Detail the values related to people and property that could be affected by any hazardous materials and actions associated with the project.

##### **4.14.2 Potential impacts and mitigation measures**

Describe the potential hazards and risk that may be associated with the project, including consideration of both natural and man-made hazards. The assessment of risk should be in accordance with relevant standards.

Provide an inventory for each class of substances listed in the Australian Dangerous Goods Codes to be held on-site. This information should be presented by classes and should contain:

- chemical name
- concentration in raw material chemicals
- concentration in operation storage tank
- U.N. number
- packaging group
- correct shipping name
- maximum inventory of each substance.

Details should be provided of:

- safeguards proposed on the transport, storage, use, handling and on-site movement of the materials to be stored on-site
- the capacity and standard of bunds to be provided around the storage tanks for classified dangerous goods and other goods likely to adversely impact upon the environment in the event of an accident
- the procedures to prevent spillages and the emergency plans to manage hazardous situations.

Assess the potential impacts and risks of both natural and induced emergency situations and counter disaster and rescue procedures as a result of the project on resources such as forests, water reserves, state and local government-controlled roads, places of residence and work, and recreational areas. The assessment should outline the implications for and the impact on the surrounding land uses, and should involve consultation with Department of Emergency Services, Queensland Fire and Rescue Authority, and Queensland Ambulance Service. Undertake a preliminary hazard analysis, conducted in accordance with appropriate guidelines for hazard analysis, and addressing:

- all relevant major hazards both technological and natural
- the possible frequency of potential hazards, accidents, spillages and abnormal events occurring
- indication of cumulative risk levels to surrounding land uses
- life of any identified hazards
- a list of all hazardous substances to be used, stored, processed, produced or transported
- the rate of usage
- description of processes, type of the machinery and equipment used
- potential wildlife hazards such as crocodiles, snakes and disease vectors
- public liability of the State for private infrastructure and visitors on public land.

Develop an integrated risk management plan for the whole of the life of the project including construction, operation and decommissioning phases. The integrated risk management plan should include the following components:

- operational hazard analysis
- regular hazard audits
- fire safety, emergency
- response plans
- qualitative risk assessment
- construction safety.

#### **4.15 Cross-reference with the terms of reference**

Provide a cross-reference of the findings of the relevant sections of the EIS, where the potential impacts and mitigation measures associated with the project are described, with the corresponding sections of the TOR.

## 5. Environmental management plan

Provide an environmental management plan (EM plan) that includes the mitigation measures detailed in section 4 of the EIS. Its purpose is to state the proponents' environmental protection commitments in a way that allows them to be measured and audited.

The EM plan is an integral part of the EIS, but will be capable of being read as a stand-alone document without reference to other parts of the EIS. For a mining project the EM plan must meet the content requirements of section 203 of the *Environmental Protection Act 1994*, whereas the EM plan for a petroleum project must meet the content requirements of section 310D of that Act.

The EM plan will be used by the administering authority to develop conditions to apply to project approvals. Therefore, the EM plan is a relevant document for project approvals, environmental authorities and permits, and may be referenced by them. The EM plan may suggest conditions that will form the basis for developing the draft environmental authority.

## 6. Commitments not included in the EM plan

Summarise any commitments made by the proponent that are not included in the EM plan (such as a commitments to assist a local community group). It should be clear how and when the commitments will be fulfilled.

## 7. References

All references consulted should be presented in the EIS in a recognised format.

## 8. Recommended appendices

### A1. Final terms of reference for this EIS

Provide a copy of the final TOR bound with the main body of the EIS. Other appendices can be provided in separate volumes.

### A2. Regulatory approvals

List the regulatory approvals required by the project.

### A3. Study team

Describe the qualifications and experience of the study team, specialist sub-consultants and expert reviewers.

### A4. The standard criteria

Provide a brief summary of the project's compatibility with the standard criteria as defined by the *Environmental Protection Act 1994*, which include the principles of ESD and other relevant policy instruments. With regard to the principles of ESD, as listed in the National Strategy for Ecologically Sustainable Development, published by the Australian Government in December 1992 (available from the Australian Government Publishing Service), discuss how the project conforms with each principle from inception to decommissioning.

### A6. Specialist studies

Include all specialist study reports undertaken for the EIS as appendices.

### A7. Research

Outline in an appendix any proposals for researching alternative environmental management strategies or for obtaining any further necessary information.

# Code of environmental compliance

## Mining lease projects

---

*This code of environmental compliance (code) has been made under Schedule 3 of the Environmental Protection Regulation 2008. It contains the standard environmental conditions approved by the Minister, under section 549(2) of the Environmental Protection Act 1994, for carrying out the aspects of the environmentally relevant activity (ERA) specified in section 2 of this code.*

## 1.0 INTRODUCTION

**Note:** The key terms and/or phrases used in this Code are *highlighted in italics* followed by an (\*). They are defined in Section 4.

### Low Impact Mining

Mining is authorised through mining leases granted by the Governor-in-Council under the *Mineral Resources Act 1989*. A mining lease allows the holder or any person working the lease as the holder's agent or employee to:

- mine the mineral or minerals specified in the Instrument of Lease;
- carry out activities associated with mining or promoting the activity of mining;
- enter and be within the land, and upon the surface area, comprised in the mining lease;
- do all things permitted or required under the lease by the *Mineral Resources Act 1989*; and
- utilise sand, gravel and rock occurring in or on the land comprised in the mining lease, subject to the conditions of the lease, payment of royalties and any other conditions governing the use or disposal of this material.

The regulation of environmental management of a mining lease is via an *Environmental Authority\** issued under the *Environmental Protection Act 1994*. A mining project that is considered to present a low risk of causing *Serious Environmental Harm\** under the *Environmental Protection Act 1994* will be assessed as a *Standard Mining Activity\**. A standard mining activity is an *Environmentally Relevant Activity\** under the *Environmental Protection Regulation 1998* and will therefore require an environmental authority.

This Code of Environmental Compliance has been developed for standard mining activities that include an *Opal\**, *Alluvial\**, *Hard Rock\**, *Clay Pit\**, *Shallow Pit\** or *Dimension Stone\** mining activity, to the satisfaction of the *Administrating Authority\**, complies with all relevant criteria listed in schedule 1A of the *Environmental Protection Regulation 1998*.

### About this Code

The Code of Environmental Compliance:

- provides the criteria used to determine the level of environmental management required for mining projects (see section 2);
- sets the environmental performance requirements as *Standard Environmental Conditions\**, which will be the compliance requirements of an environmental authority issued for standard mining projects (see section 3);
- provides advisory notes on how to achieve compliance with the standard environmental conditions. These are not compliance requirements and are contained in the boxes associated with the relevant standard environmental condition; and
- provides definitions of terms used in this code (see section 4);
- provides references to Technical Guidelines for information on best practice environmental management (see section 5).

## **Additional Conditions**

The holder of the environmental authority may apply for additional conditions at any time. The request must be made on the *Approved Form*\* and the applicant must supply enough information to allow the administering authority to decide whether or not to impose the additional condition/s.

The administering authority may set additional conditions on the environmental authority. The administering authority may only set additional conditions as long as the mining project remains a standard mining activity. In deciding whether to set an additional condition, the administering authority must comply with any relevant *Environmental Protection Policy*\* and consider the *Standard Criteria*\*.

If an application for an additional condition is granted, the additional condition will override the relevant criteria (see section 2) or standard environmental condition (see section 3) and the activity will remain a standard mining activity in accordance with section 151 of the *Environmental Protection Act 1994*.

## **Compliance Requirement**

The compliance requirements of a standard environmental authority issued under the *Environmental Protection Act 1994* for a standard mining activity are the standard environmental conditions in this code, plus any additional conditions. Failure to comply with the standard environmental conditions, or any additional conditions, is a breach of the environmental authority and the holder is liable to various compliance enforcement actions under the *Environmental Protection Act 1994*. Refer to section 430 of the *Environmental Protection Act 1994* - 'offence to contravene condition of environmental authority'.

**Note:** Additional permits and/or licences for activities carried out on the mining lease may be required under other legislation (e.g. sale of gravel or sand). Seek advice from the administering authority before carrying out any additional activities.

## **Public Notification**

Draft environmental authorities for standard mining activities will be publicly advertised as part of the application process. Any person may object to the conditions of the draft environmental authority and the objections will be heard through the Land and Resources Tribunal. The findings of the Land and Resources Tribunal will be considered by the Minister for Environment and Heritage, who may consult with the Minister for Mines and Energy in setting the final environmental conditions.

Rockhampton – (07) 4938 4440

## 2.0 CRITERIA FOR DETERMINING THE LEVEL OF ASSESSMENT

The following criteria found in schedule 1A of the *Environmental Protection Regulation 1998*, are used to determine the level of assessment required for an application for an environmental authority for a standard mining activity.

1. The mining activities do not or will not cause more than 10 ha of land to be *Significantly Disturbed\** at any one time;
2. The mining activities do not or will not cause more than 5 ha of land to be significantly disturbed at any one time -
  - i. in a riverine area;
  - ii. because of mine workings;
3. The mining activities are not or will not be carried out in, or within 2 km of a category A *Environmentally Sensitive Area\**;
4. The mining activities are not or will not be carried out in, or within 1 km of a category B environmentally sensitive area;
5. The mining activities do not include a level 1 environmentally relevant activity
6. No more than 20 persons are carrying out or will, at any one time, carry out the mining activities;
7. Only mining of a type as follows is permitted under a relevant mining lease –
  - i. Alluvial
  - ii. Clay Pit Mining
  - iii. Dimension stone mining
  - iv. Hard rock mining
  - v. Opal mining
  - vi. Shallow pit mining

If an application for an environmental authority does not meet above the assessment level criteria, it could be approved as a standard mining activity provided the environmental impact is no greater than the environmental impact of activities allowed under an environmental authority of the same type that does meet the criteria. For example, an application for a standard mining activity proposing a significant disturbance of greater than 10ha, could be granted a standard environmental authority as long as the applicant can demonstrate that the significant disturbance will have no greater environmental impact than a project that can operate within the 10ha limit.

## 3.0 STANDARD ENVIRONMENTAL CONDITIONS

### 3.1 GENERAL CONDITIONS

#### Plan of Operations

##### Condition 1

**The holder of the *Environmental Authority*\* must submit to the administering authority a *Plan of Operations*\* for the mining lease, at least 28 days prior to carrying out any activities on site, unless a shorter period is approved by the administering authority.**

Note 1 - For more detailed information refer to the following sections of the *Environmental Protection Act 1994*:

- (i) 233 Plan of operations required before acting under relevant mining lease;
- (ii) 234 Content requirements of a plan of operations.

#### Financial Assurance

##### Condition 2

**The holder of a new environmental authority must submit the required amount of *Financial Assurance*\* (ie. a security deposit) to the administering authority prior to carrying out any activities on the mining lease. If the holder of the environmental authority submits an application to amend the plan of operations or submits a new plan of operations, they must also submit an application to amend their financial assurance to the administering authority. If an application is lodged to transfer the environmental authority to another person or company, the proposed transferee must submit the required financial assurance prior to the transfer taking effect.**

Note 2 - A financial assurance must be calculated in accordance with Form 5 (Schedule of Rehabilitation Costs) and will be subject to a financial discount in accordance with the performance criteria in Appendix C (Schedule of Environmental Management Performance).

Note 3 - Section 364 of the *Environmental Protection Act 1994*, requires that the holder of the environmental authority gives the administering authority a financial assurance in a acceptable form (ie. either cash or a bank guarantee) and for the amount calculated in a manner decided by the administering authority. When necessary, the holder of the environmental authority must amend the financial assurance under section 366 of the *Environmental Protection Act 1994* (e.g. increasing the area of disturbance on the mining lease).

The holder of the environmental authority must lodge a single financial assurance with the Department of Mines and Energy. The financial assurance will consist of two components:

- (i) An amount to cover the potential costs of rehabilitation of areas disturbed by mining activities (ie. Environmental Protection Agency component); and
- (ii) An amount to cover the potential costs of restoring property improvements disturbed by mining activities and the failure of the tenure holder to pay rents and royalties (ie. Department of Mines and Energy component).

## **Land Disturbance**

### **Condition 3**

**The holder of the environmental authority must ensure that the area and duration of disturbance to land and vegetation are minimised.**

Note 4 - To minimise the area and duration of disturbance to land and vegetation the following measures or similar measures can be used:

- avoid disturbing large and/or mature trees;
- select specific trees to be cleared and avoid causing damage to the surrounding vegetation; and
- where practical, leave the rootstock of existing vegetation intact to promote regrowth.

## **Air Quality**

### **Condition 4**

**The holder of the environmental authority must not cause an *Unreasonable Release\** of dust.**

Note 5 - To prevent the unreasonable release of dust, the following measures or similar measures can be used:

- installing pollution control equipment (e.g. fitting bag filters or a cyclone to dust generating equipment);
- altering work practices to avoid or minimise the generation of dust;
- scheduling activities for times when they will have least impact;
- spraying water on roads and tracks;
- revegetating disturbed areas as soon as practical; and
- leaving or creating wind breaks or screens.

## **Noise Emissions**

### **Condition 5**

**The holder of the environmental authority must not cause *Unreasonable Noise\** at a *Noise Sensitive Place\**.**

Note 6 - To prevent causing unreasonable noise at a noise sensitive place, the following measures or similar measures can be used:

- construct and maintain noise barriers and enclosures around noisy equipment or along the noise transmission path;
- implement noise reduction measures at noise sensitive places;
- provide and maintain low noise equipment;
- carry out routine maintenance on fans to minimise bearing noise;
- repair or replace defective mufflers of vehicles and plant equipment; and
- limit the hours of operation to between 7am to 6pm from Monday to Saturday.

Note 7 - If aircraft are used for mining related activities, operate them so as to minimise disturbance to livestock (e.g. helicopters).

## **Erosion and Sediment Control**

### **Condition 6**

**The holder of the environmental authority must design, install and maintain adequate banks and/or diversion drains to minimise the potential for storm water runoff to enter areas disturbed by mining activities.**

### **Condition 7**

**The holder of the environmental authority must design, install and maintain adequate erosion and sediment control structures wherever necessary to prevent or minimise erosion of disturbed areas and the sedimentation of any *Watercourse\**, *Waterway\**, *Wetland\** or *Lake\**.**

Note 8 - For information on the design and construction of sediment ponds refer to the “Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland”, Part C, “Site Water Management”.

Note 9 – Regularly clean out sediment traps, ponds and drains and maintain them in effective working order, until erosion stability has been achieved in disturbed areas.

Note 10 – The capacity of sediment traps, ponds, drains and banks should not be reduced below 70% of their design capacity.

## **Topsoil and Overburden Management**

### **Condition 8**

**The holder of the environmental authority must ensure that *Topsoil\** is removed and stockpiled prior to carrying out any mining activity. Prevent or minimise the mixing and erosion of topsoil and *Overburden\** stockpiles.**

Note 11 – To separate topsoil and overburden and to prevent or minimise the erosion of these stockpiles the following measures or similar measures can be used:

- identify topsoil and overburden layers prior to mining;
- store topsoil and overburden in separate stockpiles install silt fences or bunding around the stockpiles
- establish and maintain a temporary cover crop on the topsoil stockpiles;
- limit the height of topsoil stockpiles to 2 m; and
- where practical reuse stockpiled topsoil within 12 months of storage.

## Hazardous Contaminants

### Condition 9

**The holder of the environmental authority must plan and conduct activities on site to prevent any potential or actual release of a *Hazardous Contaminant*\*.**

Note 12 - Section 442 of the *Environmental Protection Act 1994* makes it an offence to cause or allow a contaminant to be placed in a position where it could reasonably be expected to cause serious or material environmental harm or environmental nuisance.

Note 13 - Section 443 of the *Environmental Protection Act 1994* makes it an offence to release a prescribed contaminant. A prescribed contaminant is a contaminant prescribed by an Environmental Protection Policy.

Note 14 - To prevent or minimise any potential or actual release of a hazardous contaminant the following measures or similar measures can be used:

- maintain an inventory of hazardous contaminants stored on the mining lease;
- ensure that all hazardous contaminants are appropriately stored;
- confine the use of mercury to amalgamating ore concentrates in a spill-proof circuit within an impermeable bund;
- store mercury in sealed containers;
- carry out any retorting of amalgam in a vapour proof retort.

### Condition 10

**The holder of the environmental authority must ensure that spills of hazardous contaminants are cleaned up as quickly as practical. Do not clean up such spillage by hosing, sweeping or otherwise releasing such contaminants to any watercourse, waterway, groundwater, wetland or lake.**

Note 16 - If a mining lease becomes *Significantly Disturbed*\* because it is contaminated, it ceases to be significantly disturbed if a *Suitability Statement*\* is issued for the land. Refer to section 384 of the *Environmental Protection Act 1994*.

Note 17 – A *Site Management Plan*\* approved under part 413 of the *Environmental Protection Act 1994*, may be required by the administering authority for sites recorded on the *Environmental Management Register*\* or the *Contaminated Land Register*\*. Such sites may include acid producing waste rock stockpiles or tailings dams containing acid producing wastes..

### Condition 11

**The holder of the environmental authority must, where practical, separate acid producing waste rock from the benign waste. Acid producing waste rock may be temporarily stockpiled in the catchment of the tailings dam, in a mine excavation or in an impermeable bunded area with a restricted catchment.**

## **Condition 12**

**Where practical, the holder of the environmental authority must dispose of the acid producing waste rock in the tailings dam or mine excavation and backfill as soon as practical. Where not practical, bury acid producing waste rock in an excavation or pit and backfill as soon as practical. Backfill all mine excavations, other excavations and pits containing acid producing waste rock with benign, low permeability material and seal the mine excavation, other excavation or pit with a compacted capping layer at least 1m thick.**

Note 18 – For detailed information on the management of acid mine waste material refer to the “Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland”, Part B, ‘Assessment and Management of Acid Drainage’ and the ‘Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils (ASS) in Queensland’.

Note 19 – The owner or occupier of a mining lease must notify the administering authority if they become aware that a *Notifiable Activity*\* listed in schedule 3 of the *Environmental Protection Act 1994*, is being carried out on the land within 30 days, by giving notice to the administering authority in the approved form. For example, a mining operation that generates waste materials that contain hazardous contaminants must notify the administering authority that this activity is being carried out. Refer to section 371 of the *Environmental Protection Act 1994*.

## **Nature Conservation**

### **Condition 13**

**The holder of the environmental authority must prevent the spread of *Declared Plants*\* by ensuring that all vehicles and machinery are adequately cleaned before taking the vehicles and machinery out of a *Declared Plant Area*\*.**

Note 20 - Section 35(a) of the *Mineral Resources Regulation 1990*, requires that every precaution must be taken to ensure there is no dispersal of Parthenium weed or the seed of any other declared plant within the meaning of the *Rural Lands Protection Act 1985*, as a result of mining or as a result of access to the area of the mining lease.

Note 21 – The Department of Natural Resources provide Pest Fact sheets for declared plants in Queensland as well as clean down procedures for motor vehicles and machinery. For advice on declared plant areas contact the Department of Mines and Energy, Department of Natural Resources or your Local Shire Council.

#### **Condition 14**

**The holder of the environmental authority must not carry out activities:**

- 1. in, or within 2 km of, a category A environmentally sensitive area; or**
- 2. in, or within 1 km of, a category B environmentally sensitive area.**

**Prior to carrying out activities in a category C environmentally sensitive area, the holder of the environmental authority must consult with the relevant administering authority. If it is determined through consultation that additional conditions are necessary, the holder must comply with those conditions.**

Note 22 – For information on environmentally sensitive areas refer to Appendix A - Environmentally Sensitive Areas.

#### **Condition 15**

**The holder of the environmental authority must not carry out activities within 100m of an identified *Historical\**, *Archaeological\** or *Ethnographic\** site.**

Note 23 – With regard to cultural heritage issues, refer to the *Cultural Record (Landscapes Queensland and Queensland Estate) Act 1987* and the *Queensland Heritage Act 1992*. Prior to carrying out any activities on the mining lease, the holder of the environmental authority should consult with the administering authority if a site has the potential to be designated as a historical, archaeological or ethnographic site.

## **Other Level 2 Environmentally Relevant Activities**

### **Condition 16**

**The holder of the environmental authority must not carry out the following Level 2 *Environmentally Relevant Activities*\* (ERA) on the mining lease:**

**ERA (7) Chemical Storage – storage of chemicals (other than crude oil, natural gas and petroleum products) including ozone depleting substances, gases or dangerous goods under the dangerous goods code in containers with a design storage volume of more than 10m<sup>3</sup> but less than 1000m<sup>3</sup>;**

**ERA (76) Incinerating Waste – operation of a waste incineration facility for incinerating:**

- (a) vegetation;**
- (b) clean paper or cardboard;**

**ERA (77) Battery Recycling – operation of a facility for receiving and recycling or reprocessing any kind of battery;**

**ERA (80) Tyre Recycling – operating a facility for receiving and commercially recycling or reprocessing tyres (other than retreading tyres).**

## 3.2 ACTIVITY BASED CONDITIONS

### Roads & Tracks

#### Condition 17

**The holder of the environmental authority must consult with the *Landowner\** prior to establishing any new roads and tracks.**

Note 24 - When planning and constructing new roads and tracks refer to the Technical Guidelines.

Note 25 - Repair all damage to existing private roads and tracks resulting from mining activities, so that they are as trafficable as they were prior to any damage.

#### Condition 18

**When constructing new roads and tracks, the holder of the environmental authority must ensure that the area and duration of disturbance to land, vegetation and watercourses is minimised.**

Note 26 - When planning and constructing new roads and tracks the following measures or similar measures can be used to minimise the area and duration of disturbance to land, vegetation and watercourses:

- wherever possible use or upgrade existing roads and tracks;
- construct roads and tracks along natural grades;
- minimise the width of roads and tracks;
- minimise the number of crossings in riverine areas;
- construct crossings in riverine areas in a stable section of the bed;
- avoid constructing roads or tracks that run straight down the bank to the crossing;
- do not disadvantage other users of existing public roads & tracks;
- construct a bed level causeway, a culvert or a bridge where natural bed conditions within a watercourse will not carry the intended traffic load or where crossing of the bed will generate a significant increase in turbidity;
- minimise the number of cuts and fills in riverine areas;
- position cuts and fills in riverine areas to minimise risk of erosion from subsequent flood events;
- position crossings to prevent flow being directed towards the banks and provide erosion resistance to the bed and banks downstream of a crossing for a distance equal to the width of the normal flow channel;
- do not create any downstream or upstream drops at the lip of culverts or causeways;
- regularly clean out culverts, bridges and causeways to prevent flow being impeded or redirected; and
- construct in-stream crossings outside of main fish migration periods.

## **Campsites**

### **Condition 19**

**The holder of the environmental authority must consult with the landowner prior to establishing any *Campsites*\*.**

### **Condition 20**

**When establishing and maintaining a campsite, the holder of the environmental authority must ensure that the area and duration of disturbance to land, vegetation and watercourses is minimised.**

Note 27- When establishing and maintaining a campsite the following measures or similar measures can be used to minimise the area and duration of disturbance to land, vegetation and watercourses:

- locate campsites at least 100 m from any riverine areas;
- only disturb an area necessary for the safe functioning of the campsite;
- install an appropriate human waste disposal facility (e.g. portable self contained toilets, pit toilets, septic tanks);
- use absorption trenches, transpiration beds or spray irrigation to dispose of grey water; and
- locate all disposal areas at least 100 m distance from any watercourse, waterway, groundwater recharge area, wetland or lake.

Note 28 – With regard to on site waste water management refer to the Environmental Protection (Water) Policy 1997.

## **Waste Management**

### **Condition 21**

**The holder of the environmental authority must not directly or indirectly release waste from the project area to any watercourse, waterway, groundwater, wetland or lake.**

Note 29 – When managing waste materials the following strategy should be adopted:

- avoid creating excess waste;
- reuse waste materials;
- recycle waste;
- create and utilise energy from waste;
- treat waste; and
- dispose of waste (e.g. provide rubbish containers on site).

Note 30 - Where practical take all *General Waste*\* to a *Licensed Waste Disposal Facility*\*.

## **Condition 22**

**The holder of an environmental authority must not dispose of more than 50 tonnes of *General Waste*\* per year on the mining lease.**

Note 31 - Up to 50 tonnes of general waste may be buried on the mining lease per year. When burying general waste the following measures or similar measures should be used:

- locate the waste pit so as to ensure that the waste will not contaminate any watercourse, waterway, groundwater, wetland or lake;
- divert stormwater runoff from entering the pit;
- make the pit safe and protect it from scavengers;
- crush drums and other containers to reduce the volume of waste;
- backfill the pit when the level of rubbish in the pit is not less than 1m below the surface; and
- sufficiently overfill the pit to allow for settlement.

Note 32 - *Limited Regulated Waste*\* may be disposed of to a licensed general waste disposal facility provided the annual volume of limited regulated waste does not exceed 10% of the annual volume of general waste (e.g. tyres).

## **Dams**

### **Condition 23**

**The holder of the environmental authority must operate, maintain and decommission all dams in accordance with the criteria outlined in Appendix B. The holder of the environmental authority must build all dams, other than dams commenced before 1 January 2001, in accordance with the design and construction criteria outlined in Appendix B.**

Note 33 - Refer to Appendix B - Criteria for Dams.

Note 34 - *Referable Dams*\* require licensing by the Department of Natural Resources. Dams or weirs built on a watercourse require licensing by the Department of Natural Resources. Dams to be built in tidal waters require licensing by the Department of Primary Industries and the Environmental Protection Agency.

Note 35 - Provide safe access to water for livestock and native animals by:

- providing hard surfaces around water storage areas; and
- fencing off any soft areas around the edge of water storage areas.

Note 36 - Provide, install and maintain adequate warning devices to exclude people, livestock and native animals from dams containing hazardous contaminants (e.g. gas guns, signs, fences and bunds).

## **Mine and Process Plant**

Note 37 - Provide, install and maintain adequate warning devices to exclude people, livestock and native animals from the processing plant, open mine excavations or underground workings (e.g. signs, fences or bunds).

### **Condition 24**

**The holder of the environmental authority must not directly or indirectly release waste water from the mine or process plant to any watercourse, waterway, groundwater, wetland or lake. This condition does not apply for alluvial miners operating mobile processing plants in flowing water. Alluvial miners operating mobile processing plants in flowing waters must discharge waste water into an in-stream settlement pond (refer to condition 39 for design requirements of in-stream settlement ponds).**

Note 38 - To prevent the direct or indirect release of waste water from the mine or process plant to any watercourse, waterway, groundwater, wetland or lake the following measures or similar measures can be used:

- where practical recycle all waste water (e.g. use water from the mine or processing plant for drilling purposes, dust suppression along roads and tracks or in the process plant);
- discharge mine water onto benign overburden or waste rock heaps or to an evaporation pond for absorption and evaporation.

Note 39 - For more detailed information regarding site water management refer to the Environmental Protection (Water) Policy 1997.

## **Service, Maintenance and Storage Areas**

### **Condition 25**

**The holder of the environmental authority must prevent the release fuels, oils, lubricants or other *Contaminants*\* to any watercourse, waterway, groundwater, wetland or lake.**

Note 40 - To prevent the release of fuels, lubricants or other contaminants to any watercourse, waterway, groundwater, wetland or lake the following measures or similar measures can be used:

- maintain all refuelling equipment in good working order;
- use groundsheets or drip trays to capture spillage during maintenance of machinery and vehicles;
- locate all fuel storages within an impermeable bund;
- ensure all liquid containment, including fuel tank bunds and process water ponds, have a volume at least equal to the design volume plus an additional 10% of that volume;
- where practical, undertake all refuelling and routine maintenance of vehicles within designated service areas.

### **Condition 26**

**The holder of the environmental authority must ensure that all chemical, fuel and oil storage facilities less than 10 000L on a mining lease, must be designed and operated in accordance with Australian Standard 1940 – ‘The storage and handling of flammable and combustible liquids’, Section 2, Minor Storage.**

### **Condition 27**

**The holder of the environmental authority must ensure that:**

- (1) all chemical, fuel and oil storage facilities of more than 10 000 L on a mining lease, must be banded to contain at least one hundred percent of the volume of the largest container, plus twenty-five percent of the storage capacity of the largest container up to a maximum of 10, 000 L, together with ten percent of the storage capacity beyond 10, 000 L; and**
- (2) the facility must be operated and maintained in accordance with the Australian Standard 1940 – “The Storage and Handling of flammable and combustible liquids”.**

### **Monitoring, Reporting and Emergency Response Procedures**

#### **Condition 28**

**The holder of the environmental authority must record and notify the administering authority of any emergency or incident that demonstrates non-compliance to the standard environmental conditions.**

Note 41 - A notification of any emergency or incident, which demonstrates non-compliance to the standard environmental conditions can not be used in evidence in any further action taken by the administering authority as a result of the notification.

Note 42 - To demonstrate ongoing compliance with the standard environmental conditions, complete Form 6, ‘Monitoring and Record Keeping Summary’. Establish programs to monitor project activities and maintain records for review by the administering authority.

Note 43 - To demonstrate compliance with the standard environmental conditions complete the ‘Emergency Response Table’ in Appendix E. Provide and maintain appropriate emergency response equipment and inform all operational personnel, contractors and visitors of emergency response procedures.

Note 44 - Observe the provisions and regulations under the *Fire and Rescue Authority Act 1990* and the *Mine Regulation Act 1985*.

## **Rehabilitation**

### **Condition 29**

**In *Riverine Areas*\*, the holder of the environmental authority must complete the rehabilitation processes on areas disturbed by mining activities, apart from those areas currently being utilised for mining activities, as soon as practical and prior to the onset of the following wet season.**

Note 45 - Condition 29 is to ensure that there is adequate erosion protection in riverine areas prior to the onset of the wet season. In Queensland the wet season is generally considered to be from November to April each year.

### **Condition 30**

**For all other areas, the holder of the environmental authority must complete the rehabilitation processes on areas disturbed by mining activities, apart from those areas currently being utilised for mining activities, as soon as practical and within six months of the completion of works in those areas.**

Note 46 – Where practical undertake progressive rehabilitation of disturbed areas.

### **Condition 31**

**The holder of the environmental authority must backfill excavations less than 3m deep, with overburden and waste rock as soon as practical following the completion of mining activities.**

### **Condition 32**

**Where it is impractical to return overburden and waste rock to excavations deeper than 3m, the holder of the environmental authority must construct overburden and waste rock stockpiles in accordance with Condition 34.**

### **Condition 33**

**For excavations that are to remain at the completion of mining activities, by agreement with the land holder, and will be used as livestock water drinking supplies, the holder of the environmental authority must:**

- (1) ensure that water quality in any remaining excavation complies with the acceptable water quality *Guidelines for Livestock Drinking Water*\* as detailed in the Australian and New Zealand Guidelines for Fresh and Marine Water Quality; and**
- (2) provide safe access for livestock and native animals to the excavation.**

Note 47 – Prior to the surrender of a mining lease, all excavations that are to remain open after mining activities have ceased, need to be made safe (e.g. an open pit). Refer to the *Mines Regulation Act 1985* and the 'Technical Guidelines for the Environmental Management of Exploration and Mining in Queensland', Part D, 'Open Pit Rehabilitation'.

### **Condition 34**

**The holder of the environmental authority must rehabilitate areas disturbed by mining activities to a stable landform, similar to that of the surrounding undisturbed areas.**

Note 48 - When rehabilitating disturbed areas refer to the 'Technical Guidelines for the Environmental Management of Mining and Exploration in Queensland', Part D, 'Geo-Technical Slope Stability'.

### **Condition 35**

**The holder of the environmental authority must spread seeds or plant species that will promote vegetation of a similar species and *Density of Cover*<sup>\*</sup> to that of the surrounding undisturbed areas or vegetation that is appropriate for providing erosion control and stabilisation of the disturbed areas.**

Note 49 - To revegetate disturbed areas the following measures or similar measures can be used:

- for areas which have become compacted during the project, break up the soil surface to a depth that is suitable for establishing vegetation;
- spread stockpiled topsoil over disturbed areas to a depth that is suitable as a rooting medium for the revegetation process;
- provide suitable nutrient conditions for planting by using fertiliser if necessary; and
- collect and store native seeds to be used in rehabilitation.

Note 50 - When revegetating disturbed areas, the holder of the environmental authority should plant native species endemic to the area and location in the landscape (e.g. if clearing has occurred in a riverine area, revegetate the disturbed area using local riverine species).

Note 51 - Vegetation used to stabilise disturbed areas in the short term should be comprised of sterile, short-lived species (e.g. a cover crop). However, the long term aim of revegetating any disturbed area is to establish a stable vegetation community that is similar to that of the surrounding undisturbed landscape.

Note 52 - The holder of the environmental authority is not liable for rehabilitation of disturbed areas that existed prior to the grant of the tenure unless the holder undertakes activities within the previously disturbed areas during the term of the mining lease.

Note 53 - Where continuity of tenure makes the holder of the environmental authority liable for disturbances from previous operations, no further work will be necessary if the rehabilitation of the disturbed areas is to the satisfaction of the administering authority.

Note 54 - The rehabilitation of some disturbed areas may not be required if the workings have a recognised historic value. Consult with the administering authority regarding rehabilitation requirements for such sites.

### **Condition 36**

**For any *Mine Infrastructure*\* to remain after all mining activities have ceased, the holder of the environmental authority must obtain the written agreement of the land owner stating they will take over responsibility for that infrastructure.**

### **Condition 37**

**For underground mine workings, the holder of the environmental authority must determine the need and design of bat gates by consulting the administering authority. If bat gates are required, install the appropriate structures. Where a bat gate is not required by the administering authority prevent access to underground workings.**

Note 55 - Prior to the surrender of a mining lease, all underground mine workings are to be made safe. Refer to the *Mines Regulation Act 1985* and the 'Technical Guidelines for Environmental Management of Exploration and Mining in Queensland', Part D, 'Rehabilitation of Areas Containing Shafts, Boreholes or Adits'.

### **Condition 38**

**The holder of the environmental authority must complete the rehabilitation of areas disturbed by mining activities to the satisfaction of the administering authority.**

Note 56 - Condition 38 is a requirement of the *Environmental Protection Act 1994*. The holder of the environmental authority must submit a *Final Rehabilitation Report*\* (FRR) and an *Environmental Audit Statement*\* (EAS), prior to the cancellation or expiry of the mining lease. The surrender of the environmental authority will not be granted until the administering authority has approved the FRR and the EAS.

## **3.3 CONDITIONS FOR SPECIFIC MINING TYPES**

### **Hard Rock Mining**

Note 57 - If explosives are used during the mining operation, the holder of the environmental authority must comply with the relevant Regulations, Policies and Procedures (e.g. Environmental Protection (Noise) Policy 1997, Environmental Protection (Air) Policy 1997 and any Material Safety Data Sheet (MSDS) for storing and handling explosives).

## Alluvial Mining

### Condition 39

**When mining in a *Watercourse\**, the holder of the environmental authority must construct and use in-stream settlement ponds where necessary and ensure that:**

- **disturbances and/or erosion caused when constructing in-stream settlement ponds is minimised; and**
- **the in-stream settlement pond does not prevent water flow in the normal flow channel.**

Note 58 - Prior to working in riverine areas refer to the 'Technical Guidelines for Environmental Management of Exploration and Mining in Queensland', Part B, 'Exploration and Mining in Watercourses'.

Note 59 - To minimise disturbance when constructing in-stream settlement ponds, the following measures or similar measures can be used:

- do not divert the normal channel flow so as to cause erosion of the stream banks;
- do not compact the bund walls of the settlement ponds; and
- ensure the top of the bund wall is at least 300mm below the lower bank of the normal flow channel.

### Condition 40

**When mining in a watercourse, the holder of the environmental authority must ensure that the disturbance to the bed, *Banks\** and natural levees of the *Normal Flow Channel\** and the *Flood Flow Channel\** is minimised.**

Note 60 - To minimise the disturbance to the bed, banks and natural levees of the normal flow and flood flow channel of a watercourse the following measures or similar measures can be used:

- avoid clearing mature and/or woody vegetation;
- where practical avoid excavating directly underneath the canopy of the trees;
- avoid damaging the trunks of any remaining trees;
- do not stockpile material at the base of remaining trees; and
- provide erosion protection on exposed excavation faces to prevent flood damage to the root system (e.g. rock armouring the disturbed excavation face).

### Condition 41

**The holder of the environmental authority must not excavate or divert ponded water where there is evidence of biological activity.**

Note 61 - Condition 41 is to provide protection for remnant aquatic life forms, particularly at end of the dry season.

#### **Condition 42**

**When excavating the bed of a flowing watercourse, the holder of the environmental authority must construct a diversion channel within the bed of the watercourse to allow the stream flow to bypass the area being excavated.**

Note 62- Waterholes and in-stream storages used by the landowner should not be disturbed, unless with the agreement of the landowner. The miner will need a water licence from Department of Natural Resources to interfere with the normal flow of water.

#### **Condition 43**

**When mining in a watercourse within the natural levees of the normal flow channel or in areas of established woody vegetation, the holder of the environmental authority must leave an unmined section or buffer zone (e.g. a natural rock bar or an intact vegetation strip) between the mined sections and:**

- ensure that the length of each mined section is no more than 40 times the width of the flood flow channel or 500m, whichever is the shorter;
- ensure that the length of each unmined section is at least 10 times the width of the flood flow channel, or 150m, whichever is the shorter;
- unmined sections which separate mined sections must not be mined until two years after rehabilitation processes have been completed on the previously mined section or when regrowth and erosion stability is established, whichever is the shorter;
- when commencing mining on a new section downstream of an unmined area, protect the cut face of the unmined area from erosion, by armouring or providing a smooth transition.

#### **Condition 44**

**The holder of the environmental authority must not mine the *Banks\** on the *Outer Bends\** of the flood flow channel of a watercourse, including the areas within:**

- 5 m from the toe of the bank or twice the height of the bank whichever is the shorter;
- 3 m from the top of the bank; and
- the top, toe and banks of a length of the straight immediately downstream of the outer bend, three times the width of the flood flow channel, or 100m, whichever is the shorter.

Note 63 – For representative diagrams that define the different land form elements that make up a water course refer to Figure 1 – ‘Cross Section Through a Watercourse’ and Figure 2 – ‘Plan View of a Watercourse’.

#### **Condition 45**

**When mining in a watercourse and transporting excavated material to a fixed processing plant; the holder of the environmental authority must:**

- where practical, leave rocks larger than 400mm in diameter in the watercourse; and
- return all excavated material to the watercourse from which it was mined, apart from material:
  - (i) less than 100 mm in diameter;
  - (ii) used in the construction of mine infrastructure (e.g. roads or dams); and
  - (iii) used for erosion protection.

Note 64- In addition to the rehabilitation conditions outlined in this Code, the administering authority will consider the following issues when determining the rehabilitation requirements for the *Scrub Lead*\* of the *Gem Miners' Common*\*:

- levelling, sloping or gradient treatment of the mined surface and backfilling of excavations shall not be required unless specifically directed by the administering authority;
- mine spoil heaps and waste rock stockpiles shall be eased to at least the minimum gradient required for safety;
- access roads and tracks used for mining activities may be left provided they are likely to remain safe for use by both fossickers and livestock.

#### **Condition 46**

**After the completion of mining activities in the normal flow channel of a watercourse, the holder of the environmental authority must reinstate the normal flow channel in a similar location and with similar channel characteristics to that of the previous undisturbed section. Adequate erosion protection must be provided to the reinstated bed and banks, in particular to the banks on the outer bends of the normal flow channel.**

#### **Dimension Stone Mining**

#### **Condition 47**

**The holder of the environmental authority must prevent or minimise the release of fines from the processing plant.**

Note 65 - If explosives are used during the mining operation the holder of the environmental authority must comply with the relevant Regulations, Policies and Procedures (e.g. Environmental Protection (Noise) Policy 1997, Environmental Protection (Air) Policy 1997 and any Material Safety Data Sheet (MSDS) for handling and storing explosives).

## Opal Mining

### Condition 48

**The holder of the environmental authority should leave reshaped areas disturbed by opal mining activities in an *Uneven State*\*, to facilitate natural revegetation through catching windblown seed and rainfall.**

### Exploration Activities

Mineral exploration on mining leases is authorised by the administering authority under provisions of the *Environmental Protection Act 1994*. Exploration activities allows the holder of the environmental authority to take action to determine the existence, quality and quantity of minerals by:

- prospecting;
- using instruments, vehicles, vessels, machinery and equipment and techniques appropriate to determine the existence of any mineral;
- sampling and testing of material to determine its mineral bearing capacity or properties of mineralisation; and
- carrying out other operations the Minister approves.
- geological, geophysical and geochemical programs and other work reasonably necessary to evaluate the potential for development of any mineral occurrence that has possible economic potential;
- mining feasibility studies;
- metallurgical testing;
- environmental studies;
- marketing studies;
- engineering and design studies; and
- other activities the Minister considers appropriate.

Examples of exploration activities include drilling, excavating, sampling, establishing gridlines and conducting geophysical surveys.

The holder of the environmental authority wishing to carry out exploration activities on the mining lease must apply to the administering authority for additional conditions. The holder of the environmental authority will be required to comply with the relevant Standard Environmental Conditions as detailed in the Code of Compliance for Exploration and Mineral Development Projects. The request must be made on the *Approved Form*\* and the applicant must supply enough information to allow the *Administering Authority*\* to decide whether or not to impose the additional condition/s. The administering authority may set additional conditions on the environmental authority. The administering authority may only set additional conditions as long as the mining lease project remains a standard mining activity. In deciding whether to set an additional condition, the administering authority must comply with any relevant *Environmental Protection Policy*\* and consider the *Standard Criteria*\*.

## 4.0 DEFINITIONS

**Administrating authority - Means -**

- (a) for a matter, the administration and enforcement of which has been devolved to a local government under section 514 of the *Environmental Protection Act 1994*; or
- (b) for all other matters – the Chief Executive of the Environmental Protection Agency; or
- (c) another State Government Department, Authority, Storage Operator, Board or Trust, who's role is to administer provisions under other enacted legislation (e.g. Department of Natural Resources who licence referable dams under the Water Act 2000).

**Alluvial mining -** means excavating, in any way, unconsolidated or waterborne or weathered materials (whether or not it is in a watercourse) and processing it by chemical methods or gravity separation to extract minerals from the material.

**Annual exceedence probability (AEP) -** For a given rainfall event the AEP is the probability that the event will be exceeded within a one year period. The AEP is usually expressed as a one in 'n' (years) or a percentage.

**Approved form -** Means a form approved by the administrating authority.

**Archaeological site -** A site that has physical evidence of the past, which has the potential to increase our knowledge of earlier human occupation, activities and events.

**Banks -** The feature which confines major flows within a watercourse. They are steeper than a terrace and are generally of a slope greater than 1:1 on outer bends. Refer to Figure 1 – Cross Section through a Watercourse.

**Bend of a watercourse -** For the purposes of this Code, a bend is considered to be any change in the direction of the flood flow (ie. within the flood flow channel) in a watercourse that is greater than 30 degrees.

**Bund -** (a) An earth mound or similar structure (e.g. a concrete block wall), whether impervious or not, constructed to contain spilled material (e.g. petrol, diesel, oil etc) or (b) a structure to prevent or reduce soil erosion.

**Campsite -** The area encompassing any dwelling, amenities (e.g. toilet block, power generator), sewage or general waste disposal facility and includes the office area and vehicle parking areas associated with a temporary or permanent mining camp.

**Clay pit mining -** Means excavating waterborne or weathered material (whether or not it is in a watercourse) and processing it by a non-crushing method.

**Contaminant** - The *Environmental Protection Act 1994* defines, under Section 11, a contaminant as:

- (a) a gas, liquid or solid; or
- (b) an odour; or
- (c) an organism (whether alive or dead), including a virus; or
- (d) energy, including noise, heat, radioactivity and electromagnetic radiation; or
- (e) a combination of contaminants.

**Contamination** - Section 10 of the *Environmental Protection Act 1994* defines contamination of the environment as the release (whether by act or omission) of a contaminant into the environment.

**Contaminated land** - Schedule 3 of the *Environmental Protection Act 1994* defines contaminated land as land contaminated by a hazardous contaminant. (See below for a definition of hazardous contaminant.)

**Contaminated land register** - Means the register kept by the administering authority under section 541 of the *Environmental Protection Act 1994*.

**Contour banks** - Are mounds of earth constructed along the contours of the land to reduce the amount and velocity of run-off down the slope.

**Culvert** - A covered channel, or a pipe of large diameter conveying water below ground level. Also applies to a tunnel through which water is pumped or permitted to flow.

**Declared plant area** - Areas designated by the Department of Natural Resources or Local Government as areas infested with plants declared under section 69 of the *Rural Lands Protection Act 1985* (section 70 (3) lists the categories of declared plants).

**Declared plant** - A plant that has been declared under the *Rural Lands Protection Act 1985*.

**Density of cover** - In reference to trees and/or shrubs, it means the number of trees or shrubs in a specified area (e.g. 50 trees per square kilometre). With reference to understorey plant species (e.g. grasses and forbs), it means the percentage of surface area covered by a particular species.

**Designated service area** - Is a nominated site, selected and managed to minimise contamination of land or water, where the majority of services or maintenance of machinery or plant is to be conducted.

**Dimension stone mining** - Is the extraction of rock and the processing of this material by further cutting and shaping, mostly for use in building applications such as walls, floor tile, cladding and roofing (e.g. granite, marble, slate, sandstone and limestone).

**Environment** - Section 8 of the *Environmental Protection Act 1994* defines the environment as:

- (a) ecosystems and their constituent parts, including people and communities; and
- (b) all natural and physical resources; and
- (c) the qualities and characteristics of locations, places and areas, however large or small, that contribute to their biological diversity and integrity, intrinsic or attributed scientific value or interest, amenity, harmony and sense of community; and
- (d) the social, economic, aesthetic and cultural conditions that affect, or are affected by, things mentioned in paragraphs (a) to (c).

**Environmental audit statement** - Verifies the accuracy of the final rehabilitation report and identifies any residual financial assurance requirements.

**Environmental authority** - Means a licence or approval issued by the administering authority under the *Environmental Protection Act 1994*.

**Environmental management register** - Means the register kept by the administering authority under section 541 of the *Environmental Protection Act 1994*.

**Environmental nuisance** - Section 15 of the *Environmental Protection Act 1994* defines environmental nuisance as “unreasonable interference or likely interference with an environmental value” caused by:

- (a) noise, dust, odour, light; or
- (b) an unhealthy, offensive or unsightly condition because of contamination; or
- (c) another way prescribed by regulation. (e.g. unreasonable noise or dust emissions)”

**Environmental protection policy** - Means an environmental protection policy approved under chapter 2 of the *Environmental Protection Act 1994*.

**Environmental relevant activity** - Means an activity prescribed by regulation as an environmental relevant activity.

**Environmentally sensitive areas** - Refers to locations, however large or small, that have environmental values that contribute to maintaining biological diversity and integrity, have intrinsic or attributed scientific, historical or cultural heritage value, or are important in providing amenity, harmony or sense of community. Refer to Appendix A.

**Environmental value** - Section 9 of the *Environmental Protection Act 1994* defines an environmental value as:

- (a) a quality or physical characteristic of the environment that is conducive to ecological health or public amenity or safety; or
- (b) another quality of the environment identified and declared to be an environmental value under an Environmental Protection Policy or Regulation (e.g. water suitable for swimming in or drinking)

**Ethnographic site** - An archaeological site of particular importance to the study of a cultural group.

**Exploration Activities** - Are mining activities permitted under an environmental authority, that allows the holder to:

- (a) determine the existence, quality and quantity of minerals;
- (b) evaluate the potential for development of the mineral resource;
- (c) mining and engineering feasibility studies; and
- (d) other activities approved by the Minister

**Final rehabilitation report** - Means a final rehabilitation report prepared under chapter 5, part 10, division 2, subdivision 2 of the *Environmental Protection Act 1994*. The report assesses the extent to which the standard environmental conditions and any additional conditions of the environmental authority have been met.

**Financial assurance** - Means a security deposit, either cash or a bank guarantee, that is held by the administering authority to cover the potential:

- (a) costs to rehabilitate areas disturbed by mining activities; and
- (b) costs to restore property improvements disturbed by mining activities; and
- (c) failure of the tenure holder to pay rents and royalties.

**Flood flow channel** - For a representative drawing of a flood flow channel refer to Figure 1- 'Cross Section Through a Watercourse' and Figure 2 – 'Plan View of a Watercourse'.

**General waste** - Schedule 9 of the *Environmental Protection Regulation 1998* defines general waste as "means waste other than regulated waste". Waste rock, overburden and the contents of tailings dams are not included in the definition of general waste for the purposes of these conditions.

**Hard rock mining** - The extraction of ore from underground or open cut pits and the processing of this ore by crushing and or milling, and the use of gravity separation or chemical methods to extract minerals.

**Hazardous contaminant** - Schedule 3 of the *Environmental Protection Act 1994* defines a hazardous contaminant as "a contaminant that, if improperly treated, stored, disposed of or otherwise managed, is likely to cause serious or material environmental harm because of:

- (a) its quantity, concentration, acute or chronic toxic effects, carcinogenicity, teratogenicity, mutagenicity, corrosiveness, explosiveness, radioactivity, flammability; or
- (b) its physical, chemical or infectious characteristics. (eg: spills of mercury, cyanide, petrol, diesel or oil)".

**Historical site** - A site containing objects from the past that allows the study of the way people lived and worked at that place in the past.

**Infrastructure** - Project infrastructure includes roads, tracks, bridges, culverts, dams, bores, buildings, fixed machinery, hardstand areas, pipelines, powerlines, airstrips, helipads etc, which are constructed or installed specifically for the project.

**Lake** - A natural or artificial body of water, either permanent or intermittent.

**Landowner** - Schedule 3 of the *Environmental Protection Act 1994* defines the owner of the land as –

1. The “**owner**” of land is—

- (a) for freehold land—the person recorded in the freehold land register as the person entitled to the fee simple interest in the land; or
- (b) for land held under a lease, licence or permit under an Act—the person who holds the lease, licence or permit; or
- (c) for trust land under the *Land Act 1994*—the trustees of the land; or
- (d) for Aboriginal land under the *Aboriginal Land Act 1991*—the persons to whom the land has been transferred or granted; or
- (e) for Torres Strait Islander land under the *Torres Strait Islander Land Act 1991*—the persons to whom the land has been transferred or granted; or
- (f) for land for which there is a native title holder under the Commonwealth Native Title Act—each registered native title party in relation to the land.

2. Also, a mortgagee of land is the owner of the land if—

- (a) the mortgagee is acting as a mortgagee in possession of the land and has the exclusive management and control of the land; or
- (b) the mortgagee, or a person appointed by the mortgagee, is in possession of the land and has the exclusive management and control of the land.

**Licensed general waste disposal facility** - A site authorised by the administering authority to receive general waste or limited regulated waste (e.g. a rubbish dump).

**Limited regulated waste** - Schedule 9 of the *Environmental Protection Regulation 1998*, defines limited regulated waste. The only limited regulated wastes relevant to mining projects are asbestos and tyres.

**Material environmental harm** - Section 16 of the *Environmental Protection Act 1994* defines material environmental harm as:

- (1) material environmental harm is environmental harm (other than environmental nuisance)-
  - (a) that is not trivial or negligible in nature, extent or context; or
  - (b) that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount but less than the maximum amount; or
  - (c) that results in costs of more than the threshold amount but less than the maximum amount being incurred in taking appropriate action to -
    - i. prevent or minimise the harm; and
    - ii. rehabilitate or restore the environment to its condition before the harm.

In this section -

“**maximum amount**” means the threshold amount for serious environmental harm.

“**threshold amount**” means \$5 000 or, if a greater amount is prescribed by regulation, the greater amount.

**Mine** - Section 6A of the *Mineral Resources Act 1989*, defines mining as –

- (1) “**Mine**” means to carry on an operation with a view to, or for the purpose of -
  - (a) winning mineral from a place where it occurs; or
  - (b) extracting mineral from its natural state; or
  - (c) disposing of mineral in connection with, or waste substances resulting from, the winning or extraction.
- (2) For subsection (2), extracting includes the physical, chemical, electrical, magnetic or other way of separation of a mineral.
- (3) Extracting includes, for example, crushing, grinding, concentrating, screening, washing, jigging, tabling, electro winning, solvent extraction electro winning (SX-EW), heap leaching, flotation, fluidised bedding, carbon-in-leach (CIL) and carbon-in-pulp (CIP) processing.
- (4) However, extracting does not include -
  - (a) a process in a smelter, refinery or anywhere else by which mineral is changed to another substance; or
  - (b) testing or assaying small quantities of mineral in teaching institutions or laboratories, other than laboratories situated on a mining lease; or
  - (a) an activity, prescribed under a regulation, that is not directly associated with winning mineral from a place where it occurs.
- (5) For subsection (1)(c), includes the disposal of tailings and waste rock.
- (6) A regulation under subsection (4)(c) may prescribe an activity by reference to the quantities of minerals extracted or to any other specified circumstances.

**Mine excavation** - The void resulting from the removal of earth for the purpose of obtaining ore or materials (e.g. gravel for road construction) used for mining related activities.

**Miner’s common** - A sapphire mining area (3920 hectares) in the Emerald District, mined since the late 19th Century and set aside by the Queensland Government in September 1941 as the Miners’ Common.

**Mining project** - All activities permitted to be performed under mining leases (including excavation, transportation and processing of ore). A mining project may include more than one mining lease.

**Native vegetation** - Vegetation that occurs naturally in a certain area.

**Noise sensitive place** - Means any of the following places –

- (a) a dwelling;
- (b) a library, childcare centre, kindergarten, school, college, university or other educational institution;
- (c) a hospital, surgery or other medical institution;
- (d) a protected area or an area identified under a conservation plan as a critical habitat or an area of major interest, under the *Nature Conservation Act 1992*;
- (e) a marine park under the *Marine Parks Act 1982*; and
- (f) a park or garden that is open to the public (whether or not on payment of money) for use other than for sport or organised entertainment).

**Normal flow channel** - For a representative drawing of a normal flood flow channel of a water course refer to Figure 1– ‘Cross Section Through a Watercourse’ and Figure 2 - ‘Plan View of a Watercourse’.

**Notifiable activity** - Means an activity in schedule 2 of the *Environmental Protection Act 1994*.

**Opal mining** - Is the extraction of opal from underground or open cut pits and the processing of this ore by manual separation of opal rock or by using gravity separation methods to extract the opal.

**Outer bends** - For a representative drawing of an outer bend of a watercourse refer to Figure 1– “Cross Section Through a Watercourse” and Figure 2 – “Plan View of a Watercourse”.

**Overburden** - Material overlying a mineral ore deposit, up to but not including the topsoil.

**Plan of operations** - Is a planning document required under the *Environmental Protection Act 1994* for a standard mining project. The plan must be submitted to the administering authority prior to carrying out activities on the mining lease. The plan must contain an Action Program that will demonstrate how the holder of the environmental authority will meet the conditions of this Code.

**Project area** - The total area of the mining lease/s.

**Referable dam** - The *Water Resources Act 1989* defines referable dams as -

- (a) works or proposed works that include or would include a barrier whether permanent or temporary that does or could or would impound, divert or control water, which barrier-
  - (i) is more than 8 m in height and has a storage capacity of more than 500 ML;  
or
  - (ii) is more than 8 m in height and has a storage capacity of more than 250 ML and a catchment area that is more than 3 times its maximum surface area or full supply level;
- (b) works -
  - (i) that consist of or include or would consist of or include a barrier whether permanent or temporary that does or could or would impound, divert or control water or hazardous waste, other than a barrier defined in paragraph (a);
  - (ii) other than a barrier whether permanent or temporary that does or could or would impound, contain, divert or control hazardous waste;

declared by the chief executive by notification published in the gazette to be a referable dam by reason of the danger to life or property that could or would eventuate upon the collapse or failure of or the escape of hazardous waste from those works; and includes the storage areas created by the works but does not include a tank constructed of steel or concrete or a combination of those materials.

The term does not include a weir, other than a weir that has a variable flow control structure on the crest of the weir.

**Regulated waste** - Schedule 9 of the *Environmental Protection Regulation 1998* defines regulated waste as non-domestic waste mentioned in schedule 7 (whether or not it has been treated or immobilised), and includes –

- (a) for an element - any chemical compound containing the element; and
- (b) anything that has contained the waste.

(e.g. Regulated waste commonly generated from mining projects include tyres, oils, cyanide, mercury and batteries)

**Rehabilitation processes** - The measures and actions taken to achieve rehabilitation outcomes, including any or all of the following:

- removing all unwanted infrastructure;
- backfilling mine excavations (e.g. pits) and capping drill holes;
- reshaping the land surface to a stable landform similar to that of surrounding undisturbed areas;
- spreading of topsoil;
- spreading seed or planting seedlings to promote revegetation;
- benching ridge cuts and removing any overhanging material.

**Riverine area** - Refers to the land adjoining and associated with watercourses, including the bed, banks, adjoining terraced land and riparian vegetation. Refer to Figure 1 – “Cross Section Through a Watercourse”.

**Scrub lead** - A Designated Fossicking Land (DFL) within the Miners’ Common. Machine mining on mining leases up to 20ha in area is permitted within Scrub Lead DFL.

**Sediment pond** - A bunded or excavated structure used to contain and settle waterborne sediment running off disturbed areas.

**Sediment trap** - A device used to filter waterborne sediment running off disturbed areas. May include silt fences, hay bales or grassed strips.

**Serious environmental harm** - Section 17 of the *Environmental Protection Act 1994* defines serious environmental harm as -

- (1) environmental harm (other than environmental nuisance)
  - (a) that causes actual or potential harm to environmental values that is irreversible, of a high impact or widespread; or
  - (b) that causes actual or potential harm to environmental values of an area of high conservation value or special significance; or
  - (c) that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount; or
  - (d) that results in costs of more than the threshold amount being incurred in taking appropriate action to—
    - (i) prevent or minimise the harm; and
    - (ii) rehabilitate or restore the environment to its condition before the harm.

In this section - “**Threshold amount**” means \$50 000 or, if a greater amount is prescribed by regulation, the greater amount.

**Shallow pit mining** - Means extracting and processing material from open cut pits no more than 5 m deep.

**Significantly disturbed land** - Land is significantly disturbed if –

- (a) it is contaminated land; or
- (b) it has been disturbed and human intervention is needed to rehabilitate it.

Significantly disturbed land includes:

- areas where soil has been compacted, removed, covered, exposed or stockpiled;
- areas where vegetation has been removed or destroyed to an extent where the land has been made susceptible to erosion; (vegetation & topsoil)
- areas where land use suitability or capability has been diminished;
- areas within a watercourse, waterway, wetland or lake where mining project activities occur;
- areas submerged by tailings or hazardous contaminant storage and dam walls in all cases;
- areas under temporary infrastructure. Temporary infrastructure includes any infrastructure (roads, tracks, bridges, culverts, dams, bores, buildings, fixed machinery, hardstand areas, airstrips, helipads etc) which is to be removed after mining has ceased; or
- areas where land has been contaminated.

However, the following areas are not included:

- areas off lease (e.g. roads or tracks which provide access to the mining lease);
- areas previously significantly disturbed which have achieved the rehabilitation outcomes;
- by agreement with the EPA, areas previously significantly disturbed which have not achieved the rehabilitation objectives due to circumstances beyond the control of the mine operator (such as climatic conditions);
- areas under permanent infrastructure. Permanent infrastructure includes any infrastructure (roads, tracks, bridges, culverts, dams, bores, buildings, fixed machinery, hardstand areas, airstrips, helipads etc) which is to be left by agreement with the landowner. The agreement to leave permanent infrastructure must be recorded in the Landowner Agreement and lodged with the EPA;
- disturbances that pre-existed the grant of the tenure unless those areas are disturbed during the term of the tenure.

**Site management plan** - Means a site management plan approved under chapter 7, part 8 of the *Environmental Protection Act 1994*.

**Standard criteria** - Are defined in schedule 3 of the *Environmental Protection Act 1994*. They are:

- (a) the principles of ecological sustainable development; and
- (b) any applicable environmental protection policy; and
- (c) any applicable Commonwealth, State or local government plans, standards, agreements or requirements; and
- (d) any applicable environmental impact study, assessment or report; and
- (e) the character, resilience and values of the receiving environment; and
- (f) all submissions made by the applicant and interested parties; and
- (g) best practice environmental management; and
- (h) financial implications; and
- (i) the public interest; and
- (j) any applicable site management plan; and
- (k) any other matter prescribed under a regulation.

**Standard environmental conditions** - For an environmental authority, means the standard environmental conditions approved for the authority under section 549 of the *Environmental Protection Act 1994*.

**Guidelines for livestock drinking water** - Recommended water quality guidelines for livestock drinking water. Refer to the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 1992.

**Standard mining activity** - Means a mining activity decided to be a standard activity under section 151 of the *Environmental Protection Act 1994*.

**Suitability statement** - The *Environmental Protection Act 1994* defines a suitability statement as:  
for land, means a statement about the uses and activities for which the land is suitable.

**Tailings dams** - A dam used to collect the solid residues resulting from mineral ore processing.

**Technical guidelines** - Guidelines that indicate best practice environmental management.

**Topsoil** - The surface layer of a soil profile, which is usually more fertile, darker in colour, better structured and supports greater biological activity than underlying layers. The surface layer may vary in depth depending on soil forming factors, including parent material, location and slope, but generally is not greater than about 300mm in depth from natural surface.

**Turkey's nest dam** - A dam constructed outside a watercourse, wetland or waterway by excavating a pit and constructing a wall around the pit with the excavated material. Natural surface flow is excluded from the dam.

**Uneven state** - In reference to ground, means ground that has not been compressed, made smooth or returned to a flat profile. The ground is left with small mounds and shallow pits of a small diameter to facilitate the catching of wind blown seed and the pooling of water after rain, to promote natural revegetation.

**Unreasonable noise** - Section 18 of the Environmental Protection (Noise) Policy 1997 defines unreasonable noise as - noise that

- (a) causes unlawful environmental harm; and
- (b) is unreasonable, having regard to the following matters:
  - (i) its characteristics;
  - (ii) its intrusiveness;
  - (iii) the time at which it is made;
  - (iv) where it can be heard;
  - (v) other noises ordinarily present at the place where it can be heard; and
- (c) is not declared to be reasonable in Schedule 2 of the Environmental Protection (Noise) Policy 1997 'Reasonable Noise Levels'.

**Unreasonable release** - of a contaminant to the air environment, means a release of odours, dust, smoke or other atmospheric contaminants, that:

- (a) cause unlawful environmental harm; and
- (b) is unreasonable having regard to the following matters:
  - (i) its characteristic;
  - (ii) its intrusiveness;
  - (iii) other releases of contaminants at the place affected by the release;
  - (iv) where the effect of the release of the contaminants can be noticed; or
  - (v) the order in which the person releasing the contaminant started to carry out the activity from which the release is made and persons affected by the release started to carry out other activities that may be affected by the release of the contaminant.

**Watercourse** - Means a river, creek or stream in which water flows permanently or intermittently in a visibly defined channel (natural, artificial or artificially improved) with clear bed and banks and evidence of biological dependence.

**Waterway** - A naturally occurring feature where surface water runoff normally collects, such as a clearly defined swale or gully, but only flows in response to a local rainfall event.

**Wetland** - Are areas of permanent or periodic/intermittent inundation, whether natural or artificial, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed 6m. Wetlands typically include areas such as lakes, swamps, marshes, estuaries or mudflats.

## 5.0 TECHNICAL GUIDELINES

*Australian Standard 1940 - The storage and handling of flammable and combustible liquids.* Standards Australia (1993).

*Australian Water Quality Guidelines for Fresh and Marine Water Quality,* Australian and New Zealand Environment and Conservation Council (1992).

*Commonwealth Best Practice Environmental Management in Mining Guidelines,* Environment Australia.

*Dredging, Extraction and Spoil Disposal, Fish Habitat Management Operational Policy: FHMOP 004,* Department of Primary Industries (1998).

*Farm Water Supplies Design Manual,* Department of Primary Industries, (1992).

*Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils (ASS) in Queensland,* Department of Natural Resources (1998).

*Soil Erosion and Sediment Control - Engineering Guidelines for Queensland Construction Sites,* The Institution of Engineers, Australia, Queensland Division (1996).

*Technical Guidelines for Environmental Management of Exploration and Mining,* Department of Mines and Energy, Queensland, 1995.

*The Conservation Status of Queensland's Bioregional Ecosystems,* Environmental Protection Agency (1999).

## **6.0 RELEVANT LEGISLATION**

### **State Legislation (published by Go Print, Queensland):**

*Aboriginal Lands Act 1991*

*Cultural Record (Landscapes Queensland and Queensland Estate) Act 1987*

*Environmental Protection Act 1994*

*Environmental Protection Regulation 1998*

*Fire and Rescue Authority Act 1990*

*Fisheries Act 1994*

*Land and Resources Tribunal Act 1999*

*Land Act 1994*

*Mineral Resources Act 1989*

*Mineral Resources Regulation 1990*

*Mines Regulation Act 1985*

*Nature Conservation Act 1992*

*Queensland Heritage Act 1992*

*Torres Strait Islander Land Act 1991*

*Water Act 2000*

*Water Resources Act 1989*

### **Commonwealth Legislation:**

*Native Title Act 1993*

*Environment Protection and Biodiversity Conservation Act 1999*

## APPENDIX A - ENVIRONMENTALLY SENSITIVE AREAS

### Category A - Environmentally Sensitive Areas

<b>LAND AREA CLASSIFICATION</b>	<b>ADMINISTERING LEGISLATION</b>	<b>ADMINISTRATING AUTHORITY</b>
National Parks (Scientific); National Parks; National Parks (Aboriginal Land); National Parks (Torres Strait Islander Land); National Parks (Recovery); and Conservation Parks.	Nature Conservation Act 1992	Environmental Protection Agency

<b>LAND AREA CLASSIFICATION</b>	<b>ADMINISTERING LEGISLATION</b>	<b>ADMINISTRATING AUTHORITY</b>
Nature Refuges; and Resource Reserves.	Nature Conservation Act 1992	Environmental Protection Agency
Declared Catchment areas; Declared Irrigation and Irrigation Project Areas; and Water Reservoirs and Drainage Areas.	Water Act 2000, various Water Board Acts	Department of Natural Resources and/or Relevant Storage Operator or Board
River Improvement Areas	River Improvement Trust Act 1940	Department of Natural Resources and the Relevant River Trust
Designated Landscape Area – Stanbroke	Cultural Record (Landscapes Queensland and Queensland Estate) Act 1987	Environmental Protection Agency
Historic Mining Sites	Nil (Inter Departmental Notifications)	Environmental Protection Agency and the Department of Mines and Energy
State Forest or Timber Reserves	Forestry Act 1959	Department of Natural Resources
DPI Research Sites	Nil (Inter Departmental Agreement)	Department of Primary Industries
Critical Areas and Public Purpose Reserves	Land Act 1994	Department of Natural Resources
Areas under Coastal Management Plans and Control Districts	Coastal Protection and Management Act 1995	Environmental Protection Agency
An area subject to a State Planning Policy that the policy declares is in need of environmental protection.	Integrated Planning Act 1997	Environmental Protection Agency
Erosion Prone Areas and Coastal Management Control Districts	Beach Protection Act 1968	Environmental Protection Agency
Areas of land occupied by the Bureau of Sugar Experiment Stations to conduct research	Sugar Industry Act 1999	Department of Primary Industries

## APPENDIX B - CRITERIA FOR DAMS

Dams built on mining leases are primarily used for raw water storage, recycling treatment liquors and for tailings disposal. The Department of Natural Resources has classified dams into three categories. They are:

- (1) Referable dams;
- (2) Hazardous waste dams; and
- (3) Non-referable, non-hazardous waste dams.

The following criteria are used for the assessment, design, construction, operation, maintenance and decommissioning of dams on mining leases.

### ASSESSMENT CRITERIA

#### Referable Dams

The *Water Resources Act 1989* defines referable dams as -

- (a) works or proposed works that include or would include a barrier whether permanent or temporary that does or could or would impound, divert or control water, which barrier-
  - (i) is more than 8 m in height and has a storage capacity of more than 500 ML; or
  - (ii) is more than 8 m in height and has a storage capacity of more than 250 ML and a catchment area that is more than 3 times its maximum surface area or full supply level;
- (b) works -
  - (iii) that consist of or include or would consist of or include a barrier whether permanent or temporary that does or could or would impound, divert or control water or hazardous waste, other than a barrier defined in paragraph (a);
  - (iv) other than a barrier whether permanent or temporary that does or could or would impound, contain, divert or control hazardous waste;

declared by the chief executive by notification published in the gazette to be a referable dam by reason of the danger to life or property that could or would eventuate upon the collapse or failure of or the escape of hazardous waste from those works; and includes the storage areas created by the works but does not include a tank constructed of steel or concrete or a combination of those materials.

The term does not include a weir, other than a weir that has a variable flow control structure on the crest of the weir.

## **Hazardous Waste Dams**

A dam is likely to be a hazardous waste dam if:

- (1) water quality impacts due to loss of the stored liquid (ie. in the event of an overflow or a failure of the structure to contain the stored liquid) may result in –
  - (a) contamination of a water supply for human consumption; or
  - (b) contamination of a stock water supply; or
  - (c) environmental damage.

The parameters used to measure water quality are:

- i. pH (less than 4 or greater than 8);
- ii. salinity (greater than 1500mg/L);
- iii. cyanide (greater than 0.1mg/L);
- iv. total arsenic ( greater than 0.5mg/L); and
- v. total lead (greater than 0.1 mg/L).

## **Non-Referable and Non-Hazardous Materials Dams (3-8m high)**

A dam is likely to be a non-referable, non-hazardous waste dam if:

- (1) water quality impacts due to loss of the stored liquid (ie. in the event of an overflow or a failure of the structure to contain the stored liquid) is unlikely to result in –
  - (a) contamination of a water supply for human consumption; or
  - (b) contamination of a stock water supply; or
  - (c) environmental damage.

The parameters used to measure water quality are:

- i. pH (between 4 and 8);
- ii. salinity (less than 1500mg/L);
- iii. cyanide (less than 0.1mg/L);
- iv. total arsenic (less than 0.5mg/L); and
- v. total lead (less than 0.1 mg/L).

- (2) loss due to dam break (ie. damage caused by the ensuing flooding and force of water) is such that:

- (a) no loss of human life (ie. there is a very low chance that any person will be living, working or visiting the area immediately downstream of the structure at the time of possible failure);
- (b) no economic loss to property and infrastructure that is owned by persons other than the miner; and
- (c) no person other than the miner is wholly dependent on the supply of water stored in the structure.

# DESIGN, CONSTRUCTION, OPERATION AND MAINTENANCE CRITERIA

## Referrable Dams

The Water Resources Act 1989 requires the Department of Natural Resources to licence referrable dams. All referable dams must be designed by a professional engineers. The plans and design specifications must be submitted to the Department of Natural Resources for approval.

**Note:** Non-referable dams greater than 8m in height must be designed by a professional engineer in accordance with the standard guidelines outlined by the Australian National Committee on Large Dams (ANCOLD). There are no minimum requirements for non-referable dams less than 3m high.

## Hazardous Waste Dams

A professional engineer should design all hazardous waste dams. The dams should be designed and located to have the smallest practical catchment area. The following conditions apply to hazardous waste dams:

- (1) dams with a capacity up to 3000m<sup>3</sup> are to be constructed as *Turkeys Nest*\* dams;
- (2) as far as practical minimise seepage;
- (3) the dam should be operated to maintain a minimum freeboard of 1m;
- (4) the spillway should be capable of passing the design flood, defined as the peak discharge from a critical duration storm with an annual exceedance probability of 1% (ie 1 in 100 yr event);
- (5) batters on earth embankments, shall be no steeper than those shown in the table, unless otherwise shown to be stable:

<b>Embankment Soil Classification</b> (Universal soil classification)	<b>Upstream Batter</b>	<b>Downstream Batter</b>
GC, SC	2.5:1	2 : 1
CL, ML	35:1	2.5:1
CH, MH	3.5:1	2.5:1
GW, GP, GM, SW, SP, SM	Not suitable	Not suitable

**Note:** The codes for the Universal Soil Classification (e.g. GC) are detailed in the Department of Primary Industries, “Farm Water Supplies Design Manual”, 1992.

- (6) where foundation material differs from the embankment fill material, the batters shall be chosen conservatively to be consistent with the weaker material classification;
- (7) provide adequate measures to control seepage through the dam wall and the transmission of contaminants through underlying soil layers or rock stratum;
- (8) maintain the erosion resistance of the downstream face of the dam to avoid surface scour, which may lead to failure of the wall; and
- (9) maintain the erosion resistance of the spillway to avoid scouring during the design flood.

## Non-Referable, Non- Hazardous Materials Dams (3-8m high)

Non-referable, non-hazardous waste dams should be designed to a similar criteria as hazardous waste dams, but they may have permeable walls or under drains for material consolidation, recovery and recycling of process water. The following conditions apply to non-referable, non-material dams:

- (1) the spillway should be capable of passing the design flood, defined as the peak discharge from a critical duration storm with an annual exceedance probability of 1% (ie 1 in 100 yr event);
- (2) surfaces of the dam, including the spillway and areas disturbed by construction shall be stable with respect to erosion;
- (3) earth embankments to be compacted to a density of at least 95% of the standard dry density at a soil moisture content within a range of -1% to +3% of the optimum
- (4) batters on earth embankments, shall be no steeper then those shown in the table, unless otherwise shown to be stable:

<b>Embankment Soil Classification</b> (Universal soil classification)	<b>Upstream Batter</b>	<b>Downstream Batter</b>
GC, SC	2.5:1	2 : 1
CL, ML	3.5:1	2.5:1
CH, MH	3.5:1	2.5:1
GW, GP, GM, SW, SP, SM	Not suitable	Not suitable

**Note:** The codes for the Universal Soil Classification (e.g. GC) are detailed in the Department of Primary Industries, "Farm Water Supplies Design Manual", 1992.

- (5) where foundation material differs from the embankment fill material, the batters shall be chosen conservatively to be consistent with the weaker material classification;
- (6) where necessary provide adequate measures to control seepage through the dam wall;
- (7) maintain the erosion resistance of the downstream face of the dam to avoid surface scour, which may lead to failure of the wall; and
- (8) maintain the erosion resistance of the spillway to avoid scouring during the design flood.

## **Decommissioning Criteria**

### **Hazardous Waste Dams**

A professional engineer should be consulted prior to developing a decommissioning plan for a hazardous waste dam. Hazardous waste dams should be decommissioned by:

- (1) removing (where possible) all remaining liquids in the dam (e.g. it is generally acceptable to evaporate the liquid);
- (2) cap the dam with an appropriate capillary break and with one metre of clay or similar impermeable material;
- (3) design, install and maintain adequate diversion drains or similar structures to protect or minimise the erosion of dam surface by stormwater runoff;
- (4) design, install and maintain adequate surface drainage to prevent water ponding and infiltration into the underlying layers;
- (5) rehabilitate the disturbed areas in accordance with the conditions outlined in the rehabilitation section of this code;
- (6) address contaminated site issues by referring to Notes 16 and 17 from this code;
- (7) establish a monitoring program to determine the success of the decommissioning plan.

### **Non-Referable, Non- Hazardous Material Dams (3-8m high)**

If required, remove the wall and rehabilitate the disturbed area in accordance with the relevant conditions in the rehabilitation section of this code.

### **Access and Protection for Livestock**

- (1) Provide safe access to water for livestock and native animals by:
  - (a) providing hard surfaces around water storage areas; and
  - (b) fencing off any soft areas around the edge of water storage areas.

### **Safety controls for Dams**

- (1) Provide, install and maintain adequate warning devices, signs and fences to exclude people, stock, birds and wild animals from dams containing hazardous contaminants.

## APPENDIX C - SCHEDULE OF ENVIRONMENTAL MANAGEMENT PERFORMANCE

This schedule sets out the performance categories for financial discounts for good environmental management on mining leases. To qualify for a particular performance category, the holder of the environmental authority must be able to demonstrate that they have satisfactorily met the required performance criteria. An environmental audit statement must verify the performance category of the environmental authority holder. A record of satisfactory performance can be transferred from one project to the next new project.

**Note:** While an Environmental Management System (EMS) based on ISO 14001 is a requirement for performance categories 1, a discount of 15% for implementing an EMS can apply at any time.

Performance Category	Security Required	Performance Criteria	Validated by
<b><i>Basic Operational Requirements in Place</i></b>			
5	100%	<ul style="list-style-type: none"> <li>• Environmental authority issued under the <i>Environmental Protection Act 1994</i>.</li> <li>• Other relevant licences and/or permits have been applied for.</li> </ul>	Not applicable.
<b><i>Demonstrated ability to comply</i></b>			
4	90%	<ul style="list-style-type: none"> <li>• Hold all additional licences and/or permits.</li> <li>• Annual rehabilitation targets have been set.</li> <li>• Proof of financial capability, machinery and labour.</li> <li>• Erosion management and monitoring system in place.</li> </ul>	Environmental Audit Statement
<b><i>Demonstrated Compliance for Two Years</i></b>			
3	70%	<ul style="list-style-type: none"> <li>• Full compliance with this code for the previous two years; and</li> <li>• All rehabilitation targets have been met.</li> </ul>	Environmental Audit Statement
<b><i>Demonstrated Compliance for Five Years</i></b>			
2	40%	<ul style="list-style-type: none"> <li>• Full compliance with this code for the previous five years;</li> </ul>	Environmental Audit Statement
<b><i>Environmental management System (EMS)</i></b>			
1	25%	<ul style="list-style-type: none"> <li>• EMS based on ISO 14000 approved.</li> <li>• Implementation of EMS demonstrated by audit.</li> </ul>	Independent Environmental Audit by EPA.

**Note:** If the holder of the environmental authority has demonstrated non compliance with the standard environmental conditions or an acceptable EMS for the mining project, the administering authority can reassess the performance criteria and reset the performance category at any time.

## **APPENDIX D - PLAN OF OPERATIONS**

The holder of an environmental authority must submit a Plan of Operations to the District Mining Registrar, at least 28 days before carrying out an activity on the relevant mining lease(s), unless otherwise approved by the administering authority. The plan may relate to one or more mining leases in a project and may apply for a period of up to 5 years. Activities carried out on the mining lease must be consistent with the plan and performed in the period to which the plan applies. The plan must be accompanied by an environmental audit statement, made by or for the environmental authority holder, that states the extent to which the plan complies with the conditions of the environmental authority; and the fee (if any) prescribed under a regulation. The Plan of Operations can be amended at any time. The environmental authority holder must carry out work in accordance with submitted plan of operations.

### **Contents of the Plan of Operations**

The plan of operations for a standard mining activity consists of the following:

- (1) Project Summary (Form 1);
- (2) Site Plan (Form 2);
- (3) Action Program (Form 3);
- (4) Schedule of Disturbance and Rehabilitation (Form 4);
- (5) Schedule of Rehabilitation Costs (Form 5);
- (6) Calculation of Financial Assurance (Form 6); and
- (7) Monitoring and Record Keeping Summary (Form 7)

### **Site Plan**

The required site plan should be drafted or sketched on a page no larger than A3. The plan must contain the following information:

- (1) mining lease boundaries;
- (2) current and future mining areas;
- (3) current and future layout of all mine infrastructure including the locations of tracks and roads, processing plant, camp, workshop, mine excavations, adits, shafts and headworks, freshwater dam, tailings dam, silt traps, overburden stockpiles, waste rock stockpiles, product stockpile(s);
- (4) general slope of the land with the location of watercourses and wetlands;
- (5) dominant vegetation types (e.g. species and density);
- (6) distance and direction to the nearest residences;
- (7) location of any known or identified cultural heritage site on the mining lease; and
- (8) for each year of the period of the plan outline the:
  - (a) proposed areas of progressive mining disturbance
  - (b) previous rehabilitation (ie. now on a Care and Maintenance program) and;
  - (c) proposed future rehabilitation

## **Action Program**

The action program will indicate, by reference to the condition number, which standard environmental conditions will be implemented for the period to which the plan of operations applies. Where necessary it should also describe how the activities on site are going to be carried out in accordance with the standard environmental conditions that are to be implemented.

**Commencement date:**

### FORM 4 SCHEDULE OF DISTURBANCE AND REHABILITATION

*Note:* Complete the table by: (a) providing actual **areas (ha)** of disturbance and rehabilitation at commencement of the plan of operations; and (b) nominating areas of disturbance and rehabilitation planned for each financial year of the plan of operations, commencing with the current financial year.

DESCRIPTION	Prior to commencement of this plan (Actual)	Year 1 ____ / ____	Year 2 ____ / ____	Year 3 ____ / ____	Year 4 ____ / ____	Year 5 ____ / ____
Mine excavation						
Borrow pit						
Overburden stockpiles						
Soil stockpiles						
Rejects stockpiles						
Tailings dams						
Water supply dams						
Roads/tracks						
Plant area						
Workshop area						
Fuel, oil & chemical storage areas						
Camp						
Contaminated land						
Other						
Rehabilitation processes complete						
First year care & maintenance completed						
2nd year care & maintenance completed						
<b>TOTAL DISTURBANCE</b>						
Successfully Rehabilitated						

## PLAN OF OPERATIONS

### FORM 5 SCHEDULE OF REHABILITATION COSTS

**Environmental Authority No:**

**Project No:**

**Term of Plan (yrs):**

**Commencement date:**

*Note:* Complete Table 1 using **actual third party costs** to calculate the total cost to achieve the rehabilitation objectives for the project. The actual costs can be determined by completing Table 2, 3 and 4. A complete record of quotes and calculations used to determine rehabilitation costs for each disturbance type is to be maintained on site.

**TABLE 1 Schedule of Rehabilitation Costs**

DESCRIPTION OF DISTURBANCE	A. WORK REQUIRED to achieve the rehabilitation objectives (ie. method/ machinery/supplies/ services/no. persons/time)	B. COST (\$/ha) (third party cost to achieve rehabilitation objectives)	C. Maximum Area Disturbed and not Rehabilitated in any year of the PoO	D. Cost to Rehabilitate the Maximum Area of Disturbance (ie. BxC ) (\$)
Mine excavation				
Borrow pit				
Overburden stockpiles				
Soil stockpiles				
Rejects stockpiles				
Tailings dams				
Water supply dams				
Roads and tracks				
Plant area				
Designated Service area				
Fuel, oil & chemical storage areas				
Camp				
Contaminated land				
Rehabilitation process complete				
Care & maintenance				
Other				
			<b>TOTAL COST</b>	<b>\$</b>

**GROSS FINANCIAL ASSURANCE**

Total cost to rehabilitate the maximum area of disturbance at any time during the term of the plan of operations: \$

**NET FINANCIAL ASSURANCE**

Environmental Performance Category attained (Refer to Appendix C): \_\_\_\_\_

Percentage applicable to this Performance Category (Refer to Appendix C): \_\_\_\_\_ %

**FINANCIAL ASSURANCE REQUIRED (Includes GST)**

(multiply the Gross Financial Assurance by the applicable percentage payment) x 1.1

\$
----

**CERTIFICATION**

We certify that the determination of this Financial Assurance is correct and that information contained in Forms 1 to 6 is accurate.

Environmental Authority signature: \_\_\_\_\_ Date: \_\_\_\_\_

Auditor's name: \_\_\_\_\_ Auditor's signature: \_\_\_\_\_ Date: \_\_\_\_\_

**LODGEMENT**

**The Financial Assurance must be lodged with a District Mining Registrar before any work can commence on the project.**

## PLAN OF OPERATIONS

### FORM 7 MONITORING AND RECORD KEEPING SUMMARY

<b>Environmental Authority No:</b>
<b>Project No:</b>
<b>Term of Plan (yrs):</b>
<b>Commencement date:</b>

Data and Information	Method Of Record Keeping To Be Used				Frequency
	site plans	journal	photographs	Other	
Topsoil stripping and stockpiling (e.g. record topsoil stockpiles, location and age)					
Area disturbed and rehabilitation (e.g. map of the area of disturbance and photos of rehabilitation)					
Pre and post-mine landform (e.g. record photographs of the area prior to and following mining)					
Water discharge quality (e.g. note colour of discharge water from sediment dams)					
Dam maintenance (e.g. record of dam maintenance such as sediment removal)					
Record of complaints (e.g. air, noise, tracks etc)  (e.g. record in journal any complaints received by adjoining land owner, actions taken and the outcomes of the action)					
Site specific conditions (e.g. record of monitoring to demonstrate compliance with any site specific conditions)					
Remediation of contaminated land (e.g. record of current and remediated contaminated land)					
Waste Management (e.g. record of waste taken to a regulated waste collection depot)					
Rehabilitation quotes, estimates and actual costs					
Others – relevant to performance category					

**APPENDIX E EMERGENCY RESPONSE TABLE**

<b>Emergency situation</b>	<b>Who to contact in case of emergency situation occurring</b>	<b>Equipment required to be kept and maintained on site</b>	<b>Procedure to be followed in case of emergency situation occurring</b>

## Figure 2

(Not to scale)

*standard criteria* means—

- (a) the principles of ecologically sustainable development as set out in the 'National Strategy for Ecologically Sustainable Development'; and
- (b) any applicable environmental protection policy; and
- (c) any applicable Commonwealth, State or local government plans, standards, agreements or requirements; and
- (d) any applicable environmental impact study, assessment or report; and
- (e) the character, resilience and values of the receiving environment; and
- (f) all submissions made by the applicant and submitters; and
- (g) the best practice environmental management for activities under any relevant instrument, or proposed instrument, as follows—
  - (i) an environmental authority;
  - (ii) a transitional environmental program;
  - (iii) an environmental protection order;
  - (iv) a disposal permit;
  - (v) a development approval; and
- (h) the financial implications of the requirements under an instrument, or proposed instrument, mentioned in paragraph (g) as they would relate to the type of activity or industry carried out, or proposed to be carried out, under the instrument; and
- (i) the public interest; and
- (j) any applicable site management plan; and
- (k) any relevant integrated environmental management system or proposed integrated environmental management system; and
- (l) any other matter prescribed under a regulation.

*standard environmental conditions*, for an environmental authority or a chapter 4 activity, means the standard environmental conditions approved for the authority or activity under section 549.

---

## **Part 2                      Regulatory requirements for all environmental management decisions**

### **50      Application of pt 2**

This part applies to the administering authority for making any environmental management decision.

### **51      Matters to be considered for environmental management decisions**

- (1) The administering authority must, for making an environmental management decision relating to an activity, consider the following matters—
  - (a) each of the following under any relevant environmental protection policies—
    - (i) the management hierarchy;
    - (ii) environmental values;
    - (iii) quality objectives;
    - (iv) the management intent;
  - (aa) environmental values declared under this regulation;
  - (b) the characteristics of the contaminants or materials released from carrying out the activity;
  - (c) the nature and management of, including the use and availability of technology relating to, the processes being, or to be, used in carrying out the activity;
  - (d) the impact of the release of contaminants or materials from carrying out the activity on the receiving environment, including the cumulative impact of the release with other known releases of contaminants, materials or wastes;

[s 52]

---

- (e) the characteristics of the receiving environment and the potential impact on it from carrying out the activity;
- (f) for each affected person for the activity—the order of occupancy or use between the person carrying out the activity and the affected person;
- (g) the remaining capacity of the receiving environment to accept contaminants or wastes released from future activities while protecting environmental values;
- (h) the quantity and type of greenhouse gases released, and the measures proposed to demonstrate the release is minimised using best practice methods that include strategies for continuous improvement.

(2) In this section—

*affected person*, for an activity, means a person affected, or who may be affected, by the release of a contaminant or waste from carrying out the activity.

## 52 Conditions to be considered for environmental management decisions

- (1) The administering authority must, for making an environmental management decision relating to an activity, consider whether to impose conditions about the following matters—
- (a) implementing a system for managing risks to the environment;
  - (b) implementing measures for avoiding or minimising the release of contaminants or waste;
  - (c) ensuring an adequate distance between any sensitive receptors and the relevant site for the activity to which the decision relates;

*Examples of a condition for paragraph (c)—*

a condition requiring riparian buffers, noise buffers or buffers for protecting endangered regional ecosystems

- 
- (d) limiting or reducing the size of the initial mixing zone or attenuation zone, if any, that may be affected by the release of contaminants;
  - (e) treating contaminants before they are released;
  - (f) restricting the type, quality, quantity, concentration or characteristics of contaminants that can be released;
  - (g) the way in which contaminants may be released;

*Examples of a condition for paragraph (g)—*

- a condition restricting the release of a contaminant at a particular temperature, velocity or rate or during particular meteorological conditions or water flows
  - a condition restricting the release of a contaminant to a depth below the level of surface waters
- (h) ensuring a minimum degree of dispersion happens when a contaminant is released;

*Example of a condition for paragraph (h)—*

a condition requiring the use of a diffuser for releasing a contaminant

- (i) protecting environmental values, and meeting quality objectives, under relevant environmental protection policies;
  - (j) recycling, storing, transferring or disposing of waste in a particular way;
  - (k) rehabilitating land to achieve particular outcomes;
  - (l) measures for the ongoing protection of environmental values that are, or may be, adversely affected by the activity.
- (2) In this section—

***attenuation zone*** means the area around a release of contaminants to groundwater in which the concentration of the contaminants in the release is reduced to ambient levels through physico-chemical and microbiological processes.

[s 53]

---

*sensitive receptor* means a sensitive receptor under any relevant environmental protection policies.

**53 Matters to be considered for decisions imposing monitoring conditions**

- (1) The administering authority must, for making an environmental management decision relating to an activity, consider whether to impose monitoring conditions about the release of contaminants from the activity on the receiving environment.
- (2) For considering whether to impose a monitoring condition, the administering authority must consider the following matters—
  - (a) the potential impact on the receiving environment of—
    - (i) the activity to which the decision relates; and
    - (ii) the release of the contaminant;
  - (b) the characteristics of the contaminant;
  - (c) the potential for a control measure to fail and the effect of a failure of a control measure on the receiving environment;
  - (d) the protocols relevant to monitoring the release of the contaminant;
  - (e) whether the monitoring should be continuous or intermittent.
- (3) In this section—

*monitoring condition*, about the release of contaminants from an activity on the receiving environment, means a condition about any of the following matters—

  - (a) monitoring the quantity, quality, characteristics, timing and variability of the release;
  - (b) monitoring indicators of the effective operation of control measures;

- 
- (c) monitoring the characteristics of the receiving environment;
  - (d) assessing the effectiveness of remedial or rehabilitation measures;
  - (e) monitoring the impact of the release on the values, objectives and biota in the receiving environment;
  - (f) analysing monitoring data against objectives and standards including, for example, by predictive modelling;
  - (g) reporting the results of monitoring in a stated form and timeframe;
  - (h) reporting on the time and way in which the release is made to the receiving environment.

### **Part 3                      Additional regulatory    requirements for particular    environmental management    decisions**

#### **54            Application of pt 3**

If an environmental management decision relates to an activity mentioned in a provision in this part, the administering authority making the decision must comply with the provision in addition to part 2.

#### **55            Release of water or waste to land**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, the release of water or waste to land (the *relevant land*).

- (2) The administering authority must consider the following matters—
- (a) the topography, including the flooding potential of the relevant land;
  - (b) the climatic conditions affecting the relevant land;
  - (c) the available land on which the water or waste can be released;
  - (d) the storage of the water or waste in wet weather;
- Example—*
- storage of water or waste in ponds or tanks
- (e) the way in which the water or waste will be released to the relevant land;
  - (f) the need to protect soil and plants on the relevant land from damage;
  - (g) the potential for infiltration of the water or waste to groundwater;
  - (h) the potential for generation of aerosols or odours from the water or waste;
  - (i) the impact of any transfer or run-off of contaminants from the relevant land to surface waters;
  - (j) the ongoing availability of the land for the release of the water or waste.
- (3) The administering authority must also consider whether to impose conditions about each of the following matters—
- (a) developing and implementing a land release management plan for the relevant area that protects the environmental values affected, or that may be affected, by the activity;
  - (b) the way in which, or rate at which, the water or waste may be released;
  - (c) releasing the water or waste in a way that minimises infiltration to groundwater;

- 
- (d) if the water or waste is to be transferred to another entity—the circumstances under which the transfer may occur;
  - (e) releasing the water to a bio-retention system, including, for example, a constructed wetland, for the removal of nutrients from the water.
- (4) In this section—
- land release management plan*, for the relevant area, means a plan that achieves the following outcomes for the area—
- (a) the efficient application of water or waste using best practice methods;
  - (b) control of sodicity in the soil;
  - (c) minimal degradation of soil structure;
  - (d) control of the build-up, from water, waste or other sources, of nutrients and contaminants in the soil and subsoil;
  - (e) prevention of subterranean flows of contaminants to waters;
  - (f) prevention of impact of infiltration on groundwater resources;
  - (g) prevention of run-off by controlling the rate of application of water or waste, and by using structures, including, for example, tailwater dams;
  - (h) prevention of surface ponding;
  - (i) prevention of spraydrift or overspray from the relevant area;
  - (j) prevention of damage to native vegetation;
  - (k) reporting the results of monitoring, and an assessment of the impact on the groundwater in the relevant area of the release of the water or waste.

**56 Release of water, other than stormwater, to surface water**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, the release of water, other than stormwater, to surface water.
- (2) The administering authority must consider each of the following matters—
  - (a) any available toxicity data relevant to the release and the receiving environment;
  - (b) if there is an initial mixing zone—
    - (i) whether there is any practicable alternative that would reduce or eliminate the initial mixing zone; and
    - (ii) whether the size of the initial mixing zone is likely to adversely affect an environmental value or the ecological condition of the receiving environment, including, for example, a watercourse or wetland; and
    - (iii) whether concentrations of contaminants in the initial mixing zone are acutely toxic to the biota.
- (3) The administering authority must also consider whether to impose conditions about the following matters—
  - (a) releasing the water to tidal waters only during particular tidal conditions, including, for example, phases of the tide;
  - (b) releasing the water to non-tidal waters only if the rate of flow of the surface water is greater than a particular level.

**57 Release of stormwater**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity

that involves, or may involve, the release of stormwater to the receiving environment.

- (2) The administering authority must consider the following matters—
  - (a) the topography of, and climatic conditions affecting, the receiving environment;
  - (b) if the activity involves exposing or disturbing soil—the soil type, its characteristics and the way it is managed;
  - (c) if the activity involves the storage of materials or wastes that are exposed to rainfall or stormwater run-off—the characteristics and containment of the material or waste;
- (3) The administering authority must also consider whether to impose conditions about the following matters—
  - (a) diverting upstream stormwater run-off away from the area contaminated or disturbed by the activity (the *affected area*);
  - (b) minimising the size of the affected area;
  - (c) covering, paving, roofing and cleaning the affected area;
  - (d) cleaning the affected area without using water;
  - (e) analysing and managing soil;
  - (f) installing and maintaining appropriate control measures;

*Examples of control measures—*

bio-retention system, buffers for improving waste water quality, first flush stormwater diversion systems, oil separators, rubbish traps, sediment fences, sediment traps

- (g) treating the affected area.

*Examples—*

mulching, revegetating, using surface covers or soil agglomerants

**58 Release of water or waste to particular wetlands for treatment**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, the release of water or waste to a referable wetland or a significant coastal wetland for treatment.
- (2) The administering authority must refuse to grant the application if the authority considers that, because of the activity—
  - (a) the wetland will be destroyed or reduced in size; or
  - (b) the biological integrity of the wetland may not be maintained.
- (3) In this section—

*referable wetland* means an area shown as a wetland on a document called 'Map of referable wetlands' made available by the chief executive.

*Editor's note—*

On the day this regulation was notified in the gazette, the document was available on the department's website.

*significant coastal wetland* has the same meaning as in the State coastal management plan.

*State coastal management plan* means the State coastal management plan prepared under the *Coastal Protection and Management Act 1995*.

*Editor's note—*

On the day this regulation was notified, the State coastal management plan was published on the department's website.

**59 Activity involving berthing, docking or mooring a boat**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity

that involves, or may involve, berthing, docking or mooring a boat.

- (2) The administering authority must consider the following matters—
- (a) the availability of facilities for collecting and disposing of wastes generated from the boat;
  - (b) whether to impose a condition to provide facilities for collecting and disposing of wastes generated from the boat.

*Examples of waste generated from a boat—*

bilge waste, garbage, sewage

## **60 Activity involving storing or moving bulk material**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, storing or moving bulk material.

*Examples of bulk material—*

alumina, cement, coal, grain, metaliferous ores, quarried materials, woodchips

- (2) The administering authority must consider each of the following matters—
- (a) the chemical and physical characteristics of the material;
  - (b) the way in which the material is, or is to be, contained during each stage of the storage or movement of the material;
  - (c) the methods of cleaning up any spillage during movement of the material;
  - (d) if storage or movement of the material is likely to result in the release of part of the material into waters, the impact of the accumulation of the material on the bed of the waters.

(3) The administering authority must also consider whether to impose conditions about the following matters—

(a) installing and maintaining appropriate control measures;

*Examples—*

- installing devices for collecting dust at places where bulk material is being moved
- installing dust collectors at transfer points
- enclosing, roofing or screening equipment used for storing or moving bulk material

(b) managing stockpiles of the material in a particular way;

*Example—*

setting a maximum height for a stockpile

(c) collecting, removing or disposing of spillage released while moving the material;

(d) monitoring the impact of releases of contaminants or waste from storing or moving bulk materials on the receiving environment including, for example, the impact of environmental nuisance and impacts on the biota of adjacent waters.

## 61 Activity involving acid sulfate soil

(1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, disturbance of acid sulfate soil.

(2) The administering authority must consider—

(a) 'State Planning Policy 2/02—Planning and Managing Development Involving Acid Sulfate Soils' (*SPP 2/02*); and

(b) the guideline for *SPP 2/02* (the *guideline*).

*Note—*

The guideline states that it may be used as a source of general advice on investigation and management of acid sulfate soils for situations outside the scope of *SPP 2/02*.

*Editor's note—*

On the day this regulation was notified, SPP 2/02 and the guideline were available on the website of the Department of Infrastructure and Planning at <www.dip.qld.gov.au>.

- (3) The administering authority must also consider whether to impose conditions about the following matters—
- (a) minimising the generation of contaminated water;
  - (b) treating acid sulfate soils;
  - (c) treating or disposing of leachate and run-off;
  - (d) managing the fluctuations in the watertable;
  - (e) maintaining minimum levels of cover over any buried acid sulfate soils.
- (4) In this section—

*acid sulfate soil* means actual acid sulfate soil or potential acid sulfate soil.

*actual acid sulfate soil* means soil or sediment containing highly acidic soil horizons or layers affected by the oxidation of iron sulfides.

*disturbance*, of acid sulfate soil, means disturbance of the soil by—

- (a) excavating or removing the soil; or
- (b) exposing the soil to air; or
- (c) changing the level of groundwater.

*potential acid sulfate soil* means soil or sediment containing iron sulfides or other sulfidic material that has not been exposed to air and oxidised.

**62 Activity involving acid-producing rock**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity

that involves, or may involve, disturbance of acid-producing rock.

*Example of an activity involving disturbance of acid-producing rock—*

tailings from processing acid-producing rock in a mining operation

- (2) The administering authority must consider the following matters—
  - (a) the physical and chemical characteristics of the rock;
  - (b) the potential of the rock to generate or neutralise acidity;
  - (c) the characteristics of the leachate leaching from, or potentially leaching from, the rock including, in particular, contaminants in the leachate that are likely to cause environmental harm if released to the environment.
- (3) The administering authority must also consider whether to impose conditions about the following matters—
  - (a) the ways in which waste may be disposed of or stored, including for example, the location of areas for waste disposal or storage;
  - (b) minimising the ingress of oxygen or water to areas used, or to be used, for waste disposal or storage;
  - (c) inhibiting the generation of acidity from waste rock, including for example, through using particular treatments;
  - (d) processes for collecting, storing and treating any generated leachate;
  - (e) monitoring of the waste disposal and storage areas including, for example, the water balance and oxygen levels;
  - (f) monitoring the potential seepage zone for indications of the formation of acid rock drainage.

(4) In this section—

*acid-producing rock* means rock containing sulfidic minerals that have the potential to oxidise and generate acidity.

*disturbance*, of acid-generating rock, means disturbance of the rock by—

- (a) excavating or removing the rock; or
- (b) exposing the rock to air; or
- (c) changing the level of groundwater.

**63 Activity involving direct release of waste to groundwater**

(1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, the release of waste directly to groundwater (the *receiving groundwater*).

*Example of direct release of waste to groundwater—*

an activity involving the release of contaminated water to groundwater through a well, deep-well injection or a bore

(2) The administering authority must refuse to grant the application if the authority considers—

- (a) for an application other than an application relating to an environmental authority for a petroleum activity—the waste is not being, or may not be, released entirely within a confined aquifer; or
- (b) the release of the waste is affecting adversely, or may affect adversely, a surface ecological system; or
- (c) the waste is likely to result in a deterioration in the environmental values of the receiving groundwater.

(3) In this section—

*confined aquifer* means an aquifer that is contained entirely within impermeable strata.

**64 Activity involving indirect release of contaminants to groundwater**

- (1) This section applies to the administering authority for making an environmental management decision relating to an activity that involves, or may involve, the release of contaminants indirectly to groundwater (the *receiving groundwater*).

*Example of indirect release of waste to groundwater—*

storage of contaminated water in a pond allowing infiltration of contaminated water to groundwater

- (2) The administering authority must consider the following matters—
- (a) the geological stability of the relevant site for the activity;
  - (b) the location, quality and use, or potential use, of the receiving groundwater;
  - (c) the permeability of the earth under the place where the activity is carried out;
  - (d) the presence of containment devices at the relevant site for the activity and their effectiveness in preventing or minimising the release of the waste;

*Example of a containment device—*

a liner for a storage pond

- (e) the distance separating the receiving groundwater from any containment device;
- (f) the potential for fluctuations in the level of the receiving groundwater;
- (g) the way in which materials, including contaminants, will be removed from the containment system;
- (h) whether or not materials, including contaminants, will be removed from the containment devices and if so, the effectiveness of the methods that will be used for the removal.

- (3) The administering authority must also consider whether to impose conditions about the following matters—
- (a) the design, construction, function, protection and maintenance of containment devices;
  - (b) maintaining a particular distance between the receiving groundwater and the point of contact between each containment device and the underlying earth;
  - (c) removing materials from the containment devices.

# Compliance Strategy 2010–14

June 2010

## **Vision**

A green, strong and sustainable Queensland.

## **Role**

The Department of Environment and Resource Management (DERM) conserves, protects and manages the state's environment and natural resources for the benefit of all Queenslanders. DERM's key areas of responsibility are:

- delivering services to our clients
- meeting the challenge of climate change
- protecting and enhancing the state's natural environment and cultural heritage
- securing water for Queensland's future
- managing Queensland's land responsibly.

## **Objectives**

DERM's vision will be achieved through the realisation of the objectives set out in the Strategic Plan 2010–14, which are:

- client needs are understood and met
- Queensland is prepared for climate change
- ecosystems are healthy, protected and bio-diverse
- natural resources are well managed
- Indigenous land access and ownership is improved and Queensland's cultural heritage is conserved
- decisions are evidence based.

## **Compliance strategy**

DERM is committed to proactively managing and monitoring risks to Queensland's environment and natural resources through the implementation of a compliance strategy founded on a targeted and transparent approach to compliance, supported by a modern and strong enforcement capability.

## **Approach to compliance**

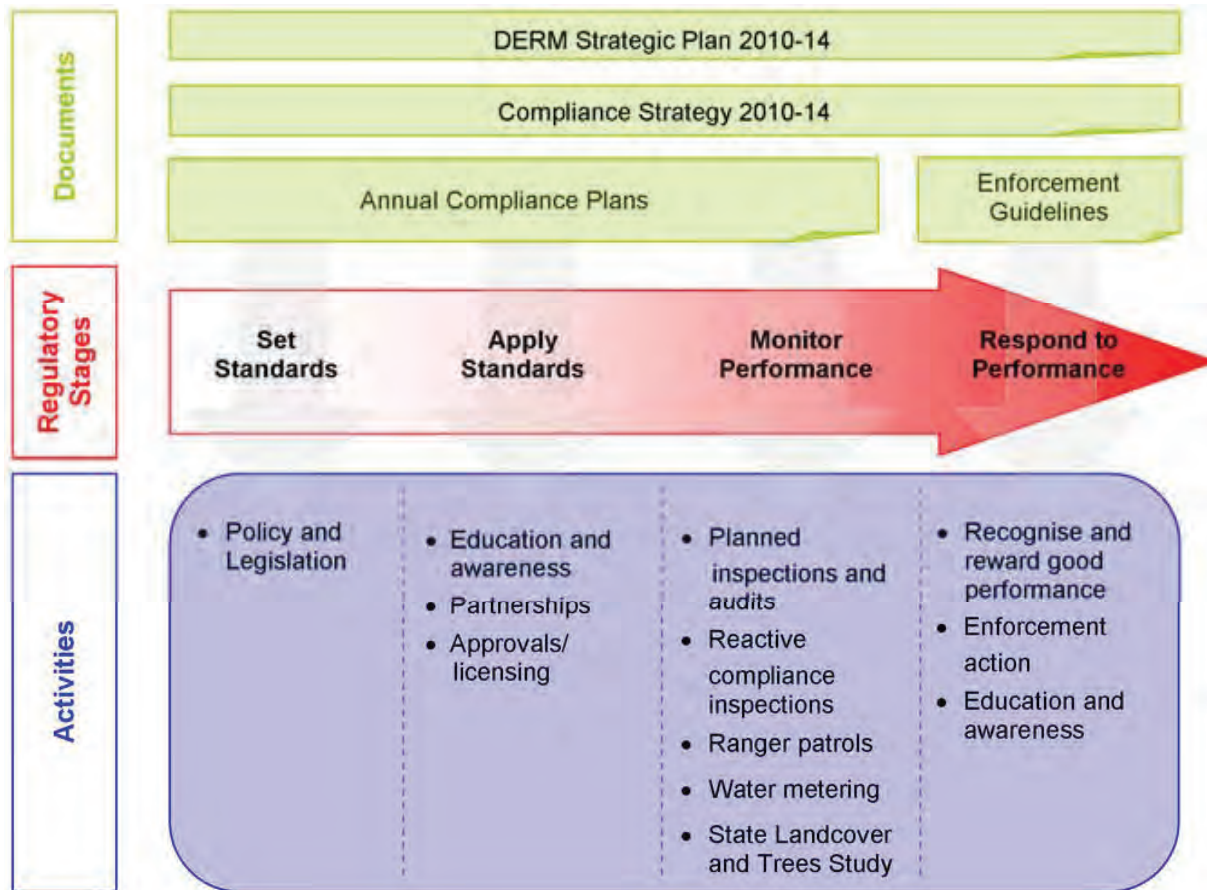

DERM will:

- ensure that our clients understand Queensland's environmental and natural resource management obligations
- encourage voluntary compliance with those obligations
- work with government, business, industry and the community to improve performance
- monitor compliance with Queensland's environmental and natural resource management laws
- take consistent and proportionate responses to non-compliance in accordance with the Enforcement Guideline to achieve environmental and natural resource outcomes and deter further non-compliance.

For more information about DERM's compliance program or for copies of the annual compliance plans or Enforcement Guideline, visit <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)>.

Agency objective	Strategies	Implementation actions
Natural resources are well managed	Develop a compliance strategy and enforcement program to proactively manage and monitor Queensland's environment and natural resources.	<p>Tell clients and the broader community about DERM's approach to compliance.</p> <p>Tell clients and the broader community about DERM's compliance focus areas through the publication of annual compliance plans.</p> <p>Educate and raise the awareness of clients about their obligations under the legislation that DERM administers.</p> <p>Give staff the skills, knowledge and support needed to undertake monitoring activities and enforcement action.</p> <p>Take enforcement responses that are consistent and proportionate to identified non-compliance.</p> <p>Maintain DERM's investigation and litigation capability so that the department can respond to serious incidents and breaches of legislation.</p> <p>Assess the effectiveness of the compliance program and use the information to continually improve it.</p>
	Work collaboratively with Government, business, industry and community groups to improve industry environmental performance and encourage sustainable behaviours.	<p>Undertake compliance projects and activities that are directed primarily to giving clients the opportunity to improve performance and levels of compliance with their obligations; supported by a commitment to take enforcement action should they choose not to meet their obligations.</p> <p>Develop a framework to recognise and reward good performance.</p>
Decisions are evidence based	Ensure processes to develop policy advice, legislation, statutory plans and management decisions include the analysis of comprehensive, accurate and contemporary science and information.	<p>Enhance DERM's compliance planning processes, with an emphasis on science and information, to ensure that compliance projects and activities address the most significant risks to the environment and natural resources.</p> <p>Enhance DERM's understanding of what motivates clients to comply with their obligations so that the department can more effectively design its compliance plans, projects and activities can be more effectively designed.</p>
Client needs are understood and met	Ensure clear and concise regulatory guidelines and procedures are readily accessible for business and industry.	<p>Progressively make available new guidance material detailing how clients can comply with their environmental and natural resource obligations.</p> <p>Publish compliance alerts that identify common non-compliance issues and identify ways to avoid those specific problems.</p>

## Our compliance framework

## Our legislation

We administer approximately 60 Acts and associated regulations and statutory instruments. The Acts that are the focus of our compliance program are listed below:

- *Aboriginal Cultural Heritage Act 2003*
- *Coastal Protection and Management Act 1995*
- *Environmental Protection Act 1994*
- *Forestry Act 1959*
- *Land Act 1994*
- *Land Protection (Pest and Stock Route Management) Act 2002*
- *Marine Parks Act 2004*
- *Nature Conservation Act 1992*
- *Queensland Heritage Act 1992*
- *Recreation Areas Management Act 2006*
- *Sustainable Planning Act 2009*
- *Torres Strait Islander Cultural Heritage Act 2003*
- *Vegetation Management Act 1999*
- *Water Act 2000*
- *Water Supply (Safety and Reliability) Act 2008*

For a full list of the legislation administered by DERM, visit <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)>.

## Overview

Queensland's economic, social and ecological welfare is reliant upon the sustainable management of its environment and use of natural resources.

The Queensland Government is committed to ecologically sustainable development—protecting the ecological processes on which life depends, while allowing for development that improves the total quality of life, both now and in the future.

In seeking to meet the challenge of protecting Queensland's natural assets, legislation has been introduced to ensure sustainable environmental and natural resource management. The Department of Environment and Resource Management (DERM) is the government's lead agency for the administration of this environmental and natural resource legislation. DERM has produced a solid policy platform on which it has built partnerships with the community and industry to encourage greater understanding of the sustainable environmental and natural resource management practices and support for innovation.

Notwithstanding the co-operative approach taken by DERM, it is sometimes in the public interest for DERM to take enforcement action. The effective management and use of natural resources requires DERM to have a clear guideline for the selection of matters for enforcement.

DERM has an established litigation unit, which works in conjunction with specialist investigation teams, to provide a strong and consistent enforcement response to non-compliance.

To the extent possible in the circumstances, it is the goal of DERM's enforcement responses to:

- reinforce the legal obligations required under environmental and natural resource legislation
- achieve good environmental and natural resource outcomes
- deter non-compliant behaviour from others within the general public.

This enforcement guideline aims to foster a corporate and community culture of positive action, consultation and co-operation with DERM. They are general in nature to provide a broad understanding of how DERM will approach enforcement.

# 1. Introduction

DERM is the lead agency responsible for administering the legislation for the protection of the environment and management of natural resources. The legislation that is commonly the focus of enforcement action by DERM includes:

- *Aboriginal Cultural Heritage Act 2003*
- *Coastal Protection and Management Act 1995*
- *Environmental Protection Act 1994*
- *Forestry Act 1959*
- *Sustainable Planning Act 2009 (with respect to those parts relevant to DERM business)*
- *Land Act 1994*
- *Marine Parks Act 2004*
- *Nature Conservation Act 1992*
- *Place Names Act 1994*
- *Queensland Heritage Act 1992*
- *Recreational Areas Management Act 2006*
- *Survey and Mapping Infrastructure Act 2003*
- *Torres Strait Islander Cultural Heritage Act 2003*
- *Vegetation Management Act 1999*
- *Water Act 2000*
- *Wet Tropics World Heritage Protection and Management Act 1993.*

DERM has focused its attention on compliance and is working with the community and industry to achieve good environmental performance and natural resource management through provision of advice, technical assistance and support of innovation. However, in appropriate cases, DERM will pursue enforcement action against those who ignore their legal obligations with respect to their environmental and natural resource responsibilities.

This guideline explains how DERM determines the enforcement action it will take in any given situation. As far as possible, it provides guidance on what behaviour will result in prosecution or other enforcement action. More specific guidance can be obtained by reference to other guidelines addressing specific pieces of legislation. This guideline has been published to ensure that DERM's enforcement responses are:

- proportionate to the conduct
- consistent with past responses for similar conduct
- occur in a timely fashion.

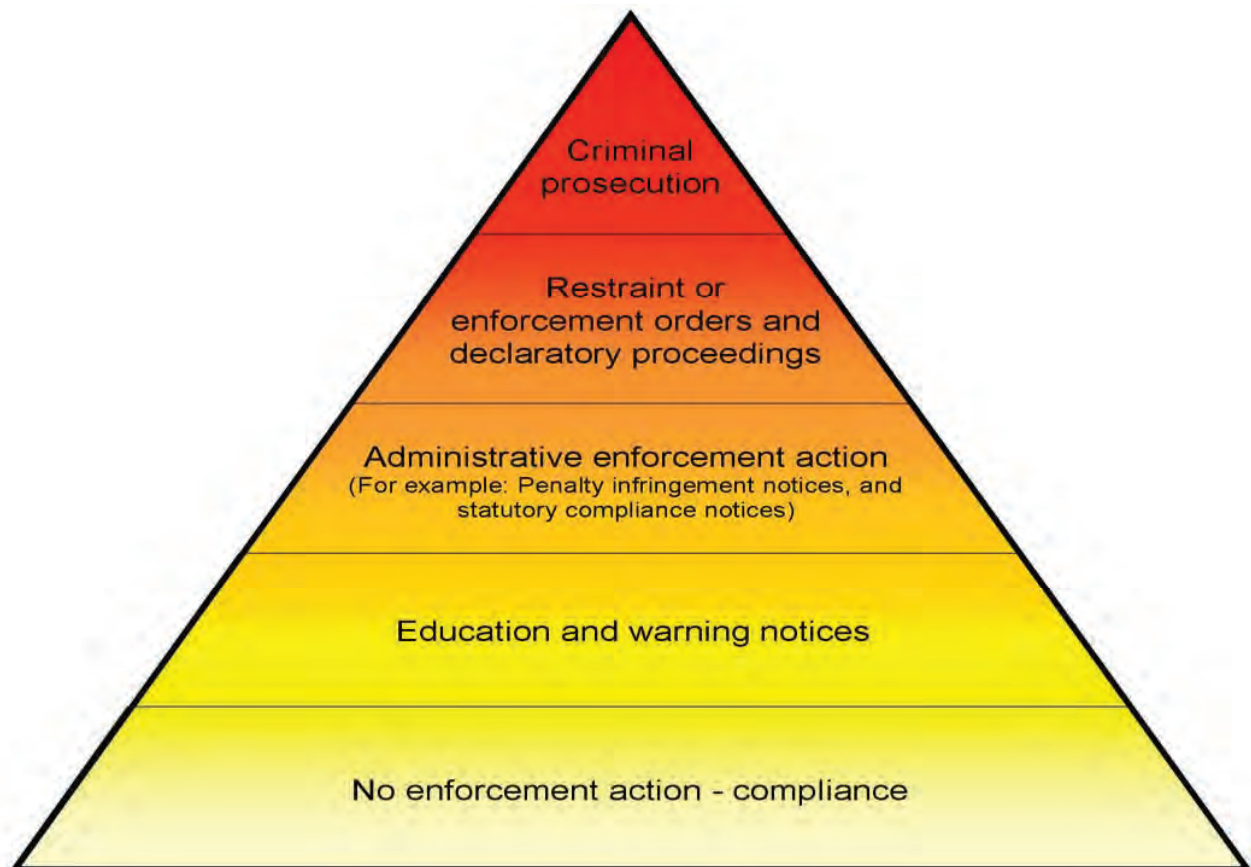

## 2. Enforcement approach

DERM takes a comprehensive approach to environmental and natural resource regulation. Enforcement is one of the measures used by DERM to achieve the objectives of the legislation it administers. It is not the only tool and will be used with restraint. If an alternative to enforcement action will be more effective in achieving the objectives of the Act being administered, then that alternative will be considered. Sometimes a number of enforcement measures are used in combination. In order to determine whether enforcement action will be taken, DERM will investigate all significant breaches of the law and then exercise its discretion in a consistent and logical fashion.

DERM has a wide range of enforcement measures available to it. Each piece of legislation has its own suite of enforcement measures, but generally they consist of the following:

- encouraging voluntary compliance through education and self regulation
- strategic compliance audits and site impact programs
- working with other agencies
- verbal warnings and warning letters
- infringement notices
- administrative and court orders to stop an activity or to take action to remedy a breach or both
- cancellation, suspension or amendment of licence, lease or other permits
- prosecution.

Rather than focusing on one particular enforcement response, this guideline provides general principles that can be applied to assist in choosing the appropriate enforcement tool in any given situation. The enforcement pyramid below (adapted from the model made famous by Ayers and Braithwaite) demonstrates the path of escalation in the enforcement response that has been adopted by DERM.

From this pyramid, it is clear that prosecution may occur where alternative enforcement measures have not been successful. Consideration needs to be given to whether money is better spent on preventing a problem or remediating the impacts of an unlawful activity rather than undertaking costly prosecution actions. In some cases, DERM may decide to negotiate a prompt and satisfactory environmental or natural resource outcome. However, negotiation does not necessarily suspend investigation. Where DERM is satisfied that negotiation is not leading to a satisfactory and prompt outcome, higher level enforcement tools may be the preferred course of action.

If the impact of the conduct is of a minor or trivial nature, enforcement action from lower down the pyramid is more likely. Higher level enforcement action, such as prosecution, may be the preferred option for unlawful conduct:

- involving dishonesty
- involving an attempt to deceive DERM or the provision of false information to it
- involving intentional, negligent or reckless behaviour
- where that unlawful conduct was motivated wholly or partly by commercial considerations
- where there has been a failure to assess, manage or mitigate risk associated with commercial and industrial activities
- resulting in clear commercial gain
- resulting in severe or irreversible harm to the environment or natural resources
- if the impact is unacceptable or dangerous.

Ultimately, DERM has the discretion to determine the appropriate response to unlawful conduct under the legislation administered by it.

## 2.1 Public interest considerations

DERM may take into account the following public interest considerations when deciding on an appropriate enforcement response:

- the seriousness, the triviality, or 'technical nature' of the offence
- the harm or potential harm to the environment caused by the offence
- any mitigating or aggravating circumstances
- the degree of culpability of the alleged offender
- the availability and effectiveness of any alternatives to enforcement action
- whether the offender has been dealt with previously without enforcement action and, if so, what level of enforcement action
- whether the breach is a continuing or second offence
- whether the offence is ongoing
- whether the administrative action or court orders are necessary to prevent a recurrence of the offence
- the prevalence of the alleged offence and the need for deterrence of the offence
- the length of time since the alleged offence occurred
- the age and physical or mental health of the offenders
- whether there are counter-productive features of the proposed enforcement tools
- in cases involving Aboriginal and Torres Strait Island cultural heritage issues, the views of the traditional owners of the area or object.

The following are further factors that should be considered specifically in the case of considering prosecution:

- the length and expense of any court hearing
- the likely outcome in the event of a conviction having regard to the sentencing options available to the court
- any precedent which may be set by not instituting proceedings
- whether the consequences of a conviction would be unduly harsh or oppressive

- whether proceedings are to be instituted against others arising out of the same incident
- the sentencing principles set out in the *Penalties and Sentences Act 1992*.

DERM adopts the overriding principle that enforcement tools must not be instituted (or not instituted) for improper purposes. A decision whether or not to use an enforcement tool will not be influenced by:

- any elements of discrimination against the person, such as ethnicity, nationality, political associations, religion, sex or beliefs
- personal feelings towards the offender or, alternatively, the victim
- possible political advantage or disadvantage to a government or any political group or party
- the possible effect of the decision on the personal or professional circumstance of those responsible for the enforcement response decision.

## **2.2 Determining who is liable for prosecution or other enforcement action**

### **2.2.1 General principles**

Some general considerations in determining who is liable to prosecution or other enforcement action are:

- who was primarily responsible for the offence—that is, who committed the act, who formed the intention (if relevant) and who created the material circumstances leading to the breach
- where a person is liable because the law creates strict liability—what was the role of the potential recipient
- the likely effectiveness of the enforcement tool against the potential recipient.

### **2.2.2 Corporate liability**

The law normally makes legal entities and individuals liable for breaches committed by employees, agents or officers in the course of their employment. Where evidence available to DERM indicates an offence was committed with the employer’s knowledge, or the employer failed to take adequate steps to avoid the harm, the employer may be the subject of an enforcement response. DERM will also consider the existence and effective implementation of management programs aimed at ensuring the compliance of the corporation to Queensland’s environmental and natural resource laws. This is considered in greater detail in the next section.

### **2.2.3 Liability of employees**

Employees cannot use as a defence the fact that they were acting under direction from a supervisor. Acting under orders might, however, be a mitigating factor in determining the appropriate enforcement response. The guiding principle in deciding whether to pursue an employee is the degree of culpability or responsibility involved. Factors to be considered in assessing the degree of culpability include:

- whether the employee knew or should have known that the activity was probably illegal or inappropriate
- whether the employee feared the loss of livelihood if they did not breach, or continue acting in breach, of the legislation
- the seniority of the employee and the scope of the employee’s employment duties
- whether, having regard to the employee’s seniority and employment duties, the employee had taken reasonable steps to draw to the attention of the employer or any other relevant person the impropriety of the practice
- whether the employee has taken reasonable steps endeavouring to mitigate or prevent any harm (if it was in the employee’s power to do so).

Where employees in good faith and without negligence endeavour to follow specific requirements set by legislation or a licence or permit condition, and an offence occurs, they should not be the subject of an enforcement response.

### **2.2.4 Liability of directors and executive officers**

When determining whether to institute any enforcement response against executive officers, in accordance with a provision that creates executive officer liability, the crucial issue will be whether the person had actual control or influence over the conduct of the corporation.

As a general policy, DERM will institute proceedings under the executive officer liability provisions only where evidence links the person with the corporation’s illegal activity. That linkage needs to show:

- intent to engage in the unlawful conduct
- that the action or omission was negligent or reckless
- there was a failure to monitor or periodically assess and manage risks associated with the corporation's relevant activities or review supporting systems and programs
- there was intent to defraud.

The general legislative exceptions to executive officer liability are:

- the executive officer was not in a position to influence the corporation's conduct
- the officer took all reasonable steps to ensure that the corporation complied with the law.

DERM may take the view that reasonable steps were taken if executive officers ensured that:

- the corporation had an effective environmental or natural resource risk management system in place, which was aimed at ensuring compliance with relevant legislative requirements
- all staff were aware of the system
- the system had been effectively implemented throughout the corporation
- the system was under regular review and was amended when necessary.

The better the corporation's documentary evidence of these matters, the stronger the executive officer(s)'s defence.

### **2.2.5 Liability of lenders, liquidators and trustees**

Although there are few situations in which lending institutions might attract liability under the law for an offence, the guiding principle for DERM is the culpability of potential recipients of an enforcement response in relation to an offence. Legal liability is necessary as a pre-requisite to any statutory enforcement response.

DERM acknowledges that in framing the law the intention was not to restrict legitimate commercial activities of lending institutions. DERM takes the view that if the lender did no more than lend money to the corporation under normal commercial processes, and did nothing that led to the causing of the unlawful activity, no enforcement action should be instituted against the lender. The closer the lender is to the management decisions that caused the unlawful activity, the greater the chance of liability.

Where a company has gone into liquidation, the lender might have day-to-day management responsibility for the company. If the lender becomes aware that the company's current activities are unlawful, or were unlawful in the past, then the lender has an obligation to take steps to stop or mitigate the impacts of the activities on the environment. The most appropriate way of doing this, and also the most effective way of ensuring that DERM will not consider the lender to be liable for unlawful environmental or natural resource impacts, is to immediately notify DERM and take steps to prevent future unlawful activities. By mitigating the impacts of unlawful activity on the environment, lenders will not only fulfil their obligations under the law but also maintain the value of their assets.

Similarly, trustees and liquidators that take over the management responsibilities of a company must ensure the company's action comply with Queensland's natural resource and environmental legislation.

### **2.2.6 Liability of state and local governments**

The legislation administered by DERM binds all people including state and local governments. The decision to commence enforcement action against state and local governments will depend on whether it is in the public interest. The laws in place are to be equally applied to both private and public sectors. The public has an interest in everyone abiding by these laws and public authorities have a greater responsibility to lead by example. One factor relevant to public interest is the potential cost of enforcement action to the taxpayer; this becomes a significant consideration as this involves a consideration of the costs of both parties.

### 3. Voluntary compliance

DERM recognises that one way to enhance environmental and natural resource protection is to protect companies that continuously improve their management practices and move beyond 'compliance'. To this end, DERM encourages companies to audit and monitor their operations. To maximise protection from higher level enforcement action, companies can follow these steps:

- implement (not just document) an appropriate risk management system that caters for routine and non-routine situations
- have contingency plans in place
- practise 'due diligence'
- comply with all statutory instruments
- have strategies in place to move towards industry best practice environmental management
- notify DERM immediately of any non-compliance
- give formal notice to DERM that the non-compliance will be appropriately dealt with and rectified.

#### 3.1 Disclosure and co-operation

Encouraging voluntary disclosure and co-operation is in the public interest. DERM recognises that early notification of an incident and full co-operation with any investigation often mitigates the impact of the non-compliant activity. Accordingly, these factors will be taken into account when considering enforcement action.

#### 3.2 Duty to notify and voluntary disclosure

The law creates a duty on all citizens to notify DERM, as soon as they become aware, of any actual or threatened environmental harm arising from an activity. Where this occurs, failure to notify DERM is an offence.

DERM wants to establish a culture of environmental and natural resource stewardship in the community where problems are reported before irreparable harm is caused. In determining whether to use information that a person has disclosed about themselves to initiate an enforcement response, DERM will consider whether the person or corporation made a voluntary, timely and complete disclosure of the incident giving rise to the offence. Specifically:

- whether the person promptly notified DERM
- whether the information assisted in the control or mitigation of any harm caused to the environment or natural resource
- whether the information substantially aided DERM's investigation of the incident
- whether the information was available from other sources
- whether the disclosure occurred prior to DERM or any other regulatory body obtaining knowledge of the non-compliance.

#### 3.3 Without prejudice negotiations with alleged offenders

From time to time, it will be necessary for DERM to enter into 'without prejudice' discussions with alleged offenders about the type of enforcement tool to be employed in response to the unlawful conduct. The driving consideration in these discussions should be to achieve the best environmental or natural resource outcome. No agreement can be reached with an alleged offender who is not prepared to take responsibility for the impacts of the unlawful conduct. When taking part in these discussions, DERM may take into consideration the public interest considerations outlined above and in particular:

- the costs of the enforcement response relative to any outcome achieved
- whether a negotiated response sets an unsatisfactory precedent for DERM's response to the conduct
- whether a negotiated response provides an adequate deterrent for similar conduct.

## **General guideline on the enforcement tools**

### **4. Administrative response (education and warnings and other statutory enforcement tools)**

There are a number of non-statutory tools available to DERM to enhance regulatory compliance with Queensland's environmental and natural resource laws. As most of the community and industry are concerned with protection of the environment and natural resources, the majority of minor non-compliance can be dealt with by way of educating them regarding their obligations. Warning letters and notices are also an effective means to ensure that the recipient is made aware of their responsibilities in this respect.

There are a range of other statutory tools that provide an appropriate regulatory response to situations requiring a stronger response. Generally, the legislative provisions mandate certain criteria that have to be met prior to the use of these tools. Specific guidance on when these tools should be used is contained in separate guides prepared by DERM.

## 5. Infringement notices

### 5.1 Background

Infringement notices are a way of dealing with common breaches of the law where the impacts are not serious enough for court action. Some of these could be traversing a State forest without a permit, exceeding noise limits, working outside given hours, emitting black smoke from chimneys, or failing to carry out monitoring. The State Penalties Enforcement Regulation 2000 nominates the infringement notice offences and penalties under the law.

The infringement notice system modifies the traditional legal system. A notice is served because it appears an offence has been committed. However, payment of the penalty does not lead to the recording of a criminal conviction. Non-payment of the fine is not dealt with by a jail sentence but is recoverable as a civil debt. On the other hand, if a person elects to have the matter heard, proceedings are commenced in the criminal jurisdiction of the Magistrates Court.

Infringement notices can be issued by authorised officers. These can include officers from organisations, such as local governments and DERM. DERM has no direct control over how authorised officers from other organisations carry out their duties. However, for fairness and consistency, DERM's authorised officers will implement the infringement notice guidelines set out here.

### 5.2 Operation

Just as there is discretion to use any other enforcement tool, there is discretion whether to serve an infringement notice. Any discretion by individual officers must take into account the intention of the legislation to penalise those breaches that, in the past, might have gone unpunished, and to recognise those active in managing and minimising their environmental and natural resource use impacts.

Infringement notices are designed primarily to deal with one-off breaches that can be remedied easily. They are usually a first response when a preventable breach is discovered. Issuing successive infringement notices for multiple statutory breaches is generally inappropriate, unless the breaches are unrelated. In such circumstances, even though each breach might be comparatively minor, there is probably a major and continuing compliance problem. Such a problem needs to be dealt with through other enforcement measures if a past infringement notice has not motivated the recipient to successfully address the underlying issue.

The legislation does not set a time by which infringement notices have to be issued. Since serving a notice might be the first notification a person has of an alleged breach, it should be issued promptly out of fairness and courtesy.

The *State Penalties Enforcement Act 1999* gives DERM the discretion to withdraw an infringement notice after serving the notice. This allows for two possibilities:

- A more serious breach of the law might have taken place without the authority's knowledge when the notice was issued. The notice can be withdrawn to allow the more serious breach to be pursued.
- A mistake of fact was made and the notice should not have been issued. In such a case, the State Penalties Enforcement Regulation 2000 allows the authority to withdraw the notice, even if the penalty has been paid.

Withdrawal provisions should be seen as a safety net, not a mechanism to be applied regularly.

### 5.3 Summary

Infringement notices are generally appropriate when the following conditions are met:

- the breach is minor
- the facts are apparently indisputable
- the breach is a one-off situation easily remedied
- inspection discovers a breach that normal operating procedures should have prevented
- where the issuing of an infringement notice is likely to act as a deterrent.

Infringement notices should not be issued in the following circumstances:

- where large-scale habitat or environmental damage has occurred
- where the breach is continuing and not within the alleged offender's ability to remedy quickly
- where the penalty seems inadequate for the severity of the offence

- where the extent of the harm to the environment cannot be assessed immediately
- where the evidence is so controversial or insufficient that court action is unlikely to succeed
- where there has been substantial delay since the alleged breach
- where another authority has issued a notice for the same or similar offence in the same period
- where a notice, direction or order has been issued by DERM to do specified work within a time limit and the limit has not expired
- where multiple breaches have occurred, unless all are minor
- where the offence took place under a proposal approved by DERM.

## 6. Court orders

Many of the Acts administered by DERM provide a power to seek orders from a court to ensure compliance with legislative requirements. These orders may take a variety of forms, including declaratory orders, enforcement orders, restraint orders or orders resulting from a criminal prosecution. Court orders are amongst the strongest enforcement tools available to DERM and will only be sought where other alternatives have failed or where the conduct is of such a serious nature that DERM considers it necessary. The public interest considerations listed above (at section 2.1) should be considered by DERM when deciding whether court orders are appropriate.

### 6.1 Model litigant

As a Queensland Government department, DERM is bound to follow the model litigant principles, which can be found on the Department of Justice and Attorney General website. The principles ensure that when conducting litigation, DERM meets the community's and the courts' expectations that the State conducts itself in a manner which exemplifies the principles of justice, and that State power be used in the public interest.

### 6.2 Declarations

Where there is uncertainty regarding if an activity is unlawful in relation to the provisions of an Act administered by DERM, the Act may provide an avenue to seek a declaration from the court. A declaration is a formal statement of legal rights enabling or disallowing an activity. Seeking a court declaration enables an activity to proceed with a clear statement of the legal situation.

An example of where a court declaration may be sought is for consideration of whether a proposed commercial activity venture would be 'interfering' with the habitat of an endangered wildlife resource in a national park. Under similar provisions in the *Sustainable Planning Act 2009* people may seek a declaration about whether an activity is lawful under a planning scheme or is in breach of a condition of the development approval.

### 6.3 Enforcement and restraint orders

Where there is an existing ongoing or potential unlawful activity under legislation administered by DERM, the legislation may provide that a court may issue either a restraint order or an enforcement order. Enforcement orders are applied in the case of a development offence. Restraint orders may be issued for a threatened or anticipated offence against relevant legislative provisions.

Generally the legislation provides the court with very broad powers when issuing orders. For example, the court may, in some cases, direct the company or person to:

- a) stop an activity that either constitutes, or will constitute, the offence
- b) do anything to comply with the law
- c) cease activities that are in contravention of the law
- d) do anything required to stop committing an offence
- e) rehabilitate or restore an area.

When making a restraint or enforcement order, the court will specify the time required for compliance with the order. It is usually an offence for a person to contravene a court order. In order to stop frivolous or vexatious applications for restraint or enforcement orders, the court has the discretion to make an order in relation to costs.

## 7. Principle prosecution

### 7.1 Background

This guideline aims to identify the key steps in DERM's approach to initiating and progressing prosecutions by outlining:

- the basis on which DERM makes a decision to prosecute
- factors taken into account in deciding which charges to lay
- factors considered in determining the appropriate type of proceedings
- submissions on sentence.

### 7.2 The decision to prosecute

#### 7.2.1 Evidence

The basic pre-requisite of any prosecution is that the available evidence, on first impression, appears to establish a *prima facie* case. At all times there is discretion not to prosecute, but the discretion to prosecute only arises once there is a *prima facie* case. This is a well established principle of law and has been enunciated in the Prosecutions Guidelines of the Queensland Office of the Director of Public Prosecutions.

The criteria that are to be applied in deciding whether to prosecute fall into two categories. First, is the evidence sufficient to justify proceedings? Second, does the public interest require a prosecution? The prosecutor must be satisfied as to the first question before moving on to the second.

Similarly, the Prosecution Policy and Guidelines of the Director of Public Prosecutions, New South Wales states:

A *prima facie* case is a necessary but not sufficient condition for launching a prosecution. Given the existence of a *prima facie* case it must be understood that a prosecution should not proceed if there is no reasonable prospect of a conviction being secured . . . This decision requires an evaluation of how strong the case is likely to be when presented in court. It must take into account such matters as the availability, competence and credibility of witnesses and their likely impression on the arbiter of fact, and the admissibility of any alleged confession or other evidence. The prosecutor should also have regard to any lines of defence which are plainly open to, or have been indicated by the alleged offender and any other factors which in the view of the prosecutor could affect the likelihood or otherwise of a conviction.

#### 7.2.2 Discretion

Sufficient evidence is not the only criterion for prosecution since:

- not every breach of the criminal law is automatically prosecuted
- the laying of charges is discretionary
- the dominant factor in exercising that discretion is the public interest.

The Prosecution Policy of the Commonwealth Director of Public Prosecutions notes:

The decision whether or not to prosecute is the most important step in the prosecution process. In every case great care must be taken in the interests of the victim (in this case the environment), the suspected offender and the community at large to ensure that the right decision is made . . . The criteria for the exercise of this discretion cannot be reduced to something akin to a mathematical formula; indeed it would be undesirable to attempt to do so.

The breadth of the factors to be considered in exercising this discretion indicates a candid recognition of the need to tailor general principles to individual cases.

One of Parliament's main aims in making a breach of the law a criminal offence is to deter someone else from similar behaviour. By extending criminal liability to many people, for example, landowners and directors and managers of corporations, the law generates increased awareness and responsibility for environmental performance and natural resource management within corporate structures and throughout the community. Prosecution is part of DERM's strategy for achieving its objectives. If prosecution is unlikely to lead to deterrence, other measures may be considered.

Each case is to be assessed to determine whether prosecution is the appropriate strategic response. The factors to be considered when deciding to institute proceedings are listed above in 'public interest considerations' (at section 2.1).

Once a decision has been made to prosecute, DERM must present facts fairly and impartially to the court. DERM should have no interest in procuring a conviction, other than to ensure that the right person is convicted, that the truth is known and that justice is done (*R v Hay and Lindsay* (1968) QdR 459 at 476 and the Queensland Barristers' Rules).

## **7.3 Decisions relating to what charges to lay**

### **7.3.1 General principle**

The charges laid must reflect the nature and extent of the conduct disclosed by the evidence with the aim of providing a basis for the court to impose an appropriate penalty. In line with this general principle, the following policy is adopted:

The administering authority has a duty to refine its case to avoid laying either duplicate or multiple charges. There will be occasions where the same conduct is prohibited under separate statutes and involves an offence under each. Where another prosecuting authority is involved, DERM is to liaise with the other organisation to ensure the most appropriate charge(s) are laid. Conversely, other prosecuting bodies, which know of DERM's actual or potential involvement in a case, should initiate contact before proceedings begin.

## **7.4 Mode of trial – summary or indictable proceedings**

Most offences under legislation administered by DERM are 'summary' offences that are heard by a Magistrate, who is the arbiter of fact and law. However, some offences are indictable, meaning that they may be heard in the District Court. Often the decision as to whether an indictable matter is to be heard summarily (before a Magistrate) is an election that can be made by the prosecution. In DERM's case, the decision as to whether or not to proceed on indictment ultimately rests with the Office of the Director of Public Prosecutions (ODPP). The ODPP have published guidelines on when it considers proceeding on indictment appropriate in the circumstances of environmental and natural resource offences. The Director of DPP guidelines can be found on its website at <[www.justice.qld.gov.au](http://www.justice.qld.gov.au)>.

## **7.5 Sentencing considerations**

The *Penalties and Sentences Act 1992* outlines the factors that can be considered by a court at sentence. When seeking a sentence for environmental and natural resource offences, the following is a non-exclusive list of factors which may be considered by DERM in preparing sentence submissions:

- the seriousness of the environmental impact or impact on natural resources (the 'victim' of the offence)
- the potential for the impact to be rectified or mitigated
- the steps taken by the defendant to rectify or mitigate the impact
- the level of cooperation by the defendant with DERM
- any prior convictions of the defendants relevant to environmental or natural resource management
- the level of penalty sufficient to deter others from similar conduct
- the prevalence of the offence
- the maximum penalty for the offence
- any relevant sentencing precedents.

## 8. Breaches of licence conditions

Breaches of licence, lease, permit, authority or the conditions of some other form of permission, can in some cases, lead to the following:

- the issuing of a warning notice or letter
- the issuing of an infringement notice
- prosecution of the offender
- the licence being cancelled.

Cancelling or suspending a licence is potentially the strongest penalty DERM can invoke as it may result in licensee's operations to close. In most cases, DERM will only take this step when:

- the breach of licence conditions has had serious consequences to human health, environment or natural resources
- continual minor breaches have occurred despite warnings being given by DERM
- provision is made for the automatic cancellation of the licence (e.g. accumulation of demerit points).

Specific legislative provisions provide the process DERM must follow before suspending or cancelling a licence. Once the process has been followed and a decision to suspend or cancel has been made, a licensee has the option to seek to have the decision reviewed by a court.

## 9. Conclusion

This guideline is not intended to have legal status. The matters outlined in this guideline are not legally binding on DERM and do not confine, restrain or limit the discretion of DERM to take any action. However, they provide general guidance on how enforcement decision-making is approached by DERM. More specific guidance can be obtained by reference to guidelines addressing specific pieces of legislation.

Should you wish to make comments or suggestions on this guideline, send them to:

Litigation Unit  
Department of Environment and Resource Management  
GPO Box 2454  
Brisbane QLD 4001

If you want to provide information about an incident relating to Queensland environment or natural resource legislation, the DERM hotline is available 24 hours a day on 13 74 68 (13QGOV).

# Annual Compliance Plan 2009–10

## Objective

To reduce risks from the activities regulated by the Department through improving the levels of compliance in the community.

## Introduction

The Department of Environment and Resource Management's (DERM) compliance program is based on being targeted, transparent and risk-based. These principles guide the development of annual compliance plans that set out the proactive compliance activities that DERM will undertake during the year. The plans address all of the areas for which DERM is responsible, including:

- efficient use of water and protection of unspoiled rivers
- sustainable use of land resources, including integrated management of soil, water and vegetation
- preservation of Indigenous and other cultural heritage
- protection of air, water, and soil quality
- waste management
- protection and conservation of ecosystems, landscapes and native plants and animals.

Projects selected for inclusion in DERM's annual compliance plans address one of three key areas:

- **Critical issues**—require immediate attention because they are causing unlawful harm to the natural landscape, or severely threatening the conservation of our natural and cultural heritage, or have an impact on issues that may affect public safety.
- **Emergent issues**—activities within a particular business sector or area that have a high potential to impact on the natural environment. These projects focus on issues such as establishing baseline compliance performance, effectiveness of current regulatory activities, strategies to improve compliance performance and identifying best practice. These projects drive improved regulatory strategies and compliance outcomes.
- **Maintenance issues**—ongoing compliance monitoring of DERM clients to ensure adherence to legislation, zoning plans, permit conditions and other regulatory instruments.

## Critical issues

Project	Issue	Objective	Approach
<i>Environmental Protection Act 1994—mine management</i>			
Mine water management	Wastewater discharges from mines during high rainfall events.	Improved stormwater and wastewater management practices at high risk mines within Queensland.	<ul style="list-style-type: none"> <li>• Review adequacy of design guidelines and consistency of permit conditions in relation to water storages.</li> <li>• Inspect those sites identified as representing highest risk, taking remedial action where required.</li> </ul>
<i>Nature Conservation Act 1992—wildlife management</i>			
Human safety in the presence of dingoes	Managing interactions between humans and dingoes to maximise safety.	A better public understanding of how to behave in the presence of dingoes will assist with implementing the <i>Dingo Management Strategy</i> on Fraser Island, and lead to fewer dangerous interactions and a reduction in intervention from the Queensland Parks and Wildlife Service (QPWS).	<p>Dingo habitats on protected areas, with particular emphasis on Fraser Island.</p> <ul style="list-style-type: none"> <li>• Educate visitors and local residents about the importance and dangers of dingoes and responsibilities under the <i>Dingo Management Strategy</i>.</li> <li>• Monitor human–animal interactions taking remedial action, where necessary.</li> </ul>
Human safety in the presence of estuarine crocodiles	Managing interactions between humans and estuarine crocodiles to maximise safety.	Enhanced community awareness and capacity leads to a reduction in negative interactions with estuarine crocodiles.	<p>Crocodile habitats across Queensland.</p> <ul style="list-style-type: none"> <li>• Educate visitors and local residents about the importance and dangers of crocodiles to build community awareness and capacity.</li> <li>• Monitor human–animal interactions taking remedial action, where necessary.</li> </ul>

## Emergent issues

Project	Issue	Objective	Approach
<b>Environmental Protection Act 1994—mine management</b>			
Mining Financial Assurance	Accuracy of financial assurance estimates in Plan of Operations.	<ul style="list-style-type: none"> <li>• Ensure Plans accurately disclose rehabilitation works and costs.</li> <li>• Develop and implement tools to allow regional implementation of financial assurance and rehabilitation assessments.</li> </ul>	<ul style="list-style-type: none"> <li>• Examine the accuracy of information contained in Plan of Operations, particularly the categorisation of significantly disturbed land and calculation of financial assurance.</li> <li>• Conduct site inspections, taking remedial action where required.</li> </ul>
<b>Environmental Protection Act 1994—industry/agriculture management</b>			
Sewage treatment plants (Great Barrier Reef)	Sewage treatment plants discharging into Great Barrier Reef catchments.	Improve quality of sewage treatment plant effluent discharges into Great Barrier Reef catchments.	Inspect high-risk sewage treatment plants discharging to Great Barrier Reef catchments, taking remedial action where appropriate.
Erosion and sediment control (urban development)	As identified in the <i>South East Queensland (SEQ) Healthy Waterways Strategy 2007–12</i> , urban development is a major contributor of sediment and other pollutants to Queensland waterways.	Expand an existing 2008–09 northern SEQ project to southern SEQ (in partnership with local governments) to protect the environmental values and water quality objectives of waters from urban development sites.	<ul style="list-style-type: none"> <li>• Provide training to DERM and local government staff.</li> <li>• Educate industry on stormwater management and water quality objectives.</li> <li>• Inspect urban development sites, taking remedial action where required.</li> </ul>
Waste disposal facilities	The operation of waste disposal facilities presents significant risk to environmental values, in particular surface and groundwater.	Improve levels of environmental compliance and minimise unlawful contamination from waste disposal facilities.	<ul style="list-style-type: none"> <li>• Assess levels of environmental compliance across a sample of the sector, taking remedial action where required.</li> <li>• Review current regulatory procedures and make recommendations into an improved regulatory regime.</li> </ul>
Water quality in Great Barrier Reef catchments (subject to the passing of the Great Barrier Reef Protection Amendment Bill 2009)	Impact of agricultural activities on the quality of water entering the Great Barrier Reef.	Support the implementation of new regulatory requirements for commercial sugar cane growing and cattle grazing in the Wet Tropics Mackay-Whitsunday, and Burdekin dry tropics catchments.	<ul style="list-style-type: none"> <li>• Ensure effective record keeping is carried out and the implementation of environmental resource management plans can commence.</li> </ul>

## Nature Conservation Act 1992—wildlife management

Flying fox management	Minimise threatening processes for flying fox populations.	Protect flying fox populations from threats by ensuring compliance with non-lethal control methods and requirements for roost protection from disturbance.	<ul style="list-style-type: none"> <li>Educate industry and community groups on the importance of, and requirements for, protecting flying fox populations.</li> <li>Inspect a sample of fruit growing properties to ensure compliance with non-lethal control.</li> <li>Liaise with communities and inspect flying fox roosts near urban areas to ensure that lethal or illegal disturbance is not occurring.</li> </ul>
Protected plants	Minimise threatening processes for protected plants.	Enhanced community awareness and streamlined permitting requirements lead to a reduction in threats to protected plant populations.	<ul style="list-style-type: none"> <li>Educate industry and community groups on importance of and requirements for protected plant populations.</li> <li>Enhance responsiveness of legislation to community and industry needs by reviewing the <i>Nature Conservation (Protected Plants) Conservation Plan 2000</i>.</li> </ul>

## Nature Conservation Act 1992—estate management

Recreational vehicle use	Illegal use of four-wheel-drive, trail bikes and quad bikes on managed estate in SEQ.	Avoid environmental degradation, disturbance to wildlife and disturbance to user amenity through illegal use of recreational vehicles following closure of private 'off road' facilities.	<ul style="list-style-type: none"> <li>Educate user groups on requirements for vehicle use of managed estate.</li> <li>Contribute to planning processes to identify appropriate sites for recreational vehicle use in SEQ.</li> </ul>
Arson	Arson on QPWS managed estate.	<ul style="list-style-type: none"> <li>Protect ecosystems from unsustainable damage caused by arson.</li> <li>Protect life and property from loss caused by arson on QPWS managed estate.</li> </ul>	<ul style="list-style-type: none"> <li>Continue to educate the public, rural communities and park neighbours on the QPWS fire management program.</li> <li>Undertake fuel reduction burns in accordance with the fire management program.</li> </ul>

## Water Act 2000

Drillers Licensing	Protecting aquifers from physical degradation and contamination.	Subartesian and artesian bores are drilled to the respective best practice standards and are compliant with work approvals.	<ul style="list-style-type: none"> <li>Ensure drillers submit their drilling logs.</li> <li>Review drilling logs to identify potential non-compliance with mandatory standards and license conditions, taking remedial action where required.</li> <li>Regular attendance on drilling sites, particularly during artesian bore grouting activities, taking remedial action if required.</li> </ul>
--------------------	--	---	--

### Water Supply (Safety and Reliability) Act 2008

Referable Dams	Ongoing identification and monitoring of dams that if they were to fail would effect a population of 2 or more.	To ensure safety of people that would be at risk if a dam were to fail.	<ul style="list-style-type: none"> <li>• Continue to identify dams with potential population at risk.</li> <li>• Ensure dam owners submit required Failure Impact Assessments, taking remedial action with those that don't.</li> <li>• Continue to educate dam owners on how to comply with legislation.</li> <li>• Audit dam owner's compliance with dam safety conditions for at least 10 referable dams.</li> </ul>
----------------	---	---	---

### Vegetation Management Act 1999

Native vegetation management	Maintenance of native vegetation consistent with the tree clearing laws.	To maintain and enhance levels of compliance with the VMA to ensure the purposes of the act are achieved, using efficient, targeted and innovative approaches.	<ul style="list-style-type: none"> <li>• Targeted education campaigns for landholders in the reef catchment and for those affected by the Regrowth Moratorium.</li> <li>• Identify unlawful clearing impacting on reef water quality, taking remedial action, where required.</li> <li>• Continue supporting industry partnerships.</li> <li>• Use the remote sensing and the Statewide Landcover and Tree Study (SLATS) to analyse vegetation clearing and permit activity trends, and target compliance activities.</li> <li>• Audit fodder and thinning permit activity compliance with the Native Forest Practice Code, taking remedial action where required.</li> </ul>
------------------------------	--	--	---

## Maintenance issues

Project	Issue	Objective	Approach
<i>Environmental Protection Act 1994—general</i>			
Licensed activities under the <i>Environmental Protection Act 1994</i> .	Ongoing monitoring of high-risk Environmentally Relevant Activities, mine operations and petroleum and gas operations.	Compliance with permit conditions, and environmental harm minimised or prevented.	<ul style="list-style-type: none"> <li>• High-risk sites will be identified, inspected, and remedial action taken, where required.</li> <li>• Focus will be, but not limited to, aquaculture facilities in the north, port operations in Townsville and Brisbane, mine operations governed by a Special Agreement Act, Ipswich extractive industry, meat and other food processing, industrial estates, and small sewage treatment plants and large sewerage infrastructure.</li> </ul>

Permit fees/returns	Illegal operations under the <i>Environmental Protection Act 1994</i> , including unpaid permit fees, abandoned sites, incorrect fee discounts, incorrect cancellations.	Ensure permit authorisations are paid in full and on time (or late fees are paid).	<ul style="list-style-type: none"> <li>• Set internal procedures, review annual return templates and processes, and educate operators on their requirements.</li> <li>• Identify extent of non-payment or incorrect payment of fees, inspect random sample of operations, and take remedial action where required.</li> </ul>
---------------------	--	--	---

Freshwater/estuarine catchments (Caboolture Estuary)	<i>Ecosystem Health Monitoring Program Report Card 2007–08</i> for waterways of SEQ and Moreton Bay.	Improve quality and/or reduce quantity of industrial discharges to a freshwater/estuarine catchment. Focus for 2009–10 is the Caboolture Estuary.	<ul style="list-style-type: none"> <li>• Inspect industrial and commercial activities that discharge into the Caboolture Estuary, taking remedial action where required.</li> <li>• Develop partnerships with local government and Department of Employment, Economic Development and Innovation, if possible; and inspect land development and rural activities that have the potential to discharge into the Caboolture Estuary, taking remedial action where required.</li> </ul>
--	--	---	--

#### Nature Conservation Act 1992—wildlife management

Commercial macropod inspections	Ongoing monitoring of high-risk commercial macropod activities under the Nature Conservation (Administration) Regulation 2006.	Ensure annual quotas for commercial harvesting are not exceeded, and compliance with the <i>National Code of Practice for the Humane Shooting of Kangaroos and Wallabies for Commercial Purposes 2008</i> .	<ul style="list-style-type: none"> <li>• Inspect a selection of harvesters, chiller premises and meat processors across Queensland, in conjunction with other agencies, taking remedial action, where required.</li> <li>• Monitor permit return data for harvesters and dealers, taking remedial action, where required.</li> </ul>
---------------------------------	--	---	--

#### Nature Conservation Act 1992—estate management

Marine parks	All State marine parks, with particular focus on Moreton Bay Marine Park.	Enhanced protection of marine ecosystems and values through encouraging appropriate user behaviour.	<ul style="list-style-type: none"> <li>• Educate users on appropriate vessel operation and the activities permitted in State marine parks, focussing on those within 'green zones' and no anchoring zones.</li> <li>• Monitor behaviour and permit compliance and take remedial action where required.</li> </ul>
--------------	---	---	---

Terrestrial parks	All terrestrial parks.	Enhanced protection of terrestrial ecosystems and values through improved user behaviour.	<ul style="list-style-type: none"> <li>• Educate users on activities such as vegetation clearing, fire management, domestic pets, protecting sensitive areas, feeding/taking wildlife, littering etc.</li> <li>• Monitor visitor behaviour, taking remedial action where required.</li> </ul>
-------------------	------------------------	---	---

Protected area boundary incursions	All terrestrial parks and marine park islands.	Enhanced protection of ecosystems and values through improved community respect for protected areas.	<ul style="list-style-type: none"> <li>Educate the community on the importance of respecting protected area boundaries.</li> <li>Monitor protected area boundaries for incursions and taking remedial action where required.</li> </ul>
Commercial activities on managed estate	Managed estate where timber harvesting or grazing leases occurred.	Better management of the impacts of timber harvesting and grazing on managed estate, and manage compliance with relevant codes, operational standards and lease requirements.	<ul style="list-style-type: none"> <li>Audit a strategic sample of grazing leases and timber harvest sales on both current and transitioning QPWS estate for operational compliance.</li> <li>Assess native forest harvest plans for compliance with the code of practice and harvest scheduling.</li> </ul>
Permit fees/returns	Ongoing monitoring at key parks and sites of commercial and non-commercial activities under the <i>Nature Conservation Act 1992</i> and subordinate legislation.	Ensure all activities are appropriately licensed or permitted, and all fees and returns are paid in full.	<ul style="list-style-type: none"> <li>Continue to educate commercial and non-commercial users about permit requirements.</li> <li>Undertake audits of high use parks and sites and take remedial action where required.</li> </ul>
Threatened species	Managed estate and marine parks where threatened species and their habitat occur.	Enhanced protection of threatened species and their habitat through minimizing human related disturbance.	<ul style="list-style-type: none"> <li>Educate visitors and volunteers on appropriate behaviour around threatened species and in their habitat.</li> <li>Monitor behaviour and permit compliance and take remedial action where required.</li> </ul>

### Queensland Heritage Act 1992

Heritage inspections	Ongoing monitoring of high risk heritage places and heritage development under the <i>Queensland Heritage Act 1992</i> .	Compliance with requirements including minimum maintenance requirements and permit conditions.	Audit high-risk heritage places and development approvals, taking remedial action where required.
----------------------	--	--	---

### Aboriginal Cultural Heritage Act 2003 and Torres Strait Islander Cultural Heritage Act 2003

Aboriginal and Torres Strait Islander cultural heritage	Duty of care when conducting activities on lands that contain Aboriginal and Torres Strait Islander cultural heritage.	Effective recognition, protection and conservation of Aboriginal and Torres Strait Islander cultural heritage by land holders.	<ul style="list-style-type: none"> <li>Educate landholders on requirements to comply with their duty of care in relation to protecting and managing cultural heritage.</li> <li>Develop cultural awareness training modules for delivery to judiciary.</li> </ul>
---	--	--	---

## Forestry Act 1959

Commercial management of forest products under the *Forestry Act 1959*

- Compliance with sales permit terms and conditions.
- Compliance with relevant codes of practice.
- Unauthorised removal of forest products and quarry materials.

To maintain and enhance levels of compliance in relation to commercial management of forest products, and commercial use of State-owned native forest areas.

- Educate contractors in the correct application of sales permit terms and conditions and codes of practice.
- Regular monitoring of sales activities in relation to sales permit conditions and codes of practice, taking remedial action where required.

## Land Act 1994

State land

Managing State land and associated values to maximise and sustain the flow of economic, social and environmental benefits to Queenslanders now and in the future.

Ensure the most appropriate use, tenure and management of land are a reflection of the intrinsic values inherent in that land.

- Educate stakeholders and the community on how to comply with their legislative and other obligations.
- Increase awareness about trespass actions via signage in high risk areas.
- Proactively identify possible breaches of legislation, and audit compliance with development leases, taking remedial action where required.

## Land Protection (Pest and Stock Route Management) Act 2002

Stock route network (SRN) management

Managing stock routes in partnership with local governments to ensure they are managed sustainably.

State *Stock Route Network Management Strategy* compliance targets achieved, including improved voluntary compliance amongst SRN users.

- Assist local governments in managing the SRN.
- Support provided where possible through planning and signage and other initiatives.

## Water Act 2000

Water Management

Managing access to water in Water Management Areas.

Sustainable allocation and management of water to achieve Water Resource Plan outcomes; equitable and consistent user access to water; and a secure basis for water accounting.

- Educate water users on importance of compliance with entitlements.
- Monitor metered use and take remedial action where required.

Managing access to water outside Water Management Areas.

Sustainable allocation and management of water to protect the interests of existing authorisation holders and water dependant ecosystems.

- Ensure appropriate limiting access conditions on entitlements.
- Monitor individual entitlements and take remedial action where required.

Water Supply Schemes	Regulating Resource Operations License (ROL), Distribution Operations License (DOL) and Interim Resource Operations License (IROL) holders in the operation and management of Water Supply Schemes.	Ensure compliance with licenses; to ensure performance of entitlements and environmental outcomes, both within and outside water resource plan/ resource operations plan areas.	<ul style="list-style-type: none"> <li>• Audit ROL and IROL, in accordance with audit program and take remedial action where required.</li> <li>• Analyse reported data for compliance with license conditions and take remedial action where required.</li> </ul>
----------------------	---	---	--

Riverine Management	Protecting the physical integrity of non tidal watercourses, lakes and springs.	Manage access to riverine quarry material to protect the physical integrity including the stability of non tidal watercourses, lakes and springs.	<ul style="list-style-type: none"> <li>• Ensure compliance with Quarry Material Allocation Notices by establishing reporting conditions, monitoring provided reports and random site audits and take remedial action where required.</li> </ul>
	Protecting the physical integrity of non tidal watercourses, lakes and springs.	Manage the placement of fill, excavation and destruction of native vegetation in non tidal watercourses, lakes and springs.	<ul style="list-style-type: none"> <li>• Ensure compliance with riverine protection permits and statutory guidelines through routine inspections of activity sites and take remedial action where required.</li> </ul>

### *Water Supply (Safety and Reliability) Act 2008*

Drinking Water Monitoring and Reporting	Protecting public health through safe drinking water supplies	Ensure providers are managing risks for producing safe drinking water.	<ul style="list-style-type: none"> <li>• Ensure water quality incidents are reported and appropriate remedial action is undertaken.</li> <li>• Continue to educate providers on how to comply with legislation.</li> </ul>
---	---	--	--

Water and Sewerage Infrastructure	Ongoing monitoring of water supply and sewerage infrastructure to ensure compliance with the legislation.	To ensure that service providers have appropriate operation, maintenance and renewal strategies in place to ensure the ongoing provision of water and sewerage services.	<ul style="list-style-type: none"> <li>• Review and monitor management plans and service standards.</li> <li>• Education and advice to service providers on how to comply with legislation.</li> <li>• Independent audits of water and sewerage infrastructure, with service providers implementing recommendations where appropriate.</li> </ul>
-----------------------------------	---	--	---

# Annual Compliance Plan 2010–2011

June 2010

#29324

Prepared by:

Compliance and Investigations Branch

July 2010

# Foreword

At the heart of the Department of Environment and Resource Management's (DERM) approach to compliance is the goal of encouraging people to voluntarily comply with their obligations. DERM does this by actively engaging with companies and individuals subject to environmental regulation through activities, such as education and awareness raising, and planned inspections and audits. Compliance and enforcement activities are also important when used in response to breaches of legislation in order to deter future breaches.

The Annual Compliance Plan 2010–11 advises Queenslanders of DERM's proposed activities over the next year to address the key compliance issues that affect our environment and natural resources. Not only do resources underpin our economic activity but also our natural heritage, which we must protect for future generations.

By publishing annual compliance plans, and advising the community what can be expected in the coming year, DERM is giving effect to its commitment to transparency in the way that compliance activities are carried out.

DERM regulates a broad range of activities—from protecting cultural heritage and water resources, to managing national parks and preventing pollution—and the work that DERM does to ensure that people comply with laws is equally broad. This year's annual compliance plan sets out both the general activities that DERM will be undertaking, as well as specific projects aimed at reducing particular risks to the environment.

For example, taking into account the expansion of the coal seam gas (CSG) industry across the state, including multiple proposals to construct liquefied gas plants for the liquefaction and export of CSG, the Queensland Government has ramped up its compliance monitoring and investigation of mining and petroleum activities. A new team has been established in Roma and DERM is committed to ensuring coal seam gas operators comply with new laws and policies affecting the industry.

Potential impacts on agricultural land, rivers and groundwater supplies are being assessed before approvals are granted. To ensure CSG operators comply with stringent operating conditions, compliance inspections will focus on land disturbance and rehabilitation, water and wastewater management, and the performance of dams used to store CSG water and brine waters.

Moreton Bay and other south-east Queensland coastal environments will also benefit under the annual compliance plan, which will see property developments and major infrastructure projects facing increasing scrutiny in relation to erosion and sediment control.

DERM will also continue to educate cane farmers and cattle graziers about the Great Barrier Reef protection laws that came into effect on 1 January 2010, which require better management of fertiliser and pesticide use to improve the quality of water that runs off their properties onto the reef.

The publication of this annual compliance plan, and the compliance activities and projects within the plan, provides an opportunity for companies and individuals to access support to improve their performance levels. It also helps deliver the vision of a green, strong and sustainable Queensland.

John Bradley  
Director-General

# Introduction

## Regulatory coverage

The Department of Environment and Resource Management (DERM) conserves and manages the environment and natural resources for the benefit of all Queenslanders. DERM's key areas of regulatory responsibility are:

- **Protecting and conserving the natural environment and cultural heritage**

This includes pollution control and waste management, managing vegetation loss and the state's coastline, conserving ecosystems, landscapes and native wildlife, and conserving Indigenous and built heritage.

- **Managing land wisely**

This includes effective planning and development, State land and stock route management, native title recognition, and the selling of quarry materials and forest products from State land.

- **Securing water for Queensland's future**

This includes managing resource use, protecting unspoiled rivers and maintained sufficient flow for healthy ecosystems, monitoring surface and groundwater levels and quality, and providing safe and reliable water supplies.

## Regulatory compliance program

DERM's regulatory compliance program is founded on a targeted and transparent approach to compliance, supported by a modern and strong enforcement program. DERM's approach is to:

- ensure that clients understand Queensland's environmental and natural resource management obligations
- encourage voluntary compliance with those obligations
- work with government, business, industry and the community to improve performance
- monitor compliance with Queensland's environmental and natural resource management obligations
- take consistent and proportionate responses to non-compliance, in accordance with the Enforcement Guidelines, to achieve environmental and natural resource outcomes and deter further non-compliance.

A key output of the regulatory compliance program is developing an overarching compliance strategy and publishing compliance plans annually. It is intended that annual compliance plans (ACPs) enable participation and information exchange and help build capacity for compliance, by transparently outlining all the compliance activity to occur in a given year, both proactive and reactive.

DERM's Compliance Strategy 2010–14, annual compliance plans, and enforcement guidelines, which set out how DERM selects matters for enforcement, are available at <[www.derm.qld.gov.au](http://www.derm.qld.gov.au)>.

# Compliance activity

## Types of compliance activity

The two main types of compliance activity DERM carries out to ensure risks are being managed appropriately are outlined below:

1. DERM **responds** to reports about incidents that affect the environment and natural resources. These reports can come from members of the public, industry self-reporting or from monitoring programs. This responsive work drives remedial and/or enforcement action on a site-by-site basis.
2. DERM **plans** a variety of compliance activities throughout the year aimed at addressing risks before they become problems, many of which would be irreversible. Activities include:
  - a. Strategic response to non-compliance  
These projects target issues that require immediate attention because they are threatening the safety of people, or the environments and natural resources that DERM protects and manages. These projects drive compliance outcomes and remedial action.
  - b. Strategic response to compliance risks  
These projects target a particular business or community sector or area that has a high potential to impact upon the natural environment or the safety of people. They focus on issues such as establishing baseline compliance performance, the effectiveness of current regulatory frameworks, strategies to improve compliance performance and identifying best practice. These projects drive improved regulatory systems and tools, and compliance outcomes.
  - c. Ongoing compliance monitoring and assistance to clients to ensure adherence to legislation, zoning plans, permit conditions and other regulatory instruments.

## Recent compliance activity

Throughout 2009–10, DERM progressively improved compliance levels in several business sectors through more open communication and by providing better educational forums and guidance materials.

For example, facilities at the Port of Brisbane, while demonstrating good performance levels overall, are further improving their stormwater emergency preparedness; more dam owners are submitting failure impact assessments and upgrading dam spillways to acceptable standards; and fruit growing properties in central Queensland are using more appropriate flying fox control measures.

DERM also prosecutes those choosing not to comply or who cause serious environmental harm.

In 2009–10, for example, DERM prosecuted five mining companies in north-west Queensland in relation to alleged environmental offences, including release of contaminated water following heavy rainfall. DERM is working with these companies to ensure mines are better prepared for the wet season.

DERM also brought criminal charges against people interfering with dingoes and feeding them on numerous occasions. DERM's strategy aims to reduce deliberate feeding of dingoes and reduce their aggressive behaviour so there is a sustainable dingo population.

Partnership building, ongoing compliance monitoring, data collection and regulatory system changes in 2009–10 have also placed the department in good stead in 2010–11 to:

- work with south-east Queensland local governments and improve erosion and sediment controls on government infrastructure and private development projects
- improve regulatory tools and compliance levels in relation to water management at high-risk waste disposal facilities and mine sites
- effectively regulate the rapidly expanding coal seam gas to liquid natural gas industry, and other petroleum and gas activity, to ensure that groundwater is protected from contamination and over extraction
- use the Statewide Landcover and Trees Study to detect potential unlawful clearing
- focus on the humane shooting of macropods rather than over-harvesting
- address overuse and degradation of our water resources.

## Annual Compliance Plan 2010–11

The Annual Compliance Plan 2010–11 sets out DERM's compliance approach in each of the following areas that it regulates:

1. coastal and inland waters – development and agriculture
2. environmental management
3. Queensland heritage conservation
4. Indigenous heritage conservation
5. land management – State land and the stock route network
6. estate management – conservation estate, marine parks and commercial native forests
7. vegetation management
8. wildlife and ecosystems
9. water supply – water use and service provision.

For each of those areas, this plan provides a brief overview, identifies any key risks, sets out DERM's general approach to ensuring compliance for that area and outlines any specific, planned compliance projects that will be carried out in 2010–11. Some projects will continue past June 2011.

Compliance projects for 2010–11 include:

- erosion and sediment control on urban development sites in south-east Queensland
- acid sulphate soils management
- Port of Townsville material handling
- mine water management
- mining rehabilitation
- petroleum and gas activity, including coal seam gas and underground coal gasification
- landfill gas migration
- heritage place compliance
- arson in the Lockyer Valley
- vehicle use in Byfield and D'Aguilar national parks
- vegetation management framework best practice
- Statewide Landcover and Tree Study assessment
- water meter compliance across the state.

# 1. Coastal and inland waters

## Development

Certain development may need to consider the State Planning Policy 4/10 – Healthy Waters, which has been developed to mitigate the risks to water quality and waterway health from urban stormwater and waste water management. Unmanaged urban stormwater causes contaminants, such as nutrients, sediment and rubbish, to enter waterways. Waterway erosion can also occur through the concentration of stormwater flows entering natural waterways. The draft policy does not apply to existing land uses, or drinking water supply or quality issues. In addition, the draft policy addresses large-scale development, and does not deal with single lots or dwellings as these are addressed by existing design and construction criteria through the building regulations and Queensland Development Code.

Developers must also be aware of the State Planning Policy 2/02 – Planning and Managing Development involving Acid Sulfate Soils (SPP 2/02) when developing land in low-lying coastal areas in certain local government areas. Development involving acid sulfate soils (ASS) should be planned and managed to avoid potential adverse effects on the natural and built environment (including infrastructure) and human health. Development permits may include a requirement to prepare and implement an ASS management plan, consistent with the SPP 2/02 Guideline.

The Draft State Planning Policy for Protecting Wetlands of High Ecological Significance in Great Barrier Reef Catchments also seeks to ensure that development in or adjacent to wetlands of high ecological significance in Great Barrier Reef catchments is planned, designed, constructed and operated to prevent the loss or degradation of wetlands and their values, or enhances these values, or enhances the hydrological regime and ecological values of those wetlands.

Permits under the *Water Act 2000* are required to extract quarry material, such as sand, gravel, rocks and soil, from non-tidal reaches of streams and freshwater natural lakes. Permits are also required to clear vegetation, excavate, or place fill within a watercourse, lake or spring.

## General compliance monitoring or assistance

- Respond to valid reports from the public to ensure placement of fill, excavation and destruction of native vegetation in non-tidal watercourses, lakes or springs is legal and protects the physical integrity of those riverine areas.
- Ensure compliance with high-risk quarry material allocations within riverine areas by monitoring reports and/or onsite activity; and only renewing permits where sustainable management of the resource and appropriate operator performance is occurring.

### Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Erosion and sediment control (ESC) 2009–2012	To protect the environmental values of waters and water quality objectives from urban development sites.	To increase monitoring of ESC practices on construction sites to ensure compliance with the <i>Environmental Protection Act 1994</i> . To build internal capacity of DERM and south-east Queensland (SEQ) local governments for undertaking compliance actions.	SEQ Healthy Waterways Strategy 2007–12 identified urban development as a major contributor of sediment and other pollutants to waterways. The project was endorsed by the chief executive officer committee for natural resource management in SEQ, as one of the strategic actions to address stormwater contamination. Undertaking compliance inspections during construction phase of high-risk public infrastructure and private developments. In partnership with SEQ local governments.	Significant improvement in ESC practices at construction sites. Significant reduction of sediments entering SEQ waterways.
Acid sulphate soils (ASS)	To ensure development doesn't result in land degradation and environmental harm from ASS, by either avoiding or appropriately treating and managing disturbance to ASS.	To provide streamlined and standardised development permit conditions requiring preparation and implementation of ASS management plans. To work with applicants and local governments to mitigate environmental harm and land degradation caused by insufficient ASS management.	In 2010–2011, implement standardised conditions for development requiring ASS management plans in accordance with the SPP 2/02 Guideline. In 2011–12, developing a range of compliance auditing tools to enable DERM to better assess, within available resources, as broad a range as possible of activities that affect ASS.	Promotion of vigilance and/or awareness to appropriately manage ASS when developing in high-risk ASS areas. Increased compliance with development permit conditions.

Further information – *Environmental Protection Act 1994*, Environmental Protection (Water) Policy 2009, *Sustainable Planning Act 2010*, State Planning Policy 4/10 – Healthy Waters, State Planning Policy 2/10 – Planning and Managing Development Involving Acid Sulfate Soils, Draft State Planning Policy for Protecting Wetlands of High Ecological Significance in Great Barrier Reef Catchments, *Water Act 2000*.

## Agriculture

There has been increasing concern about impacts to the waters of the Great Barrier Reef lagoon as a result of runoff from agricultural activity in the Mackay–Whitsunday, Burdekin Dry Tropics and Wet Tropics catchments.

In January 2010, DERM introduced new laws that require the adoption of best practice land management in these catchments, through three key measures:

- All graziers and sugar cane farmers in the priority catchments must calculate, and apply no more than, the optimum amount of fertiliser.
- These farmers must also keep records (from 1 January 2010) of annual soil tests used to determine optimal fertiliser rates, fertiliser and herbicide applications and prescribed agricultural product use (specifically ametryn, atrazine, diuron, hexazinone, tebuthiuron).
- Farms that have a high risk of impacting the reef through poor management practices must also prepare environmental risk management plans (ERMPs). High-risk farms are considered those where sugar cane is growing on more than 70 hectares in the Wet Tropics catchment, and where cattle is grazing on more than 2000 hectares in the Burdekin Dry Tropics catchment. ERMPs were required to be submitted before 1 October 2010.

The new laws aim to reduce by at least 50 per cent the amount of nitrogen, phosphorous and pesticides flowing from catchments into the reef lagoon by the end of 2013, and to cut sediment flowing to the reef by 20 per cent by 2020.

While DERM will initially focus its efforts on providing extensive information, assistance, and education to operators about the new requirements, recalcitrant operators or those causing serious environmental harm can be penalised under the new laws. Research work aiming to understand the motivations and barriers to compliance with the new laws will inform future compliance strategies.

### General compliance monitoring/assistance

- Continue to deliver education and assistance programs to landowners regulated by the new laws (in conjunction with industry groups, natural resource management bodies and the Department of Employment, Economic Development and Innovation).
- Provide additional assistance with the record-keeping requirements to operators, and conduct random reviews of record-keeping in the latter part of 2010–11.
- Identify operators who do not hold an accredited ERMP, to guide further compliance activities including education and assistance.
- Respond to public reports about inappropriate farming practices.

Further information – *Environmental Protection Act 1994*, *Chemical Usage (Agricultural and Veterinary) Control Act 1988*, *Chemical Usage (Agricultural and Veterinary) Control Regulation 1999*, information packages sent to known operators.

## 2. Environmental management

Everyone in the community is responsible for actions they take that affect the environment. No one may carry out an activity that causes, or is likely to cause, environmental harm unless they take all reasonable and practicable measures to prevent or minimise the harm. In addition, if someone becomes aware of serious or material environmental harm being caused or threatened by an activity they are involved in, they have a duty to report that harm (unless the harm is authorised by law).

To protect the environment, DERM regulates an extensive range of primary, secondary and tertiary industries under the *Environmental Protection Act 1994* broadly categorised as mining and petroleum activity, aquaculture and intensive animal industry, chemical manufacturing, fuel burning, extraction, metal fabrication, non-metal product manufacture, food processing, timber processing, transport and bulk material handling, waste management and water treatment. DERM also manages contaminated land resulting from poor environmental management and waste disposal practices, or accidental spills in industrial or commercial activities. It is important that emerging new energy industries, such as the rapidly expanding coal seam gas (CSG) to liquid natural gas (LNG) industry, are managed so that any potential environmental impacts upon agricultural lands, rivers and groundwater supplies are assessed before approvals are given, and that the industries are then regulated effectively during operation. In addition to new laws and policy that DERM has recently implemented to improve the management of impacts from CSG water dams and to manage residual salt, DERM is developing new laws to require stringent management of water extraction impacts on bores, aquifers and springs. DERM will ensure that the CSG and later the LNG industries are proactively inspected to ensure that protected vegetation is not impacted, that waste products including CSG water and residual salts are managed and disposed of correctly, that previously contaminated areas such as decommissioned evaporation dams are rehabilitated, and that groundwater is protected from contamination and over extraction.

Industry that meets certain thresholds, such as fuel use and substance handling, must report emissions and transfers of substances to DERM. This information is publicly available on the National Pollutant Inventory (NPI) internet database <[www.npi.gov.au](http://www.npi.gov.au)>.

The community can report an environmental issue from anywhere in the state through a 24-hour, seven-day-a-week hotline service. Examples of incidents and complaints reported to DERM include oil and chemical spills, sewage overflows and fish kills.

### General compliance monitoring or assistance

- Carry out compliance inspections of licensed sites (including environmentally relevant, mining and petroleum activities) posing the greatest environmental risk. Sectors targeted this year include sewage treatment plants (municipal and small operators), extraction, waste facilities, various processing industries (including meatworks, refineries, metal production, chemical manufacturers, and bulk material handling), and mine sites.
- Review the performance of, and regulatory requirements (including adequacy of development approval conditions) for, eight sites identified as presenting a high or very high risk in the Review of Queensland Industrial Estates 2006–09 project.
- Respond to incident reports received on the DERM hotline.
- Assess, and where necessary, improve the quality of all submitted NPI reports.

## Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Port of Townsville material handling	To obtain compliance with current approvals and identify areas for improvement for premises that are potential sources of air contaminants.	To work with the port and relevant port users to promote best practice for materials handling, particularly for bulk mineral concentrates. To clearly determine air quality within the Townsville airshed, relating to total suspended particles, dust fall, and the heavy metal analysis of the particles and/or dust. To advise the community about air quality in Townsville including any relevance to potential public health issues.	Activities conducted within the Townsville port area. Conducting compliance inspections of the port area and bulk materials handling facilities within the port, commenced March 2010. Air quality monitoring to occur at three locations within Townsville: two inner city locations and the Townsville Sports Reserve.	Minimised risk associated with dust nuisance and a possible public health issue in Townsville if dust fall containing metal concentrates from bulk handling activities increases.
Mine water management	To improve stormwater and waste water management practices at identified high-risk mines in Queensland.	To identify and document high risk factors and inconsistencies in water management practices. To identify appropriate conditioning and other environmental management issues to ensure effective water management.	Two-year project from September 2009 to 2011. Site water management at level 1 mines across Queensland. Targeted compliance inspections of high-risk mine sites in north Queensland.	Minimisation of wastewater discharges from mines during high rainfall events.
Mining rehabilitation (financial assurance)	To address any gap between total financial assurance held by the State and the total cost of rehabilitating disturbed land. To prevent financial liability associated with unexpected closure (such as bankruptcy) of mines.	To ensure mining plans of operations accurately reflect disturbed land and financial assurance calculations. To improve tools for DERM staff to accurately assess rehabilitation progress and financial assurance requirements.	Four-year project from August 2008 to 2012. Mining rehabilitation and financial assurance issues at level 1 mining operations across the state. Compliance inspections of a selection of mine sites across Queensland.	Improved accuracy of plans of operations, which disclose rehabilitation works and costs. Adequate financial assurance is held by the State.

Project	Goal	Objectives	Scope	Expected outcomes
<p>Petroleum and gas (P&amp;G) activity, including coal seam gas (CSG) and underground coal gasification (UCG)</p>	<p>To track and manage the P&amp;G sector's environmental performance and impacts on Queensland's environment.</p>	<p>To ensure industry holds and complies with the correct level environmental authority for the activity being carried out.</p> <p>To improve outcomes for protecting receiving waters, including groundwater, from discharge impacts, and protecting environmentally sensitive areas and important agricultural land.</p> <p>To increase awareness of rehabilitation practices, challenges faced and success rates.</p> <p>To ensure that residual salt is managed and not allowed to contaminate the landscape.</p> <p>To minimise and ensure remediation of impacts to other water users from CSG water extraction activity.</p> <p>To minimise the impacts of petroleum activities on the amenity of the community.</p>	<p>Administer CSG water management policies and legislation amendments when assessing disposal options for CSG water, including salt management and disposal—banning the use of evaporation dams unless there are no feasible alternatives, and ensuring town drinking water supplies are protected.</p> <p>An assessment of compliance by the petroleum and gas sector commenced in August 2010 and continues until April 2011.</p> <p>Level 1 and 2 petroleum activity, as well as UCG trials, will be proactively inspected. Any beneficial use approvals related to petroleum activities will also be assessed.</p> <p>Compliance inspections will assess disturbance to land, water management and releases, dam management including hazard assessment, and rehabilitation of completed activities.</p> <p>Approximately 150 groundwater bores will be sampled to assess the impacts of CSG activities on groundwater.</p> <p>Community concerns about petroleum activities will be responded to, and landowner opportunities and access to information on CSG activities on their properties, will be enhanced.</p>	<p>Minimise harm to high value conservation areas, namely Category A, B and/or C environmentally sensitive areas.</p> <p>Manage risk of dams to prevent contaminant releases to land and/or waters.</p> <p>Rehabilitation successfully undertaken to restore the land after activities cease.</p>
<p>Landfill gas migration</p>	<p>To establish a risk status for subsurface migration of landfill gas from Queensland landfills.</p>	<p>To ensure landfills operators are managing landfill gas appropriately.</p> <p>To identify any risks posed to encroaching land uses on landfill facilities.</p>	<p>Complete a desktop study to identify landfill sites within Queensland that are at risk of encroachment by incompatible land uses, prioritising putrescible waste facilities and large facilities in the first instance.</p> <p>Conduct site audits of high risk facilities and complete a review of landfill gas management procedures. Where existing data does not confirm 'no gas migration', require evaluation of potential gas migration pathways.</p>	<p>Develop a risk profile associated with potential landfill gas migration for Queensland landfill facilities.</p>

Further information – *Environmental Protection Act 1994*, draft Code of environmental compliance for level 2 petroleum activities.

### 3. Queensland heritage conservation

Heritage places contribute to our sense of place, reinforce our identity and help define what it means to be a Queenslanders. Heritage places include buildings and structures, cemeteries, archaeological sites, gardens, urban precincts and cultural landscapes.

Development involving a place on the Queensland Heritage Register must minimise the impact on the heritage values of the place, although changes designed to give a heritage place new life can often be accommodated and are regularly encouraged. Development work to heritage-listed places must first be approved by DERM with either an exemption certificate or development permit. Unauthorised works and failure to maintain heritage places is of particular concern to the department.

#### General compliance monitoring or assistance

- Provide information and advice on complying with development conditions and essential maintenance obligations, as requested.
- Work with individuals undertaking development on heritage places to ensure the cultural heritage significance of the place is retained.

#### Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Approved development and essential maintenance compliance	To protect the cultural heritage significance of places on the Queensland Heritage Register.	To ensure essential maintenance obligations are met. To ensure development consent conditions are observed and met.	Continued focus on heritage places identified as posing a high risk of disrepair in 2009–10. Heritage places for which there are recently issued notices or permits will also be inspected across the state.	Improved percentage of clients meeting their compliance obligations.

Further information – *Queensland Heritage Act 1992*, Queensland Heritage Strategy 2009.

## 4. Indigenous heritage conservation

Cultural heritage is the physical traces left behind by past inhabitants, both tangible and intangible, and is strongly tied to Aboriginal and Torres Strait Islanders' connection to the land and sea. Cultural heritage management involves effectively recognising, protecting and conserving Indigenous cultural heritage, which includes areas, objects, rituals and traditions.

Cultural heritage can easily be destroyed and it is the responsibility of all Queenslanders to help protect it. Anyone conducting activities in areas of significance, irrespective of the underlying land tenure, must take all reasonable and practical measures to avoid harming Indigenous cultural heritage (known as the 'duty of care').

Duty of care guidelines should be referred to prior to undertaking a land-use activity. While DERM can provide information on previously identified Indigenous cultural heritage places, people carrying out land-use activities should not rely solely on previous work, but rather consult with the relevant Indigenous party to determine the location and extent of any cultural heritage places or objects affected by the proposed activity.

### General compliance monitoring or assistance

- Education workshops to be carried out, where possible, for Traditional Owners, other government agencies, proponents and local governments.
- Working with individuals undertaking intensive land use activity, to improve operational procedures to better protect cultural heritage.
- Respond to reports of allegations of damage and disturbance to cultural heritage places.

Further information – *Aboriginal Cultural Heritage Act 2003*, *Torres Strait Islander Cultural Heritage Act 2003*, *Duty of Care Guideline*.

## 5. Land management

### State land

DERM administers about 70 per cent of land in Queensland, commonly referred to as State land. State land comprises unallocated State land, land held under leases, reserves including deeds of grant in trust, and all dedicated roads. Over each of these tenure types, secondary tenures, such as subleases, licences and permits, may be issued.

Occupying and using unallocated State land is illegal without the prior authority of DERM. Illegal occupation leads to risks, such as personal injury or the loss of life or property because of wild fire, coastal erosion, unsafe structures, pollution, and public health and safety issues, associated with unplanned development and poor living conditions, such as lack of potable water, sanitation and garbage disposal facilities.

Leases and licences are granted over State land for specific purposes, including pastoral, grazing, agriculture, industry, tourism, sport and development. Permits to occupy can be issued over unallocated State land, a road, or reserve for a specific purpose, such as a pump site or for short-term grazing. To protect values on leasehold land, land management agreements may be negotiated with lessees on how values will be protected.

In managing State land, DERM ensures land managers comply with their duty of care, comply with the conditions of use or trustee responsibilities, and collect an appropriate return to the State on behalf of the community for use of the land. The duty of care that applies to rural leasehold land that is leased for agricultural, grazing or pastoral purposes, is outlined in the Delbessie Agreement. This agreement takes into account the aspirations of leaseholders, conservation and Indigenous groups, and rural industry.

### General compliance monitoring or assistance

- Promote effective and sustainable land management practices through departmental and industry support services.
- Further develop remote sensing capability to identify long-term condition trend risk properties for audit purposes.
- Annual review of major development leases.
- In association with DERM's debt management program, ensure lessees comply with terms and conditions of leases particularly rent payments.
- Help lessees implement land management agreements, including through compliance inspections and assessment processes.
- Develop and publish self-assessment guidelines for use by lessees.
- Identify illegal occupation of State land during fire and pest management activities and other inspection opportunities. Progressively deal with illegal occupation throughout Queensland as resources permit.

Further information – *Land Act 1994*, Land Regulation 1995, Delbessie Agreement (State Rural Leasehold Land Strategy).

## Stock route network

Stock routes are pathways for travelling stock on roads, reserves, and other lands. They provide pastoralists with a means of moving stock 'on the hoof' around the state's main pastoral districts as an alternative to trucking and other contemporary transport methods. Approximately 72,000 kilometres (covering 2.6 million hectares) of Queensland's road network is declared as stock route. These routes, together with reserves for travelling stock, make up the Queensland Stock Route Network (SRN). There are many facilities for travelling stock use associated with the network, including more than 700 operational stock route water facilities.

Select local governments are required to have a stock route network management plan, which outlines how the local government will manage and administer the SRN in their local government area, including issuing permits to travel and agist stock on the SRN and managing the natural values located on the SRN.

A landowner or stockowner must apply to the relevant local government for a permit to walk (travel permit) or graze (agistment permit) stock on the SRN. Water agreements must be in place where a landholder takes a supply of water from a stock route water facility, or supplies water to a stock route water facility. Water agreements negotiated under previous legislation have been terminated in order to introduce a consistent equitable water agreement framework. Previous agreements must be replaced with new agreements where a landholder continues to take or supply water.

When land that has a stock route crossing is sold, the stock route must not form part of the land that is transferred to the buyer.

### General compliance monitoring or assistance

- Review local government stock route network management plans to ensure inclusion of policies to promote compliance.
- As requested by applicants, review local government permitting decisions, for both stock travel and agistment, to ensure permitting decisions are made in accordance with legislative provisions and approved local government policy.
- Help local governments establish water agreements with landholders taking water from, or supplying water to, stock route water facilities.
- Review rural property sales, and inform real estate agents if their listings include stock routes.

Further information – *Land Protection (Pest and Stock Route Management) Act 2002*, Queensland Stock Route Network Management Strategy 2009–14.

## 6. Estate management

### Conservation estate

The management principles of conservation estate are to:

- provide, to the greatest possible extent, for the permanent preservation of the area's natural condition and protect the area's cultural resources and values
- present the area's cultural and natural resources and their values
- ensure that the only use of the area is nature-based and ecologically sustainable.

The majority of visitors to, and users of, the conservation estate behave in a reasonable and sustainable manner. However, on occasion DERM's Queensland Parks and Wildlife Service (QPWS) deals with non-compliant activities, including inappropriate visitor behaviour, illegal or unsustainable vehicle use, grazing or cattle incursions, green waste and other litter dumping, illegal firewood collection, tree clearing and other boundary incursions, and interference with historic sites.

### General compliance monitoring or assistance

- Systematic program of compliance and education patrols, particularly during high volume visitor periods at Easter and Christmas.
- Systematic program of compliance and education patrols on Fraser Island to ensure visitor safety near dingoes.
- Audit commercial tour operators to verify compliance with permit conditions and legislative obligations.

### Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Arson in the Lockyer Valley	To protect ecosystems on QPWS-managed estate from damage caused by arson.	To protect life and property from loss caused by arson on QPWS-managed estate. To educate the public, rural communities and park neighbours about the QPWS fire management program.	Lockyer Valley protected areas and forests. In partnership with Queensland Fire and Rescue Service. QPWS fire management program implemented.	Alleviate community concern about fire risk arising from protected areas and QPWS-managed estate. Community understanding of, and respect for, QPWS fire management leads to the elimination of arson. Unnecessary land clearing by property owners in response to perceived fire risk is reduced.

Project	Goal	Objectives	Scope	Expected outcomes
Inappropriate vehicle use in national parks	To avoid environmental degradation and disturbance to wildlife, and to enhance visitor amenity and safety through eliminating illegal use of vehicles in protected areas.	To educate users about requirements for recreational vehicle use in managed estate, and ensure they are complied with. To contribute to planning processes to identify appropriate sites for recreational vehicle use on and off QPWS-managed estate.	Byfield National Park and D'Aguilar National Park. In partnership with Queensland Police and local government, where appropriate.	Reduced occurrence of illegal vehicle use. Reduced occurrence of accidents resulting in personal injury.

Further information – *Nature Conservation Act 1992*, Nature Conservation (Protected Areas Management) Regulation 2006, *Recreation Areas Management Act 2006*.

## Marine parks

Marine parks are established over tidal lands and waters and protect habitats, including mangrove wetlands, seagrass beds, mudflats, sandbanks, beaches, rocky outcrops and fringing reefs. DERM's Queensland Parks and Wildlife Service (QPWS) has a comprehensive program to ensure stakeholders are aware of their compliance obligations. This is achieved through interpretation, awareness, information and education. However, there continues to be unlawful activities impacting on nature conservation within these areas.

QPWS, in conjunction with the Great Barrier Reef Marine Park Authority, focuses on issues including fishing in protected zones, illegal taking of vulnerable marine and terrestrial species, damage to cultural resource or sites, non-permitted tourism operations, littering, and illegal structures and dredging.

### General compliance monitoring or assistance

- Patrols during the day or night around problem sites at various locations within the Great Barrier Reef World Heritage Area and State Marine Park.
- Implementation of the Moreton Bay Marine Park Zoning Plan, in particular ensuring visitors conduct appropriate activities in green zones.
- Respond to shipping and pollution incidents.

Further information – *Marine Parks Act 2004*, *Great Barrier Reef Marine Park Act 1975*, marine park zoning plans.

## Commercial native forests

DERM manages native forest timber production and the sale of quarry materials from State forests, timber reserves and other State-controlled lands across Queensland, as well as administering permits for apilary sites and stock grazing on designated areas of State forest. DERM's goal is to maximise financial returns to the State from the management of native forest products and quarry materials, within social, environmental and cultural expectations.

While managing the commercial sale of forest products, enhancing access to State-owned quarry resources to support infrastructure development projects, and improving the efficiency of commercial management of State-owned forest resources, DERM also ensures all native forest and quarry activities on State lands comply with relevant environmental legislation and applicable codes of practice. DERM regularly monitors timber production activities and provides constructive feedback to harvesting contractors to improve overall environmental performance. Compliance monitoring will focus on activities that have the potential to cause soil erosion and damage to forest roads and tracks.

**General compliance monitoring or assistance**

- Educate contractors about the correct application of sales permit terms and conditions and codes of practice, including introducing koala identification training.
- Regular monitoring of all sales activities in relation to sales permit conditions and codes of practice.
- Investigate removals of forest products and quarry materials not consistent with the regulations.

Further information – *Forestry Act 1959*, Code of Practice for Native Forest Timber Production on State Lands 2007.

## 7. Vegetation management

Regional ecosystems are communities of native vegetation consistently associated with a particular combination of geology, land form and soil in a bioregion. Each regional ecosystem has been assigned a conservation status based on its current remnant extent (how much of it remains) in a bioregion.

Regulating the clearing of remnant vegetation ensures the conservation of biodiversity, maintains ecological processes and ensures clearing does not cause land degradation. In Queensland, this regulation is predominantly achieved through the *Vegetation Management Act 1999* and the *Sustainable Planning Act 2009* (the vegetation management framework).

Under the vegetation management framework, clearing remnant vegetation identified on a regional ecosystem or remnant map (on freehold land, Indigenous land, and State tenures) can only occur if done under a development permit or if considered exempt development. Exempt activities include routine clearing required to manage existing fence lines, yards, establishing firebreaks and burning off. Clearing requiring a development permit can only occur for certain purposes, including significant projects, to control non-native plants or declared pests, ensuring public safety, necessary infrastructure, fodder harvesting, thinning, clearing of encroachment or extractive industry.

Since October 2009, regulated regrowth vegetation on freehold, Indigenous and leasehold land for agricultural and grazing is also protected. No permit is required to clear regulated regrowth on such tenures. However, landholders need to notify DERM that they intend to clear and any clearing must comply with the regrowth code. The government introduced the new regrowth laws to protect high-value regrowth vegetation and native vegetation alongside waterways in priority Great Barrier Reef catchments. On some other State land tenures the clearing of native woody regrowth may require a development permit.

Under certain circumstances, clearing vegetation for a development may be offset by the management and protection of another area of ecologically equivalent vegetation.

### General compliance monitoring or assistance

- Continue industry co-delivery implementation program for vegetation management, in partnership with Agforward and the Queensland Farmers' Federation, to help landowners understand their obligations under the new regrowth arrangements.
- Use the Statewide Landcover and Trees Study to detect potential unlawful clearing and understand shifting patterns of unlawful clearing.
- Continue to work with clients (including local governments) to improve their understanding of the vegetation management framework. In response to unexplained clearing, staff will undertake appropriate compliance actions that may include discussions with landholders, warning letters, Property Maps of Assessable Vegetation (PMAV) and restoration notices.

## Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Vegetation management framework – best management practice	To promote and enable effective interpretation and implementation of the vegetation management framework.	To make refinements to vegetation management codes, making them more practical and understandable. To increase client awareness and ability to interpret and implement aspects of the vegetation management framework.	Remake of the Regrowth Vegetation Code, based on feedback received and a review of its implementation. The remake will include more comprehensive best management practice guidelines to help landholders understand and comply with the code. Finalise random audit and survey of the Native Forest Practice Code. Website updates and improvements to assist landholders in understanding the vegetation management framework.	Release of a new version of the Regrowth Vegetation Code by the end of 2010, incorporating improvements. Increased compliance with vegetation management framework. Increased opportunity for self-regulation and education.
2007–2008 Statewide Landcover and Trees Study (SLATS) identification of vegetation clearing	To identify and prioritise vegetation clearing cases for investigation in a targeted manner.	To review the 12 500 hectares of unexplained clearing reported in the Analysis of Vegetation Clearing Rates in Queensland report (supplementary report to the SLATS Landcover Change in Queensland 2007–2008 report), prioritising possible illegal clearing for further investigation.	Unexplained clearing is remotely identified from the 2007–2008 SLATS. Further analysis and prioritisation will occur to determine clearing that requires further investigation. Compliance responses will be implemented where appropriate, based on the scale of clearing and the biodiversity value of the vegetation cleared.	Appropriate investigation and enforcement of illegal clearing. Compliance actions include discussions with landholders, warning letters, penalty infringement notices, restoration notices or legal proceedings.

Further information – *Vegetation Management Act 1999*, State Policy for Vegetation Management, Regional Vegetation Management codes, Regrowth Vegetation Code, Native Forest Practice Code, *Sustainable Planning Act 2009*, Vegetation Management Concurrence Agency Policies for Material Change of Use and Reconfiguring a Lot, Queensland Government Environmental Offsets Policy and the Policy for vegetation management offsets.

## 8. Wildlife and ecosystems

As well as its management of wildlife on conservation estate (such as national parks), DERM manages interaction between people and protected native wildlife 'off-park'. DERM aims to conserve and protect the wildlife while being responsive to the social and economic needs of the community.

Areas of interest to DERM include wildlife harvesting, damage mitigation, problem wildlife and incident response, enforcement and compliance, and licensing and permits. A major part of DERM's approach is liaison and engagement with key stakeholders, the general community and other parts of government.

In a vast state hosting a diverse and vast array of species, ecosystems and significant sites, nature refuges fill an important niche in promoting a community-based landscape approach to conservation. Nature refuges are voluntary agreements between a landholder and the Queensland Government that acknowledge a commitment to manage and preserve land with significant conservation values while allowing compatible and sustainable land uses to continue. Nature refuges comprise the second largest expanse of Queensland's protected areas estate. With more nature refuges changing hands from one landowner to the next, the department is committed to ensuring that new landowners are aware of their obligations under these conservation agreements. The investigation of breaches of nature conservation legislation on nature refuges includes breaches by landowners and may include breaches by third parties.

DERM is protecting more areas as national park to secure our unique biodiversity, by increasing land for conservation by 50 per cent. This will bring the total land protected in national park estate to 12.9 million hectares. As a result, some State forests and unallocated State land are being converted to protected area. As a result, the department is keen to ensure that commercial users and visitors to these newly created protected areas are aware of their new obligations.

### General compliance monitoring or assistance

- Inspect commercial macropod harvesters, dealers and processors, and monitor permit return data to ensure annual quotas for commercial harvesting of macropods are not exceeded and relevant codes are being complied with.
- Implementation of the Crocodile Management Strategy, to enhance community awareness and reduce negative interactions between human and estuarine crocodiles.
- Monitor flying fox roosts near urban areas and fruit growing farm practices, to ensure lethal or illegal disturbance of flying fox populations are not occurring.
- Investigate any suspected, reported or identified breaches of nature conservation legislation on nature refuges.
- Investigate any reported or identified potential breaches of nature conservation legislation concerning the taking of wildlife from the wild, particularly with respect to threatened species.

Further information – *Nature Conservation Act 1992*, Nature Conservation (Wildlife Management) Regulation 2006, National Code of Practice for the Humane Shooting of Kangaroos and Wallabies for Commercial Purposes 2008.

## 9. Water supply

### Water use

Water is a fundamental and vital resource that underpins the prosperity and wellbeing of all Queenslanders. Regional water supply strategies are the Queensland Government's approach to ensuring short- and long-term regional water supply security. These strategies, developed in partnership with local governments, water service providers, industries and community groups, balance water demand and supply requirements and provide regional water supply solutions for the next 50 years. Water resource plans complement parallel initiatives like regional water supply strategies.

DERM is responsible for planning the state's future needs by securing supplies for social and economic needs, such as towns, industry, irrigation, mines, fisheries, and tourism, while setting out strategies to support river health. Water resource plans, resource operations plans and resource operations licences are DERM's principal tools to strategically manage water. Water metering provides a clear picture of water-use patterns to enable effective planning, allocation and management of the resource.

Landowners require authorisation in the form of a water licence, water allocation or water permit to access, use, or distribute surface and underground water. Development permits may also be required to construct works that either take or interfere with water. Unlawfully taking water, or interfering with a watercourse, can jeopardise both the ability of other users to enjoy the benefit of the resource and the ecosystems that rely on the water.

In the case of underground water, bore drilling can reduce pressure in aquifers, possibly cross contaminate aquifers and harm nearby ecosystems, so it is important that best practice standards are complied with.

A national framework for ensuring that water users comply with their legal obligations is being developed by the Australian Government. If it is endorsed by the Council of Australian Governments, DERM will implement the framework by increasing monitoring of high-risk water resources, providing additional education to water users and moving towards nationally consistent offences, penalties and best practice compliance tools.

### General compliance monitoring or assistance

- Audit water supply scheme operations, including monitoring data, and particularly in areas where a new resource operations plan has commenced.
- Respond in a timely manner to all reports of water entitlement overuse, unlawful take of water, or illegal works in water courses.
- Ensure subartesian and artesian bores are drilled to the respective best practice standards, compliant with work approvals, and drilling logs are submitted.
- Monitor, as required, approved land and water management plans under the *Water Act 2000* to ensure risks from irrigation water use are properly managed.

## Compliance projects

Project	Goal	Objectives	Scope	Expected outcomes
Statewide meter compliance project	To reduce the risk of overuse and degradation of the water resource, such as salt water intrusion.	To ensure landholders operate in accordance with their water use entitlements. To inform clients about meter installations and potential impacts on the resource from overuse.	Landholders within metered areas of the state. Meter readings will be reviewed in accordance with water sharing rules, to identify and make landholders aware of potential non-compliance with entitlements. Inspections of works exempt from metering, to determine if still appropriate.	Maximised water resource security. Environmental flow conditions are met.

Further information – *Water Act 2000*, water resource plans, minimum standards for the construction and reconditioning of water bores that intersect the sediments of artesian basins in Queensland.

## Service provision

Providing water, sewerage services and water dam safety is regulated under the *Water Supply (Safety and Reliability) Act 2008*.

Service providers (except recycled water providers) must be registered, and where required, must have approved plans (or exemptions) in place to ensure a continuity of the provision of water and sewerage services.

Owners of water supply referable dams in Queensland are also required to ensure that they meet the requirements of the Act. Guidelines have been written to help clients address their responsibilities.

A shortage of suitably qualified people to help meet legislative requirements or time frames can impact upon the ability of owners of small size referable dams and small and/or remote service providers to meet their obligation. Introducing new requirements for drinking water and recycled water that require incident and water quality reporting has highlighted difficulties in relation to resource availability and workforce skills and capacity. The recent drought has identified the importance of drought management plans in helping service providers ensure they can meet community needs during water supply shortages.

DERM provides general information to service providers and dam owners to help them comply with their regulatory requirements, and works individually and collectively with service providers and dam owners to discuss issues and identify ways to improve compliance.

### **General compliance monitoring or assistance**

- Ensuring primary plans that are due, are received. The main focus for 2010–11 is on drought management plans for larger urban communities, drinking water quality management plans, and recycled water management plans.
- Working with dam owners and key stakeholders to ensure spillway upgrades occur in accordance with the timings approved by DERM.
- Educating, informing and working with drinking water providers to ensure that they:
  - undertake E.coli monitoring at the required frequency and sample numbers
  - report all water quality incidents as required and manage them appropriately
- Monitor and work with service providers with an approved recycled water management plan to ensure they are complying with their plans.

Further information – *Water Supply (Safety and Reliability) Act 2008*.

# Assessment of Formal Investigation Requests

## Information Sheet

The purpose of this document is to outline the considerations used to assess formal investigation requests.

### How Formal Investigation Requests Are Assessed

Upon receipt of a Formal Investigation Request (FIR), the Investigations Team within the Compliance & Investigations Branch assesses a FIR to determine whether the matter should be formally investigated (with a view to producing a full brief of evidence for potential litigation proceedings). The assessment is recorded in a document called 'Assessment Report – Formal Investigation Request'.

The purpose of the assessment is to ensure that DERM delivers proportionate, consistent, transparent, accountable and effective enforcement decisions. This is achieved by directing resources to matters which warrant a formal investigation.

Generally, a decision to commence a formal investigation is made where certain factors indicate that litigation proceedings are warranted. Under DERM's Enforcement Guidelines, litigation proceedings are considered the appropriate enforcement tool in serious matters and/or where dishonesty or wilful conduct is involved.

### Assessment considerations

The assessment of a FIR is based on DERM's Enforcement Guidelines. In particular, the Investigations Team will consider the information provided on a FIR under the following questions:

- Did the conduct involve dishonesty?
- Has there been an attempt to deceive DERM?
- Has DERM been given false or misleading information by the alleged offender?
- Was the conduct wilful (i.e. was it intentional, reckless or negligent)?
- Was the conduct motivated wholly or partly by commercial considerations?
- Was there a failure to assess, manage or mitigate risk associated with the conduct or activity?
- Did the conduct result in commercial gain?
- Did the conduct result in severe or irreversible harm to the environment, natural resources, human health or property?
- Did the conduct have the potential to result in severe or irreversible harm to the environment, natural resources, human health or property?

Affirmative answers to the above suggest that a formal investigation is warranted. A formal investigation is generally required where the conduct concerned is of such a serious nature as to warrant high level enforcement action. Decisions to commence formal investigations will vary depending on the particular circumstances of each case.

There are a number of other factors that will be considered by the Investigations Team when assessing a FIR, such as, the seriousness and nature of the alleged offence, whether the alleged offender has previous history with DERM and the degree of culpability of the alleged offender.

Alternative enforcement tools are evaluated prior to the submission of a FIR and by the Investigations Team when assessing a FIR. Consideration is given to the following:

- Is there an alternative enforcement tool to litigation proceedings which would be an effective means of responding to the non-compliance? Alternative enforcement tools include, for example, education/warning letters, Penalty Infringement Notices, Show Cause Notices or Environmental Protection Orders.
- Is the alternative enforcement action effective in achieving the object of the Act being administered?
- How the alternative enforcement action may be perceived by the public?
- Whether the alternative enforcement action would be a sufficient deterrent?

**Completion of the Assessment**

Following the consideration of a FIR, the Investigations Team will recommend a proposed course of action. Given that every case is different, the assessment of FIRs is flexible to ensure that DERM's enforcement response is proportionate, consistent, transparent, accountable and effective.

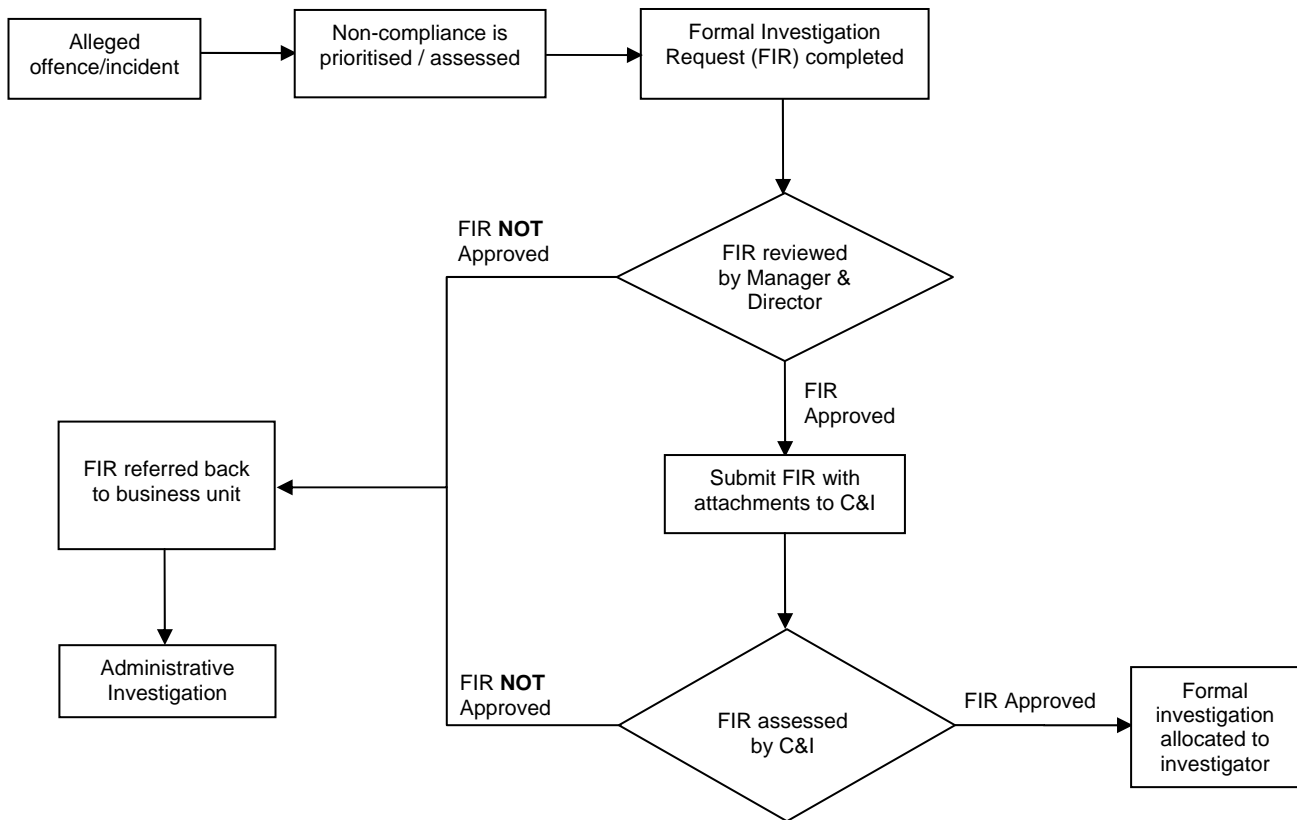

Based on the above, the Investigations Team will recommend whether the FIR should be approved or not approved. Comment may also be made on the type of litigation proceedings or alternative enforcement action that may be appropriate in light of the recommendation.

Decisions will be communicated to key stakeholders to build a greater understanding of decisions following formal investigation requests. Copies of completed assessments are available on request.

**Resources**

Availability of resources within the Compliance and Investigations Branch is also a consideration when assessing a FIR. Matters are prioritised using a state-wide perspective of DERM's compliance priorities.

**Process Overview**

## ASSESSMENT REPORT – FORMAL INVESTIGATION REQUEST

This assessment report documents the recommendation and reasoning of the Investigations Team following the assessment of a Formal Investigation Request.

### 1. DETAILS OF ASSESSMENT

<b>Date</b>	<INSERT date request was received>
<b>Assessing Officer</b>	<INSERT name and position of assessing officer completing this report>
<b>Contact Details</b>	<INSERT phone number and e-mail address>
<b>Timing</b>	<INSERT details including date and reasons of any relevant timeframes> <input type="checkbox"/> Tick this box if the matter <b>urgent</b> (i.e. requires action within 6 months)

### 2. OFFENCE/INCIDENT

Offence	<INSERT details of the alleged offence/incident>
Relevant Legislation	<INSERT offence provision and legislation>
Alleged Offender(s)	<INSERT primary alleged offender and any other potential alleged offenders>

### 3. RECOMMENDATION

<input type="checkbox"/> <b>APPROVE FORMAL INVESTIGATION REQUEST</b> Type of litigation to be considered:
<input type="checkbox"/> <b>NOT APPROVE FORMAL INVESTIGATION REQUEST</b> Recommendations/comments:

### 4. ASSESSMENT

What were the primary considerations for the recommendation?	
What other considerations were relevant to the assessment?	
Comments on availability of other enforcement actions	
Are there any counter productive features/implications of the proposed enforcement action?	

Was there any contact/further information obtained from the DERM officer who submitted the request?	
Is there any further evidence required to support or improve prospects of success for the proposed enforcement action?	
Comments on any relevant DERM material (e.g. Annual Compliance Plan, Compliance Strategy, Enforcement Guidelines)	
Other comments

# Statutory declaration

## Environmental Protection Act

### Auditor/investigator

A statutory declaration is a written statement of facts that is sworn or declared under the Oaths Act 1867. In accordance with section 325 of the Environmental Protection Act 1994, this statutory declaration must be completed by the auditor/investigator who conducted the environmental evaluation. A copy of the environmental report must be attached to this statutory declaration.

## Compliance

### Compliance program — site inspection hazard checklist

*This checklist has been devised to help officers conduct an initial hazard identification and perimeter inspection. (Adapted from the Agency's draft workplace health and safety manual)*

<b>Site use:</b> Consider the industry specific hazards.	<b><i>For industrial sites</i></b>	
	Engineering	<input type="checkbox"/>
	Light manufacturing	<input type="checkbox"/>
	Food processing	<input type="checkbox"/>
	Waste	<input type="checkbox"/>
	Chemical production	<input type="checkbox"/>
	Health/medical	<input type="checkbox"/>
	Other	<input type="checkbox"/> .....
	<b><i>For rural sites</i></b>	
	Farming	<input type="checkbox"/>
Mining	<input type="checkbox"/>	
Quarrying	<input type="checkbox"/>	
Other	<input type="checkbox"/> .....	
<b>Personal protective equipment required:</b>	Safety helmet	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Hearing protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Eye protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Protective clothing	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Protective footwear	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Respiratory protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
	Other	Yes <input type="checkbox"/> .....
<b>Training for site-specific hazards:</b>	Arrange safety induction training with occupier of Site before any work is done	Yes <input type="checkbox"/> No <input type="checkbox"/>

**Compliance program – site inspection hazard checklist**

<b>Hazards to look for on perimeter inspection:</b>	Ground: Uneven/Slippery/soft/unstable/holes/drops	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Water hazards (ponds, dams pools of liquid on the ground)	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Flash flood (creek beds & s/w pipes)(consider weather)	Yes <input type="checkbox"/>	No <input type="checkbox"/>
<b>Structures:</b>	Hazardous means of access and egress	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Platforms/stairs/walkways unstable and poorly maintained/slippery	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Obstacles without guards or barriers from ground level to head height	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	No warning signs, tags or placards visible on fences, buildings, vehicles, containers, tanks, baths or machines	Yes <input type="checkbox"/>	No <input type="checkbox"/>
<b>Biological hazards:</b>	Snakes, guard dogs, bio-wastes	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Evidence of dead fish/vegetation/animals/algae	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Aggressive or violent people (Is police help needed?)	Yes <input type="checkbox"/>	No <input type="checkbox"/>
<b>Hazardous substances:</b>	Dust, spray or vapour evident	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Unusual or unpleasant odours (e.g. hydrocarbons or 'rotten egg gas')	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Presence of gas generation/effervescence from pipes/containers or the ground	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Pesticides, asbestos	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Leaking, damaged or bulging drums	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Discoloured liquids, oil slicks or unknown substances (on ground or in water)	Yes <input type="checkbox"/>	No <input type="checkbox"/>
<b>Machinery:</b>	Indications of explosive atmosphere	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Use of heavy plant and equipment, such as earth moving machinery, forklifts and trucks	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Overhead gantries, cranes and hoists	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Steam outlets/hot pipes/condensate vents	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Air/water/steam hoses	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Electrical cables/overhead/ground	Yes <input type="checkbox"/>	No <input type="checkbox"/>
	Housekeeping, Stable storage of materials (e.g. pallets/timber/bricks)	Yes <input type="checkbox"/>	No <input type="checkbox"/>

**Disclaimer:**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

# Assessment report

Environmental Protection Act 1994

## Clean-up notice

This document is for internal use to assist Environmental Service officers to record the information considered by the Department when forming the decision to issue a clean-up notice.

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Address

**Note:**

1. Assessment reports recommending that a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be approved by the responsible officer, supervisor and the delegated decision maker.

### 1. Brief history of the matter

Outline any historical information relevant to this decision in succinct dot point form.

Outline the historical information in chronological order.

### 2. Grounds for use of clean-up notice

Identify the relevant grounds upon which the decision to use a clean-up notice is based:

- a prescribed person has been identified **and**
- a contamination incident has occurred **and**

- the contamination incident has caused or is likely to cause serious environmental harm **or**
- the contamination incident has caused or is likely to cause material environmental harm.

### 3. Expand upon the grounds

The next step is to expand upon the grounds identified for issuing the clean-up notice. This can include identifying an alleged offence or any statutory requirement which must be met prior to the Department using a clean-up notice.

Each ground should be listed independently and be allocated a separate number.

Number	Specific ground
1	On 1 July 2010, hydrocarbons were observed leaking from the premises of ABC Pty Ltd into Murphy Creek.

### 4. Detail the matters considered

The purpose of the following table is to ensure that there is evidence to support the grounds for using the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed. This section should also record how the Department has met any statutory requirements associated with the use of the tool.

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

Elements of the offence or legislative requirement	Evidence	Facts and circumstances
<i>List the elements of any alleged offence or (for grounds which are not offences) list the legislative requirement to be met by the Department</i>	<i>Identify the information considered which is relevant to the elements or requirement (i.e. statements, photographs and recordings)</i>	<i>Detail the facts and circumstance that support the Department's findings.</i>
<b>Number 1</b> (Number taken from Section 2)		
1 July 2010	Notes from phone call from Mrs Green reporting the incident in file no: 1234	The Department received a telephone call from Mrs Green reporting that waste has been leaking into Murphy Creek.
Premises at 123 Creek Road, Murphyville.	Title search of Lot 123 on RP 45678, more particularly known as 123 Creek Road, Murphyville.	ABC Pty Ltd is the registered owner of 123 Creek Road, Murphyville.
2 July 2010	Photographs (x24) of Murphy Creek	Photographs show a thick, grey liquid

	and the area to the rear of premises situated at 123 Creek Road, Murphyville.	flowing from the rear of the premises at 123 Creek Road, Murphyville.
2 July 2010	Water samples taken	Water samples indicate that the liquid escaping from the premises at 123 Creek Road is a crude oil containing a variety of toxic hydrocarbons that meet the definition of contaminant under s11 of the Act.  This liquid is leaking from storage tanks situated on the premises owned by ABC Pty Ltd at 123 Creek Road, Murphyville.
Identified the prescribed person	ASIC company search of ABC Pty Ltd.	ASIC company search shows that Mr John Paul Citizen is the sole director/secretary of ABC Pty Ltd.  Mr Citizen is the prescribed person for the contamination incident.

## 5. Natural justice

The responsible officer is required to notify the prescribed person that the Department is considering issuing a clean-up notice and that the person is welcome to make representation to the Department as to why this action should not be taken. Any information provided by the prescribed person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- All information and/or defenses provided were considered.  
Describe any information or defenses provided.
- The Department has considered the information or defences provided.  
What consideration was given and what conclusions has the Department formed?
- The decision maker and responsible officer are free from bias or the perception of bias.

## 6. Recommended actions of the clean-up notice

List the proposed requirements of the clean-up notice below. In order to ensure conditions are enforceable, they should be SMART (specific, measureable, achievable, relevant and time specific). Refer to the *writing effective and enforceable conditions* procedural guide for more information on writing conditions and requirements.

To ensure the requirements are reasonable officers will need to provide justification for the inclusion of the requirement.

Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification

## 7. Recommended decision

I, the responsible officer recommend a decision that a clean-up notice be issued in relation to the allegation.

## 8. Approval

Responsible officer	Supervisor
<b>Print name:</b> Name	<b>Print name:</b> Name
<b>Date:</b> Date	<b>Date:</b> Date

Delegate decision maker	Approve/reject recommendation (circle one)
<p><b>Reasons for decision</b></p> <p>I approve this recommended decision based upon the information set out above.</p> <p>Or, I approve this recommended decision for the reasons set out above and I note Mr Citizen has previously received a warning letter in relation to this matter.</p> <p>Or, I reject the above recommended decision as I consider it more appropriate for the Department to take an educational approach to this breach.</p>

# Procedural guide

*Environmental Protection Act 1994*

## Clean-up notice

*This document is for internal use to assist Environmental Services officers in completing a clean-up notice pursuant to ss 363F to 363L of the Environmental Protection Act 1994.*

### What is a clean-up notice?

A clean-up notice is a written notice which may be issued by the Department of Environment and Resource Management (the Department) to a person reasonably believed to be a prescribed person for a contamination incident.

The legislative provisions in regard to clean-up notices may be found in Chapter 7 part 5B, ss363F to 363L of the *Environmental Protection Act 1994* (the Act).

### Who is a prescribed person?

A *prescribed person* for a contamination incident includes each of the following persons (s363G)—

- a person who caused or permitted the incident to happen
- a person who at the time of the contamination incident was the occupier of the place where the incident occurred
- the person who owns, or is in control of, a contaminant involved in the incident
- if a clean-up notice is issued to a corporation (the first corporation) and it fails to comply with the notice:
  - a parent corporation of the first corporation and
  - an executive officer of the first corporation.

### What is a contamination incident?

The legislation defines a *contamination incident* as an event, involving the release (whether by act or omission) of a contaminant into the environment, that the Department is satisfied has caused or is likely to cause serious or material environmental harm.

A contaminant is defined in s11 of the Act as:

- a gas, liquid or solid
- an odour
- an organism (whether dead or alive), including a virus
- energy, including noise, heat, radioactivity and electromagnetic radiation or
- a combination of contaminants.

### What is serious environmental harm?

*Serious environmental harm* is defined in s17 of the Act as environmental harm (other than environmental nuisance)—

- that is irreversible, of a high impact or widespread or
- caused to an area of high conservation value or special significance or
- that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$50,000) or
- that results in costs of more than the threshold amount (\$50,000) being incurred in taking appropriate action to:
  - prevent or minimise the harm and
  - rehabilitate or restore the environment to its condition before harm.
  -

### What is material environmental harm?

Section 16 of the Act defines *material environmental harm* as environmental harm (other than environmental nuisance)—

- that is not trivial or negligible in nature, extent or context or
- that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$5,000), but less than the maximum amount of (\$50,000) or
- that results in costs of more than the threshold amount (\$5,000) but less than the maximum (\$50,000) amount being incurred in taking appropriate action to:
  - prevent or minimise harm and
  - rehabilitate or restore environment to its condition before the harm.

### When should I use a clean-up notice?

The legislation (s363H(1) of the Act) specifies that the clean-up notice may be issued to a prescribed person for a contamination incident to require the person to take action to—

- prevent or minimise contamination or
- rehabilitate or restore the environment because of an incident, including by taking steps to mitigate or remedy the effects of the incident or
- assess the nature and extent of the environmental harm, or the risk of further environmental harm, from the incident, including by inspecting, sampling, recording, measuring, calculating, testing or analysing or
- keep the Department informed about the incident or the actions taken under the notice, including by giving to the Department stated reports, plans, drawings or other documents.

## How do I successfully issue a clean-up notice?

Officers must complete an assessment report to document the decision to issue a clean-up notice as well as completing the clean-up notice.

### Step 1 – Complete the assessment report

Before completing the clean-up notice officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter, and documents the decision-making process used by the Department in determining to issue a clean-up notice.

The assessment report is not intended to replicate the Departmental file. Rather it is designed to capture all critical aspects that have led to the Department's decision. Accordingly, the information included should be limited to relevant points only. A template assessment report is attached [\[LINK\]](#).

#### 1. Brief history of the matter

Outline briefly any historical information relevant to this decision, using succinct chronological dot points, and include how the Department became aware of the alleged incident.

#### 2. Grounds for issuing a clean-up notice

Section 363H(1) of the Act provides that a clean-up notice can only be issued in certain circumstances. Please identify the relevant situation or 'grounds' upon which the decision to use a clean-up notice is based.

A clean-up notice may be issued if there has been:

- an incident involving contamination of the environment
- that the Department is satisfied has caused or is likely to cause:
  - serious environmental harm or
  - material environmental harm.

To determine whether an incident has caused or is likely to cause either serious environmental harm, or material environmental harm, officers should consider the context of the contamination incident, the harm caused and its associated long-term effects on the environment.

#### 3. Expand upon the grounds

The purpose of this section is to clearly identify what the Department must 'prove' before deciding to use a clean-up notice and should be used to expand upon the grounds which have previously been identified. This should include the statutory requirements which must be met by the Department prior to issuing a clean-up notice.

Each ground (including breaches or requirements) should be allocated a separate number.

#### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the breach and/or the grounds to the evidence gathered and the conclusions formed. This is achieved by identifying: the elements of any specific breach or allegation, the evidence which has been considered for each element, and the conclusion that has been reached by the officer.

When documenting the evidence considered, officers should provide relevant points only. Information can include (but is not limited to):

- notes recorded in an officers official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents and
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

#### 5. Provide for natural justice

Prior to the Department making a decision which may adversely impact on an individual or group the Department must:

- **Notify** - Notify the individual that the Department is considering making adverse findings.
- **Respond** - Provide the individual with an opportunity to respond to the allegation.
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

#### 6. Proposed actions

A clean-up notice must state the actions required of the prescribed person. The officer is responsible for developing proposed requirements for consideration by the delegate. Officers must consider the provisions of s363H1(1) which provides that the clean-up notice must state the actions required of the person in order to—

- prevent or minimise contamination or
- rehabilitate or restore the environment because of an incident, including by taking steps to mitigate or remedy the effects of the incident or
- assess the nature and extent of the environmental harm, or the risk of further environmental harm, from the incident, including by inspecting, sampling, recording, measuring, calculating, testing or analysing or

- keep the Department informed about the incident or the actions taken under the notice, including by giving to the Department stated reports, plans, drawings or other documents.

As prescribed persons are able to seek a review of the Department's decision to impose one or more actions, it is necessary for officers to provide justification for the inclusion of conditions/required actions. Section 363H(7) of the Act provides that actions required of the prescribed person include achieving outcomes.

Requirements must be specific, measureable, achievable, relevant to the breach and time specific. When considering the reasonableness of proposed timeframes for the completion of requirements, officers should take into account all the circumstances, having regard to the actions the recipient must take (including the risk of further harm being caused by the incident). If the location is geographically isolated, the Department should consider allowing additional time to secure appropriate contractors. The notice may also include other relevant information such as how the Department intends to monitor compliance with the clean-up notice, including by using powers under chapter 9 of the Act.

For example:

<p><i>By 24 July 2010, ABC Pty Ltd must repair the leaking bunding surrounding tanks 36 and 45 containing wood preservative pentachlorophenol (PCP). The repair work must be certified by a technical engineer to be structurally sound and guaranteed for a minimum of 5 years.</i></p>	<p><i>The leaking bunding has caused chemical waste to leak from the chemical waste tanks, out of the premises of ABC Pty Ltd and into Murphy Creek causing serious environmental harm. The bunding has been temporarily patched, but must be properly prepared to prevent further incidents of chemical waste leakage.</i></p>
--	---

A template clean-up notice is attached [\[LINK\]](#). Partial

### **If the recipient of the notice is not the owner of the land on which action is required**

If the clean-up notice requires the recipient to take action on land that the recipient does not own, officers must refer to the steps listed below that must be taken in this situation and the additional requirements as outlined in s363J of the Act

The recipient may enter the land to take the action only with the consent of the owner and occupier of the land, or if the recipient or contractor has given at least 5 business days written notice to the owner and occupier.

The notice must inform the owner and occupier of:

- the intention to enter the land and
- the purpose of the entry and
- the days and times when the entry is to be made.

All reasonable steps must be taken to ensure that any inconvenience or damage is kept to a minimum. Section 363J of the Act recipient does not authorise the recipient to enter a building used for residential purposes. If a person incurs loss or damage because of action taken by the recipient, the person is entitled to be paid by the recipient the reasonable compensation for the loss or damage.

## **7. Recommended decision**

The responsible officer is required to make a recommended decision to issue a clean-up notice in relation to the alleged breach. For example:

*It is the opinion of the Department that the contamination incident that occurred at the ABC Pty Ltd site on 24*

*Jones Road has caused serious environmental harm. It is recommended that a clean-up notice be issued.*

Administrative decisions are made based upon the balance of probabilities. This means that the decision-maker must be able to determine whether, based upon the information available, it was more likely than not that the event occurred.

Officers are encouraged to consider alternative actions/tools, Departmental enforcement guidelines and details of any consultations including site visit details.

## 8. Approval

The assessment report and decision to issue a clean-up notice must be approved by an appropriately delegated officer. As the individual (or position) that holds delegation changes regularly, officers must review the Department's list of delegations at <http://insite2.dnr.qld.gov.au/derm/delegations/>. The clean-up notice should be signed by the delegated decision-maker in conjunction with the assessment report which records the formal decision. Decisions made by individuals who do not have the delegated authority to make the decision are generally found to be invalid.

### Step 2 - Complete the clean-up notice

The tool must meet a number of legislative requirements in order to be legally binding. Section 363H(2) of the Act provides that a clean-up notice must include the following information –

- the name of the recipient (if there is more than one recipient, each recipient must receive a notice)
- a description of the contamination incident
- the place at or from which the Department is satisfied the incident happened
- the actions the recipient must take (this can include achieving outcomes)
- for each action, the time by which it must be taken.
- that it is an offence for the recipient not comply with the notice unless the recipient has a reasonable excuse
- the maximum penalty for the offence
- that, if the recipient does not comply with the notice, an authorised person may take any of the actions stated in the notice and the Department may recover from the recipient the cost incurred in taking the actions
- the name, address and contact details of the Department
- the review or appeal details.

The legislation (s363H(j)) specifies that the notice must include the review or appeal details. Basic information regarding the review and appeal process is included in the template notice. As well, a copy of the information sheet [Internal review \(DERM\) and appeal to Planning & Environment Court](#) should be attached to the clean-up notice.

## Service of the clean-up notice

Service means delivery to the party who will be affected by the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. The following methods of service are acceptable

- For a person:
  - by delivering it to the person personally, or
  - by leaving it at, or by sending it by pre-paid registered post to, the place of residence or business of the person, or
- For a body corporate - by leaving it at, or sending it by pre-paid registered post to, the head office, a registered office or a principal office of the body corporate.

If a notice is issued to two or more recipients, a copy must be given to each recipient (s363I(5) of the Act).

The method of service should be documented by contemporaneous notes, a file note, or any receipts arising from the postage. In particular, officers should record the date, time and method of service. Sending the notice by registered post with confirmation of delivery is good practice to ensure that the notice has been delivered to the recipient.

## What follow-up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the clean-up notice is issued is complying with any requirements imposed. Follow-up is to be scheduled by the relevant officer and their manager. The manager is responsible for ensuring follow-up is undertaken.

This is usually achieved by a site inspection to be conducted one week after the time period nominated in the notice has expired.

Officers are encouraged to use tools such as diary reminders to ensure the matter is followed up in a timely manner.

If the recipient does not comply with the notice, an authorised person may take any of the actions stated in the notice as outlined in s363K of the Act. The Department may recover from the recipient the cost incurred in taking the actions.

## What are my record-keeping responsibilities?

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). A hard copy of the signed assessment report and any accompanying documents should be placed on the paper file. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

## Making changes to an issued clean-up notice

If minor changes, or an extension of time are required, the prescribed person should be notified in writing. If significant amendments are required, officers should, in order to avoid confusion, repeal (revoke) the original clean-up notice, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh clean-up notice should be carried out in the same way and subject to the same conditions as the issuing of the original clean-up notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal or higher to that of the original decision-maker.

Officers should also update and record changes or the decision to repeal and reissue the clean-up notice in EcoTrack.

## Review of decisions and appeals

The provisions regarding review of decisions and appeals may be found in Chapter 11, part 3 of the Act. A review of the decision does not stay the operation of the clean-up notice.

The Act specifies that a person who is dissatisfied by a decision by the Department in respect to a clean-up notice may apply for a review of an original decision by submitting an application on the approved form to the Department:

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or
- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the court extends the period.

The court may grant a stay of the decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## What options exist for responding to non-compliance with a clean-up notice?

It is an offence under s363I of the Act not to comply with a clean-up notice without reasonable excuse. The maximum penalty for non-compliance is 2000 penalty units (\$200,000) for an individual or 10,000 penalty units (\$1,000,000) for a corporation.

### Defences

The recipient of a clean-up notice must comply with the notice, unless the recipient has a reasonable excuse. It is a reasonable excuse not to comply with a notice if it requires information that might incriminate the person to whom it was issued (s363I of the Act).

In a proceeding regarding non-compliance with a clean-up notice, s363I(3) provides that it is a defence for the recipient of the clean-up notice to show that—

- the recipient of the cost recovery notice is not a prescribed person
- the contamination incident was caused by a natural disaster
- the contamination incident was caused by a terrorist act or act of sabotage that the recipient had taken all reasonable measures to prevent
- the recipient is a parent corporation of a first corporation and has taken all reasonable steps to ensure that the first corporation has paid the amount claimed in the cost recovery notice served upon it
- the recipient is an executive officer of a first corporation that the recipient:
  - has taken all reasonable steps to ensure that the first corporation has paid the amount claimed in the cost recovery notice served upon it or
  - was not in a position to influence the first corporation in relation to its compliance with the clean-up notice.

### Cost recovery notice

The Department may issue a cost recovery notice to the recipient of a clean-up notice in the following circumstances—

- if a person who has been given a clean-up notice fails to comply with it and a person or contractor authorised by the Department carries out the actions stated in the clean-up notice pursuant to s363K or
- if a decision to issue a clean-up notice is stayed whilst the recipient appeals the decision, and during the period of the stay an authorised person or contractor carries out the actions stated in the clean-up notice pursuant to s363K, and either the appeal ends without an appeal decision or the decision confirms the decision to issue the clean-up notice.

If either of the above circumstances apply, a cost recovery notice may claim a stated amount for costs or expenses reasonably incurred—

- for taking an action stated in the clean-up notice or
- for monitoring compliance with the clean-up notice.

For the further information see the attached procedural guide for cost recovery notices [\[LINK\]](#).

# Notice

## Environmental Protection Act 1994

### Clean-up notice

*This clean-up notice is issued by the administering authority pursuant to ss363F to 363L of the Environmental Protection Act 1994 to advise you of a decision to require you to take particular action in regard to a contamination incident.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our reference: Our reference

**Take notice** that under the Environmental Protection Act 1994 (the Act) a clean-up notice is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

The clean-up notice is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of the premises/place (the place).

#### A. Grounds

The clean-up notice is issued on the following grounds:

- A contamination incident has occurred. Describe the contamination incident.
- State the place at which the contamination incident has happened or is happening.
- You are a prescribed person for a contamination incident pursuant to s363G of the Act.

The facts and circumstances forming the basis for these grounds are:

- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.

## **B. Actions**

You are required to do the following:

- Insert the requirements that are necessary to prevent or minimise environmental harm.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific. If the recipient is required to take action on land that the recipient does not own, refer to the steps that must be taken in this situation and the additional requirements that are necessary.
- Insert the requirements that are necessary to prevent or minimise environmental harm.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- Insert the requirements that are necessary to prevent or minimise environmental harm.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- Insert the requirements that are necessary to prevent or minimise environmental harm.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.

**Take notice** that:

- The requirements of the clean-up notice take effect immediately upon service of the notice.
- This notice remains in force until further notice from the administering authority.

## **C. Appeal rights**

If you are dissatisfied with the decision to issue this clean-up notice, you may apply to the Department for a review of the decision within 10 business days of the service of the order. You may also apply to the court for a stay of the decision to issue the clean-up notice.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Further information about the review and appeal process is attached to this notice.

However, the information provided above should be considered as general advice only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

## **D. Penalties**

You must comply with the clean-up notice unless you have a reasonable excuse. The maximum penalty for non-compliance is \$200,000.

If you do not comply with the clean-up notice, an authorised person may take any of the actions stated in the notice and the Department may recover from you the costs incurred in taking the actions.

Should you have any queries in relation to this notice, please do not hesitate to contact name of officer of the Department on telephone number telephone number who would be happy to assist you.

## Environmental Services

### Clean-up Notice

*This statutory notice is issued by the administering authority pursuant to section 363H of the Environmental Protection Act 1994, to advise you of a decision that requires you to take particular action in respect of a contamination incident.*

<INSERT recipient's name>  
<INSERT street address>  
<INSERT suburb, State and postal code>

Your reference: <INSERT>

Our reference: <INSERT>

**TAKE NOTICE** that under the provisions of the *Environmental Protection Act 1994*, a Clean-up Notice is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management.

The Clean-up Notice is issued to <<Name of person/entity>> in respect of a contamination incident at <<State premises/place>> on land described as <<select ONE ONLY>> Lot ## on RP ##### situated at address OR description of locality e.g. causeway of Xyz Highway over Abc Creek to <<select ONE OR MORE>> to prevent or minimise the contamination; to rehabilitate the environment because of the incident, including by taking steps to mitigate or remedy the effects of the incident; assess the nature of the environmental harm from the incident, including by inspecting, sampling, recording, measuring, calculating, testing or analysing; keep the administering authority stated reports, plans, drawings or other document.

#### A. Grounds

The Clean-up Notice is issued on the following grounds:

- That a contamination incident <<select ONE ONLY>> is occurring OR has occurred, meaning an incident, involving contamination of the environment, that the administering authority is satisfied has caused or is likely to cause serious or material environmental harm.
- <<State name of person/entity>> <<select ONE ONLY>> is causing or permitting OR has caused or permitted the incident to happen.
- The contamination incident forming the basis of these grounds are:

<<Describe the contamination incident that triggered the notice.>>

#### B. Requirements

**Pursuant to this Clean-up Notice you are required to perform the following actions by the time indicated for each action:**

- (1) <<State action and time>>;
- (2)

#### C. Penalty

**The maximum penalty for failure to comply with a Clean-up Notice is \$200,000 for an individual or \$1,000,000 for a company.**

And also **TAKE NOTICE** that:

1. The requirements of this Notice take effect immediately upon service of the Notice.
2. Failure to comply with this Clean-up Notice, without reasonable excuse, is an offence under the *Environmental Protection Act 1994*.
3. Pursuant to section 363J of the *Environmental Protection Act 1994*, if the actions required in this Clean-up Notice requires the recipient to take action on land that the recipient does not own, the recipient (or person taking action for the recipient i.e. contractor) may enter the land to take the action only:
  - a. with the consent of the owner and occupier of the land; or
  - b. if the recipient or contractor has given at least five (5) business days written notice to the owner and occupier.
4. If this Notice is not complied with, the administering authority may take any of the actions stated in the Notice and may recover from the recipient the costs incurred in taking those actions.
5. There is no right for review of this Notice.
6. You may apply for an appeal against the decision to issue the Clean-up Notice within twenty-two (22) business days of the service of this Notice. Information regarding appeals is attached to this Notice.

## **EXTRACTS FROM THE ACT REGARDING APPEALS**

### **Who may appeal**

- 531** (1) A dissatisfied person who is dissatisfied with a review decision, other than a review decision to which subdivision 1 applies, may appeal against the decision to the Court.
- (2) The chief executive may appeal against another administering authority's decision (whether an original or review decision) to the Court.
- (3) A dissatisfied person who is dissatisfied with an original decision to which section 521 does not apply may appeal against the decision to the Court.

### **Stay of operation of decisions**

- 535** (1) The Court may grant a stay of a decision appealed against to secure the effectiveness of the appeal.
- (2) A stay may be granted on conditions the Court considers appropriate and has effect for the period stated by the Court.
- (3) The period of a stay must not extend past the time when the Court decides the appeal.
- (4) An appeal against a decision does not affect the operation or carrying out of the decision unless the decision is stayed.

### **Stay of decision to issue a clean-up notice**

- 535A** (1) This section applies to an application under section 535 for a stay of a decision to issue a clean-up notice.
- (2) In deciding the application, the Court must have regard to—
- (a) the quantity and quality of contamination of the environment that is likely to be caused if the stay is granted; and
  - (b) the proximity of the place at or from which the contamination incident is happening or happened to a place with environmental values that may be adversely affected by the contamination.

## Compliance inspections (Level A, B and C)

*This procedural guide is for internal use to assist Environmental Services officers when preparing for and undertaking compliance inspections. It also provides guidance relating to post-inspection activities.*

### Who does the Department inspect?

In the context of these guidelines, the Department inspects (or audits) organisations or individuals carrying out activities that are regulated by the *Environmental Protection Act 1994* (the Act).

### What is a compliance inspection?

A compliance inspection is a systematic, independent and documented assessment of an environmentally relevant activity (ERA) or other activity to assess compliance with conditions in the relevant approval and/or the Act, its regulations and any other document that sets a standard of environmental performance.

### What is the purpose of compliance inspections?

There are a number of reasons why the Department carries out compliance inspections of sites that it licenses:

- They enable the Department to measure the performance of individual operators, and to find out whether they are complying with their approval conditions or other legal requirements.
- They can reveal strategic or systemic issues with a particular industry or client group, and can allow the Department to address those issues before they become larger problems.
- They increase the Department's profile in the community, and demonstrate that the Department is actively managing activities that pose a threat to environmental values. This increased profile can also deter people from breaching their obligations.
- They can reveal whether people are carrying out activities without the necessary approvals.

It is important to remember that compliance inspections are fact-finding exercises. The aim of inspections is to gather information that allows the Department to fulfil one of the objectives set out above. Inspections are not tools designed to penalise bad behaviour, however they can be the catalyst for doing so and may act as a deterrent.

### What are the types of compliance inspections?

There are three types of compliance inspections in the Department. They are **Level A (basic inspections)**, **Level B (condition inspections)** and **Level C (audits)**.

To determine whether a Level A, Level B or Level C inspection is triggered by a particular circumstance, refer to the [Procedural guide - Risk Assessment \(ERA and non-ERA industry/business activities\)](#) and the [Risk Assessment Tool \(ERA and non-ERA industry/business activities\)](#)

### What is a Level A (basic) inspection?

Level A inspections are compliance inspections at the lowest level of detail for Departmental interests. They often involve a single issue and require minimal planning.

The **types of site** that Level A inspections relate to include:

- low or medium risk sites (identified as such using the Risk assessment (ERA and non-ERA) industries/business activities procedural guide and Risk assessment tool ) or non-regulated sites
- non-licensed, pre-licensed or licensed sites
- sites where the degree of compliance is often unknown.

The **trigger or scope** for conducting a Level A inspection can include:

- responding to a public report or complaint
- responding to industry self-reporting, for example validating aspects of annual returns or permit applications
- checking compliance with one condition of an approval which requires only a simple observation.

The **objectives** of a Level A inspection are to:

- physically verify that corrective actions have been carried out (e.g. in response to a simple enforcement tool like a penalty infringement notice or environmental protection order)
- assess the risk and determine need for and extent of further compliance inspections.

The **methodology** involved with conducting a Level A inspection may include:

- carrying out low-level planning and record keeping
- conducting a visual examination, possibly just a drive-by.

### What is a Level B (condition) inspection?

Level B Inspections are the most common level of inspection undertaken at licensed premises. They involve an assessment of compliance with regulations, licences and standards.

The **types of site** that Level B inspections relate to include:

- non-licensed or licensed sites
- medium or high risk sites (identified as such using the Risk assessment (ERA and non-ERA) industries/business activities procedural guide and Risk assessment tool)
- where there is an unknown or fair degree of compliance usually exhibited by the site.

The **trigger or scope** for conducting a Level B inspection can include:

- proactive monitoring programs and related follow-up (e.g. industrial estate, water catchment, or industry sector inspection programs)

- the need to review specific processes or discharges that relate to a proactive monitoring program and
- the need to physically verify that corrective actions have been carried out in response to a more complex enforcement tool issued by the Department (e.g. an Environmental Evaluation).

The **objectives** of a Level B inspection are to:

- determine whether the conditions of development approvals are being complied with and that they are valid, achievable, relevant and include required monitoring programs
- review the history of legislative compliance including prior enforcement action and public complaints
- review statutory licences, whether they are correct and current
- review other regulatory requirements, for example waste tracking, National Pollutant Inventory reporting, contaminated land site-based management plans and the general environmental duty and
- assess regulatory system effectiveness across an industry, including consistency, validity, relevance, achievability, enforceability, and degree of protection.

The **methodology** for conducting a Level B inspection includes:

- carrying out medium-level planning and record-keeping and
- using professional judgement and observations to assess compliance, which needs to be based on facts. The assessment will consist of observations, inquiry, analytical procedures and discussion related to information supplied by the operator.

### What is a Level C (audit) inspection?

Level C inspections are the highest and most detailed level of compliance assessment that the Department will undertake. They usually involve a comprehensive audit of the whole site's operations. They require detailed planning and assessment.

The **types of site** to which Level C inspections relate include:

- licensed sites
- medium or high risk (identified as such using the Risk assessment (ERA and non-ERA) industries/business activities procedural guide and Risk assessment tool)
- sites that have exhibited a poor degree of compliance in the past.

The **trigger or scope** for conducting a Level C inspection can include:

- the need for proactive maintenance inspections of high-risk sites
- the need to focus on all activities, processes and discharges when generally chronic issues exist (comprehensive audit) or
- the need to examine specific processes or discharges when generally acute problems exist (focused audit).

The **objectives** of a Level C compliance inspection are to:

- review the history of the site's legislative compliance including prior enforcement action and public complaints
- review the site's statutory licences/development approvals (e.g. whether they are correct and current)

- review whether conditions of statutory licences/development approvals are SMART (specific, measurable, achievable, relevant and time-specific)
- review whether all conditions of statutory licences/development approvals are being complied with by the site
- review other regulatory requirements (for example, waste tracking, National Pollutant Inventory reporting, contaminated land site-based management plans and the general environmental duty)
- assess regulatory system effectiveness across an industry, including consistency, validity, relevance, achievability, enforceability, and degree of protection
- review the site's ability to meet future standards
- review the site's management and operating practices including:
  - staff training
  - public relations policies
  - processes for the minimisation of risks (e.g. emergency response procedures, handling/storage and transfer of hazardous materials)
  - encroaching residential areas or conflicting industries
  - maintenance procedures
  - sustainable practices (e.g. source of raw materials, minimise/ reuse/recycle materials, disposal of wastes) and
  - the adequacy of applicable financial assurance.

The **methodology** for conducting a Level C inspection includes:

- carrying out high-level planning and record-keeping
- using objective evidence to verify compliance (in relation to monitoring, for example, verification and assurance that the monitoring is being carried out, that the results are within acceptable limits or to recognise where they exceed and that monitoring will continue within the parameters set by the permits)
- using a multidisciplinary team
- taking samples and
- conducting the inspection over a specified period of time (e.g. a number of days).

## The inspection process

The inspection process involves different tasks which are sub-divided into the following:

1. pre-inspection activities
2. on-site inspection activities and
3. post-site activities.

An inspection is not restricted to the site visit and it is essential for officers to carry out careful and thorough planning before conducting on-site activities, particularly for Level B and C inspections. Priority should also be given to the post-inspection evaluation and report, which are as vital to the improvement of environmental performance as the site visit itself.

Officers should consult with their managers and exercise discretion when deciding upon a timeframe (e.g. for issuing a notice for an inspection, sending a follow-up compliance letter or finalising the inspection report). The following time-frames are best practice guidelines, however the circumstances will determine when these actions are achieved.

## Pre- inspection activities

Good planning and preparation are vital to a successful inspection. Departmental officers need to have thorough knowledge of the applicable legislation as well as obtaining and studying any development conditions, site-based management plans, policies, standards or codes that apply.

### Step 1 - Collect and review background information

The purpose of obtaining and reviewing background information is to assemble relevant information that can be used to meet the objectives of the compliance inspection. The collection and review will enable the inspection team to become familiar with the client's operations, the statutory requirements and other regulations or standards that may apply. The **compliance inspections toolkit** is located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet and provides a template to record preliminary information, which includes:

- **Part A - general information** (company name, development approval/environmental approval number, description of the ERA etc)
- **Part B - pre-inspection considerations** (environmental risk of the site, history of the activity carried out at the site, industry specific hazards (i.e. need for personal protective equipment or site inductions).

Other types of information that could be collected or reviewed include:

- site details, such as maps, aerial photographs and process descriptions
- operating standards, site-based management plans and procedures
- company environmental policies, guidelines and technical information about the process and operations carried out on site
- monitoring data relevant to the inspection
- annual reports and other statutory requirements
- main environmental issues that relate to the client's industry and any community concerns
- technical information about the processes and operations
- industry best practice and relevant standards and
- the client's working language in the event that an interpreter may be needed..

### Step 2 – Determine the objectives and scope of the site inspection

Officers should be clear on the objectives of the inspection and what they are hoping to achieve. Objectives could include assessing compliance with approval conditions, checking compliance with a statutory notice (such as an environmental protection order) or responding to a complaint.

The scope of the inspection defines the extent and boundaries of the inspection, including:

- the physical location of the inspection (for example, a particular site or part of a site)
- organisational units, activities or processes to be inspected and
- whether any samples will be taken.

The scope and objectives should be recorded in **Part C** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

### Step 3 - Determine the inspection agenda and timetable

The inspection timetable should include:

- the date(s) and locations of on-site activities to be carried out during the inspection (such as meetings or taking samples)
- the expected time and duration of each activity.

This information should be recorded in **Part C** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

### Step 4 – Determine the roles and responsibilities of the inspection team

Generally a minimum of two officers should undertake an inspection. The size of the team should be scaled up or down depending upon the level of inspection, complexity of the activity and experience of the inspection team. For more complex Level B and C inspections the team members may include:

- inspection leader
- team members
- technical specialists and
- officers from other relevant agencies.

The inspection leader must be an authorised person under s445 of the Act, and must be confident in his or her abilities to exercise the powers of an authorised person lawfully and ethically.

The inspection leader should determine whether other personnel should be involved in the inspection process. Other officers who have a working knowledge of the site should be involved in the process from the outset to help with inspection planning, provide background information, and if necessary, attend the inspection. Team members may assist with inspection evaluations, comment on draft reports and provide input to the follow-up action required. Inspection team members are not required to be authorised persons.

It is important that the roles and responsibilities of the officers who will be taking part in the inspection are clearly defined and are understood by everyone. Roles and responsibilities should be documented as part of the pre-inspection checklist, and discussed during the pre-inspection briefing. If necessary, a pre-inspection briefing should be held to make sure that everyone understands their role.

Technical experts may be called in to provide specialist knowledge. They may accompany the team on the inspection if required or be referred to when necessary.

The inspection leader should be mindful that the Department is not the only regulatory authority. It may be appropriate where possible to run the compliance inspection in association with other regulatory authorities, for example Work Place Health and Safety, Hazardous Industries Chemicals Branch (HICB)), Queensland Health and Local Government.

The inspection leader should be fully knowledgeable of the inspection scope and criteria, lead the site inspection and be the main point of contact between the site operator and the inspection team on the day.

This information should be recorded in **Part C** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

### Step 5 - Identify the conditions for assessment

**Part D** of the **compliance inspections toolkit** breaks down the conditions of any development approvals, authorities or other permits into their elements. This ensures that all aspects of each condition are dealt with during the inspection. It is a tool that helps the inspection team to assess whether any of the conditions have been breached.

It is important to remember that checklists are designed to help the inspection team complete the inspection thoroughly. They should not be applied rigidly, and something found during an inspection should not be ignored just because it is not on a checklist.

A sample checklist, showing a condition broken down into its elements, is set out below. If it would assist the person conducting the inspection, the elements could also be framed as questions, such as:

- Is there dried sewage sludge on the site?
- Is it stockpiled in a bunded area?
- Is it stockpiled in such a way as to prevent stormwater contamination being released off the site?

During the compliance inspection, observations are made for each element and/or question and recorded in the row below, followed by any options for remediation that are needed in order for the client to achieve compliance with the condition. Breaking down the condition in this way makes it easier to turn attention to all the elements of the condition, and to assess the client's performance against the condition.

When developing a checklist, the inspection leader should consider the experience and knowledge of the officer who will be using it, and also the environmental risks of the site to be inspected. This will enable the inspection leader to select the appropriate level of detail for the checklist. Experienced officers can use a checklist of all the topics to be covered during the course of an inspection without details about how to undertake each one. Less-experienced officers should use a detailed checklist of everything they need to know and do. This allows them to undertake inspections with less supervision from more experienced colleagues.

Sample checklist:

Condition number: 417C	Compliant: Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>	Photos taken Y/N
Element/question		
<i>Dried sewage sludge - must be stockpiled in a bunded area to prevent stormwater contamination from being released off-site.</i>		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		

### Step 6 - Consider workplace health and safety

The safety and security of all officers involved in the inspection is paramount. The inspection leader is required to make sure that any workplace health and safety issues that may arise during the inspection are identified and dealt with. This may include speaking with officers who are familiar with the site, and completing a job safety analysis. For information about completing a job safety analysis, refer to the [Procedural guide - Safety and Risk Management - Job Safety Analysis](#).

Each inspection must be assessed to determine whether there are any potential barriers to its successful execution. The inspection leader should be aware of any occupational health and safety requirements for entry to the site and whether appropriate staff will be available or bad weather will significantly hamper the inspection. The inspection leader responsible for the site or area will know about any basic requirements for entry to a site or if there are any other routine operational procedures that may affect the inspection (e.g. hours of operation are limited to weekdays, appropriate personal protective equipment is necessary, etc). The inspection leader must ensure that all officers are equipped with appropriate personal protective equipment (PPE) prior to attending the inspection site.

### Step 7 – Provide prior notice of the inspection

Inspections in response to a complaint or incident may be undertaken with little or no notice to the client. However, with planned compliance inspections, prior notification of the inspection is given, generally resulting in the client preparing for the inspection which may involve a cleaning-up of the sites, a positive environmental outcome in itself.

For Level B and C inspections, a pre-inspection letter should be prepared and forwarded to the site operators/owners at least four weeks prior to the inspection. For Level A inspections, a pre-inspection letter should also be sent to the site operators/owners no less than one week prior to the inspection.

A pre-inspection template letter is available on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet. The letter outlines the purpose of the inspection along with the areas to be covered and any information requirements. If the inspection leader has reasonable grounds for believing that providing notice of the intended inspection will jeopardise the effectiveness of the inspection, he or she should discuss the matter with his or her manager and obtain the manager's approval to conduct the inspection without notice. Where an inspection without notice is required because of concerns about the client's performance, or in response to complaints from members of the public, it may be more appropriate to conduct the inspection as a Level A or Level B inspection, rather than a Level C.

## On-site inspection activities

### Step 8 – Conduct the opening meeting

The objectives of the opening meeting are to meet with the site manager or their representative to:

- explain and confirm the inspection program, outlining the inspection scope, objectives and procedures
- provide a short summary of how the inspection activities will be undertaken and
- allow the site manager or their representative to ask questions.

The opening meeting is an important part of the inspection process and can set the tone for how the inspection will proceed. It is important to remain professional and polite throughout the meeting.

The following information should be conveyed:

- introduce the inspection team and provide identification if required
- explain the purpose of the inspection
- explain the activities to be inspected and criteria (keeping the inspection on track)
- explain the methods and procedures used to conduct the inspection
- explain the steps that will be taken when preparing the inspection report (e.g. all inspection information collected will be assessed, a draft report will be prepared and reviewed by my manager etc)
- explain that a letter will be sent summarising the findings of the inspection and any required follow-up actions
- agree to an inspection timetable to enable the site manager or their representative to arrange for appropriate personnel to be available during the inspection
- arrange a time and location for a closing meeting
- ensure that the resources and facilities needed by the inspection team are available
- determine safety, emergency and security procedures.

You can use **Part C** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet) to record information you have discussed in the opening meeting.

### Step 9 – Conduct the site inspection

After the opening meeting, the inspection team can start examining, recording and collecting relevant information. Officers can use **Part D** of the **compliance inspections toolkit**, (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet) to assess compliance with any development approval or environmental authority conditions. Officers can use **Part E** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet) to record details of any observations made while on site (e.g. waste storage, chemical management and storm water management). Where these overlap with conditions, they can be disregarded.

It is important that the inspection leaders (and the other members of the inspection team who are authorised persons) are familiar with the powers they can exercise during the inspection (in particular s460 of the Act). This will ensure that any information gathered is done so lawfully. By being confident in the powers that they can exercise, officers are also more likely to be able to obtain all of the information that they need. Guidance on exercising powers conferred on authorised persons under the Act can be found in the [Procedural guide - Powers of Officers](#).

Officers should look out for activities on the site that are not authorised under the client's development approval or environmental authority. If unauthorised activities are being carried out, refer to the guide [Procedural guide - Dealing with unlicensed ERAs](#).

At all times during site inspections, officer safety is a priority. If necessary, ensure that a representative of the client who understands the workplace health and safety issues for the site accompanies officers during the inspection. If safety is threatened in any way during the inspection, take action immediately to eliminate the risk to safety, including terminating the inspection and leaving the site if necessary.

If an officer identifies an activity or event that is causing serious or material environmental harm it must immediately be brought to the attention of the inspection leader. The inspection leader should consider

terminating the inspection and informing the site manager or representative and the appropriate Manager, Regional Investigations of the situation immediately.

If necessary, an emergency direction under ss467 or 468 of the Act should be given to the client or their representatives in order to prevent, minimise, or remedy the harm (refer to the procedural guide for emergency directions located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

Information can be gathered during an inspection in a number of ways:

- **Photographs**

Photographs can be an important record of the site inspection, and details of any photographs taken (including the time and date the photograph was taken, who took it, and what the photograph shows) should be recorded.

- **Company documents and records**

Some of the information gathered will be in the form of documents, and may include monitoring results, complaints registers, incident report forms, maintenance records for plant and equipment, environmental management system manuals and documents required to be kept by the development approval. Authorised persons may make photocopies of documents in certain circumstances (refer to s460 of the Act). If it is not practical to copy or view all documents that might be relevant, officers may choose to copy or view a representative sample of documents.

All documents sighted during the inspection should be recorded.

- **Inspection notes**

Observations such as what was seen, heard or smelt should be recorded in the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet) or official notebook. It is not necessary for all members of the inspection team to take notes. Other observations made, and significant conversations held, during the inspection should also be recorded in an official notebook (refer to the [Procedural guide - Use of official note books](#)).

- **Environmental sampling**

The aim of sampling is to estimate quality characteristics of one or more of the following:

- A water body – usually surface waters, but occasionally ground waters.
- Wastes released to a water body (or liable to be released).
- Bottom sediments of a water body.
- Specimens of animal or plant life thought to have been affected by a release or by a change in natural conditions.

It is generally expected that sampling will be done for Level B and C inspections. The protocols in the Department's Monitoring and Sampling Manual - Environmental Protection (Water) Policy 2009 should be followed (on Ecosteps at [Technical Manual - Water Quality Sampling Manual](#)), both to ensure that the sample results are accurate and reliable, and to ensure that the sample results will be admissible evidence if legal proceedings result from the inspection. Whether the sample is analysed will be at the discretion of the inspection leader following the inspection, keeping in mind any time limitations on the sample.

Any monitoring or sampling required by the permit must be undertaken by the permit holder and relevant data provided to the Department as required.

### Step 10 – Conduct the closing meeting

Once the inspection team have finished the inspection a closing meeting should be held with the site representatives. The following should be considered in this meeting:

- Present the preliminary findings.
- Discuss situations encountered which may affect the reliability of inspection conclusions.
- Consider outlining recommendations for improvements if the inspection team is clear about the proposed response.
- An indication of timeframes for the Department to report on findings. It may be appropriate to advise for example:

*“All inspection information collected will be assessed; a draft report will then be prepared and reviewed by my manager. You will receive a letter summarising the findings of the inspection and any required follow-up actions within the next 2 weeks.”*

Details of the closing meeting should be recorded in **Part F** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

### Post-inspection activities

Once the site inspection is complete, the important activities of evaluating the information gathered during the inspection, recording the results of the inspection and conducting follow up activities will begin.

### Step 11 - Evaluate the inspection information and complete the inspection report

The purpose of evaluating inspection information is to identify any significant observations that are presented as inspection findings. The information collected may include observations made on-site, photographs, samples, records and documentation on files, and documents produced by the site manager or their representative before, during or after the inspection. This information should be regarded as evidence relevant to further compliance action.

A template inspection report may be found here: [Inspection/audit report](#).

Evaluation of the information can include the following activities:

- comparing monitoring data held by the client, or the results of samples obtained during the inspection with requirements of the development approval or other permit, or with best practice standards
- comparing observations and photographs with requirements contained in approvals or best practice standards
- comparing statements made by the client’s representatives with observations, photographs and documents
- identifying any gaps in the information which may require follow-up with the client
- determining whether the information reveals breaches of approvals, permits or statutory requirements
- assessing whether enforcement action may be required

- identifying any shortcomings with approval conditions (for example, identifying that a condition is drafted in a way that makes it difficult to establish that it has been complied with) and
- comparing the information with information obtained from inspections of similar sites to identify any common or systemic problems.

The inspection report is one of the most important parts of the inspection. It records the inspection team's findings:

- on the performance of the client
- the remedial actions that are required by the client and
- any actions that the Department must take to respond to the client's performance.
- on important information needed for future reference, so that any actions taken by the Department can be justified if they are later challenged, and the results can be compared and analysed to see whether there is improvement over time or to identify trends.

The most significant factor in assessing the significance of non-compliance is the actual or potential impact on the environment. Other factors include:

- the nature of the receiving environment
- the seriousness of a potential or actual environment harm
- whether the non-compliance is ongoing or a repeat of a past non-compliance
- how easily the non-compliance is able to be remedied and
- how matters have been managed previously.

For one-off minor or technical non-compliances that have little or no environmental impact, it may be appropriate to issue a verbal warning on the day of the inspection. For other non-compliances it may be appropriate to write to the client outlining the non-compliances and or issues and seeking a report on the corrective action(s) they propose to undertake.

If the inspection reveals more significant non-compliance, it may be necessary to take some form of enforcement action. This can include issuing a warning notice or penalty infringement notice or using a range of statutory tools available under the Act.

Guidance on choosing an appropriate statutory tool can be found in the Department's [Enforcement Guidelines](#) and the [Procedural guide - Choosing the appropriate statutory tool to respond to non-compliance](#).

The inspection leader should aim to have the inspection report finalised within four weeks of the inspection and forwarded to their Manager for endorsement.

Inspection results and recommended actions should be recorded in **Part G** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

### Step 12 – Provide for natural justice and send follow-up letter

Prior to the Department making a decision which may adversely impact on a person (can include an individual or corporation) the Department must:

**Notify** - Notify the individual that the Department is considering making adverse findings.

**Respond** - Provide the individual with an opportunity to respond to the allegation.

**Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification with a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

Officers should complete **Part H** of the **compliance inspections toolkit** (located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet).

A post-inspection letter should be forwarded to the client within four weeks of the inspection. If the inspection report requires more than four weeks, an acknowledgement letter is to be forwarded to the client advising of when a post-inspection letter will be available. The post-inspection letter should address the following:

- any non-compliances, actual or potential breaches of legislation that were identified during the site inspection
- where non-compliances, actual or potential breaches of legislation have been identified, an invitation for the site's operators/owners to submit to the Department why a specific enforcement tool (e.g. a transitional environmental program or environmental protection order) should not be used (see the 'providing for natural justice' section)
- where compliance action is proposed, any specific timeframes
- any other relevant observations and
- a copy of the inspection report at the manager's discretion.

Both template letters may be located on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet.

### Step 13 – Record details of the site inspection in Ecotrack

Officers are required to record all allegations of non-compliance in the Ecotrack system. This includes creating a compliance activity, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). This information should be recorded at **Part I** of the **compliance inspections toolkit** (located on Ecosteps at on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet). The Department is required to make, and record, an informed decision about all allegations of non-compliance.

### Step 14 – Approval

The **compliance inspections toolkit** including recommendations is to be approved by an appropriately delegated officer. The Department's list of delegations can be found at:

<http://insite2.dnr.qld.gov.au/derm/delegations/index.html>

This information should be recorded at **Part J** of the **compliance inspections toolkit**, which may be found on the Environmental Services page at the Compliance Support Materials site on the Departmental intranet.

# Compliance inspections toolkit

## Compliance inspections (Levels A, B and C)

### Checklist, on-site record & inspection report

*This toolkit is for internal use to assist Environmental Services officers when conducting Level A, B and C site inspections to record general details of the site being inspected, pre-inspection considerations and planning, on-site observations and to document recommendations and obtain approval for compliance/enforcement action. For Levels B and C, refer to addendum sheets also. This document can be used in hard copy and taken with the officer to be completed on site. The soft copy document can be completed upon return to the office.*

#### Part A. General Information

Company name:	Date of inspection:	Time:
Trading as:	EA/DA number (if applicable):	
Description of business activity/ERAs:	File number:	
Street address:	Real property description (lot on plan):	
Site representative/s:	Position/s:	Contact telephone:
Department's representatives:		
Registered business address:		
Inspection level (check box): Level A <input type="checkbox"/> Level B <input type="checkbox"/> Level C <input type="checkbox"/>		

#### Part B. Pre-inspection considerations (add or delete lines as necessary)

Environmental risk	(e.g. very low)
Last inspection date	
General description of location and surrounding environment	
History of the activity	
Outstanding issues and/or non-compliances/enforcement (e.g. environmental protection orders)	
<b>Industry specific hazards</b> – consider personal safety	
Engineering	
Light manufacturing	

Food processing	
Waste	
Chemical production	
Health/medical	
Other	
Farming	
Mining	
Quarrying	
Other	
<b>Personal protective equipment (PPE) – consider whether any PPE is required</b>	
Safety helmet	Yes <input type="checkbox"/> No <input type="checkbox"/>
Hearing protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
Eye protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
Protective clothing	Yes <input type="checkbox"/> No <input type="checkbox"/>
Protective footwear	Yes <input type="checkbox"/> No <input type="checkbox"/>
Respiratory protection	Yes <input type="checkbox"/> No <input type="checkbox"/>
Other	Yes <input type="checkbox"/> No <input type="checkbox"/> If yes, describe PPE:
Arrange safety induction training with occupier of site before any work is done	Yes <input type="checkbox"/> No <input type="checkbox"/>

**Part C. Inspection plan including opening meeting checklist for Level B and C inspections** (add or delete lines as necessary)

Topic	Details	Confirmed in opening meeting
Objectives and scope		Yes <input type="checkbox"/> No <input type="checkbox"/>
Agenda and timeframe		Yes <input type="checkbox"/> No <input type="checkbox"/>
Audit team - roles and responsibilities of team members		Yes <input type="checkbox"/> No <input type="checkbox"/>
Methods and procedures to be used		Yes <input type="checkbox"/> No <input type="checkbox"/>
Onsite staff accompanying audit/inspection team (names and positions)		Yes <input type="checkbox"/> No <input type="checkbox"/>

**Part D. Conditions for assessment** (Use for Level B or C inspections, add or delete lines as necessary)

<b>Condition number:</b>	<b>Compliant: Yes</b> <input type="checkbox"/> <b>No</b> <input type="checkbox"/> <b>TBA</b> <input type="checkbox"/> <b>Not inspected</b> <input type="checkbox"/>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes</b> <input type="checkbox"/> <b>No</b> <input type="checkbox"/> <b>TBA</b> <input type="checkbox"/> <b>Not inspected</b> <input type="checkbox"/>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes</b> <input type="checkbox"/> <b>No</b> <input type="checkbox"/> <b>TBA</b> <input type="checkbox"/> <b>Not inspected</b> <input type="checkbox"/>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes</b> <input type="checkbox"/> <b>No</b> <input type="checkbox"/> <b>TBA</b> <input type="checkbox"/> <b>Not inspected</b> <input type="checkbox"/>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		

<b>Condition number:</b>	<b>Compliant: Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/></b>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/></b>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/></b>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		
<b>Condition number:</b>	<b>Compliant: Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/></b>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		

<b>Condition number:</b>	<b>Compliant: Yes</b> <input type="checkbox"/> <b>No</b> <input type="checkbox"/> <b>TBA</b> <input type="checkbox"/> <b>Not inspected</b> <input type="checkbox"/>	<b>Photos taken Y/N</b>
Element/question		
Observations (include name and relevant comments made by any on-site staff)		
Options for remediation		

**Part E. On-site observation – general items** (add more lines if necessary)

<b>1. Raw materials/final products</b>			
<b>Issue</b>	<b>Details (if applicable)</b> (include name and relevant comments made by any on-site staff)	<b>Photos taken Y/N</b>	<b>Satisfactory</b>
What types of raw or final product materials are on the site?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
What are the approximate volumes?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
What is the location of these materials on site?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Other?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
<b>2. Waste storage/treatment and disposal</b>			
<b>Issue</b>	<b>Details (if applicable)</b> (include name and relevant comments made by any on-site staff)	<b>Photos taken Y/N</b>	<b>Satisfactory</b>
What types of waste materials (general/regulated) are on site?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>

What are the approximate volumes?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
What is the location of these materials on site (include details of containment system, proximity to waters, etc)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Is there any evidence of spills/leaks/other emissions?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Does the facility discharge to a sewer (and does the facility have a Trade Waste Agreement)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Does the facility have waste tracking certificates to record the movement of regulated wastes offsite?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Who does the facility use to collect waste (waste contractor)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Other (e.g. recycling details)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>

### 3. Chemical management

Issue	Details (if applicable) (include name and relevant comments made by any on-site staff)	Photos taken Y/N	Satisfactory
Are flammable/combustible materials stored on-site (and does the facility have an appropriate licence)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are bunds in poor condition (e.g. filled with rainwater, overflowing, stained, damaged or cracked)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are chemical containers or drums unsafely stacked, stored outside, or stored in close			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/>

proximity to stormwater drains?			Not inspected <input type="checkbox"/>
Are there containers without lids or unsealed bags?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Is there diesel or oil staining around refuelling areas?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are there unlabelled or wrongly labelled chemical containers?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Is there an inappropriate, inaccessible, or no spill kit on site or available to the site?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
<b>4. Stormwater management</b>			
<b>Issue</b>	<b>Details (if applicable)</b> (include name and relevant comments made by any on-site staff)	<b>Photos taken Y/N</b>	<b>Satisfactory</b>
Describe the stormwater controls (e.g. bunding, sediment trap, grates, first flush, oil water separator, etc).			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Is there any evidence of contamination (e.g. staining, sedimentation, litter, etc)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Have any samples been taken (by the facility or the Department)?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are there untidy and dirty yards, carparks and outside surfaces?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are there overflowing or blocked oil interceptors, grease traps, grates, drains or treatment systems?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are containers being washed down within reach of stormwater			Yes <input type="checkbox"/> No <input type="checkbox"/>

drains?			TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Are there any outdoor bunds with open or unsecured stormwater valves?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>
Do wash bay facilities have access to stormwater drains and if so, are they dirty?			Yes <input type="checkbox"/> No <input type="checkbox"/> TBA <input type="checkbox"/> Not inspected <input type="checkbox"/>

5. Other issues identified	
Issue	Details (if applicable)
Are there issues with dust/odour/noise/contaminated land etc?	
Are there any unregistered ERAs?	
Is a follow-up inspection required (including date)?	
Are any enforcement actions required?	
Other?	

**Part F. Closing meeting**

Discuss preliminary findings, non-compliances, observations, further items to be provided, timing and any other matters (list names of all persons present).

**Part G. Inspection results summary** (NB: Refer to parts D – F where relevant)

**1. Overall findings**

General observation/s	
-----------------------	--

Compliance level	<input type="checkbox"/> Environmental nuisance/minor non-compliance <input type="checkbox"/> Actual or risk of material harm/repeat non-compliance <input type="checkbox"/> Actual or risk of serious harm <input type="checkbox"/> Compliant <input type="checkbox"/> Fully compliant/best practice
Environmental risk	<input type="checkbox"/> (1) Very low <input type="checkbox"/> (2) Low <input type="checkbox"/> (3) Moderate <input type="checkbox"/> (4) High <input type="checkbox"/> (5) Very high

**2. Client action/s required** (from information in Part D)

**Non-Compliances**

Condition number & requirement legislation reference	Observations	Recommended action (Officers should document the evidence supporting the recommendation)	Client agreement
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>

**Further observations (issues)**

Condition number & requirement legislation reference	Observations	Recommended action (Officers should document the evidence supporting the recommendation)	Client agreement
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>
			Yes <input type="checkbox"/> No <input type="checkbox"/> TBD <input type="checkbox"/>

**3. The Department's actions taken/recommended** (complete where relevant)

Enforcement measure/s taken during inspection	Date issued:	Type:	Next due date:
Further enforcement measures recommended (Note: Refer to relevant client action items listed above)			
Justification	Actions required must be specific, measurable, achievable, relevant to the non-compliance identified and time-specific. In order to ensure the actions required are reasonable, officers are required to provide justification for the inclusion of this action		
Further enforcement measures recommended (Note: Refer to relevant client action items listed above)			
Justification	Actions required must be specific, measurable, achievable, relevant to the non-		

	compliance identified and time-specific. In order to ensure the actions required are reasonable, officers are required to provide justification for the inclusion of this action
Other recommendations (e.g. permit amendments)	
Next inspection date	

**Part H. Natural justice**

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- List any information and/or defences provided.  
Describe any information or defences provided.
- The Department has considered the information or defences provided.  
Describe the consideration given and what conclusions have been formed by the Department.
- The decision-maker and environmental officer are free from bias or the perception of bias.

**Part I. Ecotrack**

Ecotrack case number

## Appendix 1

### INSTRUCTIONS FOR COMPLETING COMPLIANCE INSPECTION REPORT

#### Inspection Days

This estimate (to the nearest 0.1 day) includes the cumulative effort of all participating inspectors; any effort for laboratory analyses, testing, and remote sensing; and the billed payroll time for travel and pre and post inspection preparation.

#### Inspection Trigger

- Reactive – e.g. complaint, incident
- Routine – e.g. ERA, Mining, Coastal, Contaminated Land
- ACP Project – e.g. Activity
- Data – e.g. Annual Return, Waste Tracking, NPI
- Permit Dealing – e.g. surrender

#### Inspection Type

- Preliminary
- Compliance Assessment (e.g. compliance with conditions of approval)
- Potential Enforcement Measurement
- Compliance Progress Check (e.g. follow up inspection or compliance with issued enforcement measure)

#### Inspection Focus/Agency Interest

Biodiversity	rare and threatened species and ecosystems, vegetation clearing, marine systems, sustainable use of wildlife, riparian buffer zones, wild river area
National & International	world heritage, Ramsar listed wetlands, migratory species, national estate, commonwealth marine areas, radioactive materials
Resource Allocation	mining, dredging, occupancy of marine lands (marinas etc), activities on protected areas and marine parks, allocation of public resources (eg. physical and natural resources environmental capacity), national competition policy
Tenure Issues	protected areas, native title interests, offshore jurisdiction, commonwealth jurisdiction, inter-state jurisdiction
Water Issues	quality, discharges, stream flows (effects on ecology), waterway management, hydrology, impact on freshwater and marine systems, groundwater
Air Issues	air shed management, pollution, health, nuisance, ecological impacts
Noise Issues	community noise, transportation noise, industrial noise, ground vibration, air blast overpressure
Waste Issues	solid waste, liquid waste, gaseous waste, dredge spoil disposal, energy, best practice environmental management
Land Issues	contaminated land, acid sulphate soils, erosion/stability, landscapes, effects on hydrology, sustainable use, clearing, land use history, compliance with planning schemes, rehabilitation and subsequent use
Heritage Issues	Aboriginal and Torres Strait Islander cultural sites, historic buildings and locations, designated landscape areas
Coastal Issues	erosion, structures, reclamation, state/regional/strategic planning
Impacts on Surrounds Issues	transportation, visual impacts, compatibility with surrounding uses and activities, neighbours opinions
Social Issues	amenity, displacement of use, community views, public safety, politics/policy

#### Compliance Level

- Fully compliant and evidence of best practice
- Compliant
- Evidence of environmental nuisance or minor non-compliance
- Evidence of actual or significant risk of material environmental harm or repeated minor non-compliance
- Evidence of actual or significant risk of serious environmental harm

#### Compliance Behaviour

<p>Intentional non-compliance <i>Knowingly breaking the law</i></p>	<p>Economic motivations Low risk of detection Frustration – complexity/delays Anger and resistance Lack of acceptance of science</p>
<p>Opportunistic non-compliance <i>People will break the law if they think they can</i></p>	<p>Small number of investigations Others getting away with non-compliance Penalties not advertised Belief that investigations do not occur Belief that law breaking is not penalised</p>
<p>Accidental non-compliance <i>People who would normally comply, but who make mistakes or don't understand their obligations</i></p>	<p>Lack of understanding of obligations/procedures Lack of access to information/advice Lack of access to tools/technology</p>

Inspection Level

DESCRIPTOR	TYPES OF COMPLIANCE ASSESSMENT INSPECTIONS		
	Level A	Level B	Level C
Label	<b>Basic Inspection</b>	<b>Condition Review</b>	<b>Compliance Audit</b>
Brief Outline	<i>A basic inspection requiring minimal planning. Focussing on a specific issue typically as a result of a public report or service request, industry self-reporting, follow-up of a previous inspection, or to assess more generally the risk posed by a site and need/extent for further compliance inspections.</i>	<i>The most common level of inspection undertaken; this is an assessment of compliance with regulations, licences and standards. Formulation of an opinion about compliance is based primarily on professional judgement, or an expression of negative assurance. The effectiveness of our regulatory systems may also be assessed during the inspection.</i>	<i>An audit of high risk licensed premises requiring detailed planning. It is a systematic examination involving analysis, tests and confirmation of procedures and practices, to verify compliance with legal requirements and the presence/absence of impacts; and may consider additional factors such as management practices and the ability to meet future standards.</i>
Site Type	<ul style="list-style-type: none"> <li>non-licensed, pre-licensed or licensed</li> <li>low, medium or high risk</li> <li>degree of compliance often unknown</li> </ul>	<ul style="list-style-type: none"> <li>non-licensed or licensed</li> <li>medium or high risk</li> <li>unknown or fair degree of compliance usually exhibited</li> </ul>	<ul style="list-style-type: none"> <li>licensed</li> <li>medium or high risk</li> <li>poor degree of compliance has been exhibited in past</li> </ul>
Trigger/Scope	<ul style="list-style-type: none"> <li>initial response to a public report or service request, or industry self-reporting. (eg. determining source of impacts beyond boundary or if ERA being conducted, emergency incident response excluding cleanup, validating aspects of annual returns or permit applications)</li> </ul>	<ul style="list-style-type: none"> <li>usually associated with proactive monitoring programs and related follow-up (eg. industrial estate, water catchment, or industry sector inspection programs)                             <ul style="list-style-type: none"> <li>review focuses only on the specific processes or discharges that relate to the monitoring program</li> </ul> </li> <li>to physically verify that corrective actions have been carried out (eg. in response to a complex enforcement tool)</li> </ul>	<ul style="list-style-type: none"> <li>usually associated with proactive maintenance inspections of high risk sites or after a catastrophic event</li> <li>audit focuses on either:                             <ul style="list-style-type: none"> <li>all activities, processes and discharges when generally chronic issues exist ('comprehensive audit'); or</li> <li>specific processes or discharges when generally acute problems exist ('focussed audit')</li> </ul> </li> </ul>
Objective	<ul style="list-style-type: none"> <li>to physically verify that corrective actions have been carried out (eg. in response to a simple enforcement tool)</li> <li>to assess risk and determine need/extent for further compliance inspections</li> </ul>	<ol style="list-style-type: none"> <li>compliance with regulations, licences and standards                             <ul style="list-style-type: none"> <li>review history of legislative compliance including prior enforcement action and public complaints</li> <li>review statutory licences – held, correct and current – are conditions valid, achievable, relevant and being complied with, including required monitoring programs</li> <li>review other regulatory requirements – eg. waste tracking, NPI reporting, contaminated land SMPs, GED</li> </ul> </li> <li>could also assess regulatory system effectiveness across an industry – including consistency, validity, relevance, achievability, enforceability, degree of protection.</li> </ol>	<p>In addition to the Level B objectives, a Level C inspection may:</p> <ol style="list-style-type: none"> <li>review ability to meet future standards</li> <li>review management and operating practices                             <ul style="list-style-type: none"> <li>staff training and responsibilities and public relation policies</li> <li>minimisation of risks (eg. emergency response procedures, handling/storage and transfer of hazardous materials, encroaching residential areas or conflicting industries, maintenance procedures)</li> <li>sustainable practices (eg. source of raw materials, minimise/reuse/recycle materials, disposal of wastes)</li> </ul> </li> <li>review adequacy of financial assurance</li> </ol>
Methodology	<ul style="list-style-type: none"> <li>low-level planning and record keeping required</li> <li>cursory/visual examination, possibly just a drive-by</li> </ul> <ul style="list-style-type: none"> <li>pre-inspection – desktop analysis</li> <li>inspection – undertaken within a few hours, easily undertaken by 1 or 2 officers, simple enforcement</li> </ul>	<ul style="list-style-type: none"> <li>medium-level planning and record keeping required</li> <li>professional judgement used to assess compliance (review consists primarily of observations, inquiry, and analytical procedures and discussion related to information supplied by the operator with the limited objective of assessing if the information is plausible)</li> </ul> <ul style="list-style-type: none"> <li>pre-inspection – desktop analysis, inspection checklists</li> <li>inspection – can take up to a day, usually undertaken by multiple officers, simple enforcement action could be taken</li> </ul>	<ul style="list-style-type: none"> <li>high-level planning and record keeping required</li> <li>objective evidence used to verify compliance (in relation to monitoring for example – verification and assurance that the monitoring is being carried out, that the results are within acceptable limits (or recognise where they exceed), and that monitoring will continue within the parameters set by the permits)</li> </ul> <ul style="list-style-type: none"> <li>pre-inspection - desktop analysis, audit plan (particularly for comprehensive audits), inspection checklists</li> <li>inspection – opening/closing meetings and interviews, collection</li> </ul>

	<p>action could be taken onsite</p> <ul style="list-style-type: none"> <li>• post-inspection – Ecotrack updated with degree of compliance found, client thankyou/non-conformance letter sent</li> </ul>	<p>onsite in addition to further followup action</p> <ul style="list-style-type: none"> <li>• post-inspection – Ecotrack updated with degree of compliance found, written compliance report, client thankyou/non-conformance letter sent</li> </ul>	<p>of data; can take more than a day, undertaken by multiple officers; can include desktop/site assessment by other disciplines</p> <ul style="list-style-type: none"> <li>• post-inspection – Ecotrack updated with degree of compliance and risks found, further desktop analysis often required, written compliance report, client thankyou/non-conformance letter sent</li> </ul>

# Notice

## Environmental Protection Act

### Conduct or commission an environmental evaluation<sup>1</sup>

*This statutory notice is issued by the administering authority pursuant to <PICK FROM LIST> of the Environmental Protection Act 1994, to advise you of a decision to require <PICK FROM LIST> <PICK FROM LIST>*

Your reference : <INSERT reference>

Our reference : <INSERT reference>

<INSERT recipient's name>

<INSERT street address>

<INSERT suburb, state and postal code>

Attention: <INSERT principal contact>,

**Re: Environmental audit required for <INSERT activity> on land described as Lot <INSERT Lot> on Plan <INSERT Plan>, located at <INSERT street address>.**

Under section <PICK FROM LIST> of the *Environmental Protection Act 1994* (the Act) this notice requires you to <PICK FROM LIST>. The grounds for requiring <PICK FROM LIST> are <INSERT grounds from section 322(1) for an audit or section 323(1) for an investigation>. The facts and circumstances forming the basis for these grounds are:

<INSERT details of the basis for the grounds>.

The <PICK FROM LIST> must address the following matters:

<INSERT matters to be addressed>

<PICK FROM LIST> must be submitted by <INSERT date required> to the Department of Environment and Resource Management at <INSERT postal address>. <PICK FROM LIST> audit must complete <PICK FROM LIST>

You are responsible for the costs of meeting the requirements of this Notice.

You may apply to the Department of Environment and Resource Management for a review of this decision within 10 business days of receiving this Notice. You may also appeal against this decision to the Planning and Environment Court.

Information outlining the review and appeal processes under the *Environmental Protection Act 1994* is included with this notice. This information is intended as a guide only. You may have other legal rights and obligations.

Should you have any queries in relation to this notice, <INSERT contact officer's name> of the Department of Environment and Resource Management on telephone <INSERT phone number> would be happy to assist you.

<sup>1</sup> An environmental evaluation may be either an environmental audit under section 322 or an environmental investigation under section 323.

**Conduct or commission an environmental evaluation**

Environmental evaluation

## Part 2 – Considering and acting on environmental reports

*This document is intended for internal use to assist Environmental Services officers to record the information considered by the Department when reviewing and considering environmental reports and deciding what further action should be taken.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant Number	Number
Trading As	Trading as details
Registered Business address	Address
Date report received:	<p>Date</p> <p>Note: The Department has 20 business days in which to make a decision whether or not to accept the environmental report.</p> <p>Within eight business days after deciding to require another environmental evaluation, or additional relevant information, the Department must give the person an information notice about the decision. This requirement may be met by issuing the relevant notice within the eight business day period.</p>

**Note:**

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the investigating officer, supervisor (where possible) and the delegated decision maker.

### Environmental evaluation part 2 - Considering and acting on environmental reports

The legislative provisions in regard to environmental evaluations may be found in ss321 to 329 of the *Environmental Protection Act 1994* (the Act).

After receiving an environmental report from a person who has received a notice to conduct or commission an environmental evaluation, the Department has 20 business days to consider the report and decide whether or not to accept it. If the report is accepted, it is not necessary to complete this assessment report. Consider if another tool should be used, and if so, refer to the appropriate procedural guide and assessment report for that tool.

If the Department does not accept the environmental report, officers should consider whether to:

- reject the report and require another environmental evaluation to be completed and a further environmental report submitted **OR**
- require additional relevant information to be provided **OR**
- accept the report – skip to section 9 of this assessment report.

## 1. Grounds for issuing a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information

Identify the relevant grounds upon which the decision whether to use a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information is based.

### 1.1 Grounds for issuing a notice to conduct or commission another environmental investigation

- The report does not adequately address the relevant matters for the environmental evaluation to which the report relates.

If another environmental evaluation is required, the appropriate type is an:

- environmental audit (s322) **OR**
- environmental investigation (s323)

### 1.2 Grounds for issuing a notice requiring additional relevant information

- The Department is satisfied additional relevant information is required.

## 2. Expand upon the grounds

The next step is to expand upon the grounds identified for issuing a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information.

In the case of a notice to conduct or commission another environmental evaluation, refer to the requirements in the original notice and list the relevant matters for the environmental evaluation which have not been adequately addressed in the report.

For a notice requiring additional relevant information, consider what further information is required to enable the Department to ascertain the source, cause or extent of environmental harm being caused or likely to be caused and/or to decide whether a transitional environmental program (TEP) for the activity or event is required.

Each ground should be listed independently and be allocated a separate number.

Number	Specific ground
1	<i>Example: The report does not adequately address the relevant matters for the environmental evaluation because it does not contain an assessment of affected soils and comparison with unaffected soils as required by the original notice.</i>
2	<i>Example: The report does not adequately address the relevant matters for the environmental evaluation because it does not contain an analysis of groundwater potentially affected by the activities of ABC Pty Ltd as required by the original notice.</i>

3	<i>Example:</i>
4	<i>Example:</i>
5	<i>Example:</i>
6	<i>Example:</i>

### 3. Brief history of the matter

Briefly outline any historical information relevant to this decision in chronological order.

Briefly outline the historical information in chronological order.

### 4. Detail the matters that were not adequately addressed in the initial environmental evaluation and report or what further information is required

Refer to the original notice to conduct or commission an environmental evaluation and list in the table below any matters that were included in the original notice but have not been adequately addressed by the environmental evaluation and the environmental report. Explain why you consider that these matters were not addressed properly in the original environmental evaluation and report. If the Department requires additional relevant information, outline the information that will be listed in the notice requiring additional relevant information and explain why the information is required.

<p><b>Elements of the grounds for issuing the notice</b></p> <p><i>List the elements of the grounds for issuing the notice (i.e. the requirements listed in the original notice to conduct or commission an environmental evaluation that were not addressed or the additional relevant information required).</i></p>	<p><b>Matters that were not adequately addressed in the original environmental evaluation report or additional relevant information required</b></p> <p><i>Detail the facts and circumstances that support the Department's decision to issue a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information. (i.e. explain how the matters in the original notice have not been addressed).</i></p>
<p><b>Number 1</b></p>	
<p>1 September 2010</p>	<p>Environmental report was submitted to the Department by ABC Pty Ltd on 1 September 2010.</p>
<p>The original notice required the recipient to provide an assessment of affected soils and comparison to unaffected soils which addressed the following matters:</p> <p>(i) an analysis of affected soils, and comparable unaffected soils, for a range of analytes sufficient to</p>	<p>The recipient of the original notice has provided adequate information in the environmental report in respect to items (ii) and (iii).</p> <p>However, the recipient did not arrange for adequate analysis to be carried out of the affected soils and comparable unaffected soils to ascertain any</p>

<p>identify any impacts that may have resulted from the irrigation of effluent on ABC Pty Ltd and</p> <p>(ii) a description of the contaminants contained in the effluent irrigated and sludges applied on the ABC Pty Ltd site, including the results of a recent analysis of effluent and sludge for analytes found at elevated levels in soils from the affected area and</p> <p>(iii) the date, quality and quantity of effluent and sludge applied for each irrigation run in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010 and an analysis of rainfall records and soil moisture records at the times of irrigation for the same period and</p> <p>(iv) an assessment of the quantity of contaminants applied per hectare in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010.</p>	<p>environmental impacts resulting from effluent irrigation carried out at the premises of ABC Pty Ltd as required by item (i). Consequently, this matter has not been addressed in the environmental report.</p> <p>Further, the recipient has not provided an assessment of the quantity of contaminants applied per hectare in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010 as required by item (iv).</p> <p>Without the above information the Department will be unable to fully ascertain the source, cause or extent of the environmental harm being caused.</p>
<b>Number 2</b>	
<p>The original notice to conduct or commission an environmental evaluation required the recipient to carry out an assessment of groundwater potentially affected by the activities of ABC Pty Ltd which would include (among other things) an assessment of the stratigraphy in the area and its relationship to hydrogeological conditions.</p>	<p>Some assessment of the groundwater was carried out during the environmental evaluation, but the report did not contain the results of the required assessment of the stratigraphy in the area and its relationship to hydrogeological conditions. This information is required to ascertain the source, cause or extent of environmental harm being caused, or likely to be caused, by the activity (effluent irrigation).</p>
	<p>The officer who has carriage of this matter has come to the conclusion that another environmental evaluation and report are required for this information to be obtained.</p>
<b>Number 3</b>	

<b>Number 4</b>	

## 5. Natural justice

Officers are required to notify the affected person that the Department is considering issuing a notice to conduct or commission another environmental evaluation, or a notice requiring additional relevant information, and that the individual is welcome to make representation to the Department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Please describe how this was achieved.
- All information provided has been considered.  
Please describe any information or defences provided.
- The Department has considered the information.  
What consideration was provided and what conclusions have the Department formed?
- The decision-maker and environmental officer are free from bias or the perception of bias.

## 6. Relevant matters for the environmental evaluation or required additional relevant information

If appropriate, please list any relevant matters for the new environmental evaluation – that is, the matters that the recipient is required to investigate or audit that were not adequately addressed in the original report. Or, if additional relevant information is necessary, list the information required.

The relevant matters must be SMART: specific, measureable, achievable, relevant and time specific. Refer to the [Writing effective and enforceable conditions procedural guide](#) for more information on writing conditions and/or requirements.

To ensure the relevant matters are reasonable officers are required to provide justification for their inclusion.

Proposed requirement	Justification

# Procedural guide

## *Environmental Protection Act 1994* Environmental evaluation

### ***Part 2 – Considering and acting on environmental reports***

*This document is intended for internal use to assist Environmental Services officers to consider and act on environmental reports under s2326 to 329 of the Environmental Protection Act 1994.*

#### **When do I consider and act upon an environmental report (s326)?**

When a notice to conduct or commission an environmental evaluation has been issued, s326 of the *Environmental Protection Act 1994* (the Act) provides that the recipient of the notice must submit an environmental report to the Department on or before the specified date.

After receiving the report the Department has 20 business days in which to consider the report and decide whether to accept or reject it, unless it decides to extend the time required to make a decision by written notice (s328).

If the Department fails to make a decision whether or not to accept an environmental report within 20 business days, it is taken to be a decision by the Department to refuse to accept the report (s329).

#### **What are the Department's options after it receives an environmental report?**

The Department has the following options:

- (a) accept the report or
- (b) reject the report and require another environmental evaluation to be completed and a further environmental report submitted or
- (c) require additional relevant information to be provided.

##### **(a) Accept the report – s326(2)**

If the Department is satisfied with the environmental report, it may do one or more of the following things—

- Require the recipient to prepare and submit a transitional environmental program (TEP) to the Department. Information in regard to TEPs may be found here: [\[LINK\]](#)
- If the recipient holds an environmental authority, amend the conditions of the authority. Information in regard to amending an environmental authority may be found here: [Amending an environmental authority \(chapter 5A activities\)](#)
- If the recipient is a registered operator for a development approval, add, change or cancel a development condition of the development approval pursuant to s73C of the Act.
- Serve an environmental protection order (EPO) on the person. Information about issuing an EPO may be found here: [\[LINK\]](#)
- Take any further action it considers appropriate.

If the Department is satisfied with the environmental report and intends to use one of the alternatives listed above, officers will need to refer to the appropriate procedural guide for that tool for further instructions.

**(b) Reject the report and require another environmental evaluation – s326(3)**

If the environmental report does not address the relevant matters to the satisfaction of the Department as set out in the original notice to conduct or commission an environmental evaluation, the Department may, by giving written notice, require the recipient of the original notice to conduct or commission another environmental evaluation and submit a report on that evaluation.

**(c) Require additional relevant information – s326(4)**

If the Department requires additional relevant information, it may require the recipient to provide the information by giving written notice to the recipient.

**How do I know if the environmental report is satisfactory?**

The original notice to conduct or commission an environmental evaluation lists the Department's requirements. Look at each requirement in the notice one by one and consider whether the environmental evaluation carried out is appropriate and whether the environmental report has adequately addressed each requirement.

To assist in deciding whether the environmental evaluation and report are adequate, look at the original breach or non-compliance which led to the use of the environmental evaluation tool. Consider the following factors:

**(i) Sufficiency of information**

Does the report provide sufficient information to ascertain the source, cause and extent of the environmental harm being caused, or the extent of the harm likely to be caused, by the activity or event? Alternatively, does the report provide enough information to determine whether a condition of an environmental authority or development authority has been breached or whether there has been a contravention of a regulation, environmental protection policy or transitional environmental program?

**(ii) Inform future actions**

Is there enough information in the environmental report to enable the selection and use of appropriate tools to stop the environmental harm or prevent further environmental harm? In the alternative, is there enough information to prevent further breaches of an environmental or development authority, or further contraventions of a regulation, environmental protection policy or transitional environmental program?

**(iii) Comprehensiveness**

When considering the environmental report, identify if the report—

- includes statutory declarations as required by the legislation from the recipient of the notice and the individual commissioned to perform the environmental evaluation
- adequately reports on the matters relating to the environmental evaluation
- contains sufficient information and detail to meet all of the requirements listed in the notice to conduct or commission an environmental evaluation
- addresses all of the relevant matters for the environmental evaluation to which the report relates.

**(iv) Make a decision and record the reasons**

Officers are required to determine whether the Department accepts or rejects the environmental report, what further action is required and to record the reasoning behind the decision.

If the Department decides to accept the environmental report, it will not be necessary to complete the assessment report for this tool. If another tool is to be used in response to an accepted environmental report, officers should refer to the relevant procedural guide for that tool and to the Department's [Enforcement Guidelines](#).

### **What happens if the Department does not accept the environmental report (ss326(3) and 326(4))?**

If the Department does not accept the environmental report, it may require the person to conduct or commission another environmental evaluation. Officers should consider whether requiring another environmental evaluation is the best course of action, given that the initial notice did not produce a satisfactory report. Officers should take into account that the recipient must meet the cost of conducting or commissioning the environmental evaluation and report and consider the cost and inconvenience to the person and the possible impacts on their business activities.

The purpose of an environmental evaluation is to ascertain the source, cause or extent of environmental harm being caused and to decide whether or not a transitional environmental program (TEP) is required. The issuing of a notice to conduct or commission another environmental evaluation should not be used as a punitive measure against the recipient. If the original environmental report does not adequately address all of the relevant matters, it may be that the required information could be obtained by using other means. Examples are a requirement for additional further information under s326(4), or a notice requiring relevant information issued under s451 of the Act.

### **What happens if further information is required (s326(4))?**

If the Department is satisfied that additional relevant information is necessary it may, by giving written notice, require the recipient to provide the information.

### **Extension of time for decisions on submission of environmental reports (s328)**

The Department may decide to extend the time it requires to decide whether or not to accept an environmental report if—

- it has required additional relevant information about the report or
- there are special circumstances for extending the time.

Before the extension starts the Department must give the recipient an information notice about the decision to make the extension that states—

- the decision and
- the reasons for the decision and
- the review or appeal details.

The Department should also advise the recipient of the new time frame for deciding whether or not to accept the environmental report.

If the Department has required the recipient to provide additional relevant information about the environmental report, it is likely that the Department will need to extend the time required to decide whether or not to accept the report.

The Act is silent regarding the maximum period the Department may extend the time it requires to make a decision about the report. Accordingly, officers must use their discretion when deciding how long the extension of time should be. Factors to be taken into account include the period of time allowed for the recipient to provide the additional relevant information and how much extra time the Department will require to consider that information and to decide whether or not to accept the environmental report. Any extension of time should be reasonable and should not affect the Department taking any further action.

## **How do I successfully issue a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information?**

Officers must complete an assessment report to document the decision as well as completing a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information.

### **Step 1 - Complete the assessment report**

Before completing a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information, officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter and documents the decision-making process used by the Department in determining to issue the notice.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference.

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have lead to the Department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached: [\[LINK\]](#)

What follows is what is needed to assess:

#### **1. Grounds for issuing a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information**

The legislation specifies that the notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information can only be used in certain circumstances. Officers are required to identify the relevant situation or 'grounds' upon to which the decision to use the notice is based.

##### **1.1 Grounds for issuing a notice to conduct or commission another environmental evaluation**

If the environmental report does not address the relevant matters for the environmental evaluation to which the report relates, officers may issue a notice to conduct or commission another environmental evaluation. An environmental evaluation can be either an—

- environmental audit or
- environmental investigation.

If a notice to conduct or commission another environmental evaluation is required, the evaluation must be of the same type as the original evaluation.

### 1.2 Grounds for issuing a notice requiring additional relevant information

If the Department is satisfied that additional relevant information is required, it may require the recipient to give it the information.

## 2. Expand upon the grounds

The purpose of this section is to clearly identify what the Department must 'prove' before deciding to use a notice to conduct or commission another environmental evaluation or a notice to provide additional relevant information and should be used to expand upon the grounds which have previously been identified.

Each ground (or requirement that has not been adequately addressed) should be allocated a separate number.

In the case of the notice to conduct or commission another environmental evaluation, officers should refer to the original notice to conduct or commission an environmental evaluation to ascertain the relevant matters that should have been addressed in the environmental report. If any relevant matters have not been adequately addressed by the report, details of these should be listed.

If the Department requires additional relevant information, the information required should be listed.

## 3. Brief history of the matter

Please briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points and should include how the Department became aware of the alleged breach.

## 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the breach to the evidence gathered and the conclusions formed. This is achieved by identifying: the elements of any specific breach or allegation, the evidence which has been considered for each element, and the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence considered, limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officer's official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents and
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

## 5. Provide for natural justice

Prior to the Department making a decision which may adversely impact on an individual or group the Department must:

- **Notify** - Notify the individual that the Department is considering making adverse findings

- **Respond** - Provide the individual with an opportunity to respond to the allegation and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

## 6. Relevant matters for the evaluation

The notice must set out the relevant matters for the additional environmental evaluation – that is, the issues that the recipient is to investigate or audit, or the information that is to be provided. As the recipient of the notice may be able to seek a review of the notice, officers must provide justification for the inclusion of each of the relevant matters.

The relevant matters must be specific, measureable, achievable, time specific and relevant to the breach or reason why the notice to conduct or commission an environmental evaluation is being issued. For example:

*On or before 5.00pm on 24 July 2010, ABC Pty Ltd will have carried out an assessment of affected soils and comparison with unaffected soils that addresses at least the following matters:*

- (i) an analysis of affected soils, and comparable unaffected soils, for a range of analytes sufficient to identify any impacts that may have resulted from the irrigation of effluent on ABC Pty Ltd and*
- (ii) a description of the contaminants contained in the effluent irrigated and sludges applied on the ABC Pty Ltd site, including the results of a recent analysis of effluent and sludge for analytes found at elevated levels in soils from the affected area and*
- (iii) the date, quality and quantity of effluent and sludge applied for each irrigation run in the area known as xxx from 1 June 2008 to 1 June 2010 and an analysis of rainfall records and soil moisture records at the times of irrigation for the same period and*
- (iv) an assessment of the quantity of contaminants applied per hectare in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010.*

*A copy of the assessment must be provided to the Department on or before 5.00pm on 24 July 2010.*

## 7. Recommendation

Officers are required to make a recommendation in relation to the alleged breach. For example:

*It is the opinion of the Department that ABC Pty Ltd failed to comply with its development conditions by allowing storm water to leave 24 Jones Road and enter Murphy Creek. A notice to conduct or commission an environmental evaluation (environmental audit) was issued to Mr JP Citizen, proprietor of ABC Pty Ltd and a report on the environmental evaluation was provided. The Department has considered the report and is satisfied that it does not adequately address the matters relevant to the environmental evaluation to which it relates. The*

*failure is of a serious nature and in the absence of the information; the Department is unable to make an informed decision. The Department considers that a request for additional relevant information would not meet the Department's requirements.*

*Accordingly, it is recommended that a notice to conduct or commission another environmental evaluation be issued.*

Officers are encouraged to consider alternative actions/tools, Departmental enforcement guidelines, details of any consultations including site visit details and discussions with the ERA contact officer. The reasonableness of proposed timeframes for the completion of requirements should be taken into account.

## 8. Approval

The assessment report is to be approved by an appropriately delegated officer.

The Department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations/>.

### Step 2 - Complete the notice

#### Notice to conduct or commission another environmental evaluation or require additional information

The notice must meet a number of legislative requirements in order to be legally binding. Section 326(6) of the Act provides that a notice to conduct or commission another environmental evaluation or a notice requiring additional relevant information must—

- state the grounds on which the requirement is made and
- outline the facts and circumstances forming the basis for the grounds and
- state the relevant matter for the environmental evaluation or the information required and
- state the day (at least a reasonable period after the notice is given) by which the report or information must be given to the Department and
- state the review or appeal details.

#### Information notice

Sections 322(2) and 323(2) of the Act state that within eight business days after making a decision to require a person to conduct or commission an environmental audit or environmental investigation, the Department must give the person an information notice about the decision. The information notice must be in writing and must state the following—

- the decision and
- the reasons for the decision and
- the review or appeal details.

In order to meet these legislative requirements and to ensure the notice is readily understood by the recipient, the information required to be provided in the information notice has been included in the template notice to conduct or commission another environmental evaluation (audit or investigation) and the template notice requiring additional relevant information. Officers should ensure that the appropriate notice is served upon the

recipient within eight business days. If this is not possible, an information notice must be sent to the recipient within the eight business day period.

While it is not a legislative requirement to provide an information notice to a recipient of a notice requiring additional relevant information, it is considered best practice to provide this information by issuing this notice within eight business days after deciding to make the requirement, or if this is not possible, to give the recipient an information notice containing the information listed above.

A template notice to conduct or commission an environmental evaluation and a template notice requiring additional relevant information are attached [\[LINK\]](#)

The notice should be signed by the decision-maker in conjunction with the assessment report which records the formal decision.

### Complete the statutory declarations

When an environmental report is submitted to the Department, it must be accompanied by a statutory declaration by the recipient of the notice to conduct or commission an environmental evaluation and a statutory declaration by the person who carried out the environmental evaluation. The legislative requirements in respect to the drafting of the statutory declarations may be found in s325 of the Act. Copies of the template statutory declarations should be provided to the recipient of a notice to conduct or commission an environmental evaluation along with the notice itself. Template statutory declarations are attached: [\[LINK\]](#)

### Service of the notice

Service means delivery to the party who will be responsible for actioning the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. Methods of service are provided for in ss39 and 39A of the *Acts Interpretation Act 1954* (AI Act).

For the purposes of any Act that requires a document to be served on (which includes 'given' or 'sent to') a person, the document may be served:

- on a person:
  - by delivering it to the person personally, or
  - by leaving at, or by sending it by post, facsimile or similar facility (e.g. email) to the person's last known place of residence or business or
- on a body corporate - by leaving it at, or sending it by post, facsimile or similar facility (e.g. email) to the head office, a registered office or a principal office of the body corporate.

The date time and method of service should be documented by contemporaneous notes, a file note, any receipts arising from the postage or any facsimile or email confirmations.

### What follow-up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the notice to conduct or commission another environmental evaluation or notice to provide additional relevant information is issued, is complying with any requirements imposed. Follow-up is to be scheduled by the relevant officer and confirmed with the business area manager. The relevant manager is responsible for ensuring follow-up is undertaken within the agreed time frame.

This is usually achieved by checking that the environmental report or additional relevant information has been received by the Department by the due date, followed by a site inspection to be conducted one week after the

time period nominated in the notice has expired. Officers are encouraged to use tools such as diary reminders to ensure the matter is followed up in a timely manner.

If the recipient of the notice fails to provide the environmental report or additional relevant information by the due date, or the follow up site visit uncovers further problems, officers must consider what further action should be taken. This may include enforcement action or the use of an alternative compliance tool, such as an environmental protection order (EPO) for example.

### **What are my record keeping responsibilities?**

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). A hard copy of the notice to conduct or commission another environmental evaluation or the notice requiring additional relevant information, the signed assessment report and any accompanying documents must be placed on the paper file. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

It is important that officers adequately report and respond to all inquiries in order to assist in building a comprehensive compliance history.

### **Amendments to an issued notice or a notice requiring additional relevant information**

If minor changes to the notice to conduct or commission another environmental evaluation or the notice requiring additional relevant information, or an extension of time are required, the recipient of the notice should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original notice, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have a fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh notice should be carried out in the same way, and subject to the same conditions as the issuing of the original notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal to or higher than that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and reissue the notice in EcoTrack and place hard copies of any documentation on the paper file.

### **Review of decisions and appeals (ss519 to 539 of the Act)**

The provisions regarding review of decisions and appeals may be found in ss519 to 539 of the Act.

The Act specifies that a person who is dissatisfied by a decision by the Department in respect to a notice requiring additional relevant information may apply for a review of an original decision by submitting an application on the approved form to the Department within:

- 10 business days after the day on which the person received notice of the original decision or the date when the Department is taken to have made the decision (the “review date”) or
- such longer period as allowed by the Department if there are special circumstances.

An approved form for the review of an original decision may be found at: [Application form - Review of Original Decision](#)

If the person is dissatisfied with the review decision, the person may appeal to the Planning and Environment Court by filing written notice with the court within 22 business days after the person receives notice of the review decision, unless this time period is extended by the court.

Officers should be aware that although the decision to issue a notice requiring further relevant information is an original decision for the purposes of ss519 to 539 of the Act, the decision to require another environmental evaluation is not. Accordingly, there is no provision under the Act for review or appeal of a decision to issue a notice to conduct or commission another environmental evaluation.

A person aggrieved by a decision to issue a notice to conduct or commission another environmental evaluation may be able to seek statutory order of review or request a statement of reasons for the decision pursuant to the Judicial Review Act 1991.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

### **What penalties exist for non-compliance with a notice?**

There is no penalty for failing to comply with s326 of the Act. However, there are penalties under ss322 and 323 for failing to comply with an original requirement to conduct or commission an environmental audit (s322) or an environmental investigation (s323).

# Assessment Report

*Environmental Protection Act 1994*  
Transitional environmental program (TEP)

## Part 2 - Considering and making a decision about a draft TEP

*This document is for internal use to assist users in critically evaluating the content of a draft TEP and making a decision to either approve (with or without conditions) or refuse a draft TEP.*

Identifying details	
Compliance activity number	Compliance activity number
Ecotrack number	Ecotrack number
Permit number	Permit number
File number	File number
Applicant name	Applicant name
Registered office or place of business	Registered office or place of business
Date draft TEP received.	Date <i>Note: The department has 20 business days after the application date in which to make a decision in relation to the draft TEP.</i>

### Note:

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be signed by the investigating officer, supervisor and the delegated decision-maker.

### Considering and making a decision about a draft TEP

The legislative provisions in regard to transitional environmental programs (TEPs) are found in Chapter 7, Part 3 of the *Environmental Protection Act 1994* (the Act).

A person or public authority may submit a draft TEP to the Department for consideration, either voluntarily under s333 of the Act or pursuant to a notice requiring a draft TEP issued by the Department under s332 of the Act. Once a draft TEP is received, the Department must consider it and decide whether or not to approve it within 20 business days after the application date or, if public notice is required under s335, within 20 business days of the day stated in the notice as the day by which submissions must be made to the Department. Detailed below are the matters that the Department must consider when making a decision about a draft TEP.

## TEP Part 2 – Considering and making a decision about a draft TEP

### 1. Brief history of the matter

Briefly outline any historical information relevant to this decision.

Provide historical information relating to the matter in succinct, dot point form.

### 2. Matters that must be considered when making a decision about the draft TEP

#### ***Achieving compliance with the Act (s330)***

Identify how, if approved, the draft TEP will achieve compliance with the *Environmental Protection Act 1994* (the Act) by doing one or more of the following things—

- reducing environmental harm caused by the activity
- detailing the transition of the activity to an environmental standard
- detailing the transition of the activity to comply with:
  - a condition, including a standard environmental condition, or an environmental authority or code of environmental compliance or
  - a development condition.

#### ***Content of the TEP (s331)***

To be approved, the draft TEP, for the activity to which it relates, must accomplish the following—

#### **(a) Objectives to be achieved and maintained under the TEP**

- The draft TEP clearly sets out the objectives to be achieved and maintained under the TEP (i.e. what the draft TEP is trying to achieve).

Provide a brief summary of the objectives to be achieved and maintained under the TEP.

#### **(b) State the particular actions**

- The draft TEP states the particular actions required to achieve the objectives, and the date by which each action must be completed.

Briefly state the actions required to achieve the objectives and the dates by which each action must be completed.

- When stating the required actions, the draft TEP takes into account—
  - the best practice environmental management for the activity and  
Provide brief notes about how, when stating the required actions, the draft TEP takes into account the best practice environmental management for the activity.
  - the risks of environmental harm being caused by the activity.  
Provide brief notes about how, when stating the required actions, the draft TEP takes into account the risks of environmental harm being caused by the activity.

#### **(c) Prevention and minimisation of environmental harm**

- The draft TEP states how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented.

TEP Part 2 – Considering and making a decision about a draft TEP

Briefly describe how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented.

**(d) Transition to an environmental standard**

- If an objective of the draft TEP is for the activity to transition to an environmental standard, the draft TEP states—
- details of the standard and
  - how the activity is to transition to the standard before the TEP ends.

Provide details of the standard and briefly describe how the activity is to transition to the standard before the TEP ends.

OR

- It is not an objective of the draft TEP for the activity to transition to an environmental standard.

**(e) Transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition**

- If an objective of the draft TEP is for an activity to transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition, the draft TEP states—
- details of the condition and how the activity does not comply with it and
  - how compliance will be achieved before the end of the TEP.

Provide details of the relevant condition and how the activity does not comply with it, and describe briefly how compliance will be achieved before the end of the TEP.

OR

- It is not an objective of the draft TEP for the activity to transition to compliance with an environmental authority, or code of environmental compliance or a development condition.

**(f) Period over which TEP is to be carried out**

- The draft TEP states the period over which the TEP is to be carried out.

State the period over which the TEP is to be carried out.

**(g) Performance indicators**

- The draft TEP states appropriate performance indicators at intervals of not more than 6 months.

Provide brief details of the performance indicators.

**(h) Monitoring and reporting**

- The draft TEP adequately provides for monitoring and reporting on compliance with the program.

Briefly describe how the draft TEP provides for monitoring and reporting on compliance with the program.

***If the Department has issued a notice under s332 requiring a person to prepare and submit a draft TEP to it for approval***

- If the draft TEP was submitted in response to a written notice issued by the Department under s322 of the Act, the draft TEP has addressed all of the requirements stated in the notice.

TEP Part 2 – Considering and making a decision about a draft TEP

If the draft TEP was submitted in response to a written notice under s322, and it does not address all of the matters required to be addressed, provide details of the matters that the draft TEP does not adequately address.

OR

- The draft TEP was not submitted in response to a written notice issued under s322 of the Act.

**Regulatory requirements (s338(1)(a))**

Chapter 4, Part 1 (ss46-64) of the *Environmental Protection Regulation 2008* (the Regulation), sets out the regulatory requirements that the Department is required to comply with when making a decision whether to accept (with or without conditions) or reject a draft TEP.

- When deciding whether accept (with or without conditions) or reject the draft TEP, the Department has complied with all relevant regulatory requirements stipulated in ss46-64 of the Regulation.

Briefly describe the relevant sections of the Regulation that were considered and how they relate to the draft TEP.

Note that regulatory requirements may also be contained in environmental protection policies.

- All relevant regulatory requirements contained in environmental protection policies have been considered by the Department.

If applicable, briefly describe any regulatory requirements contained in environmental protection policies and how they relate to the draft TEP.

OR

- There are no applicable regulatory requirements contained in environmental protection policies.

**Standard criteria (s338(1)(b)(i))**

- The Department has considered all relevant matters in the standard criteria.

Provide brief details in the table below of each relevant standard criterion and how it relates to the Department's consideration of the draft TEP. If a particular criterion is not applicable, write 'N/A'.

Standard criterion	Details
Ecologically sustainable development	
Environmental protection policies (EPPs)	
Plans, standards or agreements	
Environmental impact study, assessment or report	
Receiving environment	
Submissions made by the applicant and submitters	
Best practice environmental management	

TEP Part 2 – Considering and making a decision about a draft TEP

Financial implications	
Public interest	
Site management plan	
Environmental management systems (IEMS)	

**Additional information (s338(1)(b)(ii))**

The Department has considered additional information (if any) given in relation to the draft TEP.

If applicable, briefly describe the additional information provided.

OR

No additional information has been provided.

**Views expressed at a conference (s338(1)(b)(iii))**

If a conference has been held in relation to the draft TEP, the Department has considered the views expressed at the conference.

If applicable, provide brief notes of the views expressed at the conference and the consideration given to those views.

OR

No conference has been held.

**Consistency with development conditions of a development approval (s338(2))**

If the draft TEP has been prepared because of a development condition of a development approval, the draft TEP is consistent with other conditions of the development approval.

If applicable, describe how the draft TEP is not consistent with the other conditions of the development approval.

OR

The draft TEP has not been prepared because of a development condition of a development approval.

**Public notice of submission of draft TEP (s337(2)) and substantial compliance with the Act (s342)**

If public notice is required to be given at the submission of the draft TEP, the Department is satisfied that the public notice has been properly given.

OR

The Department is not satisfied that the required public notice has been properly given, but is satisfied that there has been substantial compliance with the Act and will accept this as compliance.

Provide brief details of how the public notice has not been properly given and why the Department is satisfied that there has been substantial compliance with the Act which it will accept as compliance.

OR

Public notice is not required.

## TEP Part 2 – Considering and making a decision about a draft TEP

### *Is the Department satisfied with the draft TEP?*

For the draft TEP to be approved, at least one box should be checked next to each of the above matters for consideration. If any of the matters remain unchecked, then the draft TEP can not be approved.

- If a box has been checked next to each requirement - Proceed to section 3.
- If a box has not been checked next to each requirement - Proceed to section 4.

### **3. Request for further information and/or amendments to a draft TEP**

If the draft TEP substantially addresses all of the relevant matters listed in s331 of the Act, but cannot be approved unless further information is provided or some amendments are made, the Department may request that the person or public authority provide further information or an amended TEP. Note that if there are significant problems with the draft TEP and it will require major changes or re-writing before it can be approved, the Department should refuse to approve it.

If it is appropriate that further information or a request for amendments be made, officers should consider the following alternatives—

- Further information is required.  
Officers are to list the further information required about the draft TEP and suspend the assessment report process while waiting for the further information to provided.
- Minor amendments are required.  
Officers are to list the minor amendments required and suspend the assessment report process while waiting for the person to provide the amended TEP.
- More substantial amendments are required.  
Officers are to list the more substantial amendments required and present them to the Delegate for approval.

### **4. Approval of the draft TEP**

Prior to making a recommendation to issue a notice of decision approving the draft TEP (with or without conditions), it is important to take into account that the Act stipulates that a TEP is a program that achieves compliance with the Act for the activity to which it relates.

If the draft TEP does **not** meet the requirements of the Act it must be refused. Whilst the Act does make provision for the approval to be subject to conditions, the conditions should address relatively minor issues only. Conditions stated in a notice of decision must not be used to rectify significant issues with a draft TEP.

A notice of decision must be issued within 8 business days of making the decision to approve the TEP. If the approval is subject to conditions, the notice of decision must be an information notice.

- The notice of decision identifies the documents forming the approved TEP, including any amendments under section 339(1)(a)(ii).
- The notice of decision sets out any conditions imposed on the approval by the Department.
- The notice of decision states the day the approval ends.

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- If conditions have been imposed on the approval, the notice of decision is in the form of an information notice.

If the notice is in the form of an information notice, it must include:

- the decision and
- the reasons for the decision and
- any available rights of internal and external review.

### 5. Refusal to approve a draft TEP

The draft TEP cannot be approved unless at least one checkbox has been checked beside each of the matters required to be addressed by the draft TEP. If the draft TEP does not meet all of the requirements, and any deficiencies will not be addressed by a request for further information and/or amendments to the draft TEP, then the Department should refuse to approve the draft TEP.

If the Department refuses to approve the TEP, the notice of decision must be an information notice. Consequently, the notice of decision must include:

- the decision and
- the reasons for the decision and
- any available rights of internal and external review.

### 6. Provide for natural justice

In order to provide natural justice, the Department must advise the person that submitted the draft TEP if it intends to do one of the following things—

- request further information about the draft TEP and/or
- request amendments to the draft TEP or
- refuse to approve the draft TEP.

The Department must also provide the person with the opportunity to make submissions in response to the Department's intentions.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved. |
- All information provided has been considered.  
Describe any information or submissions provided. |
- The Department has considered the information.  
What consideration was provided and what conclusions have the Department formed? |
- The decision-maker and environmental officer are free from bias or the perception of bias.

**TEP Part 2 – Considering and making a decision about a draft TEP**

**6. Recommendation**

The environmental officer is required to make a recommendation in relation to the draft TEP.

Recommendation:

For example, "I recommend that the draft TEP be approved OR I recommend that the draft TEP be approved with the amendments agreed in the letter to the company dated XXX OR I recommend that the draft TEP be refused.

**7. Approval**

# Procedural guide

## *Environmental Protection Act 1994* Transitional environmental program (TEP)

### Part 2 - Considering and making a decision about a draft TEP

---

*This document is designed to assist users to critically evaluate the content of a draft TEP and assess whether or not the proposed objectives and actions meet the legislative requirements.*

#### Consideration of a draft TEP submitted by a person or public authority

If a person submits a draft TEP to the Department of Environment and Resource Management (the Department), the Department is required to consider the draft TEP and make a decision whether to approve or refuse the draft TEP, or to approve it with conditions.

Section 337 of the *Environmental Protection Act 1994* (the Act) provides that the Department must make its decision within 20 business days after—

- if a public notice is required under s335—the day stated in the notice as the day by which public submissions may be made to the Department or
- otherwise—the application date.

The terms *application date* and *person* are defined below.

#### Application date (s552)

The *application date* is important because many actions in relation to a draft TEP must be made within a certain number of days from the application date. Subsection 552(2) of the Act states that the application date relating to a draft TEP is 10 business days after the day it has been submitted to the Department.

However, if the Department requires additional information about the draft TEP within 8 business days after the day it has been submitted, the application date is the day the Department states in a written notice to the applicant as being the application date (s552(3)). This day must not be earlier than two business days after the person has received the written notice (s552(6)).

If, within 8 business days after a person submits a draft TEP, the Department advises the person who made the submission that the TEP (or proposed amended TEP) does not contain or provide for a matter mentioned in s331 (content of a program), and the person is required by the Department to amend the submission so that the TEP (or proposed amended TEP) is compliant with s331 and to resubmit the submission to the Department, the application date is the day that is 10 business days after the day the amended TEP is submitted to the Department.

Or, if the Department requires additional information about the amended TEP within 8 business days after the day the amended TEP is submitted to the Department, the application date is the day the Department states in a written notice to the applicant as being the application date (s552(5)). This day must not be earlier than 2 business days after the person has received the written notice (s552(6)).

#### Person

The term *person* includes an individual, public authority or corporation.

### Fee for consideration of a draft TEP (s334)

A person that submits a draft TEP to the Department for consideration and approval must pay to the Department the fee prescribed by regulation. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

An invoice for the fees incurred should be issued to the person that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued.

### What must be included in the content of a draft TEP? (s331)

Section 331 of the Act requires that a draft TEP must, for the activity to which it relates—

- (a) state the objectives to be achieved and maintained under the TEP for the activity and
- (b) state the particular actions required to achieve the objectives, and the day by which each action must be carried out, taking into account:
  - (i) the best practice environmental management for the activity and
  - (ii) the risks of environmental harm being caused by the activity and
- (c) state how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented and
- (d) if the activity is to transition to an environmental standard, state:
  - (i) details of the standard and
  - (ii) how the activity is to transition to the standard before the TEP ends and
- (e) if the activity is to transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition, state:
  - (i) details of the condition and how the activity does not comply with it and
  - (ii) how compliance with the condition will be achieved before the TEP ends and
- (f) state the period over which the TEP is to be carried out and
- (g) state appropriate performance indicators at intervals of not more than six months and
- (h) provide for monitoring and reporting on compliance with the program.

### Is public notice required? (s335)

Public notice is required where the person submits a draft TEP for approval that states the TEP is to be carried out over a period of longer than three years. Within 2 business days after the application date, the person must give public notice of the submission by:

- an advertisement published in a newspaper circulating generally in the area in which the activity to which the draft program relates is, or is proposed to be, carried out and
- if the program relates to premises, a notice must also be placed on the premises and served on the occupiers of all adjoining premises

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- invite submissions on the draft TEP (s335(3)(b)) and state the day (at least 10 business days after the advertisement and service of notice) nominated by the Department as the day by which submissions may be made to the Department.

The notice must meet the requirements of the Act,

### **In what circumstances may the Department call a Conference? (s336)**

The Department may invite the person that has submitted a draft TEP, and another person that has made a submission under section 335 about the TEP, to a conference to help it decide whether or not to approve the draft TEP. See section 336 of the Act for details of notice and other requirements regarding conferences.

### **Other consultation and considerations**

Depending on the content of the draft TEP, officers may need to consult with other business units or Departments in order to ensure that the risks from, and effects of, the draft TEP have been fully understood. For example, if the draft TEP involves releases of water, Queensland Health and/or the Office of the Water Supply Regulator should be consulted. Releases to air may also require consultation with Queensland Health.

Officers should consider whether a formal risk assessment should be undertaken to ensure that any risks from approving the draft TEP are identified and adequately managed.

### **Consideration of draft TEPs (s337)**

The Department must decide whether to approve a draft TEP submitted to it within 20 business days after the application date. Or, if a public notice is required under s335, the Department must make a decision 20 business days after the day stated in the notice as the day by which submissions may be made to the Department. If public notice of the submission of the draft TEP is required to be given, the Department must be satisfied that public notice has been properly given before making a decision (s337(2)).

If the Department fails to decide whether to approve or refuse a TEP within the time it is required to make a decision, the failure is taken to be a decision by the Department to refuse to approve the program at the end of the time (s343).

### **What must be taken into consideration? (s338)**

When deciding whether or not to approve the draft TEP or the conditions (if any) of the approval, the Department—

- must comply with any relevant regulatory requirement and
- subject to the above, must also consider the following:
  - the standard criteria
  - additional information given in relation to the draft TEP and
  - the views expressed at a conference held in relation to the draft TEP.

If the draft TEP is prepared because of a requirement of a development condition of a development approval, the Department may approve the draft TEP only if it is not inconsistent with other conditions of the approval.

## Decision about draft TEP (s339)

Section 339 of the Act provides that the Department may—

- approve a draft TEP as submitted or
- approve a draft TEP as amended at the request, or with the agreement, of the Department or
- refuse to approve a draft TEP.

If the Department approves the draft TEP it may impose—

- any conditions the Department must impose under a regulatory requirement and
- any other conditions considered appropriate by the Department.

If the draft TEP is approved, the approval remains in force for the period stated in the notice of the approval given pursuant to s340 of the Act.

## How does an officer successfully consider and make a decision about a draft TEP?

Officers must complete an assessment report to document the decision whether to accept the draft TEP (with or without conditions), to require amendments to the draft TEP or to reject the draft TEP. If the draft TEP is accepted (with or without conditions) or rejected, a notice of decision must be issued under s340 of the Act.

### Step 1 - Complete the assessment report

Before issuing a notice of decision under s340 of the Act, officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter and documents the decision-making process used in determining whether to approve or refuse the draft TEP (with or without conditions).

The assessment report lists all the matters that must be considered by officers during the decision-making process. This includes the criteria by which the TEP must be assessed, the matters that must be addressed by the draft TEP and the matters that officers must consider when making a decision about the draft TEP. Each matter has checkboxes beside it, as well as text fields for officers to provide further information if necessary. The text fields contain explanatory notes indicating the types of information that is to be provided. Officers should check the relevant checkboxes to indicate that the particular matter has either been adequately addressed or is not applicable to that particular draft TEP. If a matter is applicable, but has not been adequately addressed, the checkbox should not be checked, and details as to how the particular matter has not been adequately addressed should be inserted in the text field provided.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference. Officers should refer to the procedural guide for information while completing the assessment report.

The assessment report is not intended to replicate the Departmental file. Rather, it is designed to capture all critical aspects that have led to the Department's decision. Accordingly, officers should limit the information included to relevant points only.

A template assessment report may be accessed at the Compliance Support Materials site on the DERM intranet.

## 1. Brief history of the matter

Briefly outline any historical information relevant to this decision. This information should be presented in succinct, chronological dot points and should include the reasons why a draft TEP is now being considered, for example, as a result of a program notice, voluntary submission or in response to a notice requesting the submission of a TEP.

## 2. Matters that must be considered when making a decision about the draft TEP (s338)

A significant amount of care should go into checking and considering the potential effects of the draft TEP, because by approving the draft TEP, the officer is authorising everything it permits.

Accordingly, the assessment criteria are an instrumental part of the decision-making process. Firstly, they establish the critical objectives that the draft TEP must achieve and how the content of the draft TEP will deliver on these objectives. Secondly, from the view of compliance and enforceability, and to establish that the draft TEP passes the *SMART* test, the requirements must be specific, measurable, achievable, relevant and time-specific. These are vital considerations given that in future, the Department may have to establish beyond a reasonable doubt that the TEP has not been complied with in order to take action against the person for failure to comply with the TEP. For this reason, the contents of the draft TEP must be clearly drafted, unambiguous and easily auditable.

More information about drafting SMART requirements and conditions may be found in the [Procedural guide - Writing effective and enforceable conditions](#)

### ***Achieving compliance with the Act (s330)***

A TEP should, for the activity to which it is concerned, achieve compliance with the Act by doing one or more of the following things—

- reducing environmental harm caused by the activity
- detailing the transition of the activity to an environmental standard
- detailing the transition of the activity to comply with:
  - a condition, including a standard environmental condition, of an environmental authority or code of environmental compliance or
  - a development condition.

The term *environmental standard* is defined as being:

- an environmental standard (however called) set out, or otherwise provided for, in a regulation under the Act or
- an outcome or objective that is directed at protecting or enhancing environmental values set out in an environmental protection policy.

A *standard environmental condition* for an environmental authority or code of environmental compliance means a standard environmental condition approved by the Minister pursuant to s549 of the Act.

A *development condition* of a development approval means a condition of the approval imposed by, or because of a requirement of, the Department if it is the assessment manager or concurrence agency for the application for the approval.

The draft TEP must set out how the activity is currently in non-compliance with the Act and how the person proposes to make the activity compliant. If it is not clear from the information provided in the draft TEP that by

## TEP Part 2 – Considering and making a decision about a draft TEP

doing one or more of these things compliance with the Act will be achieved by the end of the operative period of the TEP, the draft TEP must not be approved.

### **Content of the TEP (s331)**

A TEP, for the activity to which it relates, must include the following—

#### **(a) Objectives to be achieved and maintained under the TEP**

A draft TEP must clearly set out what it is trying to achieve. For example:

##### *EXAMPLE 1*

*To bring the operator into compliance with conditions G12 and H5 of development approval 123456*

##### *EXAMPLE 2*

*To prevent or minimise environmental harm caused by the migration of landfill gas.*

The objectives should be as specific and clear as possible so that, if the draft TEP is approved, the Department can assess whether the objectives have been met.

#### **(b) State the particular actions**

The draft TEP must set out the actions that the person will carry out in order to achieve the objectives. It is important that the actions are as definite, specific and as clear as possible. If they are vague or uncertain, it will be difficult for the Department to assess whether the person is doing what they have said they will do, which may prevent the Department from taking enforcement action in future. Each action must have a due date by which it will be completed, and must comply with the SMART principles.

Progress reporting dates and final reporting dates should be included in the actions.

In stating the particular actions required to achieve the objectives, the draft TEP must take into account best practice environmental management. Officers should refer to s21 of the Act for a definition of *best practice environmental management*.

#### **(c) Prevention and minimisation of environmental harm**

The risks of environmental harm being caused by the activity should also be taken into account. The draft TEP must state how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented.

#### **(d) Transition to an environmental standard**

If the objective of the draft TEP is to transition to meet an environmental standard, the draft TEP must provide details of the standard and set out how the activity is to transition to the standard before the operative period of the TEP comes to an end. Please see 'Achieving compliance with the Act' above for a definition of *environmental standard*.

#### **(e) Transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition**

If the objective of the draft TEP is for an activity to transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition, the draft TEP must set out each condition and detail how the activity does not comply with the condition. The draft TEP must also state how compliance with the condition will be achieved before the end of the operative period of the TEP.

## TEP Part 2 – Considering and making a decision about a draft TEP

### (f) Period over which the TEP is to be carried out

To be approved, the draft TEP must state the period over which the TEP is to be carried out. If the person has submitted for approval a draft TEP that states it will be carried out over a period longer than three years, the person must give public notice of the submission within 2 business days after the application date in accordance with s335 of the Act.

### (g) Performance indicators

The draft TEP must state appropriate performance indicators at intervals of not more than 6 months. The performance indicators must show how the applicant is progressing in achieving the objectives of the TEP. The indicators must also be capable of being measured and be specific enough to enable the Department to assess with certainty whether or not they have been met. The date on which each performance indicator will be met must be set out in the TEP.

### (h) Monitoring and reporting

The draft TEP must provide for sufficient monitoring and reporting on compliance with the program. It should provide for the person to monitor and report on—

- the carrying out of the actions
- whether or not the objectives are being achieved
- whether or not the required time-frames are being met and
- any environmental and scientific testing.

The draft TEP should also allow for the person to provide—

- reports on progress with the TEP, including any failure to carry out prescribed actions by the stipulated dates
- reports on any environmental monitoring requirements (including interpretation) and
- a final report to the Department demonstrating that compliance with the Act has been achieved.

### **Regulatory requirements (s338(1)(a))**

Sections 46-64 of the *Environmental Protection Regulation 2008* specify the matters that must be considered when the Department is making environmental management decisions. An *environmental management decision* is a decision under the Act for which the Department is required to comply with regulatory requirements. All matters relevant to the draft TEP must be considered when making a decision about it, for example, if there are certain matters specified where release of water to land is contemplated.

### **Standard criteria (s338(1)(b)(i))**

As stated above, the Department **must** consider the standard criteria, set out below, before deciding whether or not to approve the draft TEP—

- **The principles of ecologically sustainable development as set out in the ‘National Strategy for Ecologically Sustainable Development (ESD)’**

Consider the following guiding principles:

- Has the decision effectively integrated long- and short-term economic, environmental, social, and equity considerations?

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- Has due regard been given to the precautionary principle? In other words, where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- Does the decision have due regard to the global dimensions of environmental impacts and policies?
- Does the decision assist in the development of a strong, growing and diversified economy, which can enhance the capacity for environmental protection?
- Has the need to maintain and enhance international competitiveness in an environmentally sound manner been considered when making the decision?
- Have cost effectiveness and flexible policy instruments (for example, improved valuation, pricing and incentive mechanisms) been adopted?
- Does the decision/action allow for broad community involvement on issues that affect them?
- **Any applicable Environmental Protection Policies (EPPs)**
  - Is the draft TEP consistent with the EPPs on water, air, noise and waste (where relevant)?
- **Any applicable Commonwealth, State or local government plans, standards, agreements or requirements**
  - Consider guidelines such as the State and Regional Coastal Plan, National Health and Medical Research Council (NHMRC) and the Australian and New Zealand Environment and Conservation Council (ANZECC) Guidelines.
- **Any applicable environmental impact study, assessment or report**
  - Consider any findings or recommendations that are relevant to the draft TEP.
- **The character, resilience and values of the receiving environment**
  - Does the draft TEP have regard to the environmental values of the receiving environment?
  - What is the impact on the values of the actions contained in the draft TEP?
- **All submissions made by the applicant and submitters**
  - Consider any submissions made by the applicant and anyone who properly makes a submission about the draft TEP.
- **Best practice environmental management for the activity to which the draft TEP relates**
  - Analyse how approving the draft TEP with or without conditions will ensure that best practice environmental management is achieved.
- **The financial implications of the requirements**
  - Explore the financial implications for the client in complying with conditions of the TEP. Are they reasonable in the particular circumstances?
- **The public interest**
  - Is it in the interest of the community that the draft TEP be approved?
- **Any applicable site management plan**
  - If there is a site management plan for contaminated land (approved under Chapter 7, Part 8 of the Act), and is the draft TEP consistent with the site management plan? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled?

## TEP Part 2 – Considering and making a decision about a draft TEP

Consult with the Contaminated Land Unit as early as possible when there are any contaminated land issues.

- **Any relevant integrated environmental management system or proposed integrated environmental management system (IEMS)**
  - Is the draft TEP consistent with the IEMS? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled?
- **Any other matter prescribed by a regulation**
  - See 'regulatory requirements' above.

### ***Additional information (s338(1)(b)(ii))***

The Department must consider any additional information given in relation to the draft TEP. Has all supporting information provided by the applicant been considered? Having considered the draft TEP and any supporting information, is it clear that the draft TEP achieves compliance with the Act?

### ***Views expressed at a conference (s338(1)(b)(iii))***

If a conference has been held as part of a public notice process, the views expressed at that conference in relation to the draft TEP must be considered and the reasons for having regard to, or not having regard to, those views must be recorded.

### ***Consistency with development conditions of a development approval (s338(2))***

If the draft TEP is prepared because of a development condition of a development approval, the Department must not approve the draft TEP unless it is consistent with other conditions of the development approval.

### ***Public notice of submission of draft TEP (s337(2)) and substantial compliance with the Act (s342)***

If public notice is required, before approving the draft TEP, ensure that the person or public authority submitting the draft TEP has properly given public notice and complied with the requirements of s335 of the Act.

The Department must be satisfied that the public notice has been properly given before making a decision (s337 of the Act). If the Department is not satisfied that public notice has been properly given, it may consider and decide whether to approve the draft program if it is satisfied there has been substantial compliance with the public notice requirements of the Act (s342).

See 'Is public notice required?' above for further information regarding public notice.

### ***Satisfaction that the draft TEP meets the requirements of the Act***

Having considered all of the above matters, officers completing the assessment report must decide whether they are satisfied the draft TEP adequately addresses all of the relevant matters. If any of the issues in the assessment report were answered 'no', officers should proceed to section 4. Otherwise, proceed to section 3.

## **3. Request for further information and/or amendments to the draft TEP**

In some cases the draft TEP may substantially address the required matters, but cannot be approved because some matters have not been adequately addressed. In this situation, the Department may request that further information be provided or that particular amendments be made to the draft TEP. It is important to recognise that if there are major problems with the draft TEP, or a large number of matters that have not been addressed by the draft TEP, officers should recommend to the Delegate that it not be approved and a notice of decision should be sent to the person or public authority that submitted the draft TEP advising of this decision.

## TEP Part 2 – Considering and making a decision about a draft TEP

---

However, if it is likely that the draft TEP would be approved if further information is provided or some changes are made, it is preferable for the Department to write to the person submitting the draft TEP and request the further information and/or amendments, rather than approve the TEP subject to conditions, owing to the fact that conditions may be difficult to enforce. See ‘Key considerations regarding conditions’ below for further information.

Officers should consult with their supervisor when considering whether to request further information or amendments to the draft TEP, and in formulating the amendments required to be made (if any). A request for amendments to a draft TEP should be made in writing. If, after the draft TEP is amended, it is approved, the amended TEP will form part of the approved TEP.

It is highly recommended that a request for amendments be made within 8 business days after the draft TEP is submitted to the Department, as this means that the application date will then be 10 business days after the date that the amended TEP is submitted to the Department. Consequently, the Department will have additional time to consider the amended TEP and make a decision whether or not to approve it.

### **Time-frames**

For information regarding a change in time-frames if further information is sought or the Department requests amendments to the draft TEP, see the section ‘Application date’ above.

### **Minor amendments and/or further information**

If only very minor amendments are necessary, officers should consider suspending the decision-making process, so as to provide the opportunity to the person submitting the draft TEP to make the requested amendments. If the requested amendments are made, the assessment report can then be completed to reflect the amendments. Then, if all relevant matters have been adequately addressed, officers may recommend that the Delegate approve the draft TEP.

### **More significant amendments**

If the amendments required are more significant or complicated, officers should list the requested amendments in the assessment report and recommend that the Delegate approve a request for the required amendments. Then, if the amendments are provided by the person submitting the draft TEP, officers must complete a fresh assessment report and provide a new recommendation to the Delegate.

## **4. Approval of the draft TEP**

The assessment report lists all the matters that must be considered by officers during the decision-making process, with checkboxes beside each matter. At least one checkbox must be checked beside each matter before a decision can be made to approve the draft TEP.

### **Key considerations regarding conditions**

The Act does make provision for an approval of a draft TEP to be subject to conditions the Department considers appropriate. However, the enforceability of conditions placed on a TEP is unclear. Accordingly, conditions should not be imposed except for minor matters. Conditions must not be used to alter the terms of the TEP itself. If the TEP is not satisfactory, it must be refused or amendments sought from the applicant. Conditions in the notice of decision should not be used as a quasi-development approval, or to alter or amend the TEP to meet the requirements of the Act.

### Financial assurance conditions (ss364-367)

Under s364 of the Act, the Department may, by condition of an approval of a TEP, require the holder of the approval to give the Department financial assurance as security for—

- compliance with any conditions of the TEP and
- costs or expenses, or likely costs or expenses, that the Department incurs, or might reasonably incur, in taking action to:
  - prevent or minimise environmental harm or rehabilitate or restore the environment, in relation to the carrying out of an activity under a TEP approval or
  - secure compliance with the TEP, or any conditions of the TEP, for which financial assurance has been given.

However, under s364(2) the Department may impose a condition requiring a financial assurance to be given only if it is satisfied that the condition is justified, having regard to—

- the degree of risk of environmental harm being caused, or that might reasonably be expected to be caused, by the activity carried out, or to be carried out, under the program and
- the likelihood of action being required to rehabilitate or restore and protect the environment because of environmental harm being caused by the activity and
- the environmental record of the holder.

Section 365 of the Act provides that before approving a draft TEP subject to the condition that financial assurance be given, the Department must give the person who submitted the draft TEP a written notice that must –

- state the grounds for the condition and
- state the form and extent of the financial assurance and
- invite the person to make representations to the Department to show why the approval of the draft TEP should not be subject to the condition and
- state the period (at least 22 business days after the notice is given to the person) within which the representations may be made and
- the representations must be made in writing (s365(3)).

Within 20 business days after the end of the period stated in the notice (s365(4)), the Department must—

- consider the representations properly made by the person and
- if the Department gives the approval subject to the condition that the holder of the approval give financial assurance—the Department must give written notice to the person giving reasons for imposing the condition.

## 5. Refusal to approve a draft TEP

The draft TEP cannot be approved unless a checkbox has been checked next to each matter listed on the assessment report, either to confirm the matter has been adequately addressed, or to indicate that the matter is not applicable to the draft TEP. If a checkbox has not been checked next to a matter, officers are to provide details in the text field provided.

## TEP Part 2 – Considering and making a decision about a draft TEP

---

If any of the required matters are not addressed in the draft TEP, officers should either recommend a refusal of the draft TEP, or seek further information or amendments to the draft TEP from the person that submitted it. (See 'Request for further information and/or amendments to the draft TEP' above). If the deficiencies in the draft TEP are too serious to be addressed by further information and amendments, the Department should refuse to approve the draft TEP.

### 6. Provide for natural justice

The Department must ensure that decisions are made in a fair and consistent manner. This includes ensuring that the affected individual is provided with 'natural justice' (that they are given an opportunity to make their case for why the decision should go in their favour) and that people involved in making the decision are free from bias or the perception of bias.

Any submissions made by the applicant that have not already been considered earlier in the assessment report process must be documented in section 5 of the assessment report.

### 7. Recommendation

Officers are required to make a recommendation as to whether or not the draft TEP should be approved (with or without conditions) or refused.

### 8. Approval

An officer with the appropriate delegation must consider the contents of the assessment report and the recommendation and make a decision about whether to approve (with or without conditions) or refuse the draft TEP. The Department's list of delegations can be found on the Department's intranet at <http://insite2.dnr.qld.gov.au/derm/delegations/>.

## Step 2 – Complete the notice of decision

Section 240 of the Act provides that within 8 business days of making a decision under s339, the Department must give the person or public authority that submitted the draft TEP a written notice of the decision (the notice of decision).

If the delegate approves the draft TEP, the notice of decision must—

- identify the documents forming the approved TEP, including any amendments under s339(1)(a)(ii) and
- state any conditions imposed on the approval by the Department and
- state the day the approval ends.

If the draft TEP is approved, the approval remains in force for the period stated in the notice of decision (s339(3)).

### ***Content of approved program (s341)***

An approved TEP consists of the following—

- the draft program submitted under section 332 or 333, as amended at the request, or with the agreement of the Department

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- any conditions imposed on the program by the Department.

### **Information notice**

If the Department refuses to approve the draft TEP, or approves it with conditions, the notice of decision given to the person or public authority that submitted the program must be an information notice (s340(3)).

An *information notice* means a written notice stating—

- the decision and
- the reasons for the decision and
- the review and appeal details.

Officers must issue an invoice for the fees for consideration of the draft TEP to the person or public authority that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

### **What is the effect of compliance with the approved TEP? (s346)**

An approved TEP protects the holder, or a person acting under the approval, from enforcement action for non-compliance with the relevant—

- regulation or
- environment protection policy (EPP) or
- environmental authority (EA) held by the holder or
- development condition of a development approval (DA) or
- standard environmental condition of a code of environmental compliance for a chapter 4 activity or
- accredited environmental risk management plan (ERMP) under the Great Barrier Reef protection measures.

### **What follow-up is required?**

It is an offence for the holder of an approved TEP to contravene the program. Officers should diarise all performance indicator requirements listed in the program or conditions and ensure they are monitored for compliance.

Officers are encouraged to use tools such as reminders in Microsoft outlook to ensure the matter is followed up in a timely manner.

### **Review of decisions and appeals**

The provisions regarding review of decisions and appeals may be found in Chapter 11, Part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision made by the Department about a draft TEP, may apply for a review of an original decision by submitting an application on the approved form to the Department—

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the Planning and Environment Court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court by filing written notice of appeal with the registrar of the Court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the Court extends the period for filing the notice of appeal.

The court may grant a stay of a decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying-out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

### **What penalties exist for a contravention of a requirement of a TEP (s432)?**

The holder of an approval of a TEP, or a person acting under a TEP, must not wilfully contravene a requirement of the program.

Maximum penalty—1665 penalty units (\$166,500.00) or 2 years imprisonment.

The holder of an approval of a TEP, or a person acting under a TEP, must not contravene the program.

Maximum penalty—835 penalty units (\$83,500.00).

The maximum penalty for a corporation is five times the penalty for an individual.

### **What penalties exist for contravention of a condition of approval (s432A)?**

A person must not, without reasonable excuse, contravene a condition of an approval of a transitional environmental program.

Maximum penalty—835 penalty units (\$83,500.00)

The maximum penalty for a corporation is five times the penalty for an individual.

# Assessment report

*Environmental Protection Act 1994*

## Cost recovery notice

*This document is intended for internal use to assist Environmental Services officers to record the information considered by the Department when deciding to issue a cost recovery notice.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Registered business address

**Note:**

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be approved by the responsible officer, supervisor, and the delegated decision-maker.

### 1. Brief history of the matter

Please briefly outline any historical information relevant to this decision.

Provide brief outline of the historical information.

### 2. Grounds for use of a cost recovery notice

The grounds for use of a cost recovery notice can be found in s363N of the *Environmental Protection Act 1994* (the Act). Officers are required to identify the relevant grounds upon which the decision to use a cost recovery notice applies.

- The prescribed person has been identified.

**If a clean-up notice has been issued**

- The recipient has failed to comply with the notice and an authorised person or contractor has carried out any of the actions stated in the clean-up notice (s363K).

**OR**

- The decision to issue the clean-up notice has been stayed by the court and, during the period of the stay, an authorised person or contractor carried out the actions stated in the clean up notice (s363K), and:
- the appeal has ended without an appeal decision being made by the court **OR**
  - the appeal decision confirms the decision to issue the clean-up notice and required the recipient to take the clean up action

**AND**

- the Department has reasonably incurred costs and expenses for taking an action stated in the cleanup notice or monitoring compliance with the clean-up notice

**OR**

- the Department has reasonably incurred costs and expenses in monitoring compliance by the recipient with the clean-up notice.

**If a clean up notice has not been issued**

- The intended recipient of the cost recovery notice is a person whom the Department reasonably believes to be a prescribed person for a contamination incident

**AND**

- an authorised person has taken action under the Department's emergency powers (s467 of the Act) in relation to serious or material environmental harm caused or likely to be caused by the incident

**AND**

- the Department has reasonably incurred costs and expenses for taking action under s467.

**Ensure that the costs and expenses incurred will be payable**

Subsection 363N(5) of the Act lists the circumstances where the costs incurred are not payable by the recipient.

- None of the circumstances specified in s363N(5) where the costs incurred will not be payable by the recipient apply to this situation.

**3. Expand upon the grounds**

Expand upon the grounds identified for issuing the cost recovery notice.

If a clean-up notice has been issued, officers will need to link the actions taken by the authorised person or contractor and the costs claimed by the Department with the requirements set out in the clean-up notice, and provide reasons to justify why the Department had to carry out the actions in place of the recipient of the clean-up notice.

If an authorised person has acted under the emergency powers pursuant to s467 of the Act, officers must provide an explanation as to why and how the actions were taken, the costs were incurred, the urgency of the situation and provide justification for the dollar value claimed.

Each ground should be listed independently and be allocated a separate number.

Number	Specific ground
1	ABC Pty Ltd failed to comply with the clean-up notice issued on 11th February 2009 and actions stated in the clean-up notice were carried out by XYZ Pty Ltd.
2	

#### 4. Detail the matters considered

The purpose of the following table is to ensure that there is evidence to support all of the grounds for using the tool. This is achieved by linking the elements of the grounds to the information gathered and the conclusions formed. This section should also record how the Department has met any statutory requirements associated with the use of the tool.

When analysing information or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

Elements of the offence or legislative requirements	Evidence	Facts and circumstances
<i>List the elements of any alleged offence or (for grounds which are not offences) list the legislative requirement to be met by the Department.</i>	<i>Identify the information considered which is relevant to the elements or requirement (i.e. statements, photographs, and recordings).</i>	<i>Detail the facts and circumstance that support the Department's findings.</i>
<b>Number 1</b> (Number taken from Section 2)		
10 July 2010: The recipient of a clean-up notice.....	A clean-up notice was issued to Mr JP Citizen, sole director/secretary of ABC Pty Ltd on 10 July 2010.	The clean up notice required Mr Citizen to take action to clean up toxic sludge leaking from ponds at the site of ABC Pty Ltd by 10 August 2010.
Has failed to comply with the clean-up notice.....	A site inspection was carried out by senior environmental officer Mr Jack Green at 123 Creek Road, Greendale on 12 August 2010.	The site inspection revealed that Mr Citizen had not carried out the actions set out the clean-up notice in the required time frame.
An authorised person or person acting under the	The department authorised contractor XYZ Pty Ltd to carry out the actions	XYZ Pty Ltd was engaged by the department to clean up the toxic

direction of an authorised person (the contractor) has taken the actions stated in the clean up notice.....	stated in the clean-up notice on 15 August 2010.	sludge leaking from ponds owned by ABC Pty Ltd.
The Department incurred reasonable costs and expenses.....	XYZ Pty Ltd has issued an invoice to the Department for the clean-up work carried out.(Copy attached to this assessment report).	XYZ Pty Ltd has invoiced the Department for the amount of \$20,000.00 which is the cost to the Department reasonably incurred when carrying out the actions stated in the clean-up notice that the recipient failed to carry out.

## 5. Calculate the monetary value

Officers are required to identify the monetary amount being sought and show the calculations used to determine this amount. Costs and expenses claimed must be defensible and reasonable in the circumstances. They can include labour, equipment and administrative costs and expenses.

Costs claimed	Monetary value
For example: Cost of consultant	For example: Engaged for 20 hours @ \$330.00 per hour (including GST) = \$6,600.00
For example: Cost of full time equivalents (FTEs)	For example: \$10,000.00
For example: Cost of sampling/monitoring	For example: \$5,000.00
For example: Cost of works	For example: Contractors engaged for 18 hours @ \$1,100.00 per hour = \$19,800.00
For example: The total amount being sought by the State	For example: \$41,400.00

A copy of the relevant documentation for each cost claimed must be attached to the assessment report.

To ensure the costs claimed are reasonable, officers are required to provide justification for the inclusion of the cost.

Costs claimed	Justification
For example: Cost of consultant	For example: It was necessary to hire a consultant to perform scientific testing to ascertain the nature and extent of the environmental damage.
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification
Cost claimed	Justification

## 6. Natural justice

The investigating officer is required to notify the affected person that the Department is considering issuing a cost recovery notice and that the individual is welcome to make representation to the Department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Please describe how this was achieved.
- All information and/or defences provided were considered.  
Please describe any information or defences provided.
- The Department has considered the information or defences provided.  
What consideration was given and what conclusions has the Department formed?
- The decision-maker and responsible officer are free from bias or the perception of bias.

## 7. Recommended decision

The responsible officer is required to make a recommendation in relation to the allegation.

Recommendation.

## 8. Approval

Responsible officer	Supervisor

<b>Print name:</b>	<b>Print name:</b>
<b>Date:</b>	<b>Date:</b>

Delegate decision-maker	Approve/reject recommendation (circle one)
<p>Reasons for decision</p> <p><i>I endorse this recommendation based upon the information set out above.</i></p> <p><i>Or, I endorse this decision for the reasons set out above and I note Mr JP Citizen has previously received a warning letter in relation to this matter.</i></p> <p><i>Or, I reject the above recommendation as I consider it more appropriate for the Department to take an educational approach to this breach.</i></p>	
<b>Print name:</b>	
<b>Date:</b>	

## Cost recovery notice

*This document is intended for internal use to assist Environmental Services officers to issue a cost recovery notice.*

### What is a cost recovery notice?

A cost recovery notice is a written notice which may be issued by the Department of Environment and Resource Management (the Department) to a person reasonably believed to be a prescribed person for a contamination incident, to recover costs reasonably incurred by the Department in—

- if a clean-up notice has been issued:
  - taking an action stated in the clean-up notice if the recipient has failed to comply with the clean-up notice or
  - monitoring the recipient's compliance with the clean-up notice or
- otherwise, taking action under the Department's emergency powers in s467 of the Act.

The issuing of cost recovery notices is governed by Chapter 7, Part 5C (ss363M to 363O) of the *Environmental Protection Act 1994* (the Act).

### Who is a prescribed person?

A *prescribed person* for a contamination incident includes the following (s363M):

- a person who caused or permitted the incident to happen
- a person who at the time of the contamination incident was the occupier of the place where the incident occurred
- the person who owns, or is in control of, a contaminant involved in the incident
- if a cost recovery notice is issued to a corporation (the first corporation) and it fails to pay the amount claimed by the notice
  - a parent corporation of the first corporation and
  - an executive officer of the first corporation.

### Who can use a cost recovery notice?

Cost recovery notices can only be issued by someone who has delegated authority. As the individual (or position) that holds the delegation changes regularly, officers are encouraged to review the Department's list of delegations at: <http://insite2.dnr.qld.gov.au/derm/delegations>

### When should I use a cost recovery notice (s363N(1))?

The legislation specifies that the cost recovery notice can be used in each of the following circumstances—

- if a person who has been given a clean-up notice fails to comply with it and a person or contractor authorised by the Department carries out the actions stated in the clean-up notice or
- if a decision to issue a clean-up notice is stayed whilst the recipient appeals the decision, and during the period of the stay an authorised person or contractor carries out the actions stated in the clean-up notice, and either the appeal ends without an appeal decision or the decision confirms the decision to issue the clean-up notice or
- if an authorised person acts under the Department's emergency powers (s467) to take action regarding environmental harm caused by a contamination incident.

When a cost recovery notice has been issued to the recipient, the costs claimed in the notice must be linked to the actions that have been carried out by an authorised person or contractor. Any cost claimed must be defensible.

If an authorised person, or a person authorised by an authorised person, has taken action under the Department's emergency powers provided for in s467 of the Act, the Department will need to show what action was taken and why and provide justification for the costs incurred.

### **What can be claimed in a cost recovery notice (s363N(2))?**

A cost recovery notice may claim a stated amount for costs or expenses reasonably incurred—

- When a notice is issued to a person who has been given a clean-up notice:
  - for taking an action stated in the clean-up notice or
  - for monitoring compliance with the clean-up notice.

OR

- When an authorised person has taken action under the Department's emergency powers (s467).

The Department will need to explain how it formulated the dollar value it is claiming and provide evidence of the costs reasonably incurred. This can be done by providing an itemised list of costs incurred which is substantiated by the appropriate invoices. All relevant invoices, receipts and other documents that establish amounts paid should be kept as evidence of the expenses. If time spent by department officers in taking any of the actions in a clean-up notice, or in taking action under the emergency powers in s467 of the Act, is to be claimed, a detailed account of the actions taken and time spent must be recorded.

### **When the costs incurred will not be payable**

There are certain circumstances when the amount claimed is not payable, as specified in s363N(5) of the Act. These include—

- if the recipient of the cost recovery notice is not a prescribed person or
- if the contamination incident was caused by a natural disaster or
- if the contamination incident was caused by a terrorist act or other deliberate act of sabotage by someone other than the recipient and, taking all of the circumstances into account, the recipient had taken all reasonable measures to prevent the incident.

In some cases, the amount claimed may also not be payable if the cost recovery notice is issued to a corporation that fails to pay the amount claimed in the notice and the prescribed person is an executive officer of the corporation.

If this instance, the amount will not be payable if:

- the executive officer took all reasonable steps to make sure the corporation paid the amount claimed in the notice or
- the executive officer was not in a position to influence the corporation in regard to paying the costs claimed in the notice.

Prior to issuing a cost recovery notice, it is important to consider whether any of the above circumstances apply. In particular, officers should ensure that the intended recipient of the notice is the prescribed person for the contamination incident.

## How do I successfully issue a cost recovery notice?

Officers must complete an assessment report to document the decision as well as completing the cost recovery notice.

### Step 1 - Complete the assessment report

Before completing the cost recovery notice, officers are required to complete an assessment report that sets out the facts and circumstances relating to the matter and documents the decision-making process used by the Department in determining to issue a cost recovery notice.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference.

The assessment report is not intended to replicate the Departmental file. Rather it is designed to capture all critical aspects that have led to the Department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached [\[LINK\]](#)

#### 1. Brief history of the matter

Briefly outline any historical information relevant to this decision. This information should be presented in succinct, chronological dot points and should include how the Department came to carry out the actions that incurred the costs that are being claimed.

#### 2. Grounds for issuing a cost recovery notice

Section 363N(1) of the Act provides that a cost recovery notice can only be issued in the following circumstances:

A cost recovery notice may be given to the recipient of a clean-up notice if—

- the recipient has failed to comply with the clean-up notice and
- an authorised person or contractor takes any of the actions stated in the clean-up notice.

OR

- the recipient has appealed the decision to issue a clean-up notice and the operation of the decision is stayed and
- an authorised person or contractor carries out the actions stated in the clean-up notice during the period of the stay and

- the appeal ends without an appeal decision or the decision confirms the decision to issue the clean-up notice.

A cost recovery notice may also be given to a prescribed person for a contamination incident if an authorised person acts under the Department's emergency powers (s467) to take action in regard to the environmental harm caused or likely to be caused by the contamination incident.

### 3. Expand upon the grounds

The purpose of this section is to clearly identify what the Department must 'prove' before deciding to use a cost recovery notice and should be used to expand upon the abovementioned grounds.

### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the grounds to the information gathered and the conclusions formed. This is achieved by identifying: the specific ground, the information which has been considered and the conclusion that has been reached by the officer after considering the information sourced.

When documenting the information considered, officers are encouraged to limit the information to relevant points only. This can include (but is not limited to):

- receipts for costs incurred
- notes recorded in an officer's official notebook
- photographs
- copies of relevant documents and
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of available information or evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

A copy of any relevant supporting documents must be attached to the assessment report for this tool. For example:

- a copy of the assessment report recording the decision to issue the clean-up notice
- a copy of the written notice of a direction given under the emergency powers in s467.
- any relevant invoices provided by contractors to the Department
- if the cost of Departmental officer salaries is to be included in the cost recovery notice, a log of Departmental officer time spent.

### 5. Calculate the monetary value

Officers are required to identify the monetary amount being sought and show the calculations used to determine this amount. Costs and expenses claimed must be defensible and reasonable in the circumstances. They can include labour, equipment and administrative costs and expenses. All amounts claimed must be recorded in the table in the assessment report and a copy of the relevant documentation for each cost claimed must be attached.

## 6. Provide for natural justice

Prior to the Department making a decision which may adversely impact on an individual or group the Department must:

- **Notify** - Notify the individual that the Department is considering making adverse findings
- **Respond** - Provide the individual with an opportunity to respond to any possible negative findings and
- **Consider** - Consider any representations that are made before finalising the decision.

The seriousness of the matter will largely dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

## 7. Recommendation

The investigating officer is required to make a recommendation in relation to the alleged breach. For example:

*The Department is of the opinion that Mr JP Citizen failed to comply with the clean-up notice issued on 1 August 2010. Accordingly, a contractor was hired by the Department to carry out the actions stated in the clean-up notice. In order for the Department to recover monies spent due to Mr Citizen's failure to comply with the clean-up notice, it is recommended that a cost-recovery notice be issued.*

Administrative decisions are made based upon the balance of probabilities. This means that the decision-maker must be able to determine whether, based upon the information available, it was more probable than not that the event occurred.

## 8. Endorsement

The assessment report is to be endorsed by an appropriately delegated officer. The Department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations>

## Step 2 - Draft the cost recovery notice

The tool must meet a number of legislative requirements in order to be legally binding. Section 363N(3) of the Act provides that a cost recovery notice must include the following information—

- the name of the recipient
- a description of the contamination incident

- the place at or from which the Department is satisfied the incident happened
- the amount claimed
- a description of costs and expenses giving rise to the claimed amount
- that, if the recipient does not pay the amount to the administering authority within 30 days after the day the notice is issued, the administering authority may claim the amount from the recipient as a debt
- the name, address and contact details of the Department and
- the review or appeal details.

With regard to issuing the cost recovery notice, the Department is also required to notify individuals of the following in a timely manner:

- any decisions made against them
- the reasons for the decision (these are the facts and circumstances identified in section 4 of the assessment report).

This information must be included in the cost recovery notice. A template cost recovery notice is attached:

[\[LINK\]](#)

The cost recovery notice must be signed by the decision maker in conjunction with the assessment report which records the formal decision.

## Review or appeal details

The legislation (s363N(h)) specifies that the notice must include the review or appeal details. Basic information regarding the review and appeal process is included in the template notice. As well, a copy of the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#) should be attached to the cost recovery notice.

## Multiple recipients

If a cost recovery notice is issued to two or more recipients (s360O)—

- a copy of the notice must be given to each recipient and
- the amount claimed in the notice is payable by the recipients jointly and severally.

The fact that the notice is payable by the recipients *jointly and severally* means that the Department may collect the entire amount payable from any one of the recipients or collect various amounts from any or all of them.

## Service of a cost recovery notice

Service means delivery to the party who will be affected by the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. Methods of service are provided for in ss39 and 39A of the *Acts Interpretation Act 1954 (AI Act)*.

For the purposes of any Act that requires a document to be served on (which includes 'given' or 'sent to') a person, the document may be served—

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by post, facsimile or similar facility (e.g. email) to the place of residence or business of the person or
- on a body corporate – by leaving it, or sending it by post, facsimile or similar facility (e.g. email) to the head office, a registered office or a principal office of the body corporate.

If a cost recovery notice is issued to two or more recipients, a copy of the notice must be given to each recipient.

The date, time and method of service should be documented by contemporaneous notes, a file note, postage receipts or any facsimile or email confirmations.

### **What follow-up is required?**

It is important that the matter is appropriately followed-up to make sure that the person to whom the cost recovery notice is issued has paid the amount claimed in the notice. Follow-up is to be scheduled by the relevant officer and confirmed with the business area manager. The business area manager is responsible for ensuring follow-up is undertaken within the agreed timeframe.

The recipient of a cost recovery notice must pay the amount claimed to the department within 30 days after the day the notice is issued, or the department may claim the amount from the recipient as a debt. At the end of the 30-day period officers should check whether the amount has been paid or not. If not, appropriate steps should be taken to recover the debt.

Information in regard to accounts receivable and the debt recovery process may be found in the [Financial Management Practice Manual \(FMPM\)](#)

Officers are encouraged to use tools such as diary reminders to ensure the matter is followed up in a timely manner.

### **What are my record-keeping responsibilities?**

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with a commentary on actions and recording any decisions made on the enforcement measure screen (this includes a decision to take no further action). A hard copy of the cost recovery notice, the signed assessment report and any accompanying documents must be placed on the paper file. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

It is important that officers adequately respond to and report on all inquiries in order to assist in building a comprehensive compliance history.

### **Amendments to an issued cost recovery notice**

If minor changes to the cost recovery notice or an extension of time are required, the recipient of the notice should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original notice, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have a fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh cost recovery notice should be carried out in the same way, and subject to the same conditions as the issuing of the original notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal to or higher than that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and reissue the notice in EcoTrack and place hard copies of any documentation on the paper file.

## Review of decisions and appeals

The provisions regarding review of decisions and appeals may be found in Chapter 11, part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision made by the Department in respect to a cost recovery notice may apply for a review of an original decision by submitting an application on the approved form to the Department—

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or
- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court by filing written notice of the appeal with the registrar of the court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the court extends the period for filing the notice of appeal.

The court may grant a stay of a decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## What penalties exist for non-compliance with a cost recovery notice?

The legislation does not provide a penalty for non-compliance with the cost recovery notice. However, s363N(4) provides that, subject to s363N(5) (situations where the amount is not payable), if the recipient does not pay the amount in the cost recovery notice within 30 days after the notice is issued, the Department may claim the amount from the recipient as a debt.

# Notice

## *Environmental Protection Act 1994*

### **Cost recovery notice**

*This cost recovery notice is issued by the administering authority pursuant to s363N of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and postal code

Your reference: Your reference

Our reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* (the Act) a cost recovery notice is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

#### **A. Grounds**

The cost recovery notice is issued on the following grounds:

- a clean-up notice was issued to you on date.
- you failed to comply with the clean-up notice by not carrying out the following actions:
  - State the actions in the clean-up notice the recipient did not carry out.
  - State the actions in the clean-up notice the recipient did not carry out.
  - State the actions in the clean-up notice the recipient did not carry out.
  - State the actions in the clean-up notice the recipient did not carry out.
- [as a result of your non-compliance an authorised person or contractor has taken the actions stated in the clean-up notice pursuant to s363K of the Act] OR [as a result of your non-compliance the Department has had to monitor your compliance with the clean-up notice]
- [the department has reasonably incurred costs in taking the action/s stated in the clean-up notice due to your non-compliance] OR [the Department has reasonably incurred costs in monitoring your compliance with the clean-up notice].

The facts and circumstances forming the basis for these grounds are:

- The notice MUST state the name of the recipient.
- The notice MUST describe the contamination incident.
- The notice MUST state the place at or from which the Department is satisfied the incident happened.
- The notice MUST state the amount claimed by the Department.
- The notice should state any other relevant facts and circumstances.

### **B. Costs and expenses claimed**

The Department claims the following reasonably incurred costs or expenses:

<b>Costs claimed</b>	<b>Monetary value</b>
For example: Cost of consultant	For example: Engaged for 20 hours @ \$330.00 per hour (including GST) = \$6,600.00
For example: Cost of full time equivalents (FTEs)	For example: \$10,000.00
For example: Cost of sampling/monitoring	For example: \$5,000.00
For example: Cost of works	For example: Contractors engaged for 18 hours @ \$1,100.00 per hour = \$19,800.00
For example: The total amount being sought by the State	For example: \$41,400.00

### **C. Requirements**

You are required to pay the Department the amount of \$ amount.

**TAKE NOTICE** that if you do not pay the amount of \$ amount to the Department within 30 days after the day this cost recovery notice is issued the Department may claim the amount from you as a debt.

### **D. Appeal rights**

If you are dissatisfied with the decision to issue this cost recovery notice, you may apply to the Department for a review of this decision within ten business days of the service of the notice. You may also apply to the Court for a stay of the decision to issue the cost recovery notice.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Further information about the review and appeal process is attached to this notice.

The information outlining the review and appeal process under the *Environmental Protection Act 1994* should be considered as a guide only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

## Dealing with aggressive and abusive behaviour

*The purpose of this guideline is to provide guidance and options for officers when confronted with aggressive and abusive behaviour.*

### Essential points

- Staff safety is of paramount concern when a Department of Environment and Resource Management (DERM) officer is confronted with aggressive or abusive behaviour. All staff have the right to leave a situation if they face a personal risk.
- If an officer knows there is likely to be aggressive or abusive behaviour, they should consider whether another officer should be brought in to assist.
- In extreme situations, officers should consider enlisting the support of the police.
- Where an officer has faced aggressive or abusive behaviour, they should document the events surrounding this as soon as possible after the event.
- Officers should consider whether to take action following an event of aggressive or abusive behaviour in consultation with their District Manager.

### Principles

- Staff safety is paramount. If a DERM officer is in a situation where there is any likelihood of physical danger, staff should leave the situation as quickly as possible. Officers should then seek the advice from their manager as to what steps to take next.
- All DERM staff have the right to work in a safe and healthy work environment free of harassment such as unreasonable abuse.
- Unreasonable abuse should be determined on the basis of the reasonable expectations of an ordinary person. Unreasonable abuse is generally behaviour that staff find personally threatening, offensive, humiliating or intimidating in some way. Behaviour that is considered unreasonable abuse will depend upon the circumstances and the tolerance levels of the staff involved.
- If an officer thinks it is likely they may be faced with aggressive or abusive behaviour, they should consider whether to enlist the support of a colleague and ensure there are two officers present. There are a number of advantages including the ability of both officers to corroborate each other's evidence should an assault or other offence occur.
- Staff should always conduct themselves in a professional manner in the face of unreasonable behaviour from customers and use their interpersonal skills to attempt to move back to a more productive discussion. For example, an officer can often diffuse a situation by explaining the reasons behind a decision or course of action. It can also be helpful to point out the appeal mechanisms available to the customer. If this is unsuccessful, it may be appropriate to politely caution the customer that the discussion will be terminated should the abuse continue.

## Dealing with aggressive and abusive behaviour

- Officers should consider whether they require any further communication or interpersonal skills training to better equip them to deal with these situations. Contact the Principal Advisor (Workforce Capability) on (07) 3239 3187.
- If the unreasonable abuse continues after the appropriate caution, an officer may terminate the discussion. If this occurs on DERM premises, an officer may politely but assertively request that the customer leave the premises. Where such action is necessary, the assistance of a more senior officer should be sought. Where the discussion occurs on other public or private property, an officer may leave the premises immediately if the abuse continues.
- In extreme situations, officers should consider requesting the assistance of the police.
- If a discussion with a customer deteriorates into unreasonably abusive behaviour, and the discussion is terminated for this reason, the officer should document what happened and forward it to their immediate manager or the District Manager as soon as possible.
- DERM staff should undertake every reasonable effort to provide a service to all customers.
- Officers who have been the subject of abusive, aggressive or threatening behaviour should consider using the DERM counselling services.
- Threats or actual harm to DERM staff will not be tolerated. Where such action breaches the law, DERM will consider all options for further action including prosecution.

### Options for further action

Where an officer has been subject to threatening or abusive behaviour, and the situation is sufficiently serious to warrant further action and cannot be resolved at the time, there are a number of options available including:

- Alternative dispute resolution;
- Prosecution by DERM for obstructing an officer on duty;
- Prosecution by the Police for assault.

### Alternative dispute resolution

The Department of Justice and Attorney General runs the dispute resolution centre, which provides dispute resolution, and mediation services throughout Queensland. Dispute resolution services have the potential to resolve differences between DERM and abusive and aggressive customers without the need for costly court cases. Dispute resolution can be an effective and confidential means of voluntarily settling a dispute. The following website provides the contact details for the dispute resolution centre [www.justice.qld.gov.au/justice-services/dispute-resolution](http://www.justice.qld.gov.au/justice-services/dispute-resolution).

### Prosecution by DERM for obstructing an officer on duty

DERM administers a number of pieces of legislation. Some of these pieces of legislation contain specific offences for the obstruction of an officer carrying out their duties. Depending upon the circumstances and the evidence gathered, DERM may consider it appropriate to take action for these offences.

### Prosecution by the Police for assault

The other option available to staff is to make a complaint to the Police for assault. Depending upon the evidence and circumstances, the Police may choose one of a number of offences. Three possible offences the Police may consider vary in seriousness and include sections 335, 339 and 340(e) of the *Criminal Code Act 1899*.

### Factors to consider in deciding what action to take

Some of the factors to consider when considering further action:

Is there likely to be a solution? – if it is likely that both parties could come to some agreement about the issue, the matter might be resolved without any further action or it might be worth considering alternative dispute resolution.

How serious is the offence? – the offences administered by the Police tend to have higher penalties and therefore complaints about more serious matters should be forwarded to the Police. For example, if a DERM officer was assaulted and significantly injured, the more serious offences such as assault with bodily harm and serious assault under the Criminal Code should be considered.

Should a proposed compliance action report be completed? – if an officer decides to recommend further action that constitutes a potentially significant legal compliance action, they should complete the 'Proposed compliance action report' (PCAR) <http://wwwhost.env.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=2163>.

This report should describe the circumstances and make a recommendation as to whether the matter should be dealt with by the Police or DERM, together with the reasons for the recommendation.

# Assessment report

*Environmental Protection Act 1994*

## Direction notice

*This document is for internal use to assist Environmental Services officers to document the information considered when forming the decision to issue a direction notice pursuant to Chapter 7, Part 5A of the Environmental Protection Act 1994.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Address

### Note:

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the investigating officer, supervisory review and the delegated decision maker.

## 1. Brief history of the matter

Briefly outline any historical information relevant to this decision.

Outline the history of the matter in succinct dot point form.

## 2. Grounds for use of direction notice

The grounds for issuing a direction notice are found in s363B of the *Environmental Protection Act 1994* (the Act).

Officers are required to identify the relevant grounds upon which the decision whether to use a direction notice is based.

A person—

is contravening a prescribed provision

OR

has contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated

AND

a matter relating to the contravention can be remedied

AND

it is appropriate to give the person an opportunity to remedy the matter.

### 3. Expand upon the grounds

Use this section to expand upon the grounds identified for issuing the direction notice. This should include identifying the alleged contravention and all statutory requirements which must be met prior to the department issuing a direction notice. If the direction notice relates to particular emissions, the matters listed in s363C must also be considered before issuing the direction notice.

The person has contravened the following prescribed provision—

**Section 440 – Offence of causing environmental nuisance.**

The person has wilfully and unlawfully caused an environmental nuisance

OR

the person has unlawfully caused an environmental nuisance.

The type of environmental nuisance caused is:

Describe the type of environmental nuisance caused by the person.

If the contravention of s440 involves an emission of aerosols, fumes, light, noise, odour, particles or smoke—the general emission criteria set out in subsection 363C(3) of the Act have been considered.

If the contravention of s440 involves the emission of noise—both the general emission criteria set out in subsection 363C(3) of the Act and the noise emission criteria set out in subsection 363C(4) of the Act have been considered.

Having given regard to the relevant criteria and considered whether to first try to resolve the matter in another way, it is appropriate in the circumstances to issue the direction notice.

The environmental nuisance caused is not one of the particular types of environmental nuisance listed in Schedule 1 of the Act that are excluded from s440.

**Section 440Q – Offence of contravening a noise standard.**

The person has unlawfully contravened a noise standard.

The person has breached the following noise standard:

State which noise standard has been contravened. The default noise standards are set out in ss440R to 440ZC of the Act.

- The noise standard that has been contravened is not one of the particular types of environmental nuisance listed in Schedule 1, Part 1 of the Act which are excluded from s440Q.

Details of the contravention of the noise standard are as follows:

Describe how the noise standard has been contravened.

- Section 440ZG – Depositing prescribed water contaminants in waters and related matters.**

The person has unlawfully deposited a prescribed water contaminant—

- in waters or
- in a roadside gutter or stormwater drainage or
- at another place, and in a way, so that the contaminant could reasonably be expected to wash, blow, fall, or otherwise move into waters a roadside gutter or stormwater drainage or

OR

- The person has unlawfully released stormwater run-off into waters, a roadside gutter or stormwater drainage that results in the build-up of earth in waters, a roadside gutter or stormwater drainage.

Details of the contravention are as follows:

Identify the prescribed contaminant (if applicable) and describe how the person has unlawfully deposited a prescribed water contaminant or released stormwater into waters or another place.

- A provision of an accredited environmental risk management plan (ERMP) for an agricultural environmentally relevant activity (ERA)**

- The person contravening the provision is the person carrying out the agricultural ERA.
- There person is not authorised by a transitional environmental plan (TEP) to do the thing which would otherwise be a contravention of the accredited ERMP.

Describe the breach of the provision of the accredited ERMP for an agricultural ERA and the circumstances surrounding it.

#### 4. Detail the matters considered

The purpose of the following table is to ensure that there is evidence to support each of the elements of the grounds for using the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed. This section should also record how the department has met any statutory requirements associated with the use of the statutory tool.

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

<b>Elements of the offence or legislative requirement</b>  <i>List the elements of any alleged offence or (for grounds which are not offences) list the legislative requirement to be met by the department</i>	<b>Evidence</b>  <i>Identify the information considered which is relevant to the elements or requirement (i.e. statements, photographs, and recordings)</i>	<b>Facts and circumstances</b>  <i>Detail the facts and circumstance that support the department's findings.</i>
<b>Number 1</b> (Number taken from Section 2)		
Time	Unknown	Unknown
Date - 1 July 2010	Notes from phone call from Mrs JP Citizen reporting the incident in file no: 987	The department received a noise complaint from Mrs JP Citizen regarding the site adjacent to her property.
Place - 123 Creek Road, Murphyville.	Officer notes dated 2 July 2010 from site inspection.	Confirmed adjacent site is owned by a government entity.
Person - Murphy Shire Council	Officer notes dated 2 July 2010 from site inspection.	Confirmed construction crew is employed by Murphy Shire Council.
Contravention - Murphy Shire Council Contravened Noise Standards	Site inspection and noise testing conducted	Noise testing conducted on site and on properties adjacent to site. Results indicated that the level of noise exceeds relevant standard.
<b>Number 2</b>		
Likely that the contravention will continue	Officer notes from meeting with Murphy Shire Council Engineer	Notes indicate there is a lack of clarity between Council and the on-site subcontractor regarding responsibility for adherence to the relevant noise standards. In this context the department considers it likely that the contravention of the noise standard is likely to continue.
<b>Number 3</b>		
<b>Number 4</b>		

## 5. Natural justice

The investigating officer is required to notify the affected person that the department is considering issuing a direction notice and that the individual is welcome to make representations to the department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- All information and/or defences provided were considered.  
Describe any information or defences provided.
- The department has considered the information or defences provided.  
What consideration was given and what conclusions has the department formed?
- The decision maker and investigator are free from bias or the perception of bias.

## 6. Reasonable steps

The direction notice may state the reasonable steps the authorised person considers necessary to remedy the contravention, or avoid further contravention, of the prescribed provision. If appropriate, please list any reasonable steps below.

In order to ensure actions are enforceable, they should be SMART, specific, measureable, achievable, relevant and time specific. Refer to the writing effective and enforceable conditions procedural guide for more information on writing conditions and actions: <http://wwwhost.env.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=2417>.

To ensure the required steps are reasonable officers are required to provide justification for the inclusion of the action.

Reasonable steps	Justification

Reasonable step	Justification
Reasonable step	Justification
Reasonable step	Justification
Reasonable step	Justification
Reasonable step	Justification
Reasonable step	Justification

## 7. Time frame

The authorised person has had regard to—

- the action required to remedy the contravention and
- the risk to human health or the natural environment, or risk of loss or damage to property, posed by the contravention and
- how long the person has been aware of the contravention, for example, because an authorised person has previously made an oral requirement that the contravention be remedied.

The time by which the person must remedy the contravention is:

State the time frame by which the person must remedy the contravention.

Justification for the time frame:

Provide justification for the time frame.

## 8. Recommendation

The authorised person is required to make a recommendation in relation to the direction notice.

Recommendation

## 9. Approval

Authorised person	Supervisor
<b>Print name:</b>	<b>Print name:</b>
<b>Date:</b>	<b>Date:</b>

Delegate decision maker	Approve/reject recommendation (circle one)

**Reasons for decision**

I endorse this recommendation based upon the information set out above.

Or, I endorse this decision for the reasons set out above and I note Mr Rodgers has previously received a warning letter in relation to this matter

Or, I reject the above recommendation as I consider it more appropriate for the Department to take an educational approach to this breach.

# Assessment report

*Environmental Protection Act 1994*

## Direction notice

*This document is for internal use to assist Environmental Services officers to document the information considered when forming the decision to issue a direction notice pursuant to Chapter 7, Part 5A of the Environmental Protection Act 1994.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Address

### Note:

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the investigating officer, supervisory review and the delegated decision maker.

## 1. Brief history of the matter

Briefly outline any historical information relevant to this decision.

Outline the history of the matter in succinct dot point form.

## 2. Grounds for use of direction notice

The grounds for issuing a direction notice are found in s363B of the *Environmental Protection Act 1994* (the Act).

Officers are required to identify the relevant grounds upon which the decision whether to use a direction notice is based.

A person—

is contravening a prescribed provision

OR

has contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated

AND

a matter relating to the contravention can be remedied

AND

it is appropriate to give the person an opportunity to remedy the matter.

### 3. Expand upon the grounds

Use this section to expand upon the grounds identified for issuing the direction notice. This should include identifying the alleged contravention and all statutory requirements which must be met prior to the department issuing a direction notice. If the direction notice relates to particular emissions, the matters listed in s363C must also be considered before issuing the direction notice.

The person has contravened the following prescribed provision—

**Section 440 – Offence of causing environmental nuisance.**

The person has wilfully and unlawfully caused an environmental nuisance

OR

the person has unlawfully caused an environmental nuisance.

The type of environmental nuisance caused is:

Describe the type of environmental nuisance caused by the person.

If the contravention of s440 involves an emission of aerosols, fumes, light, noise, odour, particles or smoke—the general emission criteria set out in subsection 363C(3) of the Act have been considered.

If the contravention of s440 involves the emission of noise—both the general emission criteria set out in subsection 363C(3) of the Act and the noise emission criteria set out in subsection 363C(4) of the Act have been considered.

Having given regard to the relevant criteria and considered whether to first try to resolve the matter in another way, it is appropriate in the circumstances to issue the direction notice.

The environmental nuisance caused is not one of the particular types of environmental nuisance listed in Schedule 1 of the Act that are excluded from s440.

**Section 440Q – Offence of contravening a noise standard.**

The person has unlawfully contravened a noise standard.

The person has breached the following noise standard:

State which noise standard has been contravened. The default noise standards are set out in ss440R to 440ZC of the Act.

- The noise standard that has been contravened is not one of the particular types of environmental nuisance listed in Schedule 1, Part 1 of the Act which are excluded from s440Q.

Details of the contravention of the noise standard are as follows:

Describe how the noise standard has been contravened.

- Section 440ZG – Depositing prescribed water contaminants in waters and related matters.**

The person has unlawfully deposited a prescribed water contaminant—

- in waters or
- in a roadside gutter or stormwater drainage or
- at another place, and in a way, so that the contaminant could reasonably be expected to wash, blow, fall, or otherwise move into waters a roadside gutter or stormwater drainage or

OR

- The person has unlawfully released stormwater run-off into waters, a roadside gutter or stormwater drainage that results in the build-up of earth in waters, a roadside gutter or stormwater drainage.

Details of the contravention are as follows:

Identify the prescribed contaminant (if applicable) and describe how the person has unlawfully deposited a prescribed water contaminant or released stormwater into waters or another place.

- A provision of an accredited environmental risk management plan (ERMP) for an agricultural environmentally relevant activity (ERA)**

- The person contravening the provision is the person carrying out the agricultural ERA.
- There person is not authorised by a transitional environmental plan (TEP) to do the thing which would otherwise be a contravention of the accredited ERMP.

Describe the breach of the provision of the accredited ERMP for an agricultural ERA and the circumstances surrounding it.

#### 4. Detail the matters considered

The purpose of the following table is to ensure that there is evidence to support each of the elements of the grounds for using the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed. This section should also record how the department has met any statutory requirements associated with the use of the statutory tool.

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

<b>Elements of the offence or legislative requirement</b>  <i>List the elements of any alleged offence or (for grounds which are not offences) list the legislative requirement to be met by the department</i>	<b>Evidence</b>  <i>Identify the information considered which is relevant to the elements or requirement (i.e. statements, photographs, and recordings)</i>	<b>Facts and circumstances</b>  <i>Detail the facts and circumstance that support the department's findings.</i>
<b>Number 1</b> (Number taken from Section 2)		
Time	Unknown	Unknown
Date - 1 July 2010	Notes from phone call from Mrs JP Citizen reporting the incident in file no: 987	The department received a noise complaint from Mrs JP Citizen regarding the site adjacent to her property.
Place - 123 Creek Road, Murphyville.	Officer notes dated 2 July 2010 from site inspection.	Confirmed adjacent site is owned by a government entity.
Person - Murphy Shire Council	Officer notes dated 2 July 2010 from site inspection.	Confirmed construction crew is employed by Murphy Shire Council.
Contravention - Murphy Shire Council Contravened Noise Standards	Site inspection and noise testing conducted	Noise testing conducted on site and on properties adjacent to site. Results indicated that the level of noise exceeds relevant standard.
<b>Number 2</b>		
Likely that the contravention will continue	Officer notes from meeting with Murphy Shire Council Engineer	Notes indicate there is a lack of clarity between Council and the on-site subcontractor regarding responsibility for adherence to the relevant noise standards. In this context the department considers it likely that the contravention of the noise standard is likely to continue.
<b>Number 3</b>		
<b>Number 4</b>		

## 5. Natural justice

The investigating officer is required to notify the affected person that the department is considering issuing a direction notice and that the individual is welcome to make representations to the department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- All information and/or defences provided were considered.  
Describe any information or defences provided.
- The department has considered the information or defences provided.  
What consideration was given and what conclusions has the department formed?
- The decision maker and investigator are free from bias or the perception of bias.

## 6. Reasonable steps

The direction notice may state the reasonable steps the authorised person considers necessary to remedy the contravention, or avoid further contravention, of the prescribed provision. If appropriate, please list any reasonable steps below.

In order to ensure actions are enforceable, they should be SMART, specific, measureable, achievable, relevant and time specific. Refer to the writing effective and enforceable conditions procedural guide for more information on writing conditions and actions: <http://wwwhost.env.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=2417>.

To ensure the required steps are reasonable officers are required to provide justification for the inclusion of the action.

# Procedural guide

*Environmental Protection Act 1994*

## Direction notice

*This document is for internal use to assist Environmental Services officers to complete and issue a direction notice pursuant to Chapter 7, Part 5A of the Environmental Protection Act 1994.*

### What is a direction notice?

A direction notice is a statutory enforcement tool which may be issued by the Department of Environment and Resource Management (the Department) if it is reasonably satisfied that there has been a contravention of certain prescribed provisions of the *Environmental Protection Act 1994* (the Act). A direction notice requires a person contravening one of the prescribed provisions to remedy the contravention.

The purpose of a direction notice is to provide the person receiving it with an opportunity to remedy the situation before any further action is taken. Where a contravention of these prescribed provisions has resulted in serious or material environmental harm, a direction notice is not appropriate and other enforcement tools provided for in the Act should be considered.

The issuing of direction notices is governed by Chapter 7, part 5A of the Act.

### Who can use a direction notice?

A direction notice may be issued by an authorised person.

Before issuing a direction notice, officers should check whether their office has any business rules concerning the issue of direction notices. In many cases, responsibility for dealing with environmental nuisance complaints and breaches of noise standards or water contaminant provisions has been devolved to local government. Officers will only be required to issue a direction notice if the prescribed provision has been contravened by State government entity or local government, or in situations where the local government has failed to act in regard to a contravention.

### When should I use a direction notice?

A direction notice may be issued for a contravention of any of the following provisions of the Act (each of which is a *prescribed provision*)—

- section 440 – offence of causing an environmental nuisance
- section 440Q – offence of contravening a noise standard
- section 440ZG – depositing prescribed water contaminants in water and related matters
- a provision of an accredited environmental risk management plan (ERMP) for an agricultural environmentally relevant activity (ERA) when the person contravening the provision is the person carrying out the agricultural ERA.

Section 363 provides that an authorised person may issue a written notice (a *direction notice*) to a person, requiring the person to remedy the contravention, if the authorised person is satisfied on reasonable grounds that—

- a person is:
  - contravening a prescribed provision or
  - has contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated and
- a matter relating to the contravention can be remedied and
- it is appropriate to give the person an opportunity to remedy the matter.

A direction notice may be given in writing or, if it is not practicable to issue a written notice, the direction may be made orally and confirmed by a written direction notice as soon as practicable.

Making an oral requirement prior to giving a direction notice is relevant to the time by which the person may be required to remedy the contravention, as s363D(2)(c) states that the time period in the notice by which the person must remedy the contravention must be reasonable having regard to, among other things, the length of time the person has been aware of the contravention.

## Section 440 – offence of causing environmental nuisance

Under s440 of the Act, it is an offence to wilfully and unlawfully cause an environmental nuisance or to unlawfully cause an environmental nuisance.

Section 15 of the Act defines *environmental nuisance* as being unreasonable interference or likely interference with an environmental value caused by—

- aerosols, fumes, light, noise, odour, particles or smoke or
- an unhealthy, offensive or unsightly condition because of contamination or
- another way prescribed by a regulation.

An *environmental value* is a quality or physical characteristic of the environment that promotes ecological health or public amenity or safety, or another quality of the environment identified and declared to be an environmental value under an environmental protection policy or regulation.

Particular types of environmental nuisance listed in Schedule 1, Part 1 of the Act are excluded from s440. These include environmental nuisance caused by certain types of safety and transport noise, government activities and public infrastructure as well as nuisance regulated by other laws. Consult Schedule 1, Part 1 for more detail.

## Matters to consider before issuing a direction notice relating to particular emissions

Section 363C states that when there is a contravention of s440 involving an emission of aerosols, fumes, light, noise, odour, particles or smoke, before deciding to issue a direction notice in relation to the contravention the authorised person must do the following—

- consider the general emission criteria set out in subsection 363C(3) of the Act and

- if the emission is of noise, consider the noise emission criteria stated in subsection 363C(4) of the Act and
- taking those criteria into account, consider whether it would be appropriate to issue the direction notice or to first try to resolve the matter in another way.

### **General emission criteria s363C(3)**

The general emission criteria, for a particular emission, are as follows—

- the characteristics or qualities of the emission
- the amount or rate of the emission
- the duration and time of the emission
- whether the emission is continuous or fluctuating
- the nature of the receiving environment
- the impact of the emission on the receiving environment
- in relation to each person affected by the emission:
  - the views of each affected person, including views about the degree of interference caused or likely to be caused by the emission at that person's place of residence
  - the order of occupancy between the person causing the emission and the affected person and
  - any structural or other changes to the place from which the emission is generated and where the affected person lives or any change to the activities carried out at either of those places
- any mitigating measures that have been taken or could reasonably have been taken by the person causing the emission.

### **Noise emission criteria s363C(4)**

If the particular emission under s440 is noise, in addition to the general emission criteria officers must also consider the noise emission criteria, which are as follows—

- any measured sound pressure levels
- the audibility of the noise
- whether the noise is continuous, at a steady level or whether it has a fluctuating, intermittent, tonal or impulsive nature
- whether the noise has vibration components.

### **Section 440Q – offence of contravening a noise standard**

It is an offence under s440Q of the Act to unlawfully contravene a noise standard. However, a person does not contravene a noise standard by causing an environmental nuisance mentioned in Schedule 1, part 1 of the Act.

## Application of noise standards

Noise can include vibrations of any frequency, whether emitted through the air or another medium (s12).

The legislation provides that a local government may enact local laws which prescribe a noise standard by prohibiting the making of a stated noise or by stating a section in Chapter 8, Part 3B, Division 3 of the Act. If there is a local law in force for which a section in Division 3 is the nominated section, the local law provision applies as the noise standard.

Default noise standards under Division 3 of the Act will apply only if—

- the local government for the local government area is not the administering authority for this part or
- the local government for the local government area is the administering authority for this part, but there is no local law in force for which the particular section is the nominated section.

The default noise standards are listed in ss440R to 440ZC of the Act and include—

- building work (s440R)
- regulated devices (s440S)
- pumps (s440T)
- air conditioning equipment (s440U)
- refrigeration equipment (s440V)
- indoor venues (s440W)
- open-air events (s440X)
- amplifier devices other than at an indoor venue or open-air event (s440Y)
- power boats sports in a waterway (s440Z)
- operating power boat engines at premises (s440ZA)
- blasting (s440ZB) and
- outdoor shooting ranges (s440ZC).

If a local government prescribed standard exists then the local government of the area is responsible for enforcing that standard.

It is important to note that if the noise standards are complied with, but the noise is still a nuisance, a direction notice may be available for a contravention of s440.

## Exclusions relating to environmental nuisance or environmental harm

Some types of environmental nuisance are excluded from s440 and s440Q and from the definitions of environmental harm and environmental nuisance. These exclusions are listed in Schedule 1 of the Act and include environmental nuisance—

- caused by safety and transport noise
- caused by government activities and public infrastructure
- regulated by other laws such as the *Work Place Health and Safety Act 1995* and the *Public Health Act 2005*

- caused by animal noise from a non-domestic animal and
- caused by a domestic cooking odour.

### Section 440ZG – depositing prescribed water contaminants in waters etc

A prescribed water contaminant includes earth (defined as sand, soil, silt or mud) or any other contaminant listed under Schedule 9 of the *Environmental Protection Regulation 2008*.

A person must not—

- unlawfully deposit a prescribed water contaminant:
  - in waters or
  - in a roadside gutter or stormwater drain or
  - at another place, and in a way, that the contaminant could reasonably be expected to wash, blow, fall or otherwise move into waters, a roadside gutter or stormwater drainage or
- unlawfully release stormwater run-off into waters, a roadside gutter or stormwater drainage if that release will result in the build-up of earth in waters, a roadside gutter or stormwater drainage.

A person *deposits* a contaminant in waters or at another place if the person drops, places, throws, releases or otherwise causes the contaminant to move into the waters or onto the place. A depositor of a contaminant includes the occupier of a place, or the person who is in control of the contaminant and who does not remove the contaminant within a reasonable time after becoming aware that it has been deposited at the place.

### A contravention of a provision of an accredited ERMP for an agricultural ERA

In certain circumstances (see s88 of the Act) a person who carries out an agricultural environmentally relevant activity (ERA) must have an accredited environmental risk management plan (ERMP) for an agricultural ERA. Section 363B provides that a direction notice may be issued for a contravention of a prescribed provision which includes, among other things, a provision of an accredited ERMP for an agricultural ERA. However, a provision of an accredited ERMP is only considered a prescribed provision if the person contravening the provision is the person who is carrying out the agricultural ERA.

### If an approved transitional environmental program (TEP) is in place

Section 346 of the Act provides that if a person is authorised to do or not do something under an approved transitional environmental program (TEP), the person may do or not do the thing despite anything in an accredited ERMP. Accordingly, a person will not be in contravention of a provision of an accredited ERMP if the person is doing or not doing something under an approved TEP, so a direction notice may not be issued in these circumstances.

### How do I successfully issue a direction notice?

Officers must complete an assessment report to document the decision as well as completing the direction notice.

The following paragraphs of the procedural guide are a guide to the completion of the assessment report. The numbering and headings of the paragraphs in the procedural guide correlate with those in assessment report, and are set out so that the process may be completed step by step.

## Step 1 - Complete the assessment report

Before completing the direction notice, officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter and documents the decision making process used by the Department in determining to issue a direction notice. The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have lead to the Department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached [\[LINK\]](#).

### 1. Brief history of the matter

Briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points and should include how the Department became aware of the alleged breach.

### 2. Grounds for issuing a direction notice

Section 363B of the Act provides that a direction notice can only be issued if the Department is satisfied on reasonable grounds that—

- a person:
  - is contravening a prescribed provision or
  - has contravened a prescribed provision in circumstances that make it likely that the contravention will continue or be repeated and
- the matter relating to the contravention can be remedied and
- it is appropriate to give the person an opportunity to remedy the matter.

Please identify the relevant situation or 'grounds' upon which the decision to use a direction notice is based.

### 3. Expand upon the grounds

The purpose of this section is to clearly identify what the Department must 'prove' before deciding to use a direction notice and should be used to expand upon the grounds which have previously been identified. This can include identifying the prescribed provision that is being, or has been, contravened. This should also include the abovementioned legislative requirements which must be met by the Department prior to issuing a direction notice.

In instances where there have been multiple contraventions, each contravention should be listed independently and will need to be proven on its own merits.

#### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the contravention (or grounds) to the evidence gathered and the conclusions formed. This is achieved by identifying: the elements of any specific contravention, the evidence which has been considered for each element, and the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence considered officers are encouraged to limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officer's official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

#### 5. Provide for natural justice

Prior to the Department making a decision which may adversely impact on an individual or group the Department must:

- **Notify** - Notify the individual that the Department is considering making adverse findings
- **Respond** - Provide the individual with an opportunity to respond to the allegation and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

#### 6. Reasonable steps

The legislation provides that the notice may state the reasonable steps the authorised person considers necessary to remedy the contravention, or avoid further contravention, of the prescribed provision.

The officer is responsible for developing the reasonable steps for consideration by the decision maker. As the recipients are able to seek a review of the Department's decision to impose one or more reasonable steps, it is necessary for officers to provide justification for the inclusion of each step.

The required steps must be specific, measureable, achievable, time specific and relevant to the breach. For example:

<p><i>By 24 July 2011 ABC Construction Pty Ltd must install a sediment fence made from heavy duty geofabric along the southern boundary of the building site at 123 Creek Road, Murphysville to prevent sediment from leaving the site and being deposited into Murphy Creek. All building works must cease until the sediment fence is in place and has been inspected by an authorised person who must be satisfied with its construction.</i></p>	<p><i>ABC Construction Pty Ltd is carrying out building works at a site at 123 Creek Road, Murphysville. Sediment from the building works has been leaving the site and is being washed into Murphy Creek where the sediment is smothering plants and animals that live at the bottom of the creek. ABC Construction Pty Ltd is required to install the sediment fence to prevent further polluting of Murphy Creek and to preserve the habitat of the animals and plants that live there. Building work must be halted on the site until the sediment fence is installed to prevent further environmental harm being caused to Murphy Creek.</i></p>
--	---

## 7. Time frame

Subsection 363D(2) of the Act provides that the time by which the person must remedy the contravention must be reasonable having regard to—

- the action required to remedy the contravention and
- the risk to human health or the natural environment, or risk of loss or damage to property, posed by the contravention and
- how long the person has been aware of the contravention, for example, because an authorised person has previously made an oral requirement that the contravention be remedied.

Officers must consider these factors carefully when deciding on a time frame.

## 8. Recommendation

Officers are required to make a recommendation in relation to the matter. For example:

*It is the opinion of the Department that sediment is leaving the building site at 123 Creek Road, Murphysville and is being deposited into Murphy Creek in contravention of s440ZG of the Act. It is recommended that a direction notice be issued immediately to ABC Construction Pty Ltd requiring the company to cease all building works on the site until a sediment fence has been installed along the southern boundary of the site.*

Administrative decisions are made based upon the balance of probabilities. This means that the decision maker must be able to determine whether, based upon the information available, it was more likely than not that the event occurred.

Officers are encouraged to consider alternative actions/tools, departmental enforcement guidelines, details of any consultations including site visit details and discussions with the ERA contact officer. The reasonableness of proposed timeframes for the completion of requirements should be taken into account (for example, if the location geographically isolated the Department should consider allowing additional time to secure appropriate contractors).

## 9. Approval

As a direction notice is issued by an authorised person, there is no delegated authority for section 363B of the Act. Accordingly, the assessment report is to be approved and signed by the authorised person's supervisor.

### Step 2 - Draft the direction notice

The tool must meet a number of legislative requirements in order to be legally binding. Section 363D of the Act provides that a direction notice must include the following information—

- that the authorised person believes the person:
  - is contravening a prescribed provision or
  - has contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated
- the particular prescribed provision that the authorised person believes is being, or has been, contravened
- briefly, how it is believed the prescribed provision is being or has been contravened
- the time by which the person must remedy the contravention
- that it is an offence to fail to comply with the direction notice unless the person has a reasonable excuse
- the maximum penalty for failing to comply with the direction notice and
- review or appeal details

The notice may also state the reasonable steps the authorised person considers necessary to remedy the contravention, or avoid further contravention of the prescribed provision.

The legislation (s363D(g)) specifies that the notice must include the review or appeal details. Basic information regarding the review and appeal process is included in the template direction notice. As well, a copy of the information sheet [\[LINK\] Internal review \(DERM\) and appeal to Planning and Environment Court](#) should be attached to the direction notice.

With regard to issuing the direction notice the Department is also required to notify individuals of the following in a timely manner:

- any decisions made against them:
- the reasons for the decision (these are the facts and circumstances identified in section 4 of the assessment report)

A template direction notice is attached [\[LINK\]](#)

The direction notice should be signed by the decision maker in conjunction with the assessment report which records a formal decision.

## Service of a direction notice

Service means delivery to the party who will be affected by the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. The following methods of service are acceptable

- For a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by pre-paid registered post to, the place of residence or business of the person or
- For a body corporate - by leaving it at, or sending it by pre-paid registered post to, the head office, a registered office or a principal office of the body corporate.

The method of service should be documented by contemporaneous notes, a file note, or any receipts arising from the postage. In particular, officers should record the date, time and method of service. Sending the notice by registered post with confirmation of delivery is good practice to ensure that the notice has been delivered to the recipient.

## What follow up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the direction notice is issued is complying with any requirements imposed. Follow up is to be scheduled by the relevant officer and confirmed with the business area manager. The business area manager is responsible for ensuring follow up is undertaken within the agreed timeframe.

This is usually achieved by a follow up by site inspection or telephone call to be conducted one week after the time period nominated in the notice has expired. Officers are encouraged to utilise tools such as diary reminders to ensure the matter is followed up in a timely manner.

If the person does not comply with the requirements of the direction notice, further action to ensure compliance must be taken. This may include enforcement action.

## What are my record keeping responsibilities?

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measure screen (this includes a decision to take no further action). A hard copy of the direction notice, the assessment report and any accompanying documentation should be attached to the paper file. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

## Changes to an issued direction notice

If minor changes to the direction notice or an extension of time are required, the person should be notified in writing.

If significant changes are required officers should, in order to avoid confusion, repeal (revoke) the original direction notice, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have a fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh direction notice should be carried out in the same way, and subject to the same conditions as the issuing of the original EPO. Accordingly, a new assessment report should be completed and approved by the authorised person's supervisor.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by another authorised person and approved by that person's supervisor.

Officers should also update and record the changes or the decision to repeal and reissue the EPO in EcoTrack

## Review of decisions and appeals (s521)

The provisions regarding review of decisions and appeals may be found in Chapter 11, part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision by the Department in respect to a direction notice may apply for a review of an original decision by submitting an application on the approved form to the Department:

- within 10 business days after the day on which the person received notice of the original decision or the date when the Department is taken to have made the decision (the "review date") or
- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

If the person is dissatisfied with the review decision, the person may appeal to the Planning and Environment Court by filing written notice with the court within 22 business days after the person receives notice of the review decision, unless this time period is extended by the court.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## What penalties exist for non-compliance with a direction notice?

It is an offence under s363E of the Act not to comply with a direction notice without reasonable excuse.

If a recipient fails to comply with a direction notice, the department may issue a penalty infringement notice (PIN) for a maximum amount of:

- \$1,000.00 for an individual or
- \$2,000.00 for a corporation.

For further information about issuing PINs, consult the PIN Manual [[LINK](#)].

If a PIN would not be considered sufficient penalty for the contravention, the Department may decide to commence legal proceedings against the recipient.

- The maximum penalty for an individual is \$30,000.00.
- The maximum penalty for a corporation is \$150,000.00.

# Notice

## *Environmental Protection Act 1994*

### **Direction notice**

*This direction notice is issued by the administering authority pursuant to s363B of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our Reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* (the Act) a direction notice is issued to you by an authorised person on behalf of the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the department).

The direction notice is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the "said premises").

#### **A. Grounds**

The direction notice is issued on the following grounds:

- A person authorised under the Act believes that you [are contravening a prescribed provision] OR [have contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated].
- The authorised person believes that you [are contravening] OR [have contravened] [section number] , a prescribed provision under s363A of the Act. The facts and circumstances forming the basis for these grounds are:
  - Briefly state how it is believed the prescribed provision is being, or has been contravened. Only salient factors which directly relate to the decision are to be included.
  - Insert the facts and circumstances that form the factual basis for the grounds.
  - Insert the facts and circumstances that form the factual basis for the grounds.
  - Insert the facts and circumstances that form the factual basis for the grounds.

**B. Reasonable steps**

The authorised person considers that the following reasonable steps are necessary to [remedy the contravention] OR [avoid further contravention] of the prescribed provision:

- Insert the reasonable steps necessary to remedy the contravention, or avoid further contravention of the prescribed provision.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- Insert the reasonable steps necessary to remedy the contravention, or avoid further contravention of the prescribed provision.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- Insert the reasonable steps necessary to remedy the contravention, or avoid further contravention of the prescribed provision.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- The contravention must be remedied by [insert date]

**TAKE NOTE** that:

- The requirements of the direction notice take effect immediately upon service of the notice.
- This notice remains in force until further notice from the administering authority.

**C. Appeal Rights**

You may apply for a review of the decision to issue the direction notice within ten business days of the service of the notice. You may also apply to the court for a stay of the decision to issue the direction notice.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Specific information regarding the process for seeking a review or appeal is attached to this notice.

However, the information outlining the review and appeal process under the *Environmental Protection Act 1994* should be considered as general advice only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

**D. Penalties**

Section 363E of the Act provides that it is an offence to fail to comply with a direction notice without a reasonable excuse.

The maximum penalty for an individual is \$30,000.00.

The maximum penalty for a corporation is \$150,000.00.

Should you have any queries in relation to this notice, please contact name of officer of the department on telephone number telephone number.

# Direction

*Environmental Protection Act 1994*

## Emergency direction for the release of a contaminant

*This direction for the emergency release of a contaminant is issued by the administering authority pursuant to s468 of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* (the Act) an emergency direction for the release of a contaminant into the environment is hereby issued to you by an authorised person.

The emergency direction is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the place).

### A. Grounds

The direction for the emergency release of a contaminant is issued on the following grounds—

- An authorised person is satisfied that:
  - it is necessary and reasonable to release the contaminant because of an emergency and
  - there is no other practicable alternative to the release.

The facts and circumstances forming the basis for these grounds are—

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Only salient factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Only salient factors which directly relate to the decision are to be included.

- Insert the facts and circumstances that form the factual basis for the grounds.

## **B. Conditions**

You are directed to do the following—

- Reasonable conditions may be imposed on the direction.
- Ensure the conditions are specific, measurable, attainable, relevant and time specific.
- Reasonable conditions may be imposed on the direction.
- Ensure the conditions are specific, measurable, attainable, relevant and time specific.
- Reasonable conditions may be imposed on the direction.
- Ensure the conditions are specific, measurable, attainable, relevant and time specific.
- Reasonable conditions may be imposed on the direction.
- Ensure the conditions are specific, measurable, attainable, relevant and time specific.

**TAKE NOTICE** that:

- The requirements of the direction for an emergency release of contaminant take effect immediately upon service of the direction.
- This emergency direction remains in force until [Date] OR [further notice from the authorised person].

## **C. Penalties**

Section 479 of the Act provides that a person to whom an emergency direction is given must comply with the direction (including a condition of a direction), unless the person has a reasonable excuse for not complying with it, and must take all reasonable precautions to prevent or minimise—

- environmental harm being caused and
- the risk of death or injury to humans and animals and
- loss or damage to property.

The maximum penalty for an individual is \$10,000.00.

The maximum penalty for a corporation is \$50,000.00.

Should you have any queries in relation to this direction, please contact name of officer of the department on telephone number telephone number.

Draft

# Assessment report

*Environmental Protection Act 1994*

## Emergency direction to release a contaminant

*This document will be used to record the information considered by the Department when forming the decision whether to issue an emergency direction to release a contaminant.*

Identifying Details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Registered business address	Address

**Note:**

1. Assessment reports recommending that a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be approved by the responsible officer, supervisor and the delegated decision maker.

### 1. Brief history of the matter

Please briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points.

Briefly outline how you became aware of the situation and any relevant historical information to exercising powers under s468.

### 2. Grounds for issuing an emergency direction

The legislation specifies that an emergency direction can only be used in certain circumstances. Please identify the relevant grounds upon which the decision to give an emergency direction is based.

An authorised person is satisfied that:

it is necessary and reasonable to release the contaminant because of an emergency

AND

there is no other practicable alternative to the release.

## Emergency direction to release a contaminant (s468)

### 3. Expand upon the grounds

The next step is to expand upon the grounds identified for giving the emergency direction to release a contaminant into the environment. This can include identifying the emergency and the contaminant that is to be released and stating the reasons why there is no practicable alternative to releasing the contaminant into the environment.

Each ground should be listed independently and be allocated a separate number. For example:

Number	Specific Ground
1	Extremely heavy rains have caused sewage ponds to overflow at ABC Sewage Treatment Pty Ltd. Due to continuing heavy rain and flooding it is reasonable and necessary to allow controlled releases of the sewage into Murphy Creek to protect the town of Murphyville which is under immediate threat of being flooded with raw sewage from the overflowing ponds.
2	Alternatives to the controlled release of the contaminant have been considered, but there is no practicable alternative to the release.
3	
4	

Consider whether there is sufficient information available in relation to each of the risks/impacts identified to allow the department to be able to clearly determine that, under the circumstances, it is necessary and reasonable to release the contaminant into the environment.

Consideration has been given to:

- The nature of the contaminant.  
Describe the type of contaminant to be released.
- The risks of releasing the contaminant.  
Describe the risks of release.
- The anticipated harm caused to the environment.  
Describe the anticipated environmental harm.

State why it is reasonable and necessary to give an emergency direction to release a contaminant and record the evidence you have gathered that has led you to this conclusion.

State the reasons why it is reasonable and necessary to give the emergency direction and list the supporting evidence.

### 4. Recommended conditions (if applicable)

Consider and identify what conditions, if any, should be included in the emergency direction in order to mitigate or manage the impacts from the release of the contaminant.

List any proposed conditions in the table below. In order to ensure conditions are enforceable, they should be SMART, specific, measurable, achievable, relevant and time specific. Refer to the *Writing effective and*

## Emergency direction to release a contaminant (s468)

*enforceable conditions* procedural guide for more information on writing conditions:

<http://wwwhost.env.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=2417>.

To ensure the conditions are reasonable, officers are required to provide justification for the inclusion of the condition:

Proposed conditions	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification
Proposed condition	Justification

### 5. Time frame

An emergency direction will normally be issued for a defined period, which should allow sufficient time for the release of the contaminant in an emergency situation.

Provide details of the proposed time frame and justifications for the period given.

### 6. Natural justice

Due to the urgent nature of an emergency direction, there is no requirement for the authorised person to specifically ask the recipient of the emergency direction to put their side of the story forward. However, if any information is provided by the recipient it should be documented and/or considered if circumstances allow.

- If the recipient of the emergency direction provided information, it was documented and considered.
- The decision maker and authorised person are free from bias or the perception of bias.

### 7. Recommended decision/Action taken

If this assessment report is being completed prior to an officer using their emergency powers a recommended decision and the proposed action to be taken is to be recorded. In instances where the assessment report is being completed retrospectively, record the decision made and the action taken.

Recommendation/Action taken

Emergency direction to release a contaminant (s468)

**8. Endorsement**

Authorised person	Supervisor of authorised person Approve / Reject Recommendation (Circle One)
	Reasons for Decision  For example:  I [approve this recommendation] OR [support the action taken] based on the information set out above.

# Procedural guide

*Environmental Protection Act 1994*

## Emergency direction to release a contaminant

*This document is for internal use to assist Environmental Services authorised officers to issue an emergency direction to release a contaminant under s468 of the Environmental Protection Act 1994.*

### What is an emergency direction to release a contaminant (s468)?

An emergency direction is a written direction to release a contaminant into the environment because of an emergency, which may be given to a person or company by an authorised person under the Act.

The legislative provisions relating to emergency directions can be found in s468 of the *Environmental Protection Act 1994* (the Act).

### What is an emergency?

The term *emergency* is not defined in the Act. However, according to the Macquarie dictionary, an emergency is 'an unforeseen occurrence; a sudden and urgent occasion for action'. This can include an environmental and 'non-environmental' emergency.

### What is a contaminant?

The Act defines a *contaminant* to include a gas, liquid or solid; odour; organism (whether alive or dead), including a virus; or energy, including noise, heat, radioactivity and electromagnetic radiation; or a combination of contaminants.

### Who can use an emergency direction?

The legislation specifies that an emergency direction may be given by an authorised person.

### When should I use an emergency direction under s468?

An emergency direction may be given by an authorised person if the authorised person is satisfied that—

- it is necessary and reasonable to release the contaminant because of an emergency and
- there is no other practicable alternative to the release.

It is important to note that an emergency direction can only be issued for an emergency that is *actually* occurring. It is not appropriate to issue an emergency direction to deal with an anticipated emergency event.

### Legislative requirements when making a decision to issue an emergency direction under s468

An emergency direction will allow environmental harm to occur. Consequently, officers must make sufficient investigation into the facts and circumstances surrounding the situation to justify the decision to issue an emergency direction. When considering whether the legislative requirements have been met, officers should consider the following factors—

- Is the situation an emergency?
  - An emergency is an unforeseen occurrence that may require a sudden or urgent action. It has the potential to impact on the environment, threaten health and safety and cause economic loss and operational disruption to businesses.
  - What is the nature of the emergency? For instance, is there a significant and imminent threat to human life, safety, property and/or environmental values?
- Is the release reasonable and necessary?
  - Consider the risk to the environment versus the consequences of not releasing the contaminant.
  - Substantiate the need for the release. For example, a Queensland Health Officer has identified that the contaminant will create a health risk if not released.
  - Consider the potential short-term and long-term impacts to the environment.
  - Consider the reliability of the information received.
  - Identify and consider the nature of the contaminant, such as volume, mobility and toxicity to humans, livestock and the environment generally.
  - Consider weather factors that may influence the direction/course of the contaminant.
  - What is the location of the release? Officers should consider the environmental values of the surrounding area.
  - Is it necessary to notify other government departments, local councils, residents, businesses, users?
  - What are the risks and potential impacts to users (residential/business) and surrounding areas, e.g. downstream?
- Are you satisfied that there are no other practicable alternatives to the release?
  - Is there an alternative course of action to releasing?
  - What are the risks from the alternative course of action?
  - What impacts would the alternatives have on the receiving environment?
  - Demonstrate that to do nothing is not an option.
- Consider the known impacts of releasing the contaminant. What steps can be taken to mitigate or manage it?

### **Can I include conditions as part of an emergency direction?**

The legislation specifies that an officer may impose reasonable conditions on an emergency direction. The conditions imposed should be definite, specific and clear. For example, a condition regarding the level of monitoring and reporting should be sufficient for the Department to review and assess the long- and short-term impacts of the release on the receiving environment.

### **How do I successfully issue an emergency direction?**

Officers must complete an assessment report to document the reasons for making the decision and also complete the emergency direction. If there is no time to complete the assessment report beforehand, the authorised person may issue an emergency direction without it, but he or she must make notes of the reasons

and evidence and complete the assessment report as soon as possible. It should be noted on the assessment report that it was completed retrospectively.

## Step 1 - Complete the assessment report

The assessment report must set out the facts and circumstances relating to the matter and document the decision-making process used by the officer in determining to give an emergency direction.

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have led to the officer's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached [LINK](#)

### 1. Brief history of the matter

Briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points and should include how the Department became aware of the situation.

### 2. Grounds for issuing an emergency direction

The legislation specifies that an emergency direction can only be given where the authorised person is satisfied that it is necessary and reasonable to release the contaminant because of an emergency and there is no other practicable alternative to the release. Officers must identify the grounds upon which the decision to give an emergency direction is based.

### 3. Expand upon the grounds

The purpose of this section is to clearly identify what the Department must 'prove' before giving an emergency direction. Sufficient details are to be provided to demonstrate the grounds upon which the decision to use an emergency direction is based. Officers should also provide reasons why there is no other practicable alternative to the release.

### 4. Proposed conditions

An officer may impose reasonable conditions on the emergency direction. In instances where it is recommended that conditions are imposed, the officer is responsible for developing proposed conditions and providing justification for their inclusion for consideration by the authorised person.

Conditions must be specific, measurable, achievable, relevant and time specific. For example:

Condition:	Justification:
You are required to maintain a record of all quantities and quality of contaminants released and their release location. This information must be made available to the Department on request.	The department requires this information to review and assess the long and short term environmental harm the contaminant may cause to the environment. If the level of environmental harm increases significantly, a decision to allow further releases of the contaminant may need to be considered.

## 5. Time frame

An emergency direction will normally be for a defined period. The time frame (start and end dates and times) should be clearly stated on the emergency direction. Note the time frame and justifications for the period given in the assessment report.

## 6. Provide for natural justice

It is likely that an emergency direction under s468 may need to be exercised as a matter of urgency and there will be no time for the authorised person to observe formal natural justice procedures. If possible, the authorised person should document and take into consideration any representations made by a person to whom a direction is given. However, there is no requirement for the authorised person to specifically ask the person to put their side of the story forward.

## 7. Recommendation

The officer is required to make a recommendation in relation to the situation. For example:

Due to unprecedented heavy rainfall and imminent flash flooding, it is the opinion of the Department that sewage ponds at ABC Sewage Treatment Pty Ltd will overflow within the next 14 days causing sudden and severe contamination to the local environment. It is considered that the environmental harm will be ameliorated by a controlled release of sewage from the ponds into Murphy Creek over a seven-day period. Accordingly, it is recommended that an emergency direction to release a contaminant be issued.

## 8. Approval

The assessment report and recommended decision/action are to be approved by the authorised person's supervisor.

## Step 2 - Complete the emergency direction

The emergency direction must be in writing and must—

- specify accurately to whom the emergency direction is issued
- give details of the circumstances which give rise to the emergency release
- give details of the release point/s
- state any reasonable conditions imposed on the direction
- state the date on which the direction takes effect (e.g. this emergency direction remains current for 14 calendar days from the date of issue)
- state that it is an offence not to comply with an emergency direction, unless the recipient has a reasonable excuse, and provide the penalty for failing to comply with the emergency direction
- state that the person must also take all reasonable and practicable precautions to prevent or minimise environmental harm, the risk of death or injury to humans or animals and loss or damage to property.

It is important to identify the appropriate person to whom the order should be issued (see [Compliance - Procedural guide - Understanding Legal Entities](#) for assistance). To help identify who runs a business, a business name search can be used (see [www.abr.gov.au](http://www.abr.gov.au)).

A template emergency direction is attached ([LINK](#)). The emergency direction should be signed by the decision maker in conjunction with the assessment report which records the formal decision.

## Service of an emergency direction

*Service* means delivery to the appropriate recipient of the direction. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the nature of the situation and the recipient in question.

It is likely that the emergency direction to release a contaminant under s468 will need to be exercised quickly. If this is the case, the officer should use his or her judgment as to the way in which the emergency direction is served. For example, if urgent, service could be by email, facsimile or hand delivery, and followed up by post, if necessary. If the emergency direction is being served by email it should be signed and put into PDF format. A hard copy should also be placed on the file.

For the purposes of any Act that requires a document to be served on (which includes 'given' or 'sent to') a person, the document may be served:

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by pre-paid post to, the place of residence or business of the person or
- on a body corporate - by leaving it at, or sending it by pre-paid registered post to, the head office, a registered office or a principal office of the body corporate.

The date, time and method of service should be documented by contemporaneous notes, a file note, receipts arising from the postage or any confirmation of receipt if the direction is served by email or facsimile.

## What follow-up is required?

It is an offence not to comply with the emergency direction (including any conditions). Officers should diarise the date the emergency direction starts and finishes and any time frames regarding conditions. Officers must closely monitor the situation for the duration of time that the notice is in force. Follow-up is to be scheduled by the relevant officer and their manager. The manager is responsible for ensuring follow-up is undertaken.

Officers must liaise with their managers to identify the appropriate internal briefing process.

Officers must closely monitor the situation for the period of time that the notice remains in force. Officers must also assess whether any ongoing monitoring will be required to assess the short-, medium- and long-term impacts to the environment that may be caused by the contaminant.

### **What are my record keeping responsibilities?**

Officers are required to record all actions in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). The Department is required to make, and record, an informed decision about all allegations of non-compliance. Hard copies of the emergency direction, the signed assessment report and any supporting documents should be placed on the paper file.

### **What penalties exist for non-compliance with an emergency direction?**

A person to whom an emergency direction is given must comply with the direction (including a condition of the direction) unless the person has a reasonable excuse for non-compliance. The person must also take all reasonable and practicable precautions to prevent or minimise—

- environmental harm being caused and
- the risk of death or injury to humans and animals and
- loss or damage to property.

The maximum penalty for an individual is 100 penalty units or \$10,000.00.

The maximum penalty for a corporation is 500 penalty units or \$50,000.00.

# Assessment report

*Environmental Protection Act 1994*

## Emergency powers

*This document is intended for internal use to assist Environmental Services officers to document the information considered when forming the decision to exercise the emergency powers pursuant to s467 of the Environmental Protection Act 1994.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If Applicable
File number	File Number
Applicant number	Number
Registered business address	Address

### Note:

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the authorised person, the supervisor and the delegated decision-maker.

### Brief history of the matter

Outline briefly any historical information relevant to this decision. This information should be provided in succinct chronological dot points.

Provide details of how you became aware of the situation and any historical information relevant to exercising the powers under s467.

### How the powers were/will be exercised

An authorised person may exercise the powers under s467 of the *Environmental Protection Act 1994* (the Act) in different ways. Specify how the emergency powers were exercised or will be exercised:

- A person [was] OR [will be] directed to take specified reasonable action within a specified reasonable time.

Provide details of the direction that [was] OR [will be] given to the person.

OR

- The authorised person [has taken] OR [will take] the action.

Provide details of the action that [has been] OR [will be] taken by the authorised person.

OR

- The authorised person [has authorised] OR [will authorise] another person to take the action.

Provide details of the person who [was] OR [will be] authorised to take the action and specify the action that [was] OR [will be] taken.

### What is the environmental harm that has been or is likely to be caused?

Specify the type of environmental harm that [required] OR [will require] the use of the emergency powers.

- Material environmental harm.  
 Serious environmental harm.

Advise how you formed the reasonable belief regarding the nature of the harm.

List the evidence upon which the reasonable belief was based.

### Why was/is urgent action necessary?

For the emergency powers to be exercised, the authorised person must be satisfied on reasonable grounds that urgent action is necessary to prevent or minimise the harm being caused or to rehabilitate or restore the environment because of the harm. Describe the facts and circumstances surrounding the matter and provide reasons why urgent action is required.

Describe the facts and circumstances that indicate urgent action is necessary.

List any evidence supporting the belief that the matter is urgent.

### What action was/is required?

Specify the type of reasonable action that [was] OR [will be] required:

- action to prevent or minimise the harm being caused  
 action to rehabilitate or restore the environment.

To ensure the actions are reasonable officers are required to provide justification for the inclusion of the action.

Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given

Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given
Action taken or direction given	Justification for the action taken or direction given

### What is the timeframe for completing the action?

The authorised person must specify a reasonable time for the person to take the specified reasonable action.

Provide details of the time frame given and why it was considered reasonable in the circumstances.

### What items, if any, were seized or damaged?

In instances where this assessment report is being completed retrospectively, the authorised person must identify whether any items were seized or damaged.

Particulars must be recorded of all items seized or damaged in the exercise of an emergency power by the authorised person or a person authorised by the authorised person. The authorised person should provide justification for the items seized and/or outline the circumstances surrounding how the damage occurred.

Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances
Items seized or damaged	Justification and circumstances

**Was a written notice of the particulars seized or damaged provided immediately?**

Pursuant to s486, if an authorised person, or a person authorised by an authorised person, seizes or damages anything in the exercise of the emergency powers, the authorised person must immediately give a written notice of the particulars of the seizure or damage to the person from whom the thing was seized or who appears to be the owner of the damaged item. If this is not practicable, the notice must be left at the place where the seizure or damage took place.

- Written notice of the particulars of the seizure or damage was given to the person OR
- written notice of the particulars of the seizure or damage was left in a secure and conspicuous position at the place where the seizure or damage happened OR
- N/A.

If applicable, provide details of the person to whom the notice was given. If no one was available, provide details of the place the notice was left and whether it was placed in a secure and conspicuous position.

**Recommendation/action taken**

The authorised person must provide either a recommendation for action to be taken, or an account of action already taken, action for approval by the authorised person’s supervisor.

Recommended approval of [action to be taken] OR [action already taken].

**Approval**

### **EMERGENCY DIRECTION – Pursuant to section 467 of the *Environmental Protection Act 1994***

#### **A. Grounds**

**TAKE NOTICE** that I, name of authorised person, being an authorised person under the *Environmental Protection Act 1994* (the Act) am satisfied on reasonable grounds that serious or material environmental harm has been, or is likely to be caused, and that urgent action is necessary to prevent or minimise the harm being caused or to rehabilitate or restore the environment because of the harm.

The urgent action is necessary to be taken in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the "said premises").

Accordingly I hereby <PICK FROM LIST> name of person <PICK FROM LIST> pursuant to the emergency powers provided by s467 of the Act.

The facts and circumstances forming the basis for this decision are—

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.

**B. Requirements**

I <PICK FROM LIST> name of person to take the following actions:

- List actions directed or authorised to be taken.
- List actions directed or authorised to be taken.
- List actions directed or authorised to be taken.
- List actions directed or authorised to be taken.
- List actions directed or authorised to be taken.
- List actions directed or authorised to be taken.

If [name of person] chooses to take the actions authorised by this emergency direction, [he] OR [she] should be aware of the provisions of the *Environmental Protection Act 1994* that are referred to in section 467(10) of that Act (see Attachment A).

This emergency direction was issued orally by [name of authorised person], an authorised person under the Act, at [time] on [day] to [person to whom direction was issued] of [organisation]. It is now confirmed by this written notice by [name of authorised person], an authorised person under the Act at [time] on [day and date].

**TAKE NOTICE** that:

- This emergency direction remains in force until further notice from the authorised person.
- The requirements of the emergency direction take effect immediately upon service of the notice.

**C. Penalty**

You must also do the following:

- comply with this notice, unless you have a reasonable excuse for not complying with it and
- take all reasonable and practicable precautions to prevent or minimise—
  - environmental harm being caused and
  - the risk of death and injury to humans and animals and
  - loss or damage to property.

Maximum penalty—

- for an individual—\$200,000.00
- for a corporation—\$400,000.00

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

## *Environmental Protection Act 1994*

### Emergency powers

---

*This document is for internal use to assist Environmental Services officers to exercise the emergency powers pursuant to s467 of the Environmental Protection Act 1994.*

#### **What are emergency powers?**

When an environmental emergency arises, authorised persons may need to take immediate, decisive action to prevent or minimise the environmental harm being caused, or harm that is likely to be caused, or to rehabilitate or restore the environment that has been harmed in the incident. In such an emergency, there may not be enough time to adhere to the procedures usually followed by the Department when an administrative decision is made, such as considering the standard criteria when an environmental protection order is issued.

Section 467 of the *Environmental Protection Act 1994* (the Act) provides authorised persons with the power to direct any person to take specified reasonable action, to take the action themselves or to authorise another person to take the action.

#### **Who can use emergency powers?**

The legislation specifies that in order to exercise these powers an officer must be an authorised person under the Act.

#### **When should I use the emergency powers under s467?**

The legislation specifies that the emergency powers under s467 can only be used if the authorised person is satisfied on reasonable grounds—

- that serious or material environmental harm has been, or is likely to be caused and
- that urgent action is required to prevent or minimise the harm, or rehabilitate or restore the environment because of the harm.

#### **What is material environmental harm?**

Section 16 of the Act defines material environmental harm as environmental harm (other than environmental nuisance)—

- that is not trivial or negligible in nature, extent or context or
- that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$5,000), but less than the maximum amount (\$50,000) or
- that results in costs of more than the threshold amount (\$5,000) but less than the maximum amount (\$50,000) being incurred in taking appropriate action to:

- prevent or minimise harm and
- rehabilitate or restore environment to its condition before the harm.

### **What is serious environmental harm?**

Section 17 of the Act defines serious environmental harm as environmental harm (other than environmental nuisance)—

- that is irreversible, of a high impact or widespread or
- caused to an area of high conservation value or special significance or
- that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$50,000) or
- that results in costs of more than the threshold amount (\$50,000) being incurred in taking appropriate action to:
  - prevent or minimise harm
  - rehabilitate or restore the environment to its condition before harm.

### **What emergency powers are available under s467?**

Section 467 of the Act provides that an authorised person may—

- direct any person (orally or in writing) to take specified action within a reasonable time or
- take the action personally or
- authorise another person to take the action

In taking action the authorised person may—

- enter any place without a warrant (other than premises that are used for residential purposes)
- exercise any powers of investigation and enforcement (authorised person powers) under Chapter 9 of the Act
- seize any thing that may provide evidence of the commission of an offence against the Act.

The authorised person may exercise the above powers at any time, with the help and use of force that is reasonable and necessary in the circumstances. This may include engaging the assistance of a police officer to remove a person or thing obstructing the authorised person in the exercise of the emergency powers.

### **How do I successfully use the emergency powers under s467?**

The legislation specifies that the direction may be given verbally or by written notice. However, if the direction is given verbally, it needs to be followed up as soon as practicable with a written notice.

If authorised persons are exercising emergency powers they must ensure that in all circumstances that they do the following—

1. present their identity card for inspection
2. advise the person that the officer is authorised under the provisions of the Act

3. advise the person that the officer is exercising the emergency powers under s467 of the Act and specify the manner in which the power is being exercised
4. advise the person that they must take all reasonable steps and precautions to minimise environmental harm, risk of death or injury to humans and animals and loss or damage to property (s478)
5. never under any circumstances compromise personal safety
6. take all reasonable steps to ensure that as little inconvenience and damage is caused as possible.

In instances where the authorised person is exercising the power by directing a person to take specified reasonable action, the authorised person must carry out the six steps listed above and must also do the following things—

- advise the person being given the direction of the action they are required to take and by when
- ensure the time frame given to carry out the specified action is reasonable having regard to the circumstances and
- advise the person that it is an offence not to comply with the directed action unless they have reasonable excuse (s478).

If the authorised person is authorising another person to take the specified reasonable action, the authorised person must carry out the six steps listed above and must also inform the person, before the person takes the action, of the following—

- the action that the other person is authorised to take
- the person's powers under s467 of the Act and
- in general terms, the provisions of s486 of the Act regarding what the person must do if the person seizes or damages anything while taking the action.

The authorised person must document the details of the authorising of the other person and the specified reasonable action required to be taken.

In all cases, authorised persons must ensure that they clearly identify and record all relevant issues or factors associated with the decision to exercise emergency powers under s467. These notes will be of assistance when completing the assessment report and written notice.

## Complete the assessment report

Authorised persons must complete the assessment report to document the facts and circumstances relating to the matter and the decision-making process used in exercising their emergency powers under s467. Where it is not possible to complete the assessment report before giving a direction because of the urgency of the situation, officers may give the direction and then complete the assessment report as soon as practicable afterwards.

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have led to the authorised person's decision. Accordingly, authorised persons are encouraged to limit the information included to relevant points only. A template assessment report is attached [\[LINK\]](#).

## Provide for natural justice

It is likely that an authorised person will exercise the emergency powers under s467 as a matter of urgency and there will be no time to observe formal natural justice procedures. If possible, the authorised person should document and take into consideration any representations made by a person to whom a direction is given. However, there is no requirement for the authorised person to specifically ask the person to put their side of the story forward.

## Complete the written notice

The legislation provides that a direction under s467 may be given orally or by written notice. If the direction is given orally, it must be confirmed as soon as practicable by written notice to the person. In either case, the written notice should—

- state the reasonable grounds the authorised person is relying upon
- state the serious or material environmental harm that the authorised person believes has been caused or is likely to be caused.
- state the specific actions the authorised person is directing the person to perform (or confirmation of the oral directions already given)
- if the authorised person has authorised another person to take action, state the specific action taken by the person
- include the time frame by which the person must take the directed actions (this should be reasonable having regard to all the circumstances)
- state that it is an offence to fail to comply with directed actions unless the person has a reasonable excuse
- state the maximum penalty for failing to comply with the direction.

## Service of the written notice

Service means delivery to the party who will be affected by the direction. Authorised persons are encouraged to use their discretion as to the most appropriate form of service, having regard to the nature of the situation and the recipient in question.

For the purposes of any Act that requires a document to be served on (which includes 'given' or 'sent to') a person, the document may be served:

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by post, facsimile or similar facility (e.g. email) to the place of residence or business of the person or
- on a body corporate – by leaving it at, or sending it by post, facsimile or similar facility (e.g. email) to, the head office, a registered office or a principal office of the body corporate.

As the written notice of a direction given under the emergency powers in s467 of the Act will need to be served upon the person as a matter of urgency, it should be sent to the person as soon as possible by facsimile transmission or email.

The date, time and method of service should be documented by contemporaneous notes, a file note, an receipts arising from the postage or any facsimile or email confirmations.

### **What follow-up is required?**

It is important that the matter is appropriately followed up to make sure that the person to whom the notice is issued is complying with any requirements imposed. Follow-up is to be scheduled by the relevant officer and confirmed with the officer's manager. The officer's manager is responsible for ensuring follow-up is undertaken within the agreed timeframe.

Authorised persons are encouraged to use tools such as diary reminders to ensure the matter is followed up in a timely manner.

### **What are my record keeping responsibilities?**

Authorised persons are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the Description field with commentary on actions and recording any decisions made on the Enforcement Measures screen (this includes a decision to take no further action). A hard copy of the signed assessment report, the written notice and any supporting documentation must be placed on the paper file for the matter. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

### **What penalties exist for non-compliance with an authorised person's direction in an emergency? (s478)**

Section 478 of the Act provides that a person must comply with a direction given by an authorised person in an emergency unless the person has a reasonable excuse. A person to whom a notice is given under section 467(2)(a) must also take all reasonable and practicable precautions to prevent or minimise—

- environmental harm being caused and
- the risk of death or injury to humans and animals and
- loss or damage to property.

Maximum penalty—

- for an individual—\$200,000.00
- for a corporation—\$400,000.00.

### **What happens if something is seized or damaged when exercising emergency powers?**

Section 486 of the Act provides that if an officer or another person authorised by an authorised person seizes or damages anything in the exercise of a power (including the power to give direction using the emergency powers

under s467), the authorised person must immediately give written notice of the particulars of the seizure or damage. The notice must be given to the person from whom the thing was seized or the person who appears to be the owner of the thing that was damaged. If this is not possible, the officer or other person authorised to take action must leave the notice at the place where the seizure or damage happened, ensuring that the notice is left in an obvious and secure place.

The authorised person must notify his or her supervisor of the particulars of the items seized or damaged as soon as practicable.

## Overview

Queensland's economic, social and ecological welfare is reliant upon the sustainable management of its environment and use of natural resources.

The Queensland Government is committed to ecologically sustainable development—protecting the ecological processes on which life depends, while allowing for development that improves the total quality of life, both now and in the future.

In seeking to meet the challenge of protecting Queensland's natural assets, legislation has been introduced to ensure sustainable environmental and natural resource management. The Department of Environment and Resource Management (DERM) is the government's lead agency for the administration of this environmental and natural resource legislation. DERM has produced a solid policy platform on which it has built partnerships with the community and industry to encourage greater understanding of the sustainable environmental and natural resource management practices and support for innovation.

Notwithstanding the co-operative approach taken by DERM, it is sometimes in the public interest for DERM to take enforcement action. The effective management and use of natural resources requires DERM to have a clear guideline for the selection of matters for enforcement.

DERM has an established litigation unit, which works in conjunction with specialist investigation teams, to provide a strong and consistent enforcement response to non-compliance.

To the extent possible in the circumstances, it is the goal of DERM's enforcement responses to:

- reinforce the legal obligations required under environmental and natural resource legislation
- achieve good environmental and natural resource outcomes
- deter non-compliant behaviour from others within the general public.

This enforcement guideline aims to foster a corporate and community culture of positive action, consultation and co-operation with DERM. They are general in nature to provide a broad understanding of how DERM will approach enforcement.

# 1. Introduction

DERM is the lead agency responsible for administering the legislation for the protection of the environment and management of natural resources. The legislation that is commonly the focus of enforcement action by DERM includes:

- *Aboriginal Cultural Heritage Act 2003*
- *Coastal Protection and Management Act 1995*
- *Environmental Protection Act 1994*
- *Forestry Act 1959*
- *Sustainable Planning Act 2009 (with respect to those parts relevant to DERM business)*
- *Land Act 1994*
- *Marine Parks Act 2004*
- *Nature Conservation Act 1992*
- *Place Names Act 1994*
- *Queensland Heritage Act 1992*
- *Recreational Areas Management Act 2006*
- *Survey and Mapping Infrastructure Act 2003*
- *Torres Strait Islander Cultural Heritage Act 2003*
- *Vegetation Management Act 1999*
- *Water Act 2000*
- *Wet Tropics World Heritage Protection and Management Act 1993.*

DERM has focused its attention on compliance and is working with the community and industry to achieve good environmental performance and natural resource management through provision of advice, technical assistance and support of innovation. However, in appropriate cases, DERM will pursue enforcement action against those who ignore their legal obligations with respect to their environmental and natural resource responsibilities.

This guideline explains how DERM determines the enforcement action it will take in any given situation. As far as possible, it provides guidance on what behaviour will result in prosecution or other enforcement action. More specific guidance can be obtained by reference to other guidelines addressing specific pieces of legislation. This guideline has been published to ensure that DERM's enforcement responses are:

- proportionate to the conduct
- consistent with past responses for similar conduct
- occur in a timely fashion.

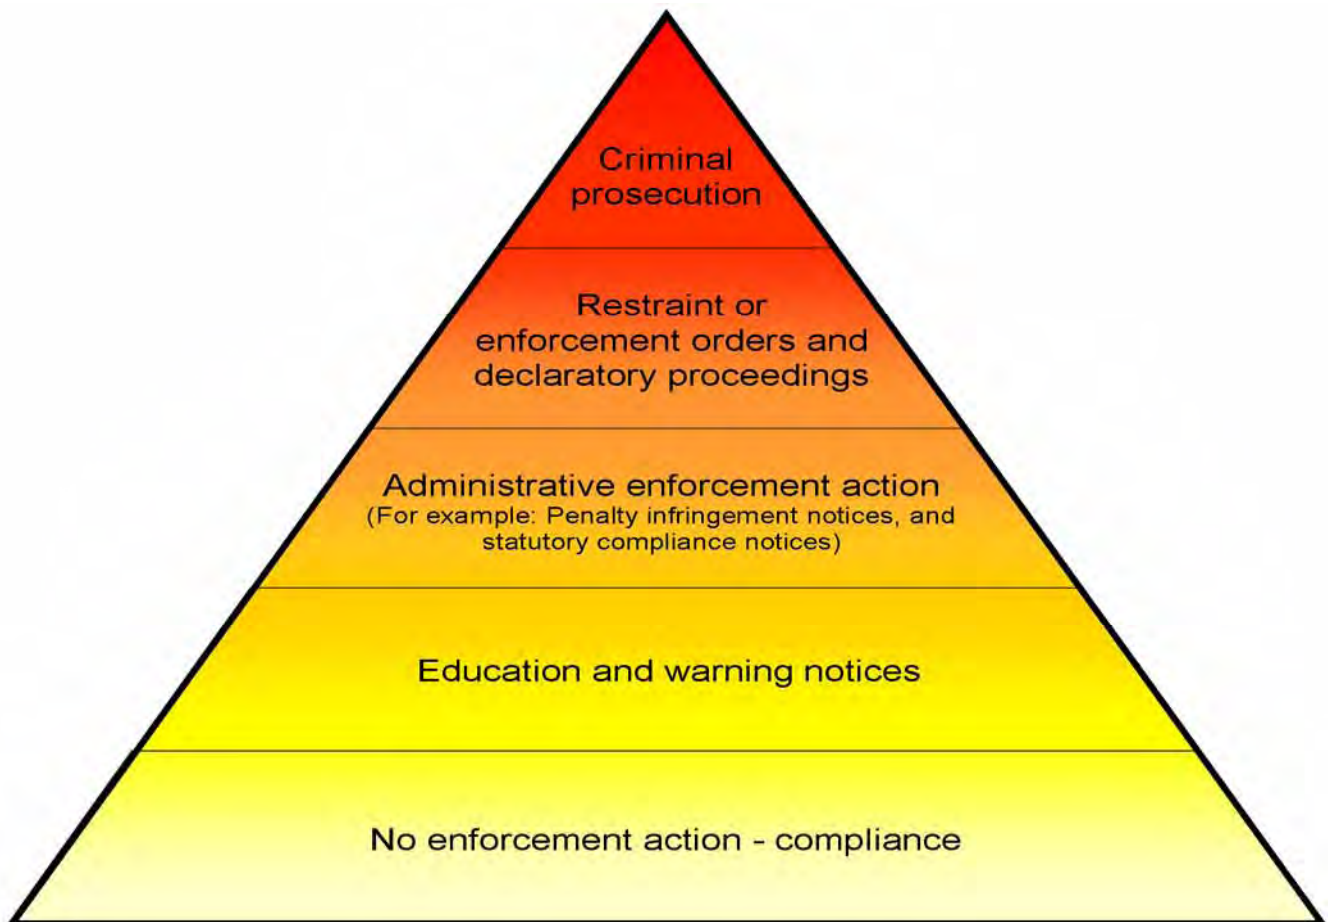

## 2. Enforcement approach

DERM takes a comprehensive approach to environmental and natural resource regulation. Enforcement is one of the measures used by DERM to achieve the objectives of the legislation it administers. It is not the only tool and will be used with restraint. If an alternative to enforcement action will be more effective in achieving the objectives of the Act being administered, then that alternative will be considered. Sometimes a number of enforcement measures are used in combination. In order to determine whether enforcement action will be taken, DERM will investigate all significant breaches of the law and then exercise its discretion in a consistent and logical fashion.

DERM has a wide range of enforcement measures available to it. Each piece of legislation has its own suite of enforcement measures, but generally they consist of the following:

- encouraging voluntary compliance through education and self regulation
- strategic compliance audits and site impact programs
- working with other agencies
- verbal warnings and warning letters
- infringement notices
- administrative and court orders to stop an activity or to take action to remedy a breach or both
- cancellation, suspension or amendment of licence, lease or other permits
- prosecution.

Rather than focusing on one particular enforcement response, this guideline provides general principles that can be applied to assist in choosing the appropriate enforcement tool in any given situation. The enforcement pyramid below (adapted from the model made famous by Ayers and Braithwaite) demonstrates the path of escalation in the enforcement response that has been adopted by DERM.

From this pyramid, it is clear that prosecution may occur where alternative enforcement measures have not been successful. Consideration needs to be given to whether money is better spent on preventing a problem or remediating the impacts of an unlawful activity rather than undertaking costly prosecution actions. In some cases, DERM may decide to negotiate a prompt and satisfactory environmental or natural resource outcome. However, negotiation does not necessarily suspend investigation. Where DERM is satisfied that negotiation is not leading to a satisfactory and prompt outcome, higher level enforcement tools may be the preferred course of action.

If the impact of the conduct is of a minor or trivial nature, enforcement action from lower down the pyramid is more likely. Higher level enforcement action, such as prosecution, may be the preferred option for unlawful conduct:

- involving dishonesty
- involving an attempt to deceive DERM or the provision of false information to it
- involving intentional, negligent or reckless behaviour
- where that unlawful conduct was motivated wholly or partly by commercial considerations
- where there has been a failure to assess, manage or mitigate risk associated with commercial and industrial activities
- resulting in clear commercial gain
- resulting in severe or irreversible harm to the environment or natural resources
- if the impact is unacceptable or dangerous.

Ultimately, DERM has the discretion to determine the appropriate response to unlawful conduct under the legislation administered by it.

## 2.1 Public interest considerations

DERM may take into account the following public interest considerations when deciding on an appropriate enforcement response:

- the seriousness, the triviality, or 'technical nature' of the offence
- the harm or potential harm to the environment caused by the offence
- any mitigating or aggravating circumstances
- the degree of culpability of the alleged offender
- the availability and effectiveness of any alternatives to enforcement action
- whether the offender has been dealt with previously without enforcement action and, if so, what level of enforcement action
- whether the breach is a continuing or second offence
- whether the offence is ongoing
- whether the administrative action or court orders are necessary to prevent a recurrence of the offence
- the prevalence of the alleged offence and the need for deterrence of the offence
- the length of time since the alleged offence occurred
- the age and physical or mental health of the offenders
- whether there are counter-productive features of the proposed enforcement tools
- in cases involving Aboriginal and Torres Strait Island cultural heritage issues, the views of the traditional owners of the area or object.

The following are further factors that should be considered specifically in the case of considering prosecution:

- the length and expense of any court hearing
- the likely outcome in the event of a conviction having regard to the sentencing options available to the court
- any precedent which may be set by not instituting proceedings
- whether the consequences of a conviction would be unduly harsh or oppressive

- whether proceedings are to be instituted against others arising out of the same incident
- the sentencing principles set out in the *Penalties and Sentences Act 1992*.

DERM adopts the overriding principle that enforcement tools must not be instituted (or not instituted) for improper purposes. A decision whether or not to use an enforcement tool will not be influenced by:

- any elements of discrimination against the person, such as ethnicity, nationality, political associations, religion, sex or beliefs
- personal feelings towards the offender or, alternatively, the victim
- possible political advantage or disadvantage to a government or any political group or party
- the possible effect of the decision on the personal or professional circumstance of those responsible for the enforcement response decision.

## **2.2 Determining who is liable for prosecution or other enforcement action**

### **2.2.1 General principles**

Some general considerations in determining who is liable to prosecution or other enforcement action are:

- who was primarily responsible for the offence—that is, who committed the act, who formed the intention (if relevant) and who created the material circumstances leading to the breach
- where a person is liable because the law creates strict liability—what was the role of the potential recipient
- the likely effectiveness of the enforcement tool against the potential recipient.

### **2.2.2 Corporate liability**

The law normally makes legal entities and individuals liable for breaches committed by employees, agents or officers in the course of their employment. Where evidence available to DERM indicates an offence was committed with the employer's knowledge, or the employer failed to take adequate steps to avoid the harm, the employer may be the subject of an enforcement response. DERM will also consider the existence and effective implementation of management programs aimed at ensuring the compliance of the corporation to Queensland's environmental and natural resource laws. This is considered in greater detail in the next section.

### **2.2.3 Liability of employees**

Employees cannot use as a defence the fact that they were acting under direction from a supervisor. Acting under orders might, however, be a mitigating factor in determining the appropriate enforcement response. The guiding principle in deciding whether to pursue an employee is the degree of culpability or responsibility involved. Factors to be considered in assessing the degree of culpability include:

- whether the employee knew or should have known that the activity was probably illegal or inappropriate
- whether the employee feared the loss of livelihood if they did not breach, or continue acting in breach, of the legislation
- the seniority of the employee and the scope of the employee's employment duties
- whether, having regard to the employee's seniority and employment duties, the employee had taken reasonable steps to draw to the attention of the employer or any other relevant person the impropriety of the practice
- whether the employee has taken reasonable steps endeavouring to mitigate or prevent any harm (if it was in the employee's power to do so).

Where employees in good faith and without negligence endeavour to follow specific requirements set by legislation or a licence or permit condition, and an offence occurs, they should not be the subject of an enforcement response.

### **2.2.4 Liability of directors and executive officers**

When determining whether to institute any enforcement response against executive officers, in accordance with a provision that creates executive officer liability, the crucial issue will be whether the person had actual control or influence over the conduct of the corporation.

As a general policy, DERM will institute proceedings under the executive officer liability provisions only where evidence links the person with the corporation's illegal activity. That linkage needs to show:

- intent to engage in the unlawful conduct
- that the action or omission was negligent or reckless
- there was a failure to monitor or periodically assess and manage risks associated with the corporation's relevant activities or review supporting systems and programs
- there was intent to defraud.

The general legislative exceptions to executive officer liability are:

- the executive officer was not in a position to influence the corporation's conduct
- the officer took all reasonable steps to ensure that the corporation complied with the law.

DERM may take the view that reasonable steps were taken if executive officers ensured that:

- the corporation had an effective environmental or natural resource risk management system in place, which was aimed at ensuring compliance with relevant legislative requirements
- all staff were aware of the system
- the system had been effectively implemented throughout the corporation
- the system was under regular review and was amended when necessary.

The better the corporation's documentary evidence of these matters, the stronger the executive officer(s)'s defence.

### **2.2.5 Liability of lenders, liquidators and trustees**

Although there are few situations in which lending institutions might attract liability under the law for an offence, the guiding principle for DERM is the culpability of potential recipients of an enforcement response in relation to an offence. Legal liability is necessary as a pre-requisite to any statutory enforcement response.

DERM acknowledges that in framing the law the intention was not to restrict legitimate commercial activities of lending institutions. DERM takes the view that if the lender did no more than lend money to the corporation under normal commercial processes, and did nothing that led to the causing of the unlawful activity, no enforcement action should be instituted against the lender. The closer the lender is to the management decisions that caused the unlawful activity, the greater the chance of liability.

Where a company has gone into liquidation, the lender might have day-to-day management responsibility for the company. If the lender becomes aware that the company's current activities are unlawful, or were unlawful in the past, then the lender has an obligation to take steps to stop or mitigate the impacts of the activities on the environment. The most appropriate way of doing this, and also the most effective way of ensuring that DERM will not consider the lender to be liable for unlawful environmental or natural resource impacts, is to immediately notify DERM and take steps to prevent future unlawful activities. By mitigating the impacts of unlawful activity on the environment, lenders will not only fulfil their obligations under the law but also maintain the value of their assets.

Similarly, trustees and liquidators that take over the management responsibilities of a company must ensure the company's action comply with Queensland's natural resource and environmental legislation.

### **2.2.6 Liability of state and local governments**

The legislation administered by DERM binds all people including state and local governments. The decision to commence enforcement action against state and local governments will depend on whether it is in the public interest. The laws in place are to be equally applied to both private and public sectors. The public has an interest in everyone abiding by these laws and public authorities have a greater responsibility to lead by example. One factor relevant to public interest is the potential cost of enforcement action to the taxpayer; this becomes a significant consideration as this involves a consideration of the costs of both parties.

### 3. Voluntary compliance

DERM recognises that one way to enhance environmental and natural resource protection is to protect companies that continuously improve their management practices and move beyond 'compliance'. To this end, DERM encourages companies to audit and monitor their operations. To maximise protection from higher level enforcement action, companies can follow these steps:

- implement (not just document) an appropriate risk management system that caters for routine and non-routine situations
- have contingency plans in place
- practise 'due diligence'
- comply with all statutory instruments
- have strategies in place to move towards industry best practice environmental management
- notify DERM immediately of any non-compliance
- give formal notice to DERM that the non-compliance will be appropriately dealt with and rectified.

#### 3.1 Disclosure and co-operation

Encouraging voluntary disclosure and co-operation is in the public interest. DERM recognises that early notification of an incident and full co-operation with any investigation often mitigates the impact of the non-compliant activity. Accordingly, these factors will be taken into account when considering enforcement action.

#### 3.2 Duty to notify and voluntary disclosure

The law creates a duty on all citizens to notify DERM, as soon as they become aware, of any actual or threatened environmental harm arising from an activity. Where this occurs, failure to notify DERM is an offence.

DERM wants to establish a culture of environmental and natural resource stewardship in the community where problems are reported before irreparable harm is caused. In determining whether to use information that a person has disclosed about themselves to initiate an enforcement response, DERM will consider whether the person or corporation made a voluntary, timely and complete disclosure of the incident giving rise to the offence. Specifically:

- whether the person promptly notified DERM
- whether the information assisted in the control or mitigation of any harm caused to the environment or natural resource
- whether the information substantially aided DERM's investigation of the incident
- whether the information was available from other sources
- whether the disclosure occurred prior to DERM or any other regulatory body obtaining knowledge of the non-compliance.

#### 3.3 Without prejudice negotiations with alleged offenders

From time to time, it will be necessary for DERM to enter into 'without prejudice' discussions with alleged offenders about the type of enforcement tool to be employed in response to the unlawful conduct. The driving consideration in these discussions should be to achieve the best environmental or natural resource outcome. No agreement can be reached with an alleged offender who is not prepared to take responsibility for the impacts of the unlawful conduct. When taking part in these discussions, DERM may take into consideration the public interest considerations outlined above and in particular:

- the costs of the enforcement response relative to any outcome achieved
- whether a negotiated response sets an unsatisfactory precedent for DERM's response to the conduct
- whether a negotiated response provides an adequate deterrent for similar conduct.

## **General guideline on the enforcement tools**

### **4. Administrative response (education and warnings and other statutory enforcement tools)**

There are a number of non-statutory tools available to DERM to enhance regulatory compliance with Queensland's environmental and natural resource laws. As most of the community and industry are concerned with protection of the environment and natural resources, the majority of minor non-compliance can be dealt with by way of educating them regarding their obligations. Warning letters and notices are also an effective means to ensure that the recipient is made aware of their responsibilities in this respect.

There are a range of other statutory tools that provide an appropriate regulatory response to situations requiring a stronger response. Generally, the legislative provisions mandate certain criteria that have to be met prior to the use of these tools. Specific guidance on when these tools should be used is contained in separate guides prepared by DERM.

## 5. Infringement notices

### 5.1 Background

Infringement notices are a way of dealing with common breaches of the law where the impacts are not serious enough for court action. Some of these could be traversing a State forest without a permit, exceeding noise limits, working outside given hours, emitting black smoke from chimneys, or failing to carry out monitoring. The State Penalties Enforcement Regulation 2000 nominates the infringement notice offences and penalties under the law.

The infringement notice system modifies the traditional legal system. A notice is served because it appears an offence has been committed. However, payment of the penalty does not lead to the recording of a criminal conviction. Non-payment of the fine is not dealt with by a jail sentence but is recoverable as a civil debt. On the other hand, if a person elects to have the matter heard, proceedings are commenced in the criminal jurisdiction of the Magistrates Court.

Infringement notices can be issued by authorised officers. These can include officers from organisations, such as local governments and DERM. DERM has no direct control over how authorised officers from other organisations carry out their duties. However, for fairness and consistency, DERM's authorised officers will implement the infringement notice guidelines set out here.

### 5.2 Operation

Just as there is discretion to use any other enforcement tool, there is discretion whether to serve an infringement notice. Any discretion by individual officers must take into account the intention of the legislation to penalise those breaches that, in the past, might have gone unpunished, and to recognise those active in managing and minimising their environmental and natural resource use impacts.

Infringement notices are designed primarily to deal with one-off breaches that can be remedied easily. They are usually a first response when a preventable breach is discovered. Issuing successive infringement notices for multiple statutory breaches is generally inappropriate, unless the breaches are unrelated. In such circumstances, even though each breach might be comparatively minor, there is probably a major and continuing compliance problem. Such a problem needs to be dealt with through other enforcement measures if a past infringement notice has not motivated the recipient to successfully address the underlying issue.

The legislation does not set a time by which infringement notices have to be issued. Since serving a notice might be the first notification a person has of an alleged breach, it should be issued promptly out of fairness and courtesy.

The *State Penalties Enforcement Act 1999* gives DERM the discretion to withdraw an infringement notice after serving the notice. This allows for two possibilities:

- A more serious breach of the law might have taken place without the authority's knowledge when the notice was issued. The notice can be withdrawn to allow the more serious breach to be pursued.
- A mistake of fact was made and the notice should not have been issued. In such a case, the State Penalties Enforcement Regulation 2000 allows the authority to withdraw the notice, even if the penalty has been paid.

Withdrawal provisions should be seen as a safety net, not a mechanism to be applied regularly.

### 5.3 Summary

Infringement notices are generally appropriate when the following conditions are met:

- the breach is minor
- the facts are apparently indisputable
- the breach is a one-off situation easily remedied
- inspection discovers a breach that normal operating procedures should have prevented
- where the issuing of an infringement notice is likely to act as a deterrent.

Infringement notices should not be issued in the following circumstances:

- where large-scale habitat or environmental damage has occurred
- where the breach is continuing and not within the alleged offender's ability to remedy quickly
- where the penalty seems inadequate for the severity of the offence

- where the extent of the harm to the environment cannot be assessed immediately
- where the evidence is so controversial or insufficient that court action is unlikely to succeed
- where there has been substantial delay since the alleged breach
- where another authority has issued a notice for the same or similar offence in the same period
- where a notice, direction or order has been issued by DERM to do specified work within a time limit and the limit has not expired
- where multiple breaches have occurred, unless all are minor
- where the offence took place under a proposal approved by DERM.

## 6. Court orders

Many of the Acts administered by DERM provide a power to seek orders from a court to ensure compliance with legislative requirements. These orders may take a variety of forms, including declaratory orders, enforcement orders, restraint orders or orders resulting from a criminal prosecution. Court orders are amongst the strongest enforcement tools available to DERM and will only be sought where other alternatives have failed or where the conduct is of such a serious nature that DERM considers it necessary. The public interest considerations listed above (at section 2.1) should be considered by DERM when deciding whether court orders are appropriate.

### 6.1 Model litigant

As a Queensland Government department, DERM is bound to follow the model litigant principles, which can be found on the Department of Justice and Attorney General website. The principles ensure that when conducting litigation, DERM meets the community's and the courts' expectations that the State conducts itself in a manner which exemplifies the principles of justice, and that State power be used in the public interest.

### 6.2 Declarations

Where there is uncertainty regarding if an activity is unlawful in relation to the provisions of an Act administered by DERM, the Act may provide an avenue to seek a declaration from the court. A declaration is a formal statement of legal rights enabling or disallowing an activity. Seeking a court declaration enables an activity to proceed with a clear statement of the legal situation.

An example of where a court declaration may be sought is for consideration of whether a proposed commercial activity venture would be 'interfering' with the habitat of an endangered wildlife resource in a national park. Under similar provisions in the *Sustainable Planning Act 2009* people may seek a declaration about whether an activity is lawful under a planning scheme or is in breach of a condition of the development approval.

### 6.3 Enforcement and restraint orders

Where there is an existing ongoing or potential unlawful activity under legislation administered by DERM, the legislation may provide that a court may issue either a restraint order or an enforcement order. Enforcement orders are applied in the case of a development offence. Restraint orders may be issued for a threatened or anticipated offence against relevant legislative provisions.

Generally the legislation provides the court with very broad powers when issuing orders. For example, the court may, in some cases, direct the company or person to:

- a) stop an activity that either constitutes, or will constitute, the offence
- b) do anything to comply with the law
- c) cease activities that are in contravention of the law
- d) do anything required to stop committing an offence
- e) rehabilitate or restore an area.

When making a restraint or enforcement order, the court will specify the time required for compliance with the order. It is usually an offence for a person to contravene a court order. In order to stop frivolous or vexatious applications for restraint or enforcement orders, the court has the discretion to make an order in relation to costs.

## 7. Principle prosecution

### 7.1 Background

This guideline aims to identify the key steps in DERM's approach to initiating and progressing prosecutions by outlining:

- the basis on which DERM makes a decision to prosecute
- factors taken into account in deciding which charges to lay
- factors considered in determining the appropriate type of proceedings
- submissions on sentence.

### 7.2 The decision to prosecute

#### 7.2.1 Evidence

The basic pre-requisite of any prosecution is that the available evidence, on first impression, appears to establish a *prima facie* case. At all times there is discretion not to prosecute, but the discretion to prosecute only arises once there is a *prima facie* case. This is a well established principle of law and has been enunciated in the Prosecutions Guidelines of the Queensland Office of the Director of Public Prosecutions.

The criteria that are to be applied in deciding whether to prosecute fall into two categories. First, is the evidence sufficient to justify proceedings? Second, does the public interest require a prosecution? The prosecutor must be satisfied as to the first question before moving on to the second.

Similarly, the Prosecution Policy and Guidelines of the Director of Public Prosecutions, New South Wales states:

A *prima facie* case is a necessary but not sufficient condition for launching a prosecution. Given the existence of a *prima facie* case it must be understood that a prosecution should not proceed if there is no reasonable prospect of a conviction being secured . . . This decision requires an evaluation of how strong the case is likely to be when presented in court. It must take into account such matters as the availability, competence and credibility of witnesses and their likely impression on the arbiter of fact, and the admissibility of any alleged confession or other evidence. The prosecutor should also have regard to any lines of defence which are plainly open to, or have been indicated by the alleged offender and any other factors which in the view of the prosecutor could affect the likelihood or otherwise of a conviction.

#### 7.2.2 Discretion

Sufficient evidence is not the only criterion for prosecution since:

- not every breach of the criminal law is automatically prosecuted
- the laying of charges is discretionary
- the dominant factor in exercising that discretion is the public interest.

The Prosecution Policy of the Commonwealth Director of Public Prosecutions notes:

The decision whether or not to prosecute is the most important step in the prosecution process. In every case great care must be taken in the interests of the victim (in this case the environment), the suspected offender and the community at large to ensure that the right decision is made . . . The criteria for the exercise of this discretion cannot be reduced to something akin to a mathematical formula; indeed it would be undesirable to attempt to do so.

The breadth of the factors to be considered in exercising this discretion indicates a candid recognition of the need to tailor general principles to individual cases.

One of Parliament's main aims in making a breach of the law a criminal offence is to deter someone else from similar behaviour. By extending criminal liability to many people, for example, landowners and directors and managers of corporations, the law generates increased awareness and responsibility for environmental performance and natural resource management within corporate structures and throughout the community. Prosecution is part of DERM's strategy for achieving its objectives. If prosecution is unlikely to lead to deterrence, other measures may be considered.

Each case is to be assessed to determine whether prosecution is the appropriate strategic response. The factors to be considered when deciding to institute proceedings are listed above in 'public interest considerations' (at section 2.1).

Once a decision has been made to prosecute, DERM must present facts fairly and impartially to the court. DERM should have no interest in procuring a conviction, other than to ensure that the right person is convicted, that the truth is known and that justice is done (*R v Hay and Lindsay* (1968) QdR 459 at 476 and the Queensland Barristers' Rules).

## 7.3 Decisions relating to what charges to lay

### 7.3.1 General principle

The charges laid must reflect the nature and extent of the conduct disclosed by the evidence with the aim of providing a basis for the court to impose an appropriate penalty. In line with this general principle, the following policy is adopted:

The administering authority has a duty to refine its case to avoid laying either duplicate or multiple charges. There will be occasions where the same conduct is prohibited under separate statutes and involves an offence under each. Where another prosecuting authority is involved, DERM is to liaise with the other organisation to ensure the most appropriate charge(s) are laid. Conversely, other prosecuting bodies, which know of DERM's actual or potential involvement in a case, should initiate contact before proceedings begin.

## 7.4 Mode of trial – summary or indictable proceedings

Most offences under legislation administered by DERM are 'summary' offences that are heard by a Magistrate, who is the arbiter of fact and law. However, some offences are indictable, meaning that they may be heard in the District Court. Often the decision as to whether an indictable matter is to be heard summarily (before a Magistrate) is an election that can be made by the prosecution. In DERM's case, the decision as to whether or not to proceed on indictment ultimately rests with the Office of the Director of Public Prosecutions (ODPP). The ODPP have published guidelines on when it considers proceeding on indictment appropriate in the circumstances of environmental and natural resource offences. The Director of DPP guidelines can be found on its website at <[www.justice.qld.gov.au](http://www.justice.qld.gov.au)>.

## 7.5 Sentencing considerations

The *Penalties and Sentences Act 1992* outlines the factors that can be considered by a court at sentence. When seeking a sentence for environmental and natural resource offences, the following is a non-exclusive list of factors which may be considered by DERM in preparing sentence submissions:

- the seriousness of the environmental impact or impact on natural resources (the 'victim' of the offence)
- the potential for the impact to be rectified or mitigated
- the steps taken by the defendant to rectify or mitigate the impact
- the level of cooperation by the defendant with DERM
- any prior convictions of the defendants relevant to environmental or natural resource management
- the level of penalty sufficient to deter others from similar conduct
- the prevalence of the offence
- the maximum penalty for the offence
- any relevant sentencing precedents.

## 8. Breaches of licence conditions

Breaches of licence, lease, permit, authority or the conditions of some other form of permission, can in some cases, lead to the following:

- the issuing of a warning notice or letter
- the issuing of an infringement notice
- prosecution of the offender
- the licence being cancelled.

Cancelling or suspending a licence is potentially the strongest penalty DERM can invoke as it may result in licensee's operations to close. In most cases, DERM will only take this step when:

- the breach of licence conditions has had serious consequences to human health, environment or natural resources
- continual minor breaches have occurred despite warnings being given by DERM
- provision is made for the automatic cancellation of the licence (e.g. accumulation of demerit points).

Specific legislative provisions provide the process DERM must follow before suspending or cancelling a licence. Once the process has been followed and a decision to suspend or cancel has been made, a licensee has the option to seek to have the decision reviewed by a court.

## 9. Conclusion

This guideline is not intended to have legal status. The matters outlined in this guideline are not legally binding on DERM and do not confine, restrain or limit the discretion of DERM to take any action. However, they provide general guidance on how enforcement decision-making is approached by DERM. More specific guidance can be obtained by reference to guidelines addressing specific pieces of legislation.

Should you wish to make comments or suggestions on this guideline, send them to:

Litigation Unit  
Department of Environment and Resource Management  
GPO Box 2454  
Brisbane QLD 4001

If you want to provide information about an incident relating to Queensland environment or natural resource legislation, the DERM hotline is available 24 hours a day on 13 74 68 (13QGOV).

# Assessment report

*Environmental Protection Act 1994*

## Environmental protection order (EPO)

*This document is intended for internal use to assist environmental service officers to document the information considered by the department when forming the decision whether to issue an environmental protection order (EPO).*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Address

Note:

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the investigating officer, supervisory review and the delegated decision maker.

### 1. Grounds for use of EPO

The legislation specifies that the EPO can only be used in certain circumstances (see s358). Please identify the relevant grounds upon which the decision whether to use an EPO is based:

- Where a person did not comply with a requirement to conduct/commission an environmental evaluation and submit it.
- Where a person did not comply with a requirement to prepare an environmental management program (EMP) and submit it.
- As a result of an environmental evaluation, the department is satisfied that an activity or event being carried out, or that is likely to be carried out, or is proposed to be carried out will cause or is likely to cause unlawful environmental harm.
- To secure compliance by the person with:

- general environmental duty
- an environmental protection policy (EPP)
- a condition of a development approval (DA) or environmental authority (EA)
- a standard environmental condition of a code of environmental compliance for a chapter 4 activity
- a condition of a site management plan
- an audit notice
- a surrender notice
- a rehabilitation direction
- a regulation.
- The person is, or has been, contravening any of the following provisions:
  - section 363E
  - section 440Q
  - section 440ZG
  - a provision of chapter 8, part 3D, 3E or 3F.

## 2. Expand Upon the Grounds

Please expand upon the grounds identified for issuing the EPO. This can include identifying an alleged offence or any statutory requirement which must be met prior to the department using an EPO, or a specific condition of a development approval (DA) or environmental authority (EA) to which the department seeks to secure compliance.

Each ground should be listed independently and be allocated a separate number.

Number	Specific ground
1	The department seeks to secure compliance with condition G-12 of developmental approval (DA) MIN12365478.
2	To secure compliance with the general environmental duty under s319 of the Act.
3	
4	

## 3. Brief history of the matter

Please briefly outline any historical information relevant to this decision.

Provide a succinct history of the matter in dot point form.

#### 4. Detail the matters considered

The purpose of the table in the assessment report is to ensure that there is evidence to support the grounds for using the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed. This section should also record how the department has met any statutory requirements associated with the use of the statutory tool.

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

<b>Elements of the offence or legislative requirement</b>	<b>Evidence</b>	<b>Facts and circumstances</b>
<i>List the elements of any alleged offence or (for grounds which are not offences) list the legislative requirement to be met by the department.</i>	<i>Identify the information considered which is relevant to the elements or requirement (i.e. statements, photographs, and recordings)</i>	<i>Detail the facts and circumstance that support the department's findings.</i>
<b>Number 1</b> (Number taken from Section 2)		
Time	Unknown	Unknown
1 July 2010	Notes from phone calls received from residence in and around 123 Creek Road x10 in file no: 123	The department received a number of telephone calls regarding the level of dust/materials coming from the ABC Pty Ltd site on 123 Creek Road.
ABC Pty Ltd, proprietor Mr. Green	Company search of ABC Pty Ltd.	Company search shows that Mr Green is the sole director/secretary of the company
		Condition 47 of the DA number 123 held by the ABC Pty Ltd provides that they must have in place a dust suppression system which details how they will minimise the release windblown or site traffic generated dust/or particulate matter
<b>Number 2</b>		
The general environmental duty requires individuals to take reasonable steps to prevent or minimise environmental	Air samples taken	Sampling confirmed high levels of dust and particulate matter in the atmosphere at the area surrounding or near

harm		the site location
	Site inspection was carried out at 123 Creek Road on 4th July 2010	The site inspection revealed that Mr. Green had not put in place any mechanisms to minimise the release of dust and/or particulate to the atmosphere
<b>Number 3</b>		
<b>Number 4</b>		

### Standard criteria checklist

Provide brief details of your consideration of each of the standard criteria in supporting and substantiating the relevant grounds purposed. If a criterion is not applicable, write "N/A".

Standard criteria	Detailed comments
Ecologically sustainable development	
Environmental protection polices (EPPs)	
Plans, standards or agreements	
Environmental impact study, assessment or report	
Receiving environment	
Best practice environmental management	
Financial implications	

Public interest	
Site management plan	
Any other matter prescribed under a regulation	
Any relevant integrated environmental management system or proposed integrated environmental management system (IMS)	

## 5. Natural justice

The investigating officer is required to notify the affected person that the department is considering issuing an EPO and that the individual is welcome to make representation to the department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Please describe how this was achieved.
- All information and/or defences provided were considered.  
Please describe any information or defences provided.
- The department has considered the information or defences provided.  
What consideration was given and what conclusions has the department formed?
- The decision maker and investigator are free from bias or the perception of bias.

## 6. Recommended conditions

If appropriate, please list any proposed conditions below. In order to ensure conditions are enforceable, they should be SMART; specific, measureable, achievable, relevant and time specific. Refer to the writing effective and enforceable conditions procedural guide for more information on writing conditions

<http://wwwhost.env.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=2417>.

To ensure the conditions are reasonable officers are required to provide justification for the inclusion of the condition.

<b>Proposed requirement</b>	<b>Justification</b>
(1) As soon as practicable but not later than 5pm on 28 February 2011 you are required to cease any curshing or screening activity at the said premises until such time as a dust suppression system is installed and operational and has been approved by the department.	(1) To secure compliance with condition G-12 of EA XYZ98765432.
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification
Proposed requirement	Justification

**7. Recommendation**

The investigating officer is required to make a recommendation in relation to the allegation.

Provide a recommendation

**8. Endorsement**

Investigating officer	Supervisory review
<b>Print name:</b>	<b>Print name:</b>
<b>Date:</b>	<b>Date:</b>
Delegate decision maker	Approve/reject recommendation (circle one)

Reasons for decision
For example: I endorse this recommendation based upon the information set out above.
For example: I endorse this decision for the reasons set out above and I note Mr Rodgers has previously received a warning letter in relation to this matter.
For example: I reject the above recommendation as I consider it more appropriate for the department to take an educational approach to this breach.
<b>Print name:</b>
<b>Date:</b>

## **Environmental protection order (EPO)**

*This document is intended for internal use to assist environmental service officers to undertake an environmental protection order.*

### **What is an environmental protection order?**

An environmental protection order (EPO) is an order that may be issued by the Department of Environment and Resource Management (the department) to impose a reasonable requirement upon a person to prevent or minimise environmental harm. This can include requiring the person to stop or not start a particular activity, to carry out a particular activity only during stated times on stated conditions or to take stated action by a certain date.

The issue of an environmental protection order is governed by Chapter 7, Part 5 of the *Environmental Protection Act 1994* (the Act).

### **Who can use an EPO?**

A decision to issue an EPO must be made by a person with the delegated authority to do so. Decisions made by individuals who do not have the delegated authority to make the decision are generally found to be invalid.

As the individual (or position) that holds delegation changes regularly, officers must review the department's list of delegations at <http://insite2.dnr.qld.gov.au/derm/delegations/>.

### **When should I use an EPO (s358)?**

The legislation specifies that an environmental protection order can be issued to a person in the following circumstances—

- if the person does not comply with a requirement to conduct or commission an environmental evaluation and submit it to the department
- if the person does not comply with a requirement to prepare an transitional environmental program (TEP) and submit it to the department
- if, as a result of an environmental evaluation, the department is satisfied that an activity or event being carried out, or that is likely to be carried out, or is proposed to be carried out by the person, is causing or is likely to cause unlawful environmental harm or
- to secure compliance by the person with:
  - the general environmental duty or
  - an environmental protection policy (EPP) or

- a condition of a development approval (DA) or environmental authority (EA) or
- a standard environmental condition of a code of environmental compliance for a chapter 4 activity or
- a condition of a site management plan or
- an audit notice or
- a surrender notice or
- a rehabilitation direction or
- a regulation or
- an accredited environmental risk management plan (ERMP) or
- if the person is, or has been, contravening any of the following provisions:
  - section 363E
  - section 440Q
  - section 440ZG
  - a provision of chapter 8, part 3D, 3E or 3F.

An EPO should be used where the outcome required is clear and can be actioned and achieved within a reasonable time frame. For further information about when to use an EPO, refer to the procedural guide: [Procedural guide - Choosing the appropriate statutory tool to respond to non-compliance](#)

### Consider the standard criteria

Officers must consider the standard criteria set out in the Act when contemplating the issue of an EPO. Some guidance on the standard criteria is set out below—

- The principles of ecologically sustainable development (as set out in the *National strategy for ecologically sustainable development*).

Consider the following questions:

- Has the decision effectively integrated long and short term economic, environmental, social, and equity considerations?
- Has due regard been given to the precautionary principle? For example, where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- Does the decision have due regard to the global dimensions of environmental impacts and policies?
- Does the decision assist in the development of a strong, growing and diversified economy, which can enhance the capacity for environmental protection?
- Has the need to maintain and enhance international competitiveness in an environmentally sound manner been considered when making the decision?
- Have cost effectiveness and flexibility been considered?
- Does the decision and action allow for broad community involvement on issues that affect them?

- Any applicable EPPs.
  - Is the EPO consistent with the EPPs on water, air, noise and waste (where relevant)?
- Any applicable Commonwealth, State or local government plans, standards or agreements.
  - Consider documents such as State and regional coastal plan, National Health and Medical Research Council (NHMRC) and Australian and New Zealand Environment and Conservation Council (ANZECC).
- Any applicable environmental impact study, assessment or report.
  - Consider any findings or recommendations that are relevant to the EPO.
- The character, resilience and values of the receiving environment.
  - Does the EPO have regard to the environmental values of the receiving environment?
  - What is the impact on the values of the actions contained in the EPO?
- All submissions made by the applicant and submitters.
  - Consider any submissions made by the applicant and anyone who makes a properly made submission about the EPO.
- Best practice environmental management.
  - Consider how the EPO will ensure that best practice environmental management (BPEM) is incorporated on site. BPEM is defined in s21 of the Act and officers should refer to the Act for more detail on what BPEM is.
- The financial implications of the requirements.
  - Explore the financial implications for the client in complying with conditions of the EPO. Are they reasonable in the particular circumstances?
- The public interest.
  - Is it in the interests of the community that the EPO be approved?
- The site management plan.
  - If there is a site management plan for contaminated land (approved under chapter 7, part 8 of the Act), is the EPO consistent with the site management plan? If not, is the inconsistency necessary for addressing the matters in the EPO? How will any inconsistency be reconciled? Consult with the Contaminated Land Unit as early as possible when there are any contaminated land issues.
- Any relevant integrated environmental management systems (IEMS) or proposed IEMS.
  - Is the EPO consistent with the IEMS? If not, is the inconsistency necessary for addressing the matters in the EPO? How will any inconsistency be reconciled?

## How do I successfully issue an EPO?

Officers must complete an assessment report to document the decision as well as completing the environmental protection order.

## Step 1 - Complete the assessment report

Before completing the environmental protection order officers are required to complete an assessment report, which sets out the facts and circumstances relating to the matter and documents the decision making process used by the department in determining to issue an environmental protection order. The next part of this procedural guide is a guide to completing the assessment report. Note that the numbering and headings for each section in the procedural guide correspond to the numbering and headings in the assessment report.

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have led to the department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached [\[LINK\]](#)

### 1. Grounds for issuing an EPO

The legislation specifies that an environmental protection order can only be used in certain circumstances. Please identify the relevant situation or 'grounds' upon which the decision to use an environmental protection order is based.

### 2. Expand upon the grounds

The purpose of this section is to clearly identify what the department must 'prove' before deciding to use an EPO and should be used to expand upon the grounds which have previously been identified. This can include identifying a specific offence or breach under investigation. This could also include any statutory requirement listed in the legislation which must be met by the department prior to issuing an environmental protection order.

In instances where one action has resulted in multiple breaches each breach should be listed independently. For example, a site inspection could potentially detect a number of breached conditions associated with a single development approval. In this situation each breach would need to be proven on its own merits and should be listed separately.

Each ground (including breaches or requirements) should be allocated a separate number.

### 3. Brief history of the matter

Please briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points and should include how the department became aware of the alleged breach.

This can include (but is not limited to) the following details:

- any EAs, DAs, EPPs and/or TEPs that are in place
- any previous acts of non-compliances in respect to any of the above
- how the matter was brought to the attention of the department (eg: Complaint from member of the public, routine department inspection)
- any action carried out by the department to date.

### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the breach to the evidence gathered and the conclusions formed. This is achieved by identifying: the ground or the elements of any specific breach

or allegation, the information or evidence which has been considered, and the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence considered officers are encouraged to limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officers official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

## 5. Provide for natural justice

Prior to the department making a decision which may adversely impact on an individual or group the department must:

- **Notify** - Notify the individual that the department is considering making adverse findings
- **Respond** - Provide the individual with an opportunity to respond to the allegation and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses provided by the affected person.

## 6. Proposed requirements

In instances where it is recommended that requirements are imposed upon the affected person, the investigating officer is responsible for developing proposed requirements for consideration by the delegate. The legislation provides that the department may impose a reasonable requirement to prevent, or minimise harm. Without limiting the reasonable requirements that may be imposed by the department, s360(2) provides that the EPO may—

- require the recipient to cease or not start a particular activity indefinitely, for a stated period or until further notice from the department or
- require the recipient to conduct a stated activity only during stated times or subject to stated conditions or
- require the recipient to take stated action within a stated period.

When drafting the requirements, officers should consider whether the requirements are reasonable and how they will contribute to preventing or minimising environmental harm. As the recipient of the EPO is able to seek a review of the department's decision to impose one or more requirements, it is necessary for officers to provide justification for the inclusion of each requirement.

Requirements must be specific, measurable, achievable, time specific and relevant to the breach. For example:

*You are required to do the following things—*

- (1) *As soon as practicable but by no later than 5.00pm on 31 January 2011, you are required to transfer 20ml of contaminated water contained within the stormwater pond system into secure tanks currently located on the site so as to prevent the release of contaminated water in contravention of conditions D1-1 and D1-2 of environmental authority ABC87654321.*
- (2) *As soon as practicable but no later than 5.00pm on 7 February 2011, you are required to ensure that the water within the stormwater pond system meets either:*
  - (a) *the water quality limits set out in Schedule D – Table 5 (end of pipe contaminant release limits) of environmental authority ABC87654321 or*
  - (b) *the mandatory reporting level set out in the environmental authority ABC87654321.*
- (3) *From 5.00pm on 7 March 2011 you must prepare and implement an action plan to ensure that:*
  - (a) *at a minimum all storages on site meet the Design Storage allowance by 30 September 2011 pursuant to condition D1-4 of environmental Authority ABC87654321;*
  - (b) *adequate treatment and pumping options are available on the said premises prior to 1 December 2011 to prevent the release of contaminated during the wet season in breach of condition D1-1 and condition D2-2 of the Environmental Authority ABC8765432;*
  - (c) *monthly water reduction targets are set and provided to the department by 7 March 2011.*

## 7. Recommendation

The investigating officer is required to make a recommendation in relation to the alleged breach. For example:

*It is the opinion of the department that ABC Pty Ltd failed to comply with its development conditions by allowing storm water to leave 24 Jones Road and enter Murphy Creek. It is recommended that an EPO be issued.*

Administrative decisions are made based upon the balance of probabilities. This means that the decision maker must be able to determine whether, based upon the information available, it was more likely than not that the events relevant to the issue of the EPO occurred.

Officers are encouraged to consider alternative actions/tools, departmental enforcement guidelines, details of any consultations including site visit details and discussions with the ERA contact officer. The reasonableness of proposed timeframes for the completion of requirements should be taken into account (for example, if earthworks or sampling are involved the department should consider whether an impending wet season may result in delays, or if the location geographically isolated the department should consider allowing additional time to secure an appropriate contractors).

## 8. Approval

The assessment report is to be approved by an appropriately delegated officer. The department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations/>

### Step 2 - Draft the EPO

The tool must meet a number of legislative requirements in order to be legally binding. Section 360 of the Act identifies that an environmental protection order—

- must be in the form of a written notice and
- must specify to whom the order is issued and
- may impose a reasonable requirement to prevent or minimise environmental harm and
- must state the review or appeal details and
- must be served on the recipient.

It is important to identify the appropriate person to whom the order should be issued (see Compliance - Procedural guide - Understanding Legal Entities for assistance). To help identify who runs a business, a business name a search can be used (see [www.abr.gov.au](http://www.abr.gov.au)).

Without limiting the reasonable requirements that may be imposed, and EPO may—

- require the recipient to stop or not start a particular activity for a stated period, until further notice from the department or indefinitely or
- require the recipient to undertake a stated activity only during stated times or subject to stated conditions or
- require the recipient to take certain action within a specified period.

With regard to issuing the environmental protection order the department is also required to notify individuals of the following in a timely manner:

- any decisions made against them
- the reasons for the decision (these are the facts and circumstances identified in section 4 of the assessment report)
- any available rights of internal and external review or appeal.

A template environmental protection order is attached [\[LINK\]](#). The environmental protection order should be signed by the decision maker in conjunction with the assessment report which records the formal decision.

### Service of an EPO

Service means delivery to the party who will be affected by the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. The following methods of service are acceptable:

- For a person:
  - by delivering it to the person personally or

- by leaving it at, or by sending it by pre-paid registered post to, the place of residence or business of the person or
- For a body corporate - by leaving it at, or sending it by pre-paid registered post to, the head office, a registered office or a principal office of the body corporate.

If it is necessary for the EPO to be brought to the recipient's attention quickly, a copy of the EPO may be sent by facsimile or email and then be followed up by service by post.

The method of service should be documented by contemporaneous notes, a file note, or any receipts arising from the postage. In particular, officers should record the date, time and method of service. Sending the order by registered post with confirmation of delivery is good practice to ensure that the order has been delivered to the person.

### **What follow up is required?**

It is important that the matter is appropriately followed up to make sure that the person to whom the environmental protection order is issued is complying with any requirements imposed. Follow up is to be scheduled by the relevant officer and confirmed with the business area manager. The business area manager is responsible for ensuring follow up action is undertaken within the agreed timeframe.

This is usually achieved by a follow up site inspection or telephone call to be conducted one week after the time period nominated in the notice has expired.

Officers are encouraged to utilise tools such as diary reminders to ensure the matter is followed up in a timely manner.

### **What are my record keeping responsibilities?**

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measure screen (this includes a decision to take no further action). A hard copy of the signed assessment report and any accompanying documents should be placed on the paper file. The department is required to make, and record, an informed decision about all allegations of non-compliance.

### **Making changes to an issued EPO**

If minor changes to the EPO or an extension of time are required, the person should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original environmental protection order, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have a fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh EPO should be carried out in the same way, and subject to the same conditions as the issuing of the original EPO. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal or higher to that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and reissue the EPO in EcoTrack.

## Review of decisions and appeals

The provisions regarding review of decisions and appeals may be found in Chapter 11, Part 3, ss519 to 539 of the Act.

The Act specifies that a person who is dissatisfied by a decision by the department to issue an environmental protection order may apply for a review of an original decision by submitting an application in the approved form to the department:

- within 10 business days after the day on which the person received notice of the original decision or the date when the department is taken to have made the decision (the “review date”) or
- if there are special circumstances, whatever longer period the department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

If the person is dissatisfied with the review decision, the person may appeal to the Planning and Environment Court by filing written notice with the court within 22 business days after the person receives notice of the review decision, unless this time period is extended by the court.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## What penalties exist for non-compliance with an EPO?

The recipient of an EPO must not contravene an environmental protection order unless the recipient commences court proceedings or has a reasonable excuse.

If a recipient contravenes an EPO the department may issue a penalty infringement notice (PIN) for a maximum amount of:

- 5 penalty units or \$500.00 for an individual and
- 20 penalty units or \$2,000.00 for a corporation.

For further information about issuing PINs, consult the PIN Manual [[LINK](#)].

If a PIN would not be considered sufficient penalty for the contravention, the department may decide to commence legal proceedings against the recipient. The maximum penalty for an individual for contravening an EPO is 1665 penalty units (\$166,500.00).

The maximum penalty for a corporation for contravening an EPO is 8,325 penalty units (\$832,500.00).

The recipient must not **wilfully** contravene an EPO.

The maximum penalty for an individual for the wilful contravention of an EPO is 2,000 penalty units (\$200,000.00) or 2 years imprisonment.

The maximum penalty for a corporation for the wilful contravention of an EPO is 10,000 penalty units (\$1,000,000.00).

## Environmental protection order (EPO)

*This environmental protection order is issued by the administering authority pursuant to s358 of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Your reference: Reference

Our reference: Reference

Dear Sir/Madam

**TAKE NOTICE** that under the provisions of the *Environmental Protection Act 1994* (the Act) an environmental protection order (EPO) is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the department).

The EPO is issued in respect to the activities of name at premises/place on land described as Lot lot number on RP/SP plan number situated address (the "said premises").

### A. Grounds

The EPO is issued on the following grounds:

- Insert the applicable grounds under s358.
- Insert the applicable grounds under s358.
- Insert the applicable grounds under s358.
- Insert the applicable grounds under s358.

The facts and circumstances forming the basis for these grounds are:

- Only salient factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.

- Insert the facts and circumstances that form the factual basis for the grounds.

### **B. Requirements**

In accordance with this EPO, you are required to do the following:

1. Insert the requirements that are necessary to prevent or minimise environmental harm.
2. Ensure the requirements are specific, measurable, attainable, relevant and time specific.
3. Insert the requirements that are necessary to prevent or minimise environmental harm.
4. Ensure the requirements are specific, measurable, attainable, relevant and time specific.
5. Insert the requirements that are necessary to prevent or minimise environmental harm.
6. Ensure the requirements are specific, measurable, attainable, relevant and time specific.
7. Insert the requirements that are necessary to prevent or minimise environmental harm.
8. Ensure the requirements are specific, measurable, attainable, relevant and time specific.

### **C. Penalty**

The maximum penalty for failure to comply with an environmental protection order is \$200,000.00 or 2 years imprisonment for an individual or \$1,000,000.00 for a company.

### **AND TAKE NOTICE that:**

- The requirements of this order take effect immediately upon service of the order.
- Failure to comply with this order is an offence under the Act.
- This order remains in force until further notice from the administering authority

### **D. Obligations**

Should you propose to dispose of the place or business to which the EPO relates, you must advise the buyer of the existence of this EPO (s362 of the Act).

### **E. Review and appeal**

If you are dissatisfied with the decision to issue this environmental protection order, you may apply to the department for a review of this decision within ten business days of the service of the order. You may also apply to the Court for a stay of the decision to issue the environmental protection order.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Further information about the review and appeal process is attached to this notice.

Should you have any queries in relation to the notice, please contact name of contact officer on telephone number phone number.

# Information Notice

*Environmental Protection Act 1994*  
Environmental Evaluation

## Extension of time for decision on submission of environmental report

*This information notice is issued by the administering authority pursuant to section 328 of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our Reference: Our reference

**Attention: [Name of principal contact]**

### **A. Decision**

This information notice is issued under the *Environmental Protection Act 1994* (the Act) to advise you that the administering authority has decided to extend the time it is required to decide whether or not to accept the environmental report submitted by you on [date] in response to a Notice to conduct or commission an environmental evaluation issued to you by the administering authority on [date]. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

The Notice to conduct or commission an environmental evaluation was issued in respect to the activities of [recipient's name] at [premises/place] on land described as [Lot number on RP/SP number] situated at [address of premises/place] (the site).

The Department has decided to extend the time it is required to decide whether or not to accept the environmental report until [date].

### **B. Reasons for decision**

The Department has decided to extend the time it is required to decide whether or not to accept the environmental report for the following reason—

- the Department has required additional relevant information about the report
- the Department is satisfied there are special circumstances for extending the time.

(If applicable) the facts and circumstances forming the basis for this decision are:

- Insert the facts and circumstances that form the factual basis for the decision.
- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the decision.
- Only factors which directly relate to the decision are to be included.

### **C. Appeal rights**

You may apply to the Department for a review of its decision to extend the time it is required to decide whether or not to accept the environmental report within ten business days of the service of this information notice, or such longer period the Department in special circumstances allows. You may also apply to the Court for a stay of the decision.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Specific information regarding the process for seeking a review or appeal is attached to this information notice. The information outlining the review and appeal process under the *Environmental Protection Act 1994* is intended as a guide only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

## FORMAL INVESTIGATION REQUEST

This document is submitted by business units following a decision that a matter warrants formal investigation.

Completed requests and supporting documentation are to be sent to [Investigation.requests@derm.qld.gov.au](mailto:Investigation.requests@derm.qld.gov.au)

### 1. DETAILS OF OFFENCE/INCIDENT

<b>Date</b>	<INSERT date request is submitted>
<b>Matter</b>	<INSERT description of activity/incident/breach>
<b>Alleged Offender</b>	<INSERT details of alleged primary offender>
<b>Multi-jurisdiction</b>	<INSERT brief details of involvement of other business units> <input type="checkbox"/> Tick this box if this is a multi-jurisdictional issue
<b>Issue</b>	<INSERT brief details of the alleged offence/incident>
<b>Primary Legislation</b>	<INSERT legislation primarily applicable and refer to any specific provisions>
<b>Other Legislation</b>	<INSERT other legislation that may be relevant>
<b>Timing</b>	<INSERT details including date and reasons of relevant timeframes> <input type="checkbox"/> Tick this box if the matter <b>urgent</b> (i.e. requires action within 6 months)

### 2. CONTACT DETAILS

DERM officer	<INSERT name and position of officer completing this form>
Contact details of DERM officer	<INSERT phone number and e-mail address>
Other relevant DERM officers	<INSERT name, position and contact details of any other DERM officers who have had significant involvement with the matter and indicate their involvement with the matter>

### 3. RECORDS

CIRaM / Ecotrack Reference	<INSERT reference number>
Other relevant DERM system records	<INSERT system name and record reference (e.g. eLVAS, WMS)>

### 4. BACKGROUND

Date matter brought to DERM's attention	<INSERT date when DERM became aware of alleged offence/incident>
How matter came to DERM's knowledge?	<INSERT how DERM became aware of the offence/incident>
Parties involved	<INSERT all potential parties involved, including other potential offenders, property owners, contractors, companies, witnesses etc>
Property details	<INSERT street address and Lot/Plan of the affected property>
Use of Property	<INSERT use/activity/business related to property e.g. dwelling, vacant land, farm, resort etc>

### 5. PRIMARY CONSIDERATIONS

Details	Y/N	Comments (include facts/relevant information/circumstances of the conduct etc)
Did the conduct involve dishonesty?		
Has there been an attempt to deceive DERM?		

Has DERM been given false or misleading information by the alleged offender?		
Was the conduct wilful (i.e. was it intentional, reckless or negligent)?		
Was the conduct motivated wholly or partly by commercial considerations?		
Was there a failure to assess, manage or mitigate risk associated with the conduct or the activity?		
Did the conduct result in commercial gain?		
Did the conduct result in severe or irreversible harm to the environment, natural resources, human health or property?		
Did the conduct have the <i>potential</i> to result in severe or irreversible harm to the environment, natural resources, human health or property?		

#### 6. OTHER CONSIDERATIONS (tick if applicable)

<input type="checkbox"/>	Serious offence	<input type="checkbox"/>	Field/site inspection conducted
<input type="checkbox"/>	Previous offences/history with DERM	<input type="checkbox"/>	Two or more years since the offence
<input type="checkbox"/>	Offence is continuing/ongoing	<input type="checkbox"/>	Other <provide details>
Comments: <INSERT details relevant to the above considerations>			

#### 7. ADDITIONAL INFORMATION

Details	Y/N	Comments (include facts, relevant information and circumstances of the conduct etc)
Does the conduct relate to an approval/authority or code?		
Are there any characteristics about the alleged offender that may be relevant (e.g. age, physical/mental health)?		
Does the alleged offender carry a high degree of culpability?		
Has the alleged offender provided any excuse or justification for the alleged offence?		
Has DERM taken enforcement action against the alleged offender for the alleged offence (e.g. warning, EPO issued)?		
Are there any other jurisdictions involved or impacted (e.g. other Departments, Councils)?		
Has there been any media or community interest?		
Are there any views of traditional owners of the area?		

#### 8. ENFORCEMENT ACTION

Actions Considered	Details (e.g. consideration of action and reasons why action may not be appropriate)
<input type="checkbox"/> Education Letter	

<input type="checkbox"/>	Warning Letter	
<input type="checkbox"/>	PIN	
<input type="checkbox"/>	Statutory Notice	
<input type="checkbox"/>	Other

## Administrative decision-making in response to non-compliance

---

### The process for making an administrative decision

Appropriately made and well-documented administrative decisions should be able to withstand public scrutiny, internal review and, if required, judicial review<sup>1</sup>. This guide is intended to act as a quick reference to support officers in using a statutory tool<sup>2</sup>. However, each case should be determined on its own merits with the specific circumstances of each case dictating the extent of the record-keeping and notification undertaken.

The department has identified four critical stages in making a good administrative decision. These are:

1. preparation
2. making the decision
3. record-keeping
4. communicating the decision.

### Stage 1: Preparation

#### Ensure legal authority

Prior to undertaking an investigative or decision-making process officers must:

1. ensure the matter is within the jurisdiction of the Department
2. ensure the officer has the authority to undertake an appropriate investigation of the matter
3. ensure the decision-maker has the authority to make a decision in relation to the matter.

#### 1. Jurisdiction

The Department is generally only able to investigate a matter which falls under legislation that it administers. Should an allegation be raised which falls outside this jurisdiction, the matter should be referred to the appropriate local government, state government department or federal agency as quickly as possible.

In instances where jurisdiction is shared between the Department and a local government and the legislation does not clearly delineate responsibilities, the relevant business area is responsible for determining whether the Department will investigate the matter.

#### 2. Authority to investigate

Before commencing an investigative process officers should give consideration to the type of investigation that is likely to be required, the type of powers necessary to support the investigation and the level of authority required by the investigating officer.

Officers are generally able to make inquiries on behalf of the Department and do not necessarily need to be authorised officers to conduct an administrative investigation. However, frequently legislation will specify that

---

<sup>1</sup> This information has been adapted from the Queensland Ombudsman's good decision-making guide. A copy of the guide is available from the Ombudsman's website <http://www.ombudsman.qld.gov.au>.

<sup>2</sup> A statutory tool is a legislative tool which can be used by the Department to ensure compliance with the legislation that it administers.

---

## Administrative decision making in response to non-compliance

---

certain investigative functions (such as entering a premises or seizing evidence) can only be exercised by an authorised officer.<sup>3</sup>

### 3. Authority to decide a matter

Decisions made by individuals who do not have the delegated authority to make the decision are generally found to be invalid and are set aside. As the individual (or position) that holds delegation may change, officers are encouraged to review the Department's list of delegations at <http://insite2.dnr.qld.gov.au/derm/delegations/pdf/epa04.pdf>.

### Ensure impartiality

Individuals undertaking an investigation or decision-making process must act impartially when considering the matter. This includes ensuring that the officer is free from bias, meaning that officers must not prematurely form an opinion or decision in relation to the guilt, innocence or actions of an individual.

In addition to actual bias, the perception of bias can invalidate a decision. The perception of bias occurs in instances where, although the officer is in fact not biased, other people may reasonably believe that bias exists.

One of the most frequent types of bias experienced is a conflict of interest. A conflict of interest occurs when a conflict exists between the personal interests of the officer and the interest of the Department in relation to the matter. This can include interests which relate to the officer's financial, family and personal relationships, or those of immediate family, close friends and organisations with which the officer may be affiliated.

Prior to considering making a decision, officers should determine whether bias or a perception of bias is likely to exist.

In instances where an officer becomes aware that they may lack impartiality, for whatever reason, the officer is required to immediately notify their line manager to discuss whether it is appropriate for another officer to take over the matter. When possible, the officer should take no further action in relation to the matter.

### Start a document trail

Under the *Public Records Act 2002*, DERM is required to make and maintain full and accurate records. A document trail should be commenced at the start of any decision-making process and should record significant oral and written communications, as well as the events and actions (such as internal and external meetings) which relate to the matter under consideration.

### Identify any specific conditions or requirements

Officers are encouraged to review the sections of legislation which are relevant to the administrative decision, the alleged breach or act of possible non-compliance, and any statutory tools which may be used. This includes:

- identifying any decision-making process established by the legislation
- identifying any (and all) criteria which are legislatively required to be considered
- identifying what actions constitute a breach or act of non-compliance
- reviewing the circumstances under which a particular statutory tool may be used
- identifying any specific requirements which must be considered as part of the decision-making process
- identifying any specific requirements which must be complied with in developing, issuing or reviewing the notice or order.

Officers are also encouraged to:

- review any Departmental policies or procedural guides available

---

<sup>3</sup> [Procedural guide - Appointment of authorised persons](#)

## Administrative decision making in response to non-compliance

- use any template memoranda, assessment reports, notices or orders which have been developed to assist officers in recording the decision.

While Departmental guides and procedures have been developed to complement the legislation and provide support to officers in the use of statutory tools, they may not be comprehensive. Accordingly, officers should refer to the specific legislation each time a statutory tool is used.

### Record the relevant issues or factors

Before commencing a decision-making process, officers should clearly identify and record the relevant issues or factors associated with the process which should include:

- a brief history of the matter
- the specific situation, problem, act of possible non-compliance or alleged breach - the time, date or date range, the location, the person and the action which resulted in the alleged breach
- the information which the Department needs to source in order to make a decision and
- the options available to the Department to respond to the non-compliance.

Importantly, officers are required to make a record regarding all statutory criteria associated with a decision. This includes documenting factors or statutory criteria which were determined to be irrelevant or excluded from the decision-making process and detailing the reasons why this determination was made. Failure to fully document matters which were considered (even if they were subsequently dismissed) may render a decision open to challenge.

### Gather and document information

Before determining whether to use a statutory tool, an officer should seek to identify the 'truths' or 'facts' associated with a matter.

This includes gathering and documenting the relevant issues or facts which need to be considered for the department to make a decision. This can include (but is not limited to) recording observations in an officer's official notebook, collecting samples for analysis, taking meeting notes, taking photographs and copies of documents, observing actions, and receiving information directly from individuals. All information collected should be labelled and recorded in an appropriate hard copy and/or electronic form.

Importantly, the strength of evidence necessary to establish a 'fact' or 'truth' may vary according to the seriousness of the issues involved. The more serious the issue, the stronger the evidence required.

### Analyse the information gathered

In analysing the information they have gathered, officers should consider whether the information is:

1. **Relevant** - All relevant information (that both supports and disproves the alleged non-compliance) must be considered. This includes information which may provide a reasonable excuse (or defence).
2. **Reliable** - If contradictory information has been obtained the decision-maker will be required to determine which seems to be the most correct.

## Stage 2: Making the decision

### Observe natural justice

Natural justice (or procedural fairness) requires ensuring that a person who may be adversely affected by a decision is given a 'fair hearing' before a decision is made.

Prior to making a decision which may adversely impact on an individual or group the Department must:

## Administrative decision making in response to non-compliance

---

- Notify the individual that the Department is beginning to form an opinion that may adversely affect them. This notification must identify the critical issues and contain sufficient information to allow the person to meaningfully participate in their own defence.
- Provide the individual with a fair hearing. This is achieved by providing a reasonable opportunity for the individual to respond to any possible negative findings and ensuring that any representations are genuinely considered by the Department.
- Ensuring that the decision-maker acts impartially in the consideration of the matter. This includes ensuring that the investigator and decision-maker are free from bias.

### Exercising discretion

Decision-makers are required to exercise their discretion appropriately in relation to the decision-making process. Decisions are to be made after considering all relevant and reliable 'facts' or 'truths' in relation to the allegation as well as any representations made by the affected party.

Administrative decisions are made based upon the balance of probabilities. In other words, the decision-maker must be able to determine whether, based upon the information available, it is more likely than not that the event in question occurred.

### Stage 3: Record-keeping

Good record-keeping is critical to good administrative decision making. Records should be clear, organised by date and document the decision-making process.

#### Record the decision

Officers are to complete a briefing note or assessment report to record the decision and reasons supporting it. The department's record should include:

- the history and any factors which have led to the Department's consideration of the matter
- all facts and circumstances considered in making the decision
- any information that was determined not to be relevant to the decision-making process
- justification as to why material was excluded from the decision-making process
- the reason a particular course of action has been selected
- the names of the investigating officer and decision-maker
- the date of the decision.

The Department uses both electronic and printed record-keeping systems. Officers are encouraged to contact their relevant business service areas to identify the appropriate record-keeping processes to be used.

### Stage 4: Communicate the Decision

#### Notify the affected individual

The Department is responsible for maintaining an appropriate level of service provision which includes communicating clearly and effectively. Accordingly, when communicating with an affected person every effort should be taken to communicate in a manner, style and format which can be readily understood.

The Department is required to notify individuals of decisions made against them in a timely manner. In communicating with the affected person, officers are encouraged to provide information in the following way:

## Administrative decision making in response to non-compliance

---

- communicate effectively – communicate in a manner, style and format which can be readily understood by the affected person
- set the scene – explain the legal basis for the decision and what factors need to be taken into account in making the decision
- refer to specific evidence – refer to specific pieces of evidence that support the conclusion reached
- discuss the weight of evidence – explain how conflicting evidence was treated and why more weight was given to some evidence than other evidence in reaching the conclusion
- presented in a logical order – that is, in a chronological order or some other appropriate order.

In addition to any specific legislative requirements which may need to be included, the notice or order must:

- include the facts identified as part of the investigation process
- include the reasons for the decision
- identify the legislation under which the decision has been made
- identify the authority of the decision-maker, including identifying if the individual is acting under a delegation
- include the date of the decision
- clearly outline any available rights of review or appeal and any associated timeframe
- identify any penalties for non-compliance with the notice or order.

Also, in instances where the affected person has made submissions to the Department under the natural justice provisions, the Department should expressly respond to their submissions.

## Administrative decision making in response to non-compliance

---

### Decision making checklist

- Does the Department have the jurisdiction to consider the matter?
- Does the decision-maker hold the necessary delegation?
- Does the officer have the necessary skills and qualifications to undertake the investigation?
- Are all officers involved in the investigation and determination of the matter free from bias?
- Has a document trail been established and followed?
- Have the issues and factors been identified and documented?
- Have the 'truths' and 'facts' been gathered where additional information was required to allow a decision to be made?
- Has the evidence been analysed to ensure it is reliable and relevant?
- Has natural justice been observed?
- Has the decision-maker considered the evidence and conclusions reached and made a decision?
- Has an appropriate record of the investigation/decision-making process been kept?
- Has the decision-maker made and recorded a decision?
- Have any submissions made by the affected person been responded to?
- Has the affected person been notified of their appeal rights?

# Guideline

## Reviewing a decision to respond to non-compliance

---

### The review process

A number of pieces of legislation administered by the Department provide for an internal review process. This document is intended to act as a reference guide to support officers to review a decision made to use a statutory tool<sup>1</sup>. However, this document is not intended to duplicate the process for making a good administrative decision and should be considered in conjunction with the Queensland Ombudsman's *Good Decision Making Guide*<sup>2</sup>, applicable legislation, and any legislatively specific guidance material available.

Importantly, this document focuses primarily upon administrative review rather than addressing allegations of bias. Should an allegation of bias be received the reviewer is encouraged to contact the appropriate human resources contact for their business area in the first instance.

The Department has identified four critical stages in performing an administrative review. These are:

1. determine capacity
2. scope the review
3. undertake the review
4. communicate the decision.

### Stage 1: Determine capacity

#### Ensure legal authority

When a request for the review of a decision is received the request should be forwarded to the business area that made the initial decision. The request is to be provided to the manager of the original decision-maker or, in the case of their prolonged absence, the manager's supervisor, who is responsible for identifying an appropriate reviewer. As soon as possible, but no later than two days from receipt of the request for review, the reviewer is to have been provided with the review request.

Prior to undertaking a review of a decision an officer must ensure they have the appropriate skills and qualifications to undertake the review. This includes ensuring that they:

- are not the original decision-maker
- hold a position equal or senior to that of the original decision-maker and
- have the authority to undertake the decision-making process.

---

<sup>1</sup> A statutory tool is a legislative tool which can be used by the Department to ensure compliance with the legislation that it administers.

<sup>2</sup> Note: A copy of the Ombudsman's Good Decision Making Guide is available from the Ombudsman's website <http://www.ombudsman.qld.gov.au>.

---

## Reviewing a decision to respond to non-compliance

---

The internal reviewer should be someone who was not involved with the original decision-making process, yet has experience in making decisions of a similar nature. Frequently this means that the internal reviewer will be a line manager or an officer of an equivalent or higher level located in a different office.

Additionally, the internal reviewer must ensure that they have the authority to undertake the review. This includes insuring that the officer holds the appropriate delegation in relation to the matter. Importantly, a review can not be undertaken by an individual who does not have the authority to undertake the review, even if the individual is a more senior officer.

### Ensure impartiality

Officers undertaking an internal review process must act impartially when considering the matter. This includes ensuring that the officer is free from real or perceived bias and does not prematurely form an opinion or decision in relation to the matter.

In instances where an officer becomes aware that they may lack impartiality, for whatever reason, the officer is required to immediately notify their supervisor to discuss whether it is appropriate for another officer to take over the handling of the matter. Whenever possible, the officer should take no further action in relation to the matter.

### Ensure independence

Officers reviewing a decision must not allow themselves to be directed in their decision-making. While the reviewer may seek to consult with other staff to assist them to arrive at a decision, the analysis and decision made must ultimately be made independently.

## Stage 2: Determine the scope of the review

Once it has been determined that it is appropriate for an officer to undertake a review process, the officer should perform a detailed scoping exercise to determine the purpose, depth, limitations and timeframes for the review. Reviewing officers are encouraged to consider and incorporate the following factors into their scoping exercise:

### The application

Officers should carefully review the application for a review in order to determine the aspects of the decision which are being challenged. For example, officers should determine whether the application is challenging the decision due to:

- an allegation of bias
- an allegation regarding a flaw in the decision-making process or
- the merits of the decision.

Officers are also encouraged to consider whether the application has been properly made. This includes ensuring that the application:

- has been made within the required statutory timeframe as specified in the legislation and
- contains enough information to enable the reviewer to examine the application.

If the application does not contain sufficient information, it is considered best practice for the reviewer to contact the applicant by telephone, when possible, to enable the applicant to remedy the application. Any telephone conversation should be confirmed in writing immediately afterwards.

### The legislation

Officers should review the legislation under which the application is made in order to:

## Reviewing a decision to respond to non-compliance

- identify any statutory timeframes for making an initial decision, applying for a review, and/or completing a review
- ensure the matter raised by the complainant is reviewable under the legislation
- ensure the complainant has provided a properly made application and
- identify the extent of review which may be performed.

Importantly, legislative provisions regarding the extent of a review vary considerably. The legislation may:

- allow the complainant to make additional submissions
- allow officers to source new information
- limit the review to procedural matters only or
- limit the review to the information before the original decision-maker at the time of the decision.

### The review category

Having examined the application for review against the relevant legislation, officers should be able to identify the scope of the review. Generally, the two types of review available are:

- 1) procedural reviews and
- 2) merit reviews.

It is important to note that the Department performs relatively few merit reviews and that the majority of reviews relate to the decision-making process or the conduct of the decision-maker.

#### 1) Procedural reviews

A procedural review examines the decision-making process used. This type of review should consider whether:

- the decision was made without sufficient evidence
- relevant factors were not considered
- irrelevant factors were considered
- the required decision-making procedures were followed
- a breach of natural justice occurred
- the decision-maker had the authority to make the decision
- the decision was authorised under law
- the law it was purportedly made under did/did not apply
- an error of law occurred
- the decision was contrary to law
- fraud was involved
- a power under the law was exercised improperly.

In undertaking a procedural review, officers are encouraged to refer to Part 3 of the *Judicial Review Act 1991* for a comprehensive list of considerations. Additionally, as the provisions are extensive, officers are encouraged to refer to the legislation for further information on what constitutes improperly exercising a power under law.

#### 2) Merit reviews

A merit review includes reviewing the original decision and making a fresh determination. The reviewer is to decide what the 'correct and preferable decision' is, having regard to the material before them.

Merit review is concerned with re-making the decision under review, rather than correcting errors which may have been made previously. In this context, the reviewer is to decide all questions of fact and discretion for themselves. This enables a reviewer to consider any evidence that will help them come to the correct decision, including evidence that the applicant failed to put before the original decision-maker. In light of that new evidence, the reviewer can substitute their own findings of fact, even if the original decision-maker's findings

---

## Reviewing a decision to respond to non-compliance

---

were "correct" on the basis of the information available at the time. Additionally, even if the reviewer does not identify any errors of fact (or law) in the original decision, they may substitute their own judgment of how any discretion should be exercised in order to come to a decision.

### Stage 3: Undertake the review

#### Approach to a review

In conducting an internal review, an impartial assessment of the matter is required. It is important for reviewers to be conscious that the earlier decision will be superseded by the new decision.

While the specific legislation will dictate the scope and extent of the review, generally the reviewer may consider some or all of the following:

- all of the information that the reviewer has been given pursuant to the internal review application
- any specific statutory requirements or criteria
- the information that was available to the original decision-maker at the time (whether or not they considered that material)
- any other relevant information (including any other information that was not available at the time of the original decision) and
- any submissions made by the person seeking the review.

#### Forming a decision

The decision must be made in accordance with the relevant sections of the applicable legislation and any relevant policy.

In forming a decision, reviewers should balance consideration of policy and the intent of the legislation. That is, whilst applicable Departmental policy affecting a decision should be considered by the reviewing officer, the weight should consider the particular circumstances of the application. Ultimately, decisions should be fair, reasonable and meet the aims of the legislation.

In making a decision the following options generally exist for reviewers:

- substitute the original decision with a new decision
- amend the decision, including the removal or addition of conditions
- confirm the original decision or
- revoke the original decision.

It should be noted that once a decision has been made in support of, or contrary to, a previous decision, it is the most recent decision which will be subject to any future reviews. This frequently means it is the reviewed decision that is subject to any judicial review process.

### Stage 4: Communicate the decision

#### Record the decision

Under the *Public Records Act 2002*, agencies are required to make and maintain full and accurate records. Records should record all communications, as well as the events and actions which relate to the matter under consideration.

Officers are to complete a statement of reasons to record the decision. This document should be signed by the reviewing officer and must include:

## Reviewing a decision to respond to non-compliance

---

- the decision
- the facts identified as part of the investigation process
- the evidence relied upon to establish the facts and
- the reasons for the decision.

### **Notify the affected individual**

The Department is responsible for maintaining an appropriate level of service provision which includes communicating clearly and effectively. Accordingly, when communicating with an affected person every effort should be taken to communicate in a manner, style and format which can be readily understood.

The Department is also required to notify the person seeking the review of the decision in a timely manner. In addition to any specific legislative requirements which may need to be included in a notice, the notice should:

- include the requirements set out above
- identify the legislation under which the review was made
- identify the authority of the reviewer
- include the date of the review decision
- clearly outline any available rights of review or appeal and any associated timeframes.

Additionally, in instances where the affected person has provided a submission or information to the Department, the Department should expressly respond to their comments.

### **Notify the original decision-maker**

The reviewer should notify the original decision-maker of the outcome of the review. In advising the original decision-maker, the reviewer should be sensitive to how the outcome of the review will be received, especially if the review revokes or substantially amends the original decision.

# Guideline

## Compliance and Investigations

### Guidelines for level C compliance inspections

*These guidelines have been developed to assist and guide officers when undertaking Level C compliance inspections for activities regulated by the Environmental Protection Act 1994. They may also provide general assistance for Level B inspections, and for inspections of other activities regulated by DERM.*

## Purpose of these guidelines

These guidelines outline procedures and protocols on the auditing process that must be used when undertaking level C inspections of premises licensed under the *Environmental Protection Act 1994* (EP Act). They will help to ensure that all level C inspections are adequate, reliable and comparable. These guidelines (with any necessary changes) can also be used for level B inspections as appropriate, and for audits of activities regulated by other legislation administered by DERM. These guidelines have been adapted from the New South Wales Department of Environment and Climate Change (DECC) Compliance Audit Handbook.

Guidance on how to determine whether an inspection should be level A, level B or level C is contained at the back of the [compliance inspection report form](#) on Ecosteps.

Level C inspections are the most detailed level of compliance inspection that DERM undertakes. They may be undertaken for a site that has a risk rating of 4—High or 5—Very High as determined using the procedural guide [Risk assessment \(ERA and non-ERA\) industry/business activities](#) on Ecosteps. Level C inspections are pre-planned and scoped, will often involve a multi-disciplinary team for a specified period of time and will examine compliance with all aspects of issued statutory documents and the broader legislation. Level C inspections will usually include the taking of samples or performance of on-site monitoring to determine or validate the presence or absence of environmental impacts.

## A note on terminology

Level C compliance inspections are also known as compliance audits. This is because they involve a detailed assessment of the performance of a site, compared against approval conditions and other requirements and obligations – in other words, an audit.

However, to avoid confusion with environmental audits that may be required under the *Environmental Protection Act 1994*, and to remain consistent with the level A, level B, level C classifications adopted by DERM, this guideline will refer to “level C inspections” rather than “audits”.

## 1 Introduction

### 1.1 What is a level C compliance inspection?

As noted above, a level C inspection is an “audit” of a site. The Australian standard AS/NZS ISO 19011:2003 defines a compliance audit as “*A systematic, independent and documented verification process of objectively obtaining and evaluating audit evidence to determine whether specified criteria are met*”. These guidelines are designed to ensure that level C compliance inspections are carried out in a way that is systematic, that the inspection process and findings are documented, and that evidence is gathered lawfully and appropriately.

It should go without saying that DERM officers should be independent and objective when conducting compliance inspections. They should be free from bias or from any reasonable apprehension of bias. For more information on bias and the requirement of DERM officers to be objective and impartial, refer to DERM’s [Code of Conduct](#).

The “specified criteria” referred to in the above definition include conditions of development approvals and environmental authorities, codes of environmental compliance and the requirements of the *Environmental Protection Act 1994* (EP Act).

### 1.2 Who does DERM inspect?

In the context of these guidelines, DERM inspects (or audits) organisations or individuals who are carrying out activities that are regulated by the EP Act. These will include people carrying out an environmentally relevant activity, or mining or petroleum and gas activities. People who are the subject of an audit are sometimes referred to as “auditees”.

More generally, anyone who carries out an activity that is regulated by DERM (such as clearing native vegetation or using water for irrigation) may also be audited by DERM officers.

### 1.3 Compliance inspections as a regulatory tool in DERM

There are four stages of regulation within DERM – setting standards; applying standards; monitoring performance and responding to performance. For the activities that DERM licences, *setting standards* is done through legislation (the EP Act and regulations) and policies about how that legislation is administered. *Applying those standards* is done by issuing licences that are consistent with the legislation and policies. Compliance inspections are one of the main ways that DERM *monitors performance*. The outcomes of compliance inspections will often dictate how DERM *responds to the performance* of its clients.

### 1.4 Annual compliance plans

DERM’s Compliance Strategy 2010-14 is the document that sets out DERM’s approach to ensuring that people comply with the laws that we administer. A part of that approach is to proactively monitor and manage risks to Queensland’s environment and natural resources. DERM undertakes an annual compliance planning process which identifies the main risks to the environment as well as the actions that DERM will undertake to address those risks. As part of DERM’s commitment to being transparent with the community, we publish annual compliance plans that set out what those actions are. The Compliance Strategy 2010-14 and the annual compliance plans are available on the DERM website <http://www.derm.qld.gov.au/>.

A key component of the annual compliance plans is the program of inspections of sites that are carrying out an environmentally relevant activity. Because the program focuses on inspecting high-risk sites, many of the inspections that are carried out are level C inspections – the most detailed compliance inspections that DERM undertakes, and so the inspections that are most appropriate for high-risk sites.

### **1.5 Purpose of compliance inspections**

There are a number of reasons why DERM carries out compliance inspections of sites that it licences:

- They allow DERM to measure the performance of individual operators, and to find out whether they are complying with their approval conditions or other legal requirements.
- They can reveal strategic or systemic issues with a particular industry or client group, and can allow DERM to address those issues before they become larger problems.
- They increase DERM's profile in the community, and demonstrate that DERM is actively managing activities that pose a threat to environmental values. This increased profile can also deter people from breaching their obligations, by reminding them that they may be caught if they do the wrong thing.
- They can reveal whether people are carrying out activities without the necessary approvals from DERM.

It is important to remember that compliance inspections are fact finding exercises. The aim of inspections is to gather information that allows DERM to fulfil one of the objectives set out above. Inspections are not tools designed to punish bad behaviour.

### **1.6 Knowledge and skills of officers conducting compliance inspections**

Officers who are involved in compliance inspections should have a level of skill and experience appropriate to their role. Officers who are leading a level C inspection should have been involved with previous level C inspections, and should be confident in their knowledge of and ability to use the powers of authorised persons under the EP Act. They should be familiar with the site to be inspected or the industry involved, or include in the inspection team someone with that knowledge.

Other officers involved in the inspection should have a sufficient knowledge and technical skills to be able to carry out their assigned role competently, safely and lawfully.

## 2.0 DERM Level C inspection Procedures

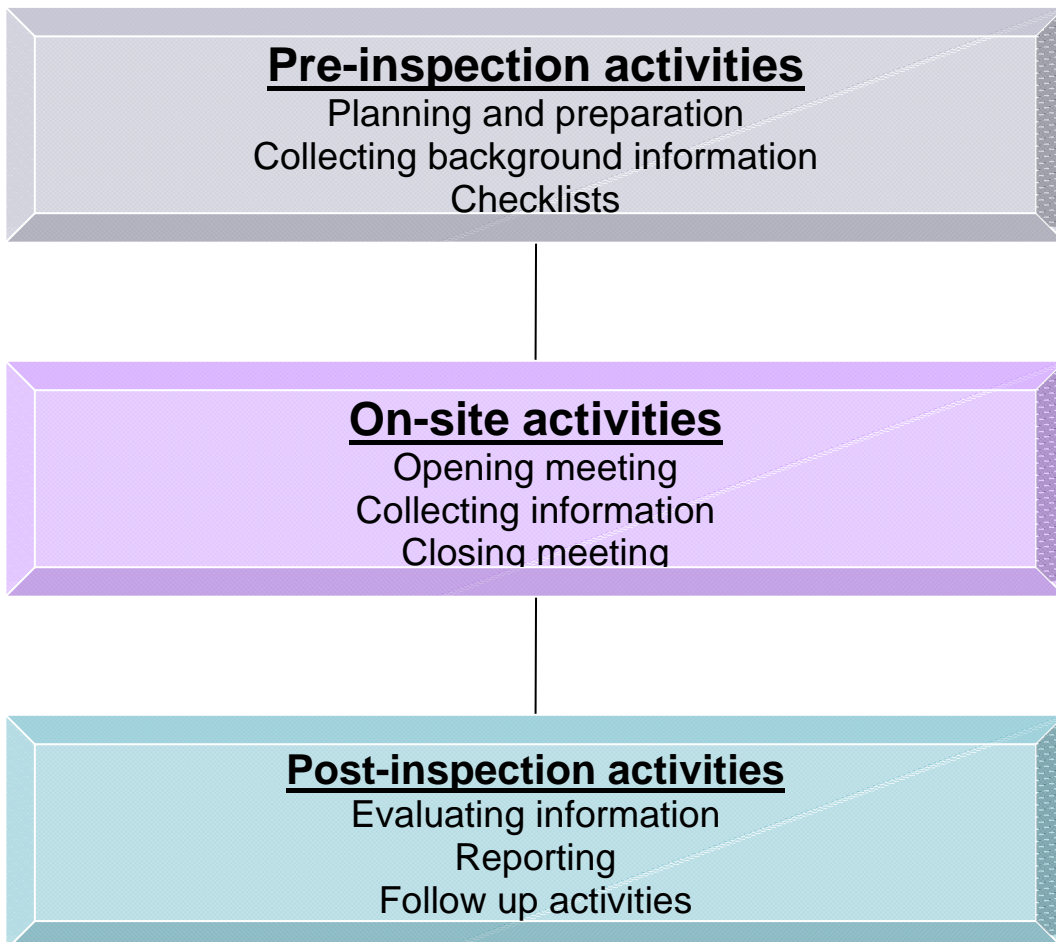

### 2.1 The inspection process

The inspection process involves different tasks which are sub-divided into the following phases of the inspection:

- Pre-inspection activities
- On-site activities
- Post-inspection activities

A successful inspection depends on more than just the inspection itself – it requires officers to carefully plan the inspection, and to conduct and prepare a thorough post-inspection evaluation and report

**A level C inspection audit process involves:**

### 2.2 Pre-inspection activities

To carry out a successful inspection, good planning and preparation is vital. Officers need to have a good knowledge of the relevant parts of the EP Act, as well as any other standards or conditions that are relevant to the client. Officers will also gather any other information that will be relevant to the inspection.

### 2.2.1 Inspection planning and preparation

Planning a level C inspection involves:

- Preparing an inspection plan
- Obtaining background information about the person to be audited
- A comprehensive consideration and assessment of workplace health and safety issues
- Ensuring that checklists are developed to cover all conditions of the relevant permit or statutory requirements
- Obtaining information on best practices being used in the industry being inspected

A Pre-inspection briefing note template is available on Ecosteps to assist officer in planning for an inspection.

#### **Key elements of an inspection plan**

The [compliance inspection plan](#) outlines the inspection's objectives, scope and timetable, and the products (such as reports) that the inspection will generate. The plan should be reviewed and approved by a manager before the inspection is conducted.

The key elements of an inspection plan:

- Inspection objectives
- Inspection criteria
- Inspection scope
- Inspection timetable
- Roles and responsibilities of officers
- Allocation of time and resources
- Workplace health and safety issues

#### **Inspection objectives**

The inspection objectives define what the inspection will achieve and can be based on considerations such as management priorities, or statutory and regulatory requirements. The inspection objectives must be established at the outset. The objectives of a level C compliance inspection can include:

- To check compliance with regulatory requirements
- To manage environmental impacts and reduce environmental risk associated with industry
- To provide guidance to industry on how they can improve their environmental performance
- To facilitate behavioural change
- To provide internal quality assurance to improve agency policies, processes and the quality of the instruments used
- To provide internal feedback to help protect the integrity of the regulatory system
- To assess overall policy performance
- To provide the community with confidence that robust compliance assurance systems are in place

### **Inspection criteria**

The inspection criteria are the reference points used to determine whether the person being inspected is complying with their obligations. They can include:

- Development conditions of development approvals
- Requirements contained in the EP Act and regulations, codes of environmental compliance or other environmental standards
- Environmental management system requirements
- Industry codes of practice

### **Scope of the inspection**

The scope of the inspection defines the extent and boundaries of the inspection, including:

- The physical location of the inspection (for example, a particular site or part of a site)
- Organisational units, activities or processes to be inspected
- Time period covered by the inspection

### **Inspection timetable**

The inspection timetable should include:

- The date(s) and locations of on-site activities to be carried out during the inspection (such as meetings or taking samples)
- The expected time and duration of each activity.

### **Roles and responsibilities of officers**

It is important that the roles and responsibilities of the officers who will be taking part in the inspection are clearly defined and are understood by everyone. Roles and responsibilities should be documented as part of the inspection plan, and discussed during the pre-inspection briefing. If necessary, a pre-inspection briefing should be held to make sure that everyone understands their role.

The inspection team will include a lead inspector, and other officers who will take part in the inspection. The team may also consist of technical specialists and/or officers from other agencies where necessary.

The lead inspector will choose the inspection team, and is responsible for leading the planning of the inspection, the gathering of pre-inspection information, coordination and management of on-site activities and the completion of all post-inspection activities. He or she will be the main point of contact between the client and DERM. The lead inspector must be an authorised person under the EP Act, and must be confident in his or her abilities to exercise the powers of an authorised person lawfully and ethically.

Other members of the inspection team may carry out a variety of roles, including providing pre-inspection information about the site, the client or the industry; reviewing documents or inspecting the site during the inspection; talking with members of the client's staff during the inspection; taking photographs or collecting samples; and preparing the post-inspection documents. Inspection team members are not required to be authorised persons.

### **Allocating appropriate resources**

The lead inspector is responsible for ensuring that the personnel required for the inspection are available on the day, and that sufficient resources (including vehicles, sampling equipment and personal protective equipment)

are available. Resources should be addressed during the pre-inspection briefing to ensure that they are appropriate for the site and activities to be undertaken.

### **Workplace health and safety**

The safety and security of all officers involved in the inspection is paramount. The lead inspector is required to make sure that workplace health and safety issues that may arise during the inspection are identified and addressed. This may include speaking with officers who are familiar with the site, and completing a [job safety analysis](#) (available on Robin). More information on managing health and safety risks is contained in the [Environmental Operations Safety Manual](#) (available on Robin). Workplace health and safety considerations must be addressed during the pre-inspection briefing.

### **2.2.2 Collecting background information**

The purpose of collecting and reviewing background information is to make sure that the inspection team is as informed as possible about the nature of the operations being conducted at the site; the client's compliance and performance history; the legal requirements that the client is required to meet; and what constitutes an acceptable standard of environmental performance for the client's business.

When collecting background information, it is important to also consider whether the client may be conducting any activities at the site without the necessary approvals from DERM. Turn your mind to whether there are any activities that are commonly conducted in conjunction with any activities for which the client holds a licence, and consider what evidence of such activities you might be likely to find during the inspection.

The types of information that should be reviewed include:

- site details, such as maps, aerial photographs and process descriptions;
- the characteristics of the environment adjacent to the site;
- details of the company structure, directors and other executive officers;
- the main environmental issues that relate to the client's industry;
- technical information about the processes and operations carried on at the site;
- industry best practice and relevant standards;
- operating manuals, plans and procedures;
- company environmental policies and guidelines;
- any approval, authority or other permit issued by DERM to the client;
- statutory requirements (such as sections of the EP Act and regulations that may be relevant);
- previous audits and compliance history;
- evidence of past environmental performance, such as inspections and complaints;
- workplace health and safety issues related to the site and the industry;
- community concerns about the site, regional area or industry type; and
- and language, social or cultural characteristics of the client or their staff that may be relevant.

This information can be obtained from a number of sources including:

- Ecotrack;

- Ecomaps;
- client files;
- Google Earth and Google Maps;
- technical journals;
- Australian standards;
- Australian Securities and Investments Commission (ASIC) records (available from [www.asic.gov.au](http://www.asic.gov.au) or through Citec searches (available in some regional offices); and
- DERM officers.

### 2.2.3 Inspection checklists

The [compliance inspection checklist](#) breaks the conditions of any development approvals, authorities or other permits into their elements. This ensures that all aspects of each condition are appropriately addressed during the inspection. It is a tool that helps the inspection team to assess whether any of the conditions have been breached.

It is important to remember that checklists designed to help the inspection team to complete the inspection thoroughly. They should not be applied rigidly – do not ignore something that you find during an inspection just because it is not on a checklist.

A sample checklist, showing a condition broken down into its elements:

<b>Permit / Approval No. JH4231</b>	
<b>Condition No.: 4C17</b>	<b>Compliant: yes <input type="checkbox"/> no <input type="checkbox"/></b>
<b>Element / Question</b>	
Dried sewage sludge – must be stockpiled in a bunded area – so as to prevent stormwater contamination being released off the site	
<b>Observations</b>	
<b>Recommendation</b>	

The condition has been broken up into its elements. If it would assist the person conducting the inspection, the elements could also be framed as questions – “Is there dried sewage sludge on the site?”; “Is it stockpiled in a bunded area?”; “Is it stockpiled in such a way as to prevent stormwater contamination being released off the site?”. During the compliance inspection, observations are made for each element and/or question and recorded in the row below, followed by any recommendations that are needed in order for the client to achieve compliance with the condition. Breaking down the condition in this way makes it easier to remember to turn your attention to all the elements of the condition, and to assess the client’s performance against the condition.

When developing a checklist, the lead inspector should consider the experience and knowledge of the auditor who will be using it, and also the environmental risks of the site to be inspected. This will enable the lead inspector to select the appropriate level of detail for the checklist. Experienced officers can use a checklist that

consists of a list of all the topics to be covered during the course of an audit and does not give details about how to undertake the auditing of each one. Less experienced officers should use a detailed checklist that lists everything they need to know and do. This allows them to undertake audits with less supervision from more experienced colleagues.

#### 2.2.4 Providing prior notice of an audit

Because of the number of people involved in conducting a level C inspection, the length of time that the inspection will take and the need to look at all aspects of a site's environmental performance (and so the high level of cooperation that is often required from the client's staff), clients are generally advised of the planned date(s) of a level C compliance inspection before it takes place. Clients may be advised of the intended inspection verbally, but verbal advice should always be confirmed in writing. The amount of notice given will depend on the nature of the inspection. Not only is giving sufficient notice courteous, it can lead to a more effective inspection by allowing the client time to arrange for key staff to be present to answer questions and assist with the inspection. are undertaken in an announced manner.

If the lead inspector has reasonable grounds for believing that providing notice of the intended inspection will jeopardise the effectiveness of the inspection, he or she should discuss the matter with his or her manager and obtain their approval to conduct the inspection without notice. The difficulties caused by not providing notice should be weighed against the risks of providing notice to the client. In circumstances where an inspection without notice is required because of concerns about the client's performance, or in response to complaints from members of the public, it may be more appropriate to conduct the inspection as a level A or level B inspection, rather than a level C.

### 2.3 On-site activities

#### 2.3.1 Opening meeting

The objectives of the opening meeting ([Compliance inspection opening meeting agenda/minutes template](#)) are to meet with the site manager or their representative and:

- explain and confirm the inspection plan, outlining the objectives, scope and inspection procedures;
- provide a short summary of how the inspection activities will be undertaken; and
- allow the site manager or their representative to ask questions.

The minutes of the opening meeting should be signed off by the site manager or their representative.

The opening meeting is an important part of the inspection process and can set the tone for how the inspection will proceed. It is important to be professional and polite throughout the meeting. At the opening meeting, the lead inspector should:

- introduce the inspection team and show identification;
- explain the purpose of the inspection;
- explain the inspection objectives, scope and criteria (this will help keep the audit on track);
- explain the methods and procedures used to conduct the inspection;

- explain the steps that will be taken when preparing the inspection report, (for example, explain that information collected during the inspection will be assessed, a report will be prepared and a letter summarising the findings of the inspection and any required follow up actions will be sent);
- explain the inspection timetable so that the site manager or their representative can arrange for appropriate personnel to be available during the inspection;
- ensure that the resources and facilities needed by the inspection team are available; and
- determine safety, emergency and security procedures.

### 2.3.2 Collecting information

After the opening meeting, the inspection team can start collecting and recording audit information. It is important that the lead inspector (and preferably the other members of the inspection team who are authorised persons) are familiar with the powers that they can exercise during the inspection (in particular s460 of the EP Act). This will ensure that any information gathered is done so lawfully. By being confident in the powers that they can exercise, officers are also more likely to be able to obtain all of the information that they need. Guidance on exercising powers is contained in the procedural guide [Powers of officers](#).

Some of the information that will be gathered will be in the form of documents, and may include monitoring results, complaints registers, incident report forms, maintenance records for plant and equipment, environmental management system manuals and documents required to be kept by the development approval. Authorised persons may make photocopies of documents in certain circumstances (refer to s460 of the EP Act). If it is not practical to copy or view all documents that might be relevant, officers may choose to copy or view a representative sample of documents.

Photographs can be an important record of the site inspection, and details of any photographs taken (including, the time and date the photograph was taken, who took it, and what the photograph shows) should be recorded in an official notebook. Other observations made, and significant conversations held, during the inspection should also be recorded in an official notebook (refer to the procedural guide [Use of official notebooks](#) for more information).

All samples taken during the inspection must be taken in accordance with any applicable standards (such as DERM's Water Quality Sampling Manual), both to ensure that sample results are accurate and reliable, and to ensure that the sample results can provide admissible evidence if legal proceedings result from the inspection.

Officers should consider whether they should conduct their own sampling (particularly water sampling) to verify sampling carried out by the client. Client sampling may not have been carried out in a way that produces reliable results, and may not be able to be relied on in legal proceedings. Accordingly it may be necessary for DERM officers to conduct their own sampling, even where the client has provided sampling results to DERM. Particular consideration should be given to conducting sampling where the contaminants have the potential to cause serious environmental harm, or where officers have reason to doubt the accuracy of the client's sampling results.

Another important point to note about sampling is that sampling (particularly water sampling) may be conducted to confirm sampling results provided by the client. The mere fact that a client has carried out sampling and provided the results to DERM does not mean that there is no need for DERM to conduct its own sampling. It is important that officers remember that any information collected during the inspection may at some time be used as evidence to support legal proceedings, so as much care as possible should be taken to ensure that the information will be admissible. This includes:

- making accurate notes of observations and conversations

- making notes during the inspection, or as soon as possible after returning to the office
- collecting samples in accordance with DERM procedures, and maintaining chain of custody records [chain of custody data sheet and sample submission form](#)
- recording all documents sighted, copied or borrowed and photographs taken in an inspection (a compliance inspection documents sighted form is available on Ecosteps)
- copying photographs onto a hard drive (if there is a likelihood that the photographs will be needed for court proceedings, they should be copied to a CD-ROM or DVD and stored securely).

At all times during site inspections, be mindful of your safety. If necessary, ensure that a representative of the client who understands the workplace health and safety issues for the site accompanies you during the inspection. A [compliance inspection hazard checklist](#) is available on Ecosteps to help officers conduct an initial hazard identification and perimeter inspection. If your safety is threatened in any way during the inspection, you should immediately take action to eliminate the risk to your safety, including terminating the inspection and leaving the site if necessary.

If, during the inspection, you become aware of a serious incident that is causing or is likely to cause serious or material environmental harm, you should inform your manager and the Manager Regional Investigations for your region immediately. If necessary, an emergency direction under s467 or 468 of the EP Act should be given to the client or their representatives in order to prevent or minimise, or remedy, the harm (refer to the procedural guide Emergency direction on Ecosteps).

### 2.3.3 Closing meeting

Once the inspection team has finished the site inspection a closing meeting (refer to the Inspection closing meeting agenda/minutes template available on Ecosteps) is held with the site representatives. Again, these minutes must be signed off by the site manager or their representative. At the closing meeting, the lead inspector should:

- present the preliminary findings
- discuss and agree to timeframes for reporting of findings
- discuss anything which may effect the reliability of inspection conclusions
- provide recommendations for improvements
- inform the site manager about any likely enforcement action (such as a penalty infringement notice or environmental protection order) that may result from the inspection.

## 2.4 Post-inspection activities

Once the site inspection is complete, the important activities of evaluating the information gathered during the inspection, recording the results of the inspection and conducting follow up activities will then begin.

### 2.4.1 Evaluation of information

The purpose of evaluating information collected during the inspection is to identify any significant observations that should be documented as findings of the inspection. While initial conclusions may be able to be drawn during the site inspection, a more detailed assessment of the information is usually possible once the inspection

team returns to the office. This assessment can be used to identify non-compliance, compliance, and best practice.

Evaluation of the information can include the following activities:

- Comparing monitoring data held by the client, or the results of samples obtained during the inspection with requirements of the development approval or other permit, or with best practice standards.
- Comparing observations and photographs with requirements contained in approvals or best practice standards.
- Comparing statements made by the client's representatives with observations, photographs and documents.
- Identifying any gaps in the information which may require follow up with the client.
- Assessing whether the information reveals breaches of approvals, permits or statutory requirements.
- Assessing whether enforcement action may be required (refer to DERM's Enforcement Guidelines available on the DERM website <http://www.derm.qld.gov.au/>).
- Identifying any shortcomings with approval conditions (for example, identifying that a condition is drafted in a way that makes it difficult to establish that it has been complied with).
- Comparing the information with information obtained from inspections of similar sites to identify any common or systemic problems.

#### 2.4.2 Reporting

The inspection report is one of the most important parts of the inspection. It records the inspection team's findings on the performance of the client, the remedial actions that are required by the client, and any actions that DERM must take to respond to the client's performance. Preparing a written record means that important information is recorded for future reference, any actions taken by DERM can be justified if they are later challenged, and the results can be compared and analysed to see whether there is improvement over time or to identify trends.

The template [compliance inspection report form](#) is on Ecosteps.

#### 2.4.3 Follow up actions

Once the information has been evaluated and the report prepared, there may be a number of other activities that need to take place.

##### Follow up letter

A follow up letter must be sent to the client once the inspection report has been completed. It should list any non-compliances identified, any follow up action required, and timeframes for completing those actions. The lead inspector should ensure that follow up actions have been completed within the stipulated timeframes. This may require follow up visits to the site. If actions have not been completed within the timeframes, the lead inspector must take some action to address this (which can range from negotiating a new timeframe with the client to taking enforcement action or recommending referral to the Investigations Team).

### Responding to non-compliance

If the inspection reveals non-compliance with approval conditions or statutory requirements, it may be necessary to take some form of enforcement action. This can include issuing a warning notice or penalty infringement notice or issuing a statutory notice such as an environmental protection order or environmental evaluation. Although not strictly an enforcement action, in cases of serious non-compliance it may be appropriate to refer the matter to the Investigations Team for investigation with a view to determining whether a prosecution or other court action is warranted.

Guidance on choosing an appropriate response can be found in DERM's Enforcement Guidelines and the procedural guide [Choosing the appropriate statutory tool to respond to non-compliance](#).

### Unlicensed ERAs

If the inspection revealed that the client is carrying out an environmentally relevant activity without the necessary approvals from DERM, refer to the procedural guide [Dealing with unlicensed ERAs](#) for information on what action is to be taken.

### Inspection de-brief

No inspection runs perfectly, and there is always scope to improve the way an inspection is conducted. A valuable learning tool is to gather the inspection team soon after the conclusion of an inspection to discuss what worked well during the inspection, and areas for improvement. The de-brief should be conducted as an opportunity to improve the way DERM does its business, and not as a means of criticising officers. Any lessons learned for the de-brief should be recorded, and passed on to the relevant people for action.

### Incident reports

If a workplace health and safety incident occurred during the inspection, an [incident report form](#) must be completed as soon as possible after returning to the officer. Your manager must also be notified.

## 2.4.5 Recording information

Keeping accurate records of compliance inspections is important for a number of reasons:

- it provides a record of client performance that may be important in the future
- it allows the department to defend any actions it takes as a result of the inspection, if those actions are challenged
- it preserves evidence that may be needed if legal proceedings result from the inspection
- it allows the department to identify trends and patterns that may suggest systemic problems that could pose a high risk to the environment
- good record keeping is an obligation of all public servants. Failure to keep good records may amount to a breach of the Code of Conduct.

Ecotrack is DERM's main source of compliance information. Data held in Ecotrack is used to assess individual client performance, to plan future compliance activities and to report to the Director-General and the Ministers on DERM's compliance program. It is important that details of compliance inspections are entered accurately and in a timely fashion. If not, significant decisions about future compliance activities may be made on the basis of bad information.

# Inspections - tips and traps checklist

## Compliance inspections (Level A, B and C)

*This document is for internal use to assist Environmental Service officers to conduct safe, effective and efficient site inspections.*

Effective and thorough preparation allows officers to effectively perform site inspections. Knowledge of the site prior to the inspection date enhances confidence and the likelihood that the objectives of the inspection will be met. It is important to know and understand inspection powers however polite appropriate questioning and proper preparation will limit the need to use them.

- Why are you going?
  - Reactive... responding to a complaint.
  - Proactive... auditing.
  - Establish clear objectives and set timeframes.
  - Facts to be determined.
  
- Where are you going and who are you meeting?
  - The property itself, and within the property - site plans/aerial photographs, access points, sampling points and any health and safety issues.
  - If applicable, telephone ahead of time to confirm/reconfirm inspection time, location and who you will be meeting with. Record in your notebook.
  
- What do you know?
  - 'Desktop' preparation – known facts regarding compliance history – previous conditions/ breaches/outstanding EPOs.
  - Take copies of any relevant documentation (e.g. conditions or TEPs) you may need to call upon. Do not assume that these will be available on site.
  - Check that you are authorised to carry out the inspection.
  - Know your powers and be confident and fluent in using them.
  - Compile and carry an emergency contact list of numbers in the event that you are presented with a serious situation and you need to act quickly.
  
- What are you looking for?
  - Facts to be determined - (consider any history of non-compliance and dangers).

- Identify the original operation conditions of the site. Check these against the relevant legislation to know what you are looking for.
- Know the offence provisions of the Act.
- If applicable, contact complainant to confirm details and location.
  
- What equipment might you need?
  - Take the time to put together a well-organised and easily accessible kit bag. This will assist you on site to carry and locate everything that you might need to conduct the inspection. Consider the following: voice recorder, camera, batteries, charger, GPS, notebooks and sampling equipment.
  - Do you require other technical experts to assist you?
  
- On-site
  - Introduce yourself and any other team members. Present your ID for inspection or wear it in an easily visible spot.
  - Politely but firmly explain the purpose of your visit, what you will be doing and any assistance that you may lawfully require (e.g. site safety inspection officer's input). Always maintain eye contact.
  - Have a clear idea of where you want to go on site. Do not let yourself be guided. Maintain control over your own movements on site.
  - Maintain control of the conversation. If you are refused access to a particular area or sight of covered materials ask why they do not want to show you. Do they have a reasonable excuse?
  - If for any reason the situation becomes out of control e.g. violent or threatening behaviour, trust your instincts, and walk safely away.
  - Never compromise you or your team member's safety under any circumstances. If necessary, leave the site and alert other authorities such as the police.

### Investigation Costs Record

*Record Costs and Expenses (including materials & external providers) and Officer Time*

#### Record Costs and Expenses

#### Officer Time

Date	Time Spent (to nearest ¼ hour)	Officer Name	Brief description of activity

# Letter – Alleged source information request

Compliance and Support

## Suggested Text – Alleged source information request

*The purpose of this procedural guide is to provide officers with a suggest body of text with respect to an alleged source information request. Officers are required to copy and past the below text and insert the text into the current Departmental approved letter template. In addition officers are required to amend the font in blue to the extent that it relates to their current circumstances. If officers using this template require further assistance, please contact the Compliance and Investigations Branch.*

The <INSERT Department or unit e.g. Community Response Unit (“CRU”)> recently received complaints from residents of <INSERT details> regarding <INSERT details – e.g. nuisance or noise> from <INSERT details> at <INSERT details>. The complainant alleges that:

<INSERT details>

The role of the <INSERT Department or unit e.g. Community Response Unit (“CRU”)> is to investigate this matter and ensure that where a genuine problem is found to exist, action is taken to fix the problem.

This matter will be investigated by the <INSERT Department or unit e.g. Community Response Unit (“CRU”)>, however at this stage the <INSERT Department or unit e.g. Community Response Unit (“CRU”)> invites you to respond to this allegation in writing on or before <INSERT date – usually 2 weeks from receipt of letter>.

The address to send your response to is:

<INSERT address>

Should you have any questions about this matter or require any further information, <INSERT contact name> of the <INSERT Agency or unit e.g. Community Response Unit (“CRU”)> on telephone <INSERT contact telephone number> will be happy to assist you.

## Penalty Infringement Notices (PINs)

This manual will provide officers who are authorised to issue Penalty Infringement Notices (PINs), information about how to issue the PIN and the location of other resources to assist them in issuing PINs.

The *State Penalties Enforcement Act 1999 (SPE Act)* and the *State Penalties Enforcement Regulation 2000 (SPE Reg)* enable authorised officers<sup>1</sup> to issue PINs for specific offences under various Acts. These Acts and offences are listed in [Schedule 2 of SPER](#). DERM in conjunction with the State Penalties Enforcement Registry (SPER) has developed a range of codes for these offences that must be used when issuing PINs.

## Offence Codes

The Offence Codes can be currently accessed through Ecosteps.

- [Procedural Guides – Penalty Infringement Notices – Offence Codes – EP Act](#);
- [Procedural Guides – Penalty Infringement Notices – Offence Codes – Forestry](#);
- [Procedural Guides – Penalty Infringement Notices – Offence Codes – Marine Parks](#);
- [Procedural Guides – Penalty Infringement Notices – Offence Codes – Nature Conservation](#);
- [Procedural Guides – Penalty Infringement Notices - Offence Codes - RAM Act](#).
- [Procedural Guides – Penalty Infringement Notices - Offence codes – Vegetation \(\*Sustainable Planning Act\*\)](#)
- [Penalty Infringement Notices - Offence Codes – Land](#)
- [Penalty Infringement Notices - Offence Codes – Stock Routes](#)

These guides provide officers with the correct offence codes to use when issuing PINs. The shortened description of offences provided in the guides are **NOT** to be used as a substitute for consideration of the specific provisions of the legislation, and whether an offence has occurred. Further information on this will be provided below. To issue a PIN, officers **MUST** be satisfied that an offence has occurred under relevant legislation.

As a result of frequent legislative changes, the Offence Codes are updated regularly. Although the Compliance and Investigations Branch will endeavour to advise on changes, it is the responsibility of the issuing officer to ensure that you are issuing PINs with the correct offence codes. The relevant Offence Codes should be regularly checked on relevant databases to obtain the current offence code. It is important that officers ensure that they have given consideration to up to date versions of both the legislation and the relevant offence codes before issuing a PIN.

---

<sup>1</sup> “Authorised Officers” will be used to cover all persons who can be appointed under the relevant legislation to exercise powers in relation to compliance and enforcement. Commonly they can be called: authorised officers, inspectors, or conservation officers.

PINs that are incorrectly issued must be withdrawn (more information is provided on this below). Remember, the penalty applied is the penalty in force at the time/date of offence.

## Who can issue a PIN?

PINs can be issued by officers authorised under the law. These can include officers from organisations such as local governments and DERM. This guide has been prepared for DERM authorised officers and is best practice. DERM requires all of its authorised officers to follow the PIN guidelines set out in this document.

A person *authorised* under relevant legislation (title dependant on the legislation) who reasonably believes a person has committed an offence specified as a PIN offence, may serve a PIN on the person for the offence (s13 (1) *SPE Act*).

The *SPE Regulation* provides that the following officers are authorised persons for the purposes of serving PIN:

- an **authorised person\*** appointed under s 445 of the *Environmental Protection Act 1994*
- an **authorised person (litter)** appointed under s 445 of the *Environmental Protection Act 1994*
- a **forest officer** appointed under s 17 of the *Forestry Act 1959*
- a **conservation officer** appointed under s 127 of the *Nature Conservation Act 1992*
- an **inspector** appointed under s 52 of the *Marine Parks Act 2004*
- an **authorised officer** under s 143 of the *Recreational Areas Management Act 2006*.
- an **authorised officer** under s 24 of the *Vegetation Management Act 1999*
- an **authorised officer** under s 395 of the *Land Act 1994*

\*Currently authorised persons under the *Environmental Protection Act* must first obtain the approval of their relevant Manager prior to the issuing of the PIN. For all other legislation, DERM staff should ensure that they have the appropriate delegation and are complying with relevant policy relating to the issue of the PIN applicable to their business unit.

## When should a PIN be issued?

Authorised officers must reasonably believe an offence has occurred – see information under standard of proof. The DERM *Enforcement Guidelines* offer guidance for the use of regulatory tools and discretion. You may also find the Queensland Ombudsman [“Good Decision-Making Guide”](#) useful in determining or evaluating appropriateness and proportionality of the enforcement action.

The PIN process is available for matters that could be considered not of a serious enough nature to put immediately through court. A PIN is served based on the reasonable belief that an offence has been committed; however payment of the penalty does not lead to the recording of a criminal conviction. Non-payment of the fine is not dealt with by a jail sentence but is recoverable as a civil debt. On the other hand, if a

person elects to have the matter heard, proceedings are commenced in the criminal jurisdiction of the Magistrates Court.

### **Standard of Proof**

As a basic proposition, an investigation should be undertaken and sufficient evidence must be obtained to establish beyond a reasonable doubt that an offence has occurred, before a PIN is issued. A PIN is in effect a *de facto* prosecution brief; the same evidence is led for either process. A PIN can be contested by the recipient and in this event it is likely that the authorised officer will have to give evidence as to the alleged offence. In essence a PIN should not be issued for any matter that the issuing officer (informant) would not be able to produce a brief of evidence for – the standard of proof remains the same.

There are a number of procedural documents that can help you in relation to establishing whether or not you have enough evidence to issue a PIN, for example:

- *Use of Official Notebooks* – provides you with information concerning what you should be recording when investigating offences and issuing PINs;
- *Briefs of Evidence* – provides you with the information that is required for a brief of evidence (relevant for when a PIN is contested)
- *Statement Guide* – provides you with information about taking statements from potential witnesses.

### **Discretion**

Just as there is discretion to use any other enforcement tool, there is discretion whether to issue a PIN. Any discretion by individual officers must take into account the intention of the legislation in relation to managing and minimising environmental and natural resource use impacts, and any specific references to breaches of that legislation.

PINs are designed primarily to deal with one-off breaches that can be remedied easily and provide a mechanism to deal with breaches through a simplified administrative process. They are usually a first response when a preventable breach is discovered.

Issuing successive PINs for multiple and ongoing statutory breaches is generally inappropriate, unless the breaches are unrelated. In such circumstances, even though each breach might be comparatively minor, there is probably a major and continuing compliance problem. Such a problem needs to be dealt with through other enforcement measures if a past PIN has not motivated the recipient to successfully address the underlying issue.

An authorised officer may use their discretion about a matter. In determining whether to exercise the discretion to issue a PIN, regard should be had to the sufficiency of the evidence and public interest factors. The issue of a warning may also be appropriate for a minor breach of legislation.

Most matters do not have to be dealt with immediately and on-the-spot (exceptions to this generally related to service of the PIN to itinerant or international visitors). If in doubt, authorised persons should record all relevant details and seek advice from their manager. Inform the person that the matter has been recorded and that further action may result. **Do not** indicate that they are “likely to get” or “might receive” a warning or a fine – it leads to unfair expectations and can generate subsequent complaints from a person receiving a PIN.

### Ensuring elements meet proof requirements

The same elements that must be proven when developing a brief of evidence for court are the same elements that need to be established when issuing a PIN.

There are some elements, which are common to every offence, such as time, date, place and a person. Apart from the common elements, each word or phrase of the offence must be examined to see if it involves a particular issue of law or fact. For example:

**Offence:** *A person must not camp in a protected area without a permit*

<b>Elements:-</b> <i>Time, date and place</i>
<i>A person (can be an individual or company)</i>
<i>Must not camp (if the term is not defined in the Act refer to the Macquarie Dictionary)</i>
<i>Protected Area (gazetted as a protected area)</i>
<i>Without Permit (record person’s reason for not having permit)</i>

It is good practice to secure evidence to support issue of a PIN at the time the offence is detected. Specifically contemporaneous notes and other aids such as photos, samples, and statements in the event that the recipient of the PIN later elects to have the matter heard in court. It may be too late to secure relevant evidence at a later time.

### Juveniles

PINs are **NOT** to be issued to persons under the age of 17. PINs issued to minors will be withdrawn (even after payment).

### How to issue a PIN?

Please refer to **Appendix 2**; PINs are produced on sensitised paper to facilitate duplication. A firmly pressed ball point pen is recommended when filling the document out. All the relevant fields must be completed. The PIN has an individual identifier and is an accountable document.

### Alleged Offender

Try to confirm the identity of the alleged offender through some form of corroborative identification. If the person is reasonably suspected of committing an offence an authorised person may lawfully require the person to furnish identification.

### Essential elements to include on PIN

It is essential that core elements of the PIN are correctly filled out with:

- Family/Company name and number (ACN);
- Given names;
- Residential/Company real address (not a post office box);
- Phone contact number;
- Date of birth; and
- Male/Female/Owner/Driver/Passenger/Other.

Note the origin of the source of identification used to confirm the identity of the alleged offender (for example: **Licence/permit type**: Driver's licence; **State**; **Number of licence/permit**; **Issued by**: eg DERM, Queensland Transport etc; and **Expiry date** of the licence/permit produced.)

### Vehicle/Vessel/Aircraft related offences

Where a vehicle/vessel/aircraft are involved in the commission of the offence, the appropriate<sup>2</sup> vehicle details **must** be completed. For vehicle related litter offences, a [vehicle observation report](#) must be completed. Also see [Litter Procedural Guide](#) for further information.

In other circumstances where a vehicle/vessel is not involved in the actual commission of an offence, details of any vehicle present should be included on the rear of the original notice to assist in locating an alleged offender where the means of identification provided is subsequently proven to have been false.

Details to be included (some of which may appear on the back of the original PIN copy) are: Registration no; Registration label no; State; Type of vehicles/vessel/aircraft; Make/model; Colour/trim; and Expiry date of registration. Vehicle Identification Numbers (VIN and Hull Identification Numbers (HIN) should be recorded if possible.

A vehicle registration search should be undertaken to confirm that the registration details taken at the time of the offence match the description of the vehicle and to also confirm the name and address of the registered owner.

---

<sup>2</sup> The most appropriate vehicle will be the one directly involved with a vehicle offence. For example, a cigarette deposited by the driver of an articulated truck, the appropriate registration would be the prime mover. But if the litter fell from the trailer or dogs, then the appropriate registration to use would be the trailer.

### Vegetation related offences

Where an officer issues a vegetation PIN, it is the regions responsibility to enter that PIN into the Compliance Information Register and Management system (CIRaM). Compliance and Investigations Support will update CIRaM to reflect any changes in the status of the PIN, for example receipt of payment or referral to SPER for further action. Monthly reports are generated from SPER to obtain a list of any infringement notices that have been paid or otherwise satisfied with SPER and CIRaM will be updated accordingly.

### Alleged Offence

This section of the notice **must** contain the following details concerning the alleged offence:

- For those instances where a person is “found committing” an offence, tick the box marked ‘Committed’. For an offence where for example a person has permitted another person to commit an offence, tick the box marked ‘Permitted’ (this will often occur with vehicle or vessel related offences)
- Time of alleged offence, day of the week and date;
- ‘Between’ dates may be included where the offence took place over a period of time and did not involve a vehicle (refer s15(2)(d)(ii) *SPE Act*);
- Location of offence - this section should contain accurate details as to where the offence actually occurred. Details which cannot be included on the face of the notice due to insufficient space should be recorded in notes made on the rear of the original (prosecution) copy;
- Offence code and penalty – see list provided above; and
- Long title of relevant Act and description of alleged offence. **Do not** abbreviate legislation titles i.e. *EP Act*, *NC Act*. The legislation title must be written in full.

### Particulars of animal (on second page)

Where the offence involves an animal, include details as to species, breed, colour, sex and identification tags, brands etc.

### Issuing officer

This section of the notice includes the following details:

- Name of authorised person/officer;
- Office/agency to which they are attached;
- Name\* and Signature; and
- Date of issue **must** be stated on the PIN (this date may differ from the actual date of the offence).

\* There is a basic obligation the issuing authorised officers to identify themselves by name (please note *Employee Id number* is not suitable). DERM officers who are not prepared issue a PIN using their name may

request that their manager or an alternative authorised officer issue the PIN. Do not issue a PIN without an authorised officer named.

The original PIN and copies are dealt with as follows:

- White – Original
- Pink – Infringement Administration Officer's Copy
- Green – Audit Copy (remains in book, which remains in Region)
- Buff – Alleged Offender's Copy

### When Should a PIN be Issued?

PINs are generally appropriate when the following conditions are met:

- where the breach is minor;
- where the facts are apparently indisputable;
- where the breach is a one-off situation easily remedied;
- when inspection discovers a breach that normal operating procedures should have prevented; and
- where the issue of an PIN is likely to be a deterrent.

### When Should a PIN *not* be Issued?

PINs should not be issued in the following circumstances:

- where large-scale habitat or environmental damage has occurred;
- where the breach is continuing and not within the alleged offender's ability to remedy quickly;
- where the penalty seems inadequate for the severity of the offence;
- where the extent of the harm to the environment cannot be assessed immediately;
- where the evidence is so controversial or insufficient that court action is unlikely to succeed;
- where there has been substantial delay since the alleged breach;
- where another authority has issued a notice for the same or similar offence in the same period;
- where a notice, direction or order has been issued by DERM to do specified work within a time limit and the limit has not expired;
- where multiple breaches have occurred, unless all are minor; or where the offence took place under a proposal approved by DERM.

### How do you serve a PIN?

The legal term for giving someone a ticket is *service*. There are statutory rules that must be applied to ensure the PIN is *served* legally (and thus enforceable by a Court or SPER). Therefore it is imperative that appropriate service is chosen and affected correctly.

After completion, the issuing officer should **carefully** scrutinise the notice for possible mistakes ensuring all relevant sections have been completed. The alleged offender's copy can then be served.

A PIN may be served "on-the-spot" **in person** (preferred), **by post** (preferably *registered post* for record-keeping and proof) to an address supplied by the alleged offender (or otherwise known by the authorised officer), or in the case of an unattended vehicle, served on "The Owner" and placed conspicuously on the vehicle.

If the offender is likely to receive a PIN in the circumstances, but it is not proposed to serve the PIN on-the-spot then it is appropriate to inform the person of this. It is unfair to suggest to an alleged offender that they may receive a warning as a result of reporting the matter to a Manager. It gives a person an expectation that the matter *will* result in a warning and the receipt of a PIN in the mail is often cause for a formal complaint to be made. If an authorised officer is genuinely unsure of what an outcome will be at the conclusion of enquiries, the alleged offender should be told that the matter will be investigated, or enquiries will be made, and that they will be notified of the result in the mail. Do not get drawn into committing to a final outcome by an alleged offender.

### **PINs issued on-the-spot**

"On-the-Spot" service of a PIN refers to circumstances where the PIN is served directly to the alleged offender found committing an offence immediately or soon after discovery. This is the most effective, fair and immediate method of serving a PIN, and is the preferred method for QPWS officers conducting regulatory duties. It ensures the matter is dealt with promptly and that the offender has definitely received their copy of the PIN. The only time a QPWS officer should defer to an alternative method of service is if they genuinely consider they may be at physical risk or it is likely to escalate a confrontation. An alternative method of service should not be used just to avoid having direct and difficult conversations with clients.

Officers issuing PINs under legislation other than primarily QPWS administered legislation may be subject to policy requirements to ensure management approval of PIN service. Please ensure you have complied with your relevant business unit obligations.

When serving the PIN personally at the time of offence (for forestry, nature conservation and marine parks offences), a verbal explanation should include advice on the following:

- Why the person is being issued the PIN
- The amount of the penalty
- How the payment of the penalty can be made;
- How to contest the matter through an option to elect for a court hearing.

Responses and reasons offered by the recipient should be noted on the rear of the original (white) copy of the notice.

### **PINs not issued on-the-spot**

While a PIN can be served at any time (within the limitation of time specified in relevant legislation for proceedings for an offence), in fairness to an offender it is highly desirable that the notice is served within **14 days** after detection of the offence. The pink copy must be forwarded to the Infringement Administration Officer **within 2 days of service**.

### **Where to send the PIN**

Where service of a PIN cannot be effected personally, officers may do so by post. The PIN can be mailed to a PO Box; however, the address appearing on the PIN must be the full address of where the person actually lives or works. In all instances where there is a need to effect service of a PIN notice by post, the method of posting recommended is by registered post and return of service card.

### **What to send with the PIN**

There are suggested PIN cover letters available from Compliance and Investigation Support for use by staff. Help can be sought using the following email: [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au).

When issuing a *littering PIN*, officers must ensure they include a frequently asked questions (FAQ) information sheet with the PIN. This FAQ is designed to answer the general queries people will have when receiving a PIN. The FAQ is also available from Compliance and Investigation Support.

### **How do I make notes for evidence?**

The authorised person should record details of any conversation with the alleged offender on the rear of the prosecution copy of the PIN (white). Observations by the authorised person concerning the offence alleged should also be recorded. Where there is insufficient space for recording such information on the rear of the prosecution copy of the PIN, officers are to utilise their official notebooks (see procedural guide on [Use of official notebooks](#) for further information). Reference to relevant notebook page numbers used is also to be included on the rear of the prosecution copy of the PIN.

Notes of any conversation and/or observations made can be referred to by a witness during a court hearing only if they were made during or as soon as practicable after the conversation and/or observations (*contemporaneously*). Great care must be taken when making these notes, as they might be required later as evidence to support the prosecution case. The time and place the notes were made should also be recorded and adoption of the notes by a corroborator is recommended.

### **Relevant PIN Copies**

The distribution of the prosecution and central office copies of a PIN should be attended to promptly following service of the notice.

The prosecution (white) copy, is the original notice, and forms the basis of any future prosecution action. It is to be removed from the book and placed in a separate file at the issuing office and a photocopy is to be placed on a relevant file (if any) relating to the alleged offender. There should be a regional file for storing all original PINs. These are to be filed in numerical order. This procedure ensures that other previously issued original PINs that might be required in any future court proceedings will not be lost if a book of PINs is lost.

### What to return to Investigations Support

The Infringement Administration Officer's (pink) copy of the notice is to be forwarded to the Infringement Administration Officer **within 2 days** of the issue of the PIN. It is important to get the pink copy returned as it is the only record the administering officer has to manage payment from offenders. The copy may be sent by mail (GPO Box 2454, Brisbane 4001), or scanned and emailed to [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au)

The Audit (green) copy remains in the book for the purpose of record keeping and government audit requirements. The PIN book also remains with the Region that it was issued to. Completed books are **not** to be returned to the Infringement Administration Officer.

The Alleged Offender's (Buff/Beige) copy is served on the named person or company.

### Service Letter PINs

Where an officer has received a PIN back as 'return to sender' or 'not known at this address', it is essential the officer informs the Investigations Support Unit this has occurred as soon as possible. Where possible the Infringement Administration Officer will conduct a secondary drivers licence or vehicle registration check to confirm the mailing address is correct.

### How is a PIN cancelled?

An officer may *cancel* a PIN written in error **prior to service** on the alleged offender. If an officer detects an error before serving a PIN, under no circumstances should particulars be crossed, removed or deleted.

Two parallel lines are to be drawn across the face of the original (white) page of the PIN and the word '*cancelled*' written between the lines. The entry is to be initialled and dated. Another PIN can then be issued.

The original of the cancelled PIN is to be filed with other previously issued original PINs. The duplicate and triplicate copies and a [Cancellation of Infringement Notice](#) form are to be forwarded to Infringement Administration Officer for recording.

## How is a PIN withdrawn?

The *State Penalties Enforcement Act 1999* gives DERM the discretion to *withdraw* a PIN notice **after serving** the notice. This allows for two possibilities:

- where a more serious breach of the law might have taken place without the authority's knowledge when the PIN was issued. The notice can be withdrawn to allow the more serious breach to be pursued; or
- where a second possibility is that a mistake of fact was made and the PIN should not have been issued. In such a case, the *State Penalties Enforcement Regulation 2000* allows the authority to withdraw the PIN, even if the penalty has been paid.

Unfortunately errors in PINs are often detected after it has been served..

A PIN must be withdrawn and a new PIN served for the offence when it contains one or more of the following types of errors:

- no time / incorrect time of alleged offence;
- no date / incorrect date of alleged offence [in the 'Alleged offence details' section only];
- no date or an incorrect date of issue (separate to date of offence);
- no location / incorrect location of alleged offence [differs greatly from actual location];
- no penalty / incorrect penalty;
- no offence / incorrect offence;
- incorrect registration no. of vehicle / vessel / aircraft where involved in the commission of the offence.
- Act or Regulation the PIN is issued under is incorrect
- missing issuing officer's signature or identifier

A PIN can be withdrawn for reasons other than for an error or omission. If for example after having issued a PIN, the alleged offender is found to be a persistent offender and has previously committed similar offences, the PIN may be withdrawn. This then allows the matter to proceed to prosecution by way of complaint and summons. Evidence gathered for the issue of the PIN can be used for any subsequent prosecution.

A PIN may also be withdrawn based on evidentiary, procedural, or policy matters. A PIN will be withdrawn if the recipient is found to be less than 17 years of age.

Withdrawal of PINs may occur until the issue of a warrant by the State Penalties Enforcement Registry.

Withdrawal provisions should be seen as a safety net, not a mechanism to be applied regularly.

Section 160 of the SPE Act provides for the delegation of powers by the Chief Executive of an administering authority. Accordingly, the Chief Executive has delegated certain powers (including the power to withdraw a

PIN) under the SPE Act to various officers within the department (delegate). Please be aware that it is not lawful to “withdraw” a PIN after it has been served unless you are a delegated officer (Current delegation sits with Director, C&I and Director, Litigation, and Manager, Investigation Support).

Where a PIN has been issued and it is determined that there are reasons for withdrawing the PIN, the issuing officer is to complete a [Withdrawal of Infringement Notice](#) form and forward it to the relevant manager outlining the circumstances and the reasons for the requested withdrawal. The form is then to be forwarded through the relevant Manager to the Infringement Administration Officer, with a recommendation as to withdrawal of the notice. In locations where mail is slow or difficult, please email them to [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au)

A delegate within the Investigation Support Team will then withdraw the PIN and forward appropriate advice to the alleged offender. Following withdrawal of a PIN, advice in writing is to be forwarded by the Infringement Administration Officer to the issuing officer so that other copies of the PIN can be similarly noted. Copies of the withdrawn PIN, the ‘Withdrawal of the Infringement Notice’ form and any legal advice from the Litigation Team are to be placed on the common file for all PINs, and on a relevant file (if any) relating to the alleged offender.

Where a PIN has been paid and a decision is subsequently made to withdraw it and proceed by summons, a full refund is to be made to the alleged offender by the Infringement Administration Officer. The refund should be accompanied by an explanation as to the reasons for the refund and the intended course of action.

### **Requests for Review and Complaints concerning the issue of PINs**

In addition to advising the person concerned that they can elect to have the matter heard in court, PIN recipients can also be informed that they may seek a formal review relating to the issue of a PIN within the 28 day statutory period. Persons wishing to make a complaint concerning the issue of a PIN are to be informed that any complaint they wish to make must be in writing and forwarded to the Infringement Administration Officer at the address appearing on their copy (rear) of the notice, or email [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au)

On occasions, a person issued with a PIN may consider that the issue of such notice was unwarranted and seek advice from the issuing officer as to what action they can take. A verbal discussion about the circumstances surrounding the issue should be avoided and the person should be directed to submit a written complaint to the Infringement Administration Officer outlining their version of events and concerns. The Infringement Administration Officer will record the correspondence and ensure an appropriate review of the circumstance surrounding the issue of the PIN is conducted by the relevant Regional Manager or delegate.

When the Infringement Administration Officer receives a written complaint or request for review, an acknowledgment letter will be sent as an initial reply.

At the same time, a memorandum and copy of the letter of complaint is sent to the relevant Regional Manager requesting that a report be generated by the issuing officer setting out the full circumstances surrounding the issue of the relevant PIN. This is to aid Compliance and Investigation staff in communicating with the client.

The completed report is to be returned to the Infringement Administration Officer via the Regional Manager with a recommendation as to whether or not the notice should be waived. In the case that the recommendation is to withdraw the PIN, it will be referred to an appropriate delegate and actioned in accordance with the Regional Manager's recommendation. Where the decision is to uphold the decision to issue a PIN, appropriate advice will then be sent to the person concerned.

Where a letter of complaint concerning the issue of a PIN is received at a regional office, the letter is to be forwarded immediately to the Infringement Administration Officer who will action the matter in the previously outlined process. Written advice should not be forwarded from the office receiving the letter of complaint or review until it has first been received by Infringement Administration Officer as it may inhibit the capture and recording of all relevant correspondence.

All reviews of PINs must be coordinated through the Infringement Administration Officer to ensure statutory compliance and consistency.

### **Infringement Administration Officer**

The Infringement Administration Officer (IAO) is responsible for the management of all PINs issued by DERM officers. The generic email to use is [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au)

The Infringement Administration Officer will enter PIN details for SPER on CIRaM, and is responsible for those PINs recorded as being overdue for payment, that is, those PINs that have not been paid within the initial 28 days. If no action is taken by the alleged offender to meet the requirements of the PIN within the 28 payment day period, the Infringement Administration Officer may forward information contained on the original PIN to the SPER to enforce.

The Infringement Administration Officer is able to extend the 28 day period at the reasonable request of the alleged offender.

### **State Penalties Enforcement Registry**

The referral of a matter to the State Penalties Enforcement Registry (SPER) Registrar by the Infringement Administration Officer effectively ends DERM's involvement in the enforcement process unless the alleged offender subsequently chooses to have the matter heard in the Magistrates Court.

The possible outcomes of the SPER system are as follows:-

- Alleged offender pays in full. SPER remits money
- Alleged offender applies for extension of further 28 days to pay
- Alleged offender applies to pay fine by instalments
- Alleged offender applies for fine option order
- Alleged offender elects not to pay - SPER may issue enforcement warrant, fine collection notice or arrest and imprisonment warrant
- Alleged offender elects hearing in Magistrates Court. SPER will refer the matter back to the Infringement Administration Officer for commencement of summons proceedings

### Election for Court hearing

A recipient of a PIN may elect for the matter to be heard by the Magistrates Court. When an alleged offender elects to have their matter heard by a court, the Election for Court Hearing Notification section on the rear of the offender's copy of the PIN is completed by the recipient and forwarded to the Infringement Administration Officer. Alternatively advice may be received from the State Penalties Enforcement Registry Registrar of a defended matter.

Upon receipt of an election to have a PIN dealt with in Magistrates Court, the Infringement Administration Officer will acknowledge receipt, and notify the issuing officer (Informant) and the Manager responsible for the location and business in which the alleged offence occurred. The matter will also be entered on CIRaM for tracking and notification to Manager, Regional Investigations.

It is the issuing officer's obligation as the informant in the first instance to ensure that all evidence to be alleged is available. The issuing officer and their Manager should review the circumstances in which the PIN was issued and ensure the progression of the matter to court is desirable and appropriate in the circumstances. It is also appropriate and encouraged that the relevant Manager, Regional Investigations (MRI) is involved in such discussions. The Manager of the issuing business unit should then confirm the decision to proceed via memo or email to the MRI with a copy to the Infringement Administration Officer.

At this time the matter is no longer managed as a PIN (through SPER) process and becomes a DERM investigation. The PIN process is concluded by the Infringement Administration Officer.

Upon confirmation that the PIN must be escalated to a brief of evidence by the issuing officer's manager (memo or email) the following steps should be taken :

- Manager, Regional Investigations will delegate the task to an investigator
- Issuing officer and investigator will liaise and review circumstances and available evidence. Carriage of the matter remains always with issuing officer, who now becomes *informant* in the matter, but will be

assisted/lead by the investigator until the matter is complete (this is to ensure consistency and best practice)

- Investigator will review available evidence and where necessary gather further evidence in support of the brief of evidence. The PIN has effectively become an investigation and will be managed in accordance with brief of evidence protocols and time frames
- Investigator is responsible for production of the *Brief of Evidence* document with recommendations to the MRI and the brief checker and then onto the Litigation Unit
- The decision to seek approval from the Assistant DG (ENRR) as delegate to charge and proceed to court is made by Director, Compliance and Investigation in consultation with Regional Managers
- As informant, the issuing officer carries the responsibility of lead witness. The concluding obligation of the issuing officer will be the presentation of their evidence before a court

If at any point in this process a decision is made to withdraw the PIN, the Infringement Administration Officer must be notified and a [Withdrawal of Infringement Notice](#) forwarded to [infringement.notices@derm.qld.gov.au](mailto:infringement.notices@derm.qld.gov.au) through the Infringement Administration Officer to Manager, Investigation Support to ensure statutory compliance.

As capacity is built within various branches of business the necessity to heavily involve investigators in PIN matters should reduce.

### How is a PIN paid?

Officers are not to accept payments for PINs in the field. The only acceptable methods of payments are:

- Attendance at DERM office (equipped to take payments)
- by mail to GPO Box 2454, Brisbane QLD 4001.
- Credit Card payment over the phone

All monies received from the Customer Service Unit and Infringement Administration Officer as payment for PINs are to be sent to the DERM Financial Services Unit. Internal procedures within the Customer Service Unit are to be referred to when transferring money to the DERM Financial Services Unit.

After receipting of PIN monies, the Financial Services Unit will forward details of monies receipted and the relevant PIN to the Infringement Administration Officer. The Infringement Administration Officer will then enter details on ECOTRACK against the PIN paid in *Environmental Protection Act* only matters, and the PIN database.

## How do I get more PIN books? (Accountable forms)

Each Region has a nominated regional/environmental support officer for accountable forms. To request a supply of accountable forms<sup>3</sup>, a requesting officer is required to obtain manager approval before filling out a [Supply of Accountable Forms](#) form (this form is between the requesting manager and regional/environmental support officer) and sending the form through to the relevant regional/environmental support officer for his/her region.

Upon receiving an order for accountable forms, the regional/environmental support officer is then required to prepare and submit a [Supply of Accountable Forms](#) form to the Administration Officer, Litigation Team. The Administration Officer will then arrange for the order to be filled using the relevant region's costing code. The Administration Officer will then complete the 'supply' section of the Supply of Accountable Forms form and return the form to the regional/environmental support officer with the required accountable forms. The Administration Officer is required to keep an accountable forms record (type of forms, sequence numbers, date application received, date forms issued) of all forms distributed to regional/environmental support officer.

On receiving the requested supply, the regional/environmental support officer is to immediately check that the forms received are the same as those detailed in the request and supply section of the Supply of Accountable Forms form. The regional/environmental support officer is then to complete the acknowledgement section of the Supply of Accountable forms form and return it to the Administration Officer. The regional/environmental support officer is required to keep an accountable forms record (type of forms, sequence numbers, date of application, date forms received) of all accountable forms received from the Administration Officer.

Once this is completed the regional/environmental support officer is to distribute the forms to the requesting manager along with the completed "supply" section of the Supply of Accountable Forms form and maintain a record in an Accountable Forms Register (type of forms, sequence numbers, date application received, date forms issued) of all forms issued to offices within the Region.

On receiving the requested supply, the requesting manager is to immediately check that the notices received are the same as those detailed in the request and supply section of the Supply of Accountable Forms form forwarded by the regional/environmental support officer, enter the details (type, sequence numbers, date application issued, date forms received) in the office's Accountable Forms Register and place the forms in secure storage. The requesting manager must then complete the acknowledgment section of the Supply of Accountable Forms form and return the form to the regional/environmental support officer.

An entry in the Accountable Forms Register is to be completed on all occasions when stocks of accountable forms have been issued for use.

---

<sup>3</sup> Accountable forms includes Penalty Infringement Notice books,

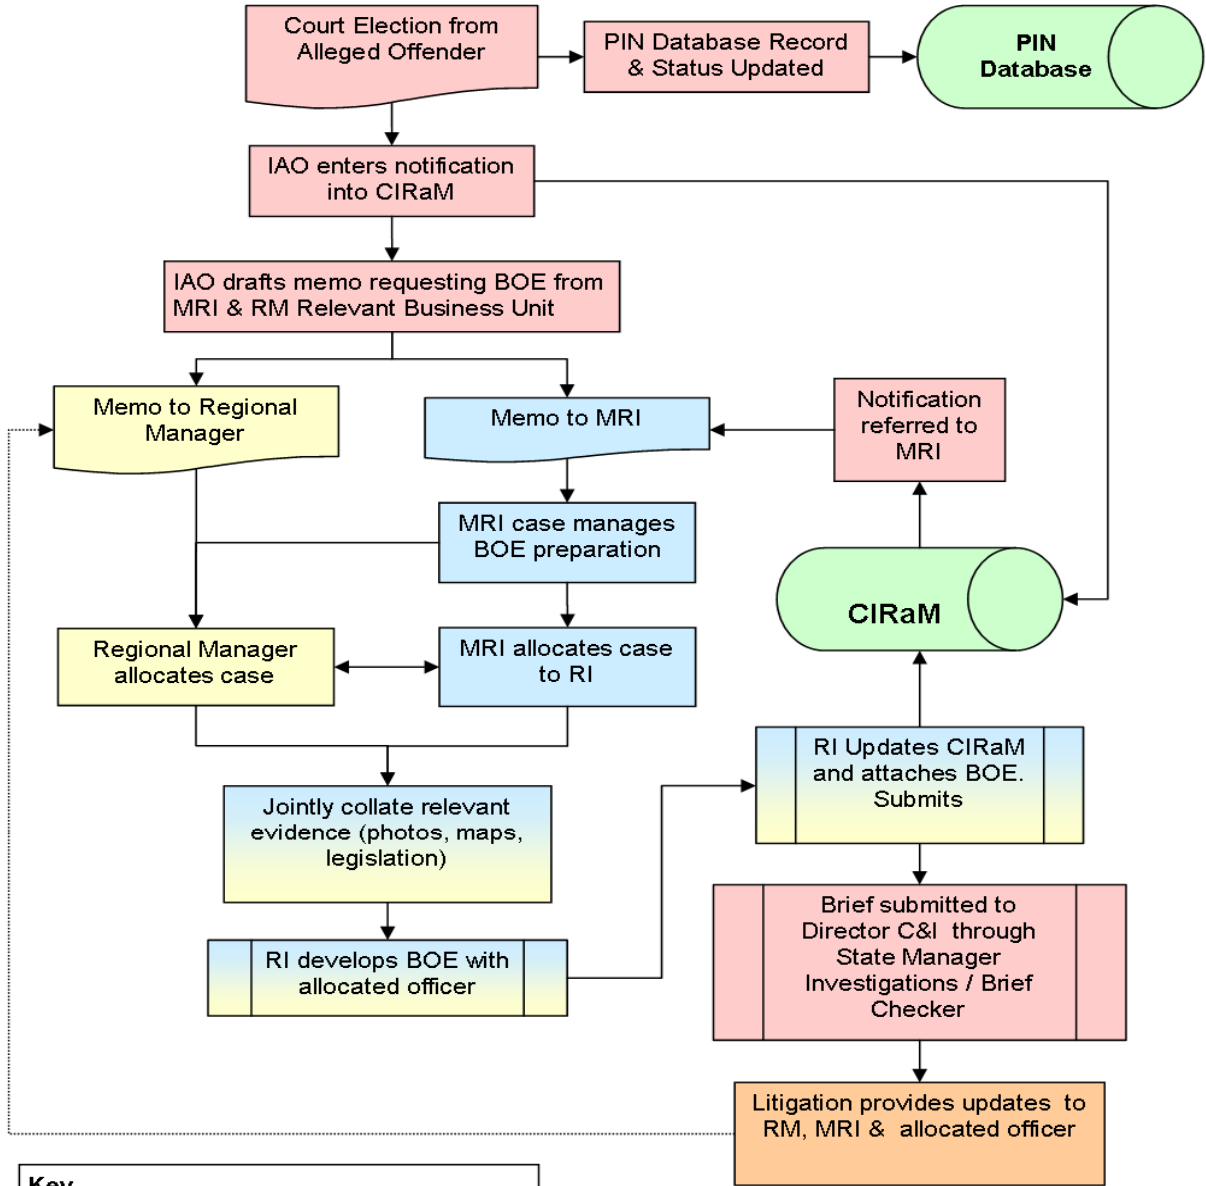

Accountable forms must be held in secure storage at all times. Accountable forms must never be left unattended at any time when not in secure storage.

**Disclaimer**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the former Environmental Protection Agency should satisfy themselves independently and by consulting their professional advisors before embarking on any proposed course of action.

# Assessment report

## *Environmental Protection Act 1994* Transitional Environmental Program (TEP)

### Part 1 – Notice requiring a draft TEP

*This document is intended for internal use to assist Environmental Services officers to record the information considered by the Department when deciding to issue a notice requiring a draft TEP.*

Identifying Details	
Compliance activity number	Number
EcoTrack number	Number
Permit number:	Permit number (if applicable)
File number:	File Number
Applicant number:	Number
Trading as:	Trading as details (if applicable)
Registered business address:	Registered business address

**Note:**

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the responsible officer, supervisor and the delegated decision-maker.

#### 1. Brief history of the matter

Briefly outline any historical information relevant to this decision in chronological order.

Briefly outline the historical information in chronological order.

#### 2. Grounds for issuing a notice requiring a draft TEP

Section 332 of the *Environmental Protection Act 1994* provides that the Department may require the submission of a draft Transitional Environmental Program (TEP) in certain circumstances. Identify on which of the following grounds the decision to issue a notice requiring a draft TEP is based.

The Department may require a person or public authority to prepare and submit to it for approval a draft TEP:

As a condition of an environmental authority (EA).

**OR**

- As a development condition of a development approval (DA).

The Department may also require a person or public authority to prepare and submit to it for approval a draft Transitional Environmental Program if it is satisfied:

- An activity carried out, or proposed to be carried out, by the person or authority is causing, or may cause, unlawful environmental harm.

**OR**

- It is not practicable for the person or public authority to comply with an environmental protection policy or regulation on its commencement.

**OR**

- That a condition of an environmental authority held by the person or public authority is, or has been, contravened.

**OR**

- That a standard environmental condition of a code of environmental compliance for a Chapter 4 activity is, or has been, contravened by the person or public authority.

**OR**

- A development condition of a development approval is, or has been, contravened and the person or public authority is:
- an owner of the land for which the approval is granted or
  - another person in whom the benefit of the approval vests.

### 3. Expand Upon the Grounds

Expand upon the grounds identified for issuing the notice requiring a draft TEP. This can include identifying an alleged offence or any statutory requirement which must be met prior to the Department issuing the notice.

Each ground should be listed independently and allocated a separate number.

Number	Specific Ground
1	Example: ABC Pty Ltd is a timber preservation/treatment operator. While conducting timber preservation/treatment activities, ABC Pty Ltd has released stormwater from its operating site that does not comply with release limits, thereby causing unlawful environmental harm. If ABC Pty Ltd does not upgrade its site and improve its stormwater management system, it is likely that non-compliant releases of stormwater from the site will continue, thereby causing further environmental harm.
2	
3	
4	

#### 4. Detail the Matters Considered

The purpose of the following table is to ensure that there is evidence to support the use of the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed (i.e. the facts and circumstances).

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

<p><b>Elements of the offence or legislative requirement</b></p> <p><i>List the elements of any grounds for issuing the notice requiring a TEP</i></p>	<p><b>Evidence</b></p> <p><i>Identify the evidence considered which is relevant to the elements or requirement (i.e. statements, photographs, and recordings)</i></p>	<p><b>Facts and Circumstances</b></p> <p><i>Detail the facts and circumstance that support the Department's findings.</i></p>
<p><b>Number 1</b> (Number taken from Section 2)</p>		
<p>An activity carried out, or proposed to be carried out by the person.....</p>	<p>Compliance Inspection CA123: Notes from officer's official notebook taken during site inspection on 20 May 2008.</p>	<p>ABC Pty Ltd carries out timber preservation and treatment activities at its site at 123 Creek Road, Murphyville.</p> <p>The inspection has shown that whilst the operators have some stormwater controls in place, it is apparent that the current system would not be able to effectively manage an increase in production and/or increased rain levels.</p>
	<p>Photographs (x20) of the ABC Pty Ltd site taken during the site inspection on 20 May 2008.</p>	<p>Photographs taken of the existing stormwater management infrastructure, including the stormwater catchments show that the catchments are 80% full. An increase in production or heavy rain is likely to fill the catchments to overflowing.</p>
<p>Is causing, or may cause, unlawful environmental harm.....</p>	<p>Compliance inspection CA456: Notes from officer's official notebook taken during compliance inspection on 3 May 2009.</p>	<p>A visual inspection of the stormwater catchments show that they are 90% full.</p>
	<p>Copy of letter to ABC Pty Ltd from the Department dated 12 May 2010.</p>	<p>Letter to ABC Pty Ltd outlining the Department's concerns in relation to stormwater controls and management on the site and reminding the site operator of its responsibilities.</p>

	Copy of the company's stormwater quality monitoring results for the past 12 months.	The stormwater quality monitoring results indicate that ABC Pty Ltd has exceeded its release limits on 2 occasions in the past 12 months.
	Compliance inspection CA780: Copy of the site operator's stormwater quality monitoring results for the previous 12 months collected from the operator during compliance inspection on 15 May 2010.	The stormwater quality monitoring results indicate that the operator has exceeded stormwater release limits on 6 occasions in the past 12 months.
	Compliance inspection CA780: Notes from officer's official notebook taken during compliance inspection on 15 May 2010.	<p>During the site inspection, Departmental officer Mary Green had further discussions with the site operator regarding the implications of the repeated exceedances of the stormwater release limits.</p> <p>The site operator says that ABC Pty Ltd has made significant investment in stormwater management infrastructure in 2005. However, the business has grown substantially since this time.</p> <p>During the discussions the site operator indicated an acceptance of the need to investigate and pursue further stormwater management improvements and included a commitment to consider drafting a voluntary TEP.</p>
	File note written by environmental officer Mary Green on 23 June 2010.	<p>ABC Pty Ltd is carrying out timber preservation/treatment activities at a site at 123 Creek Road, Murphyville.</p> <p>Visual inspections of the site in 2008, 2009 and 2010 have indicated that the business has grown substantially and the stormwater management system and infrastructure are no longer coping and require improvements.</p> <p>Annual stormwater release quality monitoring records for 2009 and 2010 indicate that ABC Pty Ltd has exceeded its stormwater release limits on a number</p>

		<p>of occasions.</p> <p>The repeated exceedences of the stormwater release limits by ABC Pty Ltd are causing unlawful environmental harm and may cause further unlawful environmental harm. The operator indicated that it would voluntarily submit a draft TEP. However, a voluntary draft TEP has not been submitted.</p> <p>In the circumstances, the Department considers that a notice requiring a draft TEP should be issued to ABC Pty Ltd.</p>

<b>Number 3</b>		

## 5. Natural Justice

The investigating officer is required to notify the affected person that the Department is considering issuing a notice requiring a TEP and that the individual may make representations to the Department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- All information and/or defences provided were considered.  
Describe any information or defences provided.
- The Department has considered the information or defences provided.  
Describe the consideration given and the conclusions formed by the Department based on the information provided.
- The decision-maker and the environmental officer are free from bias or the perception of bias.

## 6. Recommended Conditions (if appropriate)

If appropriate, please list any proposed conditions below. In order to ensure conditions are enforceable, they should be SMART - Specific, Measureable, Achievable, Relevant and Time-specific. Refer to the [Procedural Guide - Writing effective and enforceable conditions](#)

To ensure the conditions are reasonable, officers are required to provide justification for the inclusion of the condition.

<b>Proposed Requirement</b>	<b>Justification</b>

# Procedural guide

## *Environmental Protection Act 1994* Transitional environmental program (TEP)

### Part 1 – Notice requiring a draft TEP

---

*This document is designed to assist Environmental Services officers to issue a notice requiring a draft TEP under the provisions of Chapter 7, Part 3 of the Environmental Protection Act 1994.*

#### What is a TEP?

Section 330 of the *Environmental Protection Act 1994* (the Act) provides that a transitional environmental program (TEP) is a specific program which, when complied with, facilitates compliance with the Act for the activity to which the TEP relates by doing one or more of the following—

- reducing environmental harm caused by the activity
- detailing the transition of the activity to an environmental standard
- detailing the transition of the activity to comply with:
  - a condition (including a standard environmental condition) of an environmental authority or code of environmental compliance or
  - a development condition.

The legislative provisions in respect to TEPs can be found in Chapter 7, Parts 3 and 4 (ss330-357) of the Act.

#### Who can enter into a TEP?

A person or public authority may enter into a TEP voluntarily or may be required to submit a draft TEP by the Department.

#### When can a TEP be used?

TEPs are intended to be used where a significant change or changes are needed to be made by a person to achieve compliance. One of the reasons for this is that a person has some protection from prosecution for actions conducted under the TEP for the duration of the TEP.

##### (a) Requirement to submit a draft TEP

There are certain circumstances when the Department may require a person or public authority to prepare and submit for approval a draft TEP. These circumstances are set out in Section 332 of the Act.

##### (b) Voluntary TEP

Section 333 of the Act provides that a person or public authority may also, at any time, submit a draft TEP to the Department for an activity the person or public authority is carrying out or proposes to carry out.

### (c) Program notices

A person intending to prepare and submit a voluntary TEP may give the Department a program notice under s350 of the Act. For further information in regard to program notices, see: [Procedural Guide - Program notices TEP](#)

### (d) Fee for consideration of draft TEP

A person or public authority that submits a draft TEP to the Department for consideration and approval must pay the Department the fee prescribed by regulation. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

An invoice for the fees incurred should be issued to the person or public authority that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued.

## How do I successfully issue a notice requiring a draft TEP?

Officers must complete an assessment report to document the decision to issue a notice requiring a draft TEP, as well as completing the notice.

### Step 1 - Complete the Assessment Report

Before completing the notice requiring a draft TEP, officers must complete an assessment report. The assessment report sets out the facts and circumstances relating to the matter and documents the decision-making process of the Department in determining whether or not to issue the notice.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference.

The assessment report is not intended to replicate the Departmental file. Rather it should capture all critical aspects considered by the Department in making a decision. Accordingly, officers should include relevant points only. A template assessment report may be found on the Compliance Support Materials page on the Departmental intranet.

#### 1. Brief history of the matter

Briefly outline any historical information relevant to the decision. This information should be presented in succinct chronological dot points and include how the Department became aware of the issues that led the Department to consider issuing a notice requiring a draft TEP.

For example:

- *Previous compliance inspections have identified risks with stormwater controls and management on the site (CA123 – Ecotrack – May 2008) (CA456 – Ecotrack – May 2009).*
- *The operator made significant investments in stormwater management infrastructure in 2002, however the business has grown substantially since this period with no changes to stormwater management.*
- *Discussions with the operator during a compliance inspection on 10 May 2010 indicated an acceptance of the need to investigate and pursue further stormwater management improvements and included a discussion of the potential submission of a draft TEP.*

- *The Department wrote to the operator on 1 June 2010 to advise of the outcomes of the May compliance inspection.*
- *The Department received an Annual Return Form from the operator attaching stormwater release monitoring results demonstrating non-compliance with development approval conditions C11 and C12.*
- *The Department issued a notice requiring a draft TEP to another timber preservation/treatment operator in the region for non-compliance with development approval conditions associated with stormwater management issues.*

## 2. Grounds for issuing a notice requiring a draft TEP

The legislation provides in Section 332 that the Department may require the submission of a draft TEP—

- as a condition of an environmental authority or
- as a development condition of a development approval.

The Department may also require the preparation and submission of a draft TEP if satisfied that—

- an activity carried out, or proposed to be carried out by the person or authority is causing, or may cause unlawful environmental harm or
- it is not practicable for the person or public authority to comply with an environmental protection policy or regulation on its commencement or
- a condition of an environmental authority held by the person or public authority is, or has been, contravened or
- a standard environmental condition of a code of environmental compliance for a chapter 4 activity is, or has been, contravened by the person or public authority or
- a development condition of a development approval is, or has been, contravened and the person or public authority is:
  - an owner of the land for which the approval is granted or
  - another person in whom the benefit of the approval vests.

In this section, an officer must identify the relevant grounds upon which the decision to issue the notice requiring a draft TEP is based. For example:

*A timber preservation/treatment operator is required under development approval conditions to ensure that stormwater released from the site meets specific limits. A compliance inspection was undertaken on the site that identified some issues with stormwater controls and management. Following the inspection, a letter was sent by the Department to the operator advising of the outcomes of the inspection and reminding the operator of its responsibilities. The operator submitted monitoring results indicating that on occasion, stormwater was released from the site in breach of the release limits.*

*A notice requiring a draft TEP was issued to the operator based on the following grounds:*

1. *that an activity carried out, or proposed to be carried out, by the person is causing, or may cause, environmental harm and/or*
2. *that a development condition of a development approval is, or has been, contravened and the person is an owner of the land for which the approval is granted.*

### 3. Expand upon the grounds

The purpose of this section is to clearly identify the elements, or what the Department must 'prove' before deciding to use a notice requiring a draft TEP, and should be used to expand upon the grounds which have previously been identified. This can include identifying the specific offence or breach under investigation or any statutory requirements listed in the legislation which must be met by the Department prior to issuing the notice.

In instances where one action has resulted in multiple breaches, each breach should be listed independently. For example, a site inspection could potentially detect a number of breached conditions associated with a single development approval. In this situation each breach would need to be proven on its own merits and should be listed separately.

Each ground (including breaches or requirements) should be allocated a separate number.

### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the breach to the evidence gathered and the conclusions formed. This is achieved by identifying:

- the elements of any specific breach or allegation
- the evidence which has been considered for each element and
- the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence, officers should limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officer's official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents and
- any observed actions and direct testimony received from individuals.

The last column in the table requires officers to detail the relevant facts and circumstances. Officers are encouraged to consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

After considering the details, evidence, facts and circumstances, officers are required to set out how the TEP would deal with the issues.

### 5. Provide for Natural Justice

Prior to the Department making a decision which may adversely impact on an individual or group it must:

- **Notify** - Notify the individual that the Department is considering issuing a notice requiring a draft TEP
- **Respond** - Provide the individual with an opportunity to respond to the allegation and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers should use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. In some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site

inspection or a telephone interview and to take contemporaneous notes. In more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses given by the affected person. For example:

*Following each of the compliance inspections, the Department wrote to the site operator advising of the outcomes of the inspections and the risks identified with stormwater management on the site:*

- CA123 – May 2008
- CA456 – May 2009
- CA780 – May 2010

*On-site discussions with the operator during the May 2010 compliance inspection indicated an acceptance of the need to investigate and pursue further stormwater management improvements and included commitments to consider drafting a voluntary TEP.*

*Since the May 2010 compliance inspection the Department has had further discussions with the operator, raising the implications of the exceedances of the release limits observed in the stormwater quality monitoring results for the last 12 months. The operator was also informed that the Department's intention was to issue a notice requiring a draft TEP and given a period of five business days to submit any further information for consideration by the Department. The operator did not submit any formal submissions to the Department but has advised by telephone of an intention to engage a suitably qualified consultant to assist with drafting a plan of action for site upgrades.*

## 6. Proposed requirements of the TEP

Officers are required to include the following things (amongst other things as set out in s332(4)) in the notice requiring a draft TEP—

- the matters to be addressed by the program and
- the period over which the program is to be carried out and
- the day (at least a reasonable period after the notice is given) by which the program must be prepared and submitted to the Department.

In instances where it is recommended that requirements are imposed upon the affected person, officers are required to develop proposed requirements for consideration by the delegate. As affected persons are able to seek a review of the Department's decision to impose one or more conditions/requirements, it is necessary for officers to provide justification for their inclusion.

Requirements must be specific, measureable, achievable, relevant to the activity and time-specific. For further information, refer to the [Procedural Guide - Writing effective and enforceable conditions](#). For example:

Proposed requirement	Justification
<i>The draft TEP must include a stormwater management plan in order to cease all unlawful releases of stormwater from the site on or before 30 November 2011 and be submitted to DERM by 1 July 2011.</i>	<i>The development of a stormwater management plan is considered to be best practice and is a requirement which is currently being met at other ABC Pty Ltd development sites in Queensland.  Compliance inspections conducted in May 2008, 2009</i>

*The stormwater management plan must include the following—*

1. *An assessment of the existing site infrastructure, including but not limited to:
 
  - (a) *a determination of the effectiveness of existing stormwater infrastructure in controlling stormwater runoff and capturing contaminants to prevent or minimise the release of contaminants to waters and*
  - (b) *a determination of the effectiveness of existing containment facilities associated with the storage, transport and production of materials in minimising the release of contaminants to the stormwater system and*
  - (c) *a determination of the effectiveness of current management practices and procedures regarding the minimisation of stormwater contamination.**
2. *An identification of measures to improve stormwater management on site, which must:
 
  - (a) *assess the adequacy of existing pollution control measures and*
  - (b) *identify opportunities to reduce areas of surface contamination and minimise contact of stormwater with contaminants and*
  - (c) *identify opportunities to separate the clean and contaminated stormwater catchments and*
  - (d) *identify opportunities for harvesting clean stormwater for beneficial reuse and*
  - (e) *identify the infrastructure (including its appropriate structural design) required to effectively manage stormwater in each of the stormwater catchments.**
3. *A program of activities to construct measures to improve stormwater management on the site, including but not limited to:
 
  - (a) *a program of activities informed by 1 and 2 above and*
  - (b) *stormwater quality monitoring to inform the effectiveness of (a) above.**
4. *The operator is required to propose a reasonable timetable for consideration of approval by the*

*and 2010 have identified a number of exceedances of release limits of stormwater, with an increase in the last 12 months.*

*The Department has consulted with the operator on a number of occasions and discussed the implications of the exceedances. However, such consultation has not resulted in any action by the operator in relation to reducing unlawful stormwater releases.*

*The Department estimates that it will take at least 12 months for the operator to upgrade the site to a standard that results in compliance with stormwater release limits.*

*After considering all of the issues and the estimated time-frame for the operator to achieve compliance, the Department considers that requiring the operator to provide a draft TEP is the most appropriate and effective course of action.*

*As ABC Pty Ltd is currently operating in a regional area, the Department has allowed ABC Pty Ltd 9 weeks (5 weeks more than for an urban area) to develop the plan.*

<i>administering authority for the above actions to be completed.</i>	
---	--

## 7. Recommendation

The responsible officer is required to make a recommendation in relation to the alleged breach. For example:

<i>It is the opinion of the Department that ABC Pty Ltd failed to comply with development conditions D11 and D12 of development approval IPDE123456 by allowing stormwater to leave 24 Jones Road and enter Murphy Creek. After considering all factors the Department has determined that requiring a draft TEP would be the most effective way of achieving the operator's compliance with the development conditions. It is recommended that a notice requiring a draft TEP be issued.</i>
---

Administrative decisions are made based upon the balance of probabilities. This means that the decision-maker must be able to determine whether, based upon the information available, it was more likely than not that the event occurred.

Officers are encouraged to consider alternative actions/tools, the Department's enforcement guidelines, details of any consultations including site visit details and discussions with the ERA contact officer (if applicable) prior to making a recommendation. The reasonableness of proposed timeframes for the completion and submission of the draft TEP for consideration and approval, and the period over which the TEP is to be carried out, should be taken into account. For example, if the location is geographically isolated, or there is an impending wet season, the Department may consider allowing additional time for the recipient of the notice to prepare the draft TEP.

## 6. Approval

The assessment report is to be approved by an appropriately delegated officer. The Department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations/>

### Step 2 - Complete the notice requiring a TEP

The notice requiring a draft TEP must meet a number of legislative requirements in order to be legally binding. A requirement to prepare and submit a draft TEP must be made by written notice which must state—

- the grounds on which the requirement is made and
- the matters to be addressed by the TEP and
- the period over which the TEP is to be carried out and
- the day (at least a reasonable period after the notice is given) by which the TEP must be prepared and submitted to the Department and
- the review or appeal details.

A template notice requiring a draft TEP is included in the TEP material.

The notice and the assessment report must be signed by the decision-maker.

## Service of a notice requiring a draft TEP

Service means delivery to the party who will be responsible for actioning the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question.

Methods of service are provided for in ss39 and 39A of the *Acts Interpretation Act 1954* (AI Act).

A notice requiring a draft TEP may be served:

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by post, facsimile or similar facility (e.g. email) to the person's last known place of residence or business or
- on a body corporate - by leaving it at, or sending it by post, facsimile or similar facility (e.g. email) to the head office, a registered office or a principal office of the body corporate.

The date, time and method of service should be documented by contemporaneous notes, a file note, any receipts arising from the postage or any facsimile confirmations and email 'read' receipts.

## What follow-up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the notice requiring a draft TEP is issued complies within the required time-frame. Follow-up is to be scheduled by the relevant officer and confirmed with the business area manager. The business area manager is responsible for ensuring follow-up is undertaken within the agreed time frame.

Once a notice has been issued, dates for the submission of the draft TEP and the review and appeal periods should be diarised and monitored. If the draft TEP is not submitted by the due date, follow-up should be carried out by way of a site visit or telephone call. The recipient should be reminded that the time-frame has expired and that non-compliance with the notice could lead to prosecution.

The recipient of the notice requiring a draft TEP may contact the Department during the period of the notice and establish legitimate reasons for non-compliance with the relevant time frame. In this instance the Department may consider granting an extension of time. However, it must be remembered that the affected person should communicate any issues with time-frames prior to their expiration. For further information regarding amendments to an issued notice requiring a draft TEP, please see the paragraph below headed 'Amendments to an issued notice requiring a draft TEP'.

## What are my record-keeping responsibilities?

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). Hard copies of any relevant documents should be placed on the paper file. The Department is required to make and record an informed decision about all allegations of non-compliance.

## Amendments to an issued notice requiring a draft TEP

If minor changes to the notice requiring a draft TEP or an extension of time to respond are required, the recipient of the notice should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original notice, and issue a fresh one on the same grounds with the necessary changes.

The repeal and issue of a fresh notice requiring a draft TEP should be carried out in the same way, and subject to the same conditions as the issuing of the original notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision to issue a fresh notice is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal to or higher than that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and re-issue the notice in EcoTrack or CIRaM and place hard copies of any documents on the paper file.

## Review of decisions and appeals

The provisions regarding review of decisions and appeals may be found in Chapter 11, Part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision made by the Department in respect to a notice requiring a draft TEP may apply for a review of an original decision by submitting an application on the approved form to the Department—

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or
- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the Planning and Environment Court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court by filing written notice of appeal with the registrar of the Court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the Court extends the period for filing the notice of appeal.

The court may grant a stay of a decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## Non-Compliance with a notice requiring a draft TEP

Officers must respond and may take further action in relation to non-compliance with a notice requiring a draft TEP. The following issues should be considered—

- **Providing extra time** – If extra time to comply has been granted, officers should document the details of the extra time allowed and the reasons for giving the extension of time. Confirmation of these details should be provided in writing to the recipient of the notice.
- **Other tools** – It may be that using another compliance tool would be more likely to achieve compliance. For example, issuing an Environmental Protection Order (EPO) in relation to the non-compliance may be a more appropriate way to achieve compliance due to the far higher penalty for breaching the EPO.
- **Prosecution** – If no other action is likely to be effective, officers should consider prosecuting a non-compliant recipient of a notice requiring a TEP for both failure to comply with the notice as well as for the environmental harm being caused.

### **What penalties exist for non-compliance with a notice requiring a draft TEP?**

A person must comply with a notice requiring a draft TEP, unless the person has a reasonable excuse (s332(5)).

Maximum penalty for non-compliance with a notice requiring a TEP—

For an individual – 100 penalty units or \$10,000.00.

For a corporation – 500 penalty units or \$50,000.00.

# Notice

## *Environmental Protection Act 1994* Transitional Environmental Program (TEP)

### Notice requiring a draft TEP

*This notice requiring a draft Transitional Environmental Program is issued by the administering authority pursuant to s332 of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* (the Act), a notice requiring a draft Transitional Environmental Program (TEP) is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

The notice requiring a draft TEP is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the premises).

#### A. Grounds

The notice requiring a draft TEP is issued on the following grounds:

- Insert the applicable grounds under s332 of the Act.
- Insert the applicable grounds under s332 of the Act.
- Insert the applicable grounds under s332 of the Act.
- Insert the applicable grounds under s332 of the Act.

The facts and circumstances forming the basis for these grounds are:

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.

#### **B. Matters to be addressed by the TEP**

You are required to address the following matters in the draft TEP:

1. Insert the matters to be addressed by the program.
2. Ensure the requirements are specific, measurable, attainable, relevant and time-specific.
3. Insert the matters to be addressed by the program.
4. Ensure the requirements are specific, measurable, attainable, relevant and time-specific.
5. Insert the matters to be addressed by the program.
6. Ensure the requirements are specific, measurable, attainable, relevant and time-specific.
7. Insert the matters to be addressed by the program.
8. Ensure the requirements are specific, measurable, attainable, relevant and time-specific.

The TEP is to be carried out [insert time period over which the TEP is to be carried out].

#### **TAKE NOTICE that:**

- The requirements of the notice requiring a draft TEP take effect immediately upon service of the notice
- This notice remains in force until further notice from the administering authority.
- The draft TEP must be prepared and submitted to the Department by date (must be at least a reasonable period after the notice is given).

#### **C. Appeal rights**

You may apply for a review of the decision to issue the notice requiring a draft TEP within ten business days of the service of the notice. You may also apply to the court for a stay of the decision to issue the notice.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Specific information regarding the process for seeking a review or appeal is attached to this notice.

However, the information outlining the review and appeal process under the *Environmental Protection Act 1994* is intended as a guide only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

#### **D. Penalties**

You must comply with this notice unless you have a reasonable excuse. The maximum penalties for non-compliance are:

- For an individual - \$10,000.00.

- For a corporation - \$50,000.00.

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

# Notice

## *Environmental Protection Act 1994* Environmental evaluation

### Notice requiring additional relevant information

---

*This notice requiring additional relevant information is issued by the administering authority pursuant to s326(4) of the Environmental Protection Act 1994.*

Date

Recipient's name

Street address

Suburb, State and Postcode

Your reference: Your reference

Our Reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* a notice requiring additional further information on an environmental report is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

This notice requiring additional relevant information is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the "said premises"). The additional relevant information is required in regard to a report on an environmental <PICK FROM LIST> submitted by you to the Department on date.

#### **A. Grounds**

The notice requiring additional relevant information is issued on the following grounds:

- Insert the applicable grounds under the relevant legislation.
- For example: A notice to conduct or commission an environmental [audit] OR [investigation] was given to you by the Department on [date].
- For example: An environmental report was submitted to the Department by you on [date].by you on [date].
- For example: The Department is satisfied that additional relevant information is required regarding the environmental evaluation and/or the report.
- For example: The Department requires you to give it the information.

The facts and circumstances forming the basis for these grounds are:

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.

### **B. Requirements**

The additional relevant information you are required to provide is as follows:

- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.
- List the additional relevant information required by the Department.

The additional relevant information must be submitted to the Department on or before:

- date

### **TAKE NOTE that:**

- The requirements of the notice to provide additional relevant information take effect immediately upon service of the notice.
- This notice remains in force until further notice from the Department.
- You are responsible for meeting the costs of providing the additional relevant information to the Department.

### **C. Appeal rights**

There is no specific provision in the Act for review or appeal regarding a notice to provide additional relevant information. A person aggrieved by the decision to issue this notice may be able to make an application under the *Judicial Review Act 1991* for a statutory order of review pursuant to s20 or 21 of that Act or a request for a statement of reasons for the decision pursuant to s32 of that Act.

However, the information outlining the review and appeal process under the *Judicial Review Act 1991* should be considered as general advice only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

# Assessment report

*Environmental Protection Act 1994*  
Environmental evaluation

## Part 1 – Notice to conduct or commission an environmental evaluation

*This document is intended for internal use to assist environmental services officers to record the information considered by the Department when forming the decision to issue a notice to conduct or commission an environmental evaluation.*

Identifying details	
Compliance activity number	Number
EcoTrack number	Number
Permit number	If applicable
File number	File number
Applicant number	Number
Trading as	Trading as details
Registered business address	Address
Date decision made	Date  Note: Within eight business days after deciding to require an environmental audit or an environmental investigation, the Department must give the intended recipient of the notice an information notice about the decision. This requirement may be met by issuing the notice within the eight business day period.

**Note:**

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be approved by the environmental officer, supervisor (where possible) and the delegated decision-maker.

### 1. Grounds to issue a notice to conduct or commission an environmental evaluation

Please identify the relevant grounds upon which the decision to issue a notice to conduct or commission an environmental evaluation is based. Officers are required to establish whether the environmental evaluation required should be an environmental audit (s322) or an environmental investigation (s323).

- Environmental audit**
- A person who holds or is acting under an environmental authority (EA) is breaching, or has breached, a condition of the authority.

OR

- A person is contravening, or has contravened, a development condition of a development approval (DA).

OR

- A person is, or has been, contravening a regulation, an environmental protection policy or a transitional environmental program (TEP).

- Environmental investigation**

- An event has happened causing environmental harm while an activity was being carried out.

OR

- An activity has caused, or a proposed activity is likely to cause, environmental harm.

## 2. Expand upon the grounds

Please expand upon the grounds identified for issuing the notice to conduct or commission an environmental evaluation. This can include identifying a specific alleged offence or any statutory requirement which must be met prior to the Department using the notice.

Each ground should be listed independently and be allocated a separate number.

Number	Specific ground
1	Example: ABC Pty Ltd , a company carrying out effluent irrigation activities, has caused environmental harm by releasing contaminants onto a neighbouring property.
2	Example: ABC Pty Ltd has breached its TEP by releasing contaminants onto land from premises situated at 123 Creek Road, Murphyville that are owned by ABC Pty Ltd.
3	Example: ABC Pty Ltd is contravening a DA condition by causing salt scald on a neighbouring property due to the carrying out effluent irrigation activities on premises situated at 123 Creek Road, Murphyville.
4	

## 3. Brief history of the matter

Briefly outline any historical information relevant to this decision in chronological order.

Briefly outline the historical information in chronological order.

## 4. Detail the matters considered

The purpose of the following table is to ensure that there is evidence to support the grounds for using the statutory tool. This is achieved by linking the elements of the breach to the evidence gathered and the conclusions formed. This section should also record how the Department has met any statutory requirements associated with the use of the statutory tool.

When analysing evidence or developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of the information available, historical details, professional expertise and the weight attributed to any direct testimony provided.

<p><b>Elements of the offence or legislative requirement</b></p> <p><i>List the elements of any allegation or the grounds which must be met for issuing the notice to conduct or commission an environmental evaluation</i></p>	<p><b>Evidence</b></p> <p><i>Identify the information considered which is relevant to the elements or proving the grounds (i.e. statements, photographs, and recordings)</i></p>	<p><b>Facts and circumstances</b></p> <p><i>Detail the facts and circumstances that support the Department's findings.</i></p>
<b>Number 1</b>		
<p>1 July 2010 at 9.30am</p>	<p>File note of telephone call on 1 July 2010 at 9.30am from Mr Flower, owner of the property adjacent to the northern boundary of 123 Creek Road, Murphyville.</p>	<p>Mr Flower has alleged that effluent irrigation activities carried out by a neighbour, ABC Pty Ltd at 123 Creek Road, Murphyville, are causing salt scald to his property.</p>
<p>123 Creek Road, Murphyville (more particularly known as Lot 555 on RP 78987)</p>	<p>SLAM Data identifying property boundary</p>	<p>Shows the northern boundary of 123 Creek Road, Murphyville where it borders onto Lots 1 and 2 on RP 45678 which are owned by Mr Flower.</p>
<p>JP Citizen</p>	<p>Title Search identifying Mr Citizen as owner of 123 Creek Road, Murphyville.</p>	<p>Mr John Paul Citizen is the registered owner of 123 Creek Road, Murphyville, more particularly known as Lot 555 on RP 78987.</p>
<p>ABC Pty Ltd</p>	<p>ASIC company extract for ABC Pty Ltd.</p>	<p>ASIC company extract shows Mr JP Citizen to be the sole director and secretary of ABC Pty Ltd.</p>
<p>An activity is being carried out.....</p>	<p>Photographs (x 15) taken during site visit by Ms Green of DERM on 1 July 2010 showing a designated effluent irrigation area along the northern boundary of 123 Creek Road, Murphyville.</p>	<p>ABC Pty Ltd is carrying out effluent irrigation activities at 123 Creek Road, Murphyville which is inconsistent with its DA conditions.</p>
<p>An activity or proposed activity is causing, or is likely to cause environmental harm.....</p>	<p>File note of conversation with complainant Mr Flower during site visit on 1 July 2010 at 2.00pm to 4.00pm.</p>	<p>Mr Flower states that an area of his property adjacent to the northern boundary of 123 Murphy Road, Murphyville appears to have been affected by salt scald caused by</p>

		<p>effluent irrigation activities from mid 2009 and the following months.</p> <p>Mr Flower reported that the affected area had increased in size over a period of five to six months but had approximately doubled in size over the past three months.</p>
<p>It is alleged that contaminants have been released to land beyond the boundaries of 123 Creek Road, Murphyville.....</p>	<p>Photographs (x 16) taken of Lots 1 and 2 on RP 456 near northern boundary of 123 Creek Road, Murphyville by DERM officer Ms Green during site visit on 1 July 2010 during which Ms Green inspected the alleged salt affected area.</p>	<p>Ms Green noted what appeared to be a salt-affected area approximately 48 metres from north to south and approximately 37 metres from east to west on Lots 1 and 2 on RP 456. The area was approximately 10 metres down the slope from the northern boundary fence of 123 Creek Road, Murphyville.</p> <p>Photographs show the alleged salt-affected area has almost no living vegetation on it. Two trees upslope but adjacent to the affected area have recently died.</p>
	<p>Surface soil samples (0 to 10cm) were taken from two locations in the affected area and two other samples were taken nearby from which appears to be an unaffected area.</p>	<p>Results of the analysis carried out on the soil samples indicates salt scald of the alleged affected area on Lots 1 and 2 on RP 456.</p>
		<p>It is the conclusion of Ms Green, a senior environmental officer of DERM, that the salt scald on Mr Flower's property has been caused by the release of contaminants to land as a result of effluent irrigation activities carried out by ABC Pty Ltd at 123 Creek Road, Murphyville.</p> <p>Based on a site inspection, analysis of soil samples and discussions with the complainant, Mr Green is of the opinion that effluent irrigation activities being carried out by ABC</p>

		<p>Pty Ltd are causing environmental harm, namely salt scald, on an adjacent property.</p> <p>In the circumstances it is appropriate to issue a notice to conduct or commission an environmental evaluation (environmental investigation) to Mr John Paul Citizen as director of ABC Pty Ltd.</p>
<b>Number 2</b>		

## 5. Provide for natural justice

Officers are required to notify the affected person that the Department is considering issuing a notice to conduct or commission an environmental evaluation and that the individual is welcome to make representation to the Department as to why this action should not be taken. Any information provided by the affected person is to be documented and considered.

Sections 322(2) and 323(2) of the Act state that within eight business days after making a decision to require a person to conduct or commission an environmental audit or environmental investigation, the Department must give the person an information notice about the decision. The legislative requirements in regard to the information notice will be met by serving the notice to conduct or commission an environmental evaluation upon the individual concerned within 8 business days.

- The person has been provided with the opportunity to put their side of the story forward.  
Describe how this was achieved.
- All information and/or defences provided have been considered.  
Please describe any information or defences provided.
- The Department has considered the information or defences provided.  
What consideration was given and what conclusions has the Department formed?
- The decision-maker and the environmental officer are free from bias or the perception of bias.

## 6. Relevant matters for the environmental evaluation

List any relevant matters for the environmental evaluation below – that is, the matters that the recipient of the notice will be required to investigate or audit.

The relevant matters must be SMART: specific, measurable, achievable, relevant and time specific. Refer to the [Writing effective and enforceable conditions procedural guide](#) for more information on writing conditions and/or requirements.

As the recipient can seek a review of the decision to require an environmental evaluation, officers are required to provide justification for the inclusion of the relevant matters.

## 7. Recommendation

The environmental officer is required to make a recommendation in relation to issuing the notice to conduct or commission an environmental investigation.

### Recommendation:

Example: It is the opinion of the Department that ABC Pty Ltd failed to comply with its development conditions by allowing storm water to leave 24 Jones Road and enter Murphy Creek. It is recommended that a notice to conduct or commission an environmental evaluation be issued.

## 8. Approval

Environmental officer	Supervisor (if applicable)

# Procedural guide

## *Environmental Protection Act 1994* Environmental evaluation

### **Part 1 – Notice to conduct or commission an environmental evaluation**

*This document is intended for internal use to assist Environmental Services officers to issue a notice to conduct or commission an environmental evaluation.*

#### **What is an environmental evaluation (s321)?**

An environmental evaluation is an administrative tool designed to assess the nature, extent and cause of environmental harm being caused for the purpose of facilitating a solution to the problem.

The legislative provisions relating to environmental evaluations can be found in ss321 to 329 of the *Environmental Protection Act 1994* (the Act). The Act provides that an environmental evaluation is an evaluation of an activity or event to decide—

- the source, cause or extent of environmental harm being caused, or likely to be caused, by the activity or event and
- the need for a transitional environmental program for the activity or event.

There are two types of an environmental evaluation:

- (1) environmental audit (s322 of the Act)
- (2) environmental investigation (s323 of the Act)

A person given a notice to conduct or commission an environmental evaluation must carry out an audit or investigation into the matters stated in the notice and submit a report on that evaluation to the Department.

#### **Who can issue a notice to conduct or commission an environmental evaluation?**

A notice to conduct or commission an environmental evaluation can be issued by the administering authority or delegates of the administering authority.

Decisions made by individuals who do not have the delegated authority to make the decision will be found to be invalid.

As the individual (or position) that holds delegation changes regularly, officers must review the Department's list of delegations at <http://insite2.dnr.qld.gov.au/derm/delegations/>

#### **When should I require an environmental evaluation?**

##### **(1) Environmental audit (s322)**

The Department may require a person to conduct or commission an environmental audit and submit a report on the audit, if it is satisfied on reasonable grounds that a person is breaching a condition of an environmental

authority (EA) or contravening a regulation, environmental protection policy or a transitional environmental program (TEP) under the Act or contravening a development condition of a development approval (DA) given pursuant to the provisions of the *Sustainable Planning Act 2009*.

**Example:**

*The Department has received a telephone call from a member of the public complaining of a foul smelling liquid emanating into Murphy Creek from the site of ABC Pty Ltd, operators of a sewage treatment plant. A limited site inspection carried out by a senior officer in the vicinity of Murphy Creek has confirmed the presence of a foul liquid being discharged from the site.*

*ABC Pty Ltd, the holder of Development Approval (DA) number 68754, must comply with a condition of the DA, which requires effluent to be appropriately treated and meet development approval water quality levels prior to being released. The Department is satisfied on reasonable grounds that treated effluent that is contaminated above development approval water quality release limits has been released into Murphy Creek.*

*In this instance, the Department does not know the exact cause of the treatment failure (e.g. could be volume of effluent to be treated, failure of biological treatment process, or possibly the quality of the influent) to be able to direct steps to be taken to rectify. An environmental audit would be the appropriate type of environmental evaluation to be used in the circumstances as the Department is satisfied on reasonable grounds that ABC Pty Ltd has contravened a development condition of DA number 68754 and requires further information in regard to the contravention so as to identify the cause of the problem and position the Department and holder of the DA as to what steps should then be taken to rectify the problem.*

## (2) Environmental investigation (s323)

The Department may require a person to conduct or commission an environmental investigation, and submit a report on the investigation, if it is satisfied on reasonable grounds that an event causing environmental harm has occurred while an activity was being carried out, or an activity or proposed activity is causing, or is likely to cause, environmental harm.

**Example:**

*It has been alleged in a telephone call from a member of the public that ABC Pty Ltd, in the course of its business activities, has released a large amount of contaminated waste into Murphy Creek, thereby causing environmental harm. A senior officer of the Department has attended the site at Murphy Creek where it is alleged the contaminated waste was released and noted brown sludge oozing from the western boundary of the ABC Pty Ltd site into Murphy Creek. Water samples were taken from Murphy Creek and samples of the sludge were also taken from the area near the creek and from the western boundary of the ABC Pty Ltd site. Testing of the samples indicates that both the water and area surrounding Murphy Creek are contaminated with toxic chemicals. The same chemicals have been found in the sludge sample taken from near the ABC Pty Ltd site.*

*In the circumstances, the Department is satisfied on reasonable grounds that an event has happened causing environmental harm while ABC Pty Ltd was carrying out an activity. Accordingly it would be appropriate to require ABC Pty Ltd to carry out an environmental investigation.*

*A number of factors might need to be investigated in this instance, including obtaining information on how the release of toxic waste came about, what could have been done to prevent it, what could be done to prevent it happening again and the extent of the harm caused to the environment by the event.*

### Consider alternative tools

Before issuing a notice to conduct or commission an environmental evaluation, officers should consider if any other tool may be more suitable to use. For instance, it may be possible that the required information can be obtained by using a notice to provide relevant information under s451 of the Act. Or it may be more appropriate for preliminary investigation and testing to be done pursuant to the provisions of s453, or an initial inspection to be carried out under s454 of the Act.

### What can the Department require someone to do in an environmental evaluation?

The notice to conduct or commission an environmental evaluation must set out the matters that the recipient is required to address in the evaluation. The matters must be aimed at determining the source, cause or extent of environmental harm being caused by the activity or event that the notice relates to. The recipient cannot be required to conduct an evaluation into matters that are not related to finding out about environmental harm.

The notice must not require the recipient to do things that are not in the nature of an evaluation. For example, the notice may require the recipient to conduct monitoring or sampling but may not require the recipient to implement a plan or carry out works. If officers require the recipient to take actions in addition to carrying out an environmental evaluation, an environmental protection order should be issued as well as the notice.

The notice may not require the recipient to submit interim reports.

### How do I successfully issue a notice to conduct or commission an environmental evaluation?

Officers must complete an assessment report to document the decision as well as completing the notice to conduct or commission an environmental evaluation.

### Step 1 - Complete the assessment report

Before completing the notice to conduct or commission an environmental evaluation, officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter and documents the decision making process used by the Department in determining to issue the notice.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference.

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have led to the Department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is attached [\[LINK\]](#)

What follows is what is needed to assess:

#### 1. Grounds for issuing a notice to conduct or commission an environmental evaluation

The legislation specifies that an environmental evaluation can only be required in certain circumstances. Please identify the relevant situation or 'grounds' upon which the decision to issue a notice to conduct or commission an environmental evaluation is based.

The Department may require a person to conduct or commission an environmental audit (s322 of the Act) if it is satisfied on reasonable grounds that—

- a person who holds or is acting under and environmental authority (EA) is, or has been, breaching a condition of the authority or
- a person is, or has been, contravening a development condition of a development approval (DA) or
- a person is or has been contravening a regulation, an environmental protection policy or a transitional environmental program (TEP).

**OR**

The Department may require a person to conduct or commission an environmental investigation (s323 of the Act) if it is satisfied on reasonable grounds that—

- an event has happened causing environmental harm while an activity was being carried out or
- an activity or proposed activity is causing, or is likely to cause environmental harm.

Officers will need to establish whether the environmental evaluation required should be an environmental audit (s322) or an environmental investigation (s323).

A definition of environmental harm may be found in s14 of the Act.

## **2. Expand upon the grounds**

The purpose of this section is to clearly identify what the Department must ‘prove’ before deciding to issue a notice to conduct or commission an environmental evaluation and should be used to expand upon the grounds which have previously been identified. This should also include any statutory requirement listed in the legislation which must be met by the Department prior to issuing a notice to conduct or commission an environmental evaluation and can include identifying any specific offences or breaches under investigation.

In instances where one action has resulted in multiple breaches each breach should be listed independently. For example, a site inspection could potentially detect a number of breached conditions associated with a single development approval. In this situation each breach would need to be proven on its own merits and should be listed separately.

Each ground (including breaches or requirements) should be allocated a separate number.

## **3. Brief history of the matter**

Please briefly outline any historical information relevant to this decision. This information should be presented in succinct chronological dot points and should include how the Department became aware of the alleged breach.

## **4. Detail the matters considered**

The purpose of the table in the assessment report is to link the elements of the breach to the evidence gathered and the conclusions formed. This is achieved by identifying: the elements of any specific breach or allegation, the evidence which has been considered for each element, and the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence considered officers are encouraged to limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officer’s official notebook

- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents and
- any observed actions and direct testimony received from individuals.

When developing the facts and circumstances, officers are encouraged to consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

## 5. Provide for natural justice

Prior to the Department making a decision which may adversely impact on an individual or group the Department must:

- **Notify** - Notify the individual that the Department is considering making adverse findings
- **Respond** - Provide the individual with an opportunity to respond and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers are encouraged to use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. While in some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site inspection or a telephone interview and to take contemporaneous notes, in more serious circumstances a written notification which includes a specific closing date for submissions should be used.

## 6. Relevant matters for the environmental evaluation

Section 327 of the Act provides that the recipient of a notice to conduct or commission an environmental evaluation must meet the costs of carrying out the requirements of the notice and of providing any additional relevant information about the report required by the Department. Carrying out the environmental evaluation and preparing the required report may also cause down-time and potential loss of profits for the recipient of the notice. Officers should consider whether the expense and inconvenience to the recipient is justified in the circumstances.

The notice must set out the relevant matters for the environmental evaluation – that is, the issues that the recipient of the notice is required to investigate or audit. As the recipient can seek a review of the notice, it is necessary for officers to provide justification for the inclusion of each of the relevant matters.

The relevant matters must be specific, measureable, achievable, time-specific and relevant to the breach or reason why the notice to conduct or commission an environmental evaluation is being issued. For example:

*On or before 5.00pm on 24 July 2010, ABC Pty Ltd will have carried out an assessment of affected soils and comparison with unaffected soils that addresses at least the following matters:*

- (i) an analysis of affected soils, and comparable unaffected soils, for a range of analytes sufficient to identify any impacts that may have resulted from the irrigation of effluent on ABC Pty Ltd and*
- (ii) a description of the contaminants contained in the effluent irrigated and sludges applied on the ABC Pty Ltd site, including the results of a recent analysis of effluent and sludge for analytes found at elevated levels in soils from the affected area and*

(iii) the date, quality and quantity of effluent and sludge applied for each irrigation run in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010 and an analysis of rainfall records and soil moisture records at the times of irrigation for the same period and

(iv) an assessment of the quantity of contaminants applied per hectare in the area known as Lot 123 on RP 45678 from 1 June 2008 to 1 June 2010.

A copy of the assessment must be provided to the Department on or before 5.00pm on 24 July 2010.

## 7. Recommendation

The investigating officer is required to make a recommendation in relation to the alleged breach. For example:

*It is the opinion of the Department that ABC Pty Ltd failed to comply with its development conditions by allowing storm water to leave 24 Jones Road and enter Murphy Creek. It is recommended that a notice to conduct or commission an environmental evaluation be issued.*

Administrative decisions are made based upon the balance of probabilities. This means that the decision maker must be able to determine whether, based upon the information available, it was more likely than not that the event occurred.

Officers are encouraged to consider alternative actions/tools, departmental enforcement guidelines, details of any consultation undertaken including site visit details and discussions with the ERA contact officer. The reasonableness of proposed timeframes for the completion of requirements (for example, if earthworks are involved the Department should consider whether an impending wet season may result in delays, or if the location is geographically isolated the Department should consider allowing additional time to secure an appropriate contractors).

## 8. Approval

The assessment report is to be approved by an appropriately delegated officer. The Department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations/>.

### Step 2 - Complete the notice to conduct or commission an environmental evaluation (s324)

Sections 322(2) and 323(2) of the Act provide that a requirement to conduct or commission an environmental evaluation must be made by written notice and must—

- state the grounds on which the requirement is made and
- outline the facts and circumstances forming the basis for the grounds and
- state the relevant matters for the evaluation and
- state the day (at least a reasonable period after the notice is given) by which an environmental report must be submitted to the Department.

#### Information notice

Sections 322(2) and 323(2) of the Act also state that within eight business days after making a decision to require a person to conduct or commission an environmental audit or environmental investigation, the

Department must give the person an information notice about the decision. The information notice must be in writing and must state the following—

- the decision and
- the reasons for the decision and
- the review or appeal details.

In order to meet these legislative requirements and to ensure the notice is readily understood by the recipient, the information required to be provided in the information notice must be included in the notice to conduct or commission an environmental evaluation. Officers should ensure that this notice is served upon the recipient within eight business days. If this is not possible, an information notice must be sent to the recipient within the eight business day period. The template notice to conduct or commission an environmental evaluation includes the information that must be included in the information notice.

A template notice to conduct or commission an environmental evaluation is attached [\[LINK\]](#)

A copy of the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#) should be attached to the notice.

The notice to conduct or commission an environmental evaluation should be signed by the decision maker in conjunction with the assessment report which records the formal decision.

### Complete the statutory declarations

When an environmental report is submitted to the Department, it must be accompanied by statutory declarations signed by the recipient of the notice and the person who carried out the environmental evaluation (s325 of the Act). Copies of the template statutory declarations should be provided to the recipient of a notice to conduct or commission an environmental evaluation along with the notice itself. Template statutory declarations are attached: [\[LINK\]](#)

### Service of a notice to conduct or commission an environmental evaluation

Service means delivery to the party who will be responsible for actioning the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question. Methods of service are provided for in ss39 and 39A of the *Acts Interpretation Act 1954* (AI Act).

For the purposes of any Act that requires a document to be served on (which includes 'given' or 'sent to') a person, the document may be served:

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by post, facsimile or similar facility (e.g. email) to the person's last known place of residence or business or
- on a body corporate - by leaving it at, or sending it by post, facsimile or similar facility (e.g. email) to the head office, a registered office or a principal office of the body corporate.

The date time and method of service should be documented by contemporaneous notes, a file note, any receipts arising from the postage or any facsimile or email confirmations.

## What follow-up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the notice to conduct or commission an environmental evaluation is issued is complying with any requirements imposed. Follow-up is to be scheduled by the relevant officer and confirmed with the business area manager. The relevant manager is responsible for ensuring follow up is undertaken within the agreed time frame.

This is usually achieved by checking that the environmental report has been received by the department by the due date, followed by a site inspection to be conducted one week after the time period nominated in the notice has expired. Officers are encouraged to use tools such as diary reminders to ensure the matter is followed up in a timely manner.

If the recipient of the notice fails to provide the environmental report by the due date, or the follow-up site visit uncovers further problems, officers must consider what further action should be taken. This may include enforcement action or the use of an alternative compliance tool, such as an environmental protection order (EPO) for example.

## What are my record keeping responsibilities?

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). A hard copy of the notice to conduct or commission an environmental evaluation, the signed assessment report and any accompanying documents must be placed on the paper file. The Department is required to make, and record, an informed decision about all allegations of non-compliance.

It is important that officers adequately respond to and report on all inquiries in order to assist in building a comprehensive compliance history.

## Amendments to an issued notice to conduct or commission an environmental evaluation

If minor changes to the notice to conduct or commission an environmental evaluation or an extension of time are required, the recipient of the notice should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original notice, and issue a fresh one on the same grounds with the necessary changes. It is important to note that the recipient will have a fresh appeal rights and should be advised accordingly.

The repeal and issue of a fresh notice to conduct or commission an environmental evaluation should be carried out in the same way, and subject to the same conditions as the issuing of the original notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal or higher to that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and reissue the notice in EcoTrack and place hard copies of any documentation on the paper file.

## **Review of decisions and appeals (ss519 to 539 of the Act)**

The provisions regarding review of decisions and appeals may be found in ss519 to 539 of the Act.

The Act specifies that a person who is dissatisfied by a decision by the Department in respect to an environmental evaluation may apply for a review of an original decision by submitting an application on the approved form to the Department within:

- within 10 business days after the day on which the person received notice of the original decision or the date when the Department is taken to have made the decision (the “review date”) or
- such longer period as allowed by the department if there are special circumstances.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#).

If the person is dissatisfied with the review decision, the person may appeal to the Planning and Environment Court by filing written notice with the court within 22 business days after the person receives notice of the review decision, unless this time period is extended by the court.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#).

## **What penalties exist for non-compliance with a notice to conduct or commission an environmental evaluation?**

A person must comply with a notice to conduct or commission an environmental evaluation unless the person commences court proceedings or has a reasonable excuse.

Should a person fail to comply with a notice to conduct or commission an environmental evaluation, the Department may determine to commence legal proceedings.

The maximum penalty for an individual is 100 penalty units or \$10,000.00.

The maximum penalty for a corporation is 500 penalty units or \$50,000.00.

# Notice

## *Environmental Protection Act 1994* Environmental Evaluation

### **Notice to conduct or commission an environmental evaluation<sup>1</sup>**

---

*This notice to conduct or commission an environmental evaluation is issued by the administering authority pursuant to <PICK FROM LIST> of the Environmental Protection Act 1994.*

Date

Recipient's name

Business name (if applicable)

Street address

Suburb, State and Postcode

Your reference: Your reference

Our Reference: Our reference

**TAKE NOTICE** that under the *Environmental Protection Act 1994* a notice to conduct or commission an environmental <PICK FROM LIST> is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

The notice to conduct or commission an environmental <PICK FROM LIST> is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the "said premises").

#### **A. Grounds**

The notice to conduct or commission an environmental <PICK FROM LIST> is issued on the following grounds:

- Insert the applicable grounds under s322 or s 323.
- Insert the applicable grounds under s322 or s 323.
- Insert the applicable grounds under s322 or s 323.
- Insert the applicable grounds under s322 or s 323.

---

<sup>1</sup> An environmental evaluation may be either an environmental audit under section 322 or an environmental investigation under section 323.

**Notice to conduct or commission an environmental evaluation**

---

The facts and circumstances forming the basis for these grounds are:

- Only factors which directly relate to the decision are to be included.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.
- Insert the facts and circumstances that form the factual basis for the grounds.

**B. Requirements**

The report on the environmental <PICK FROM LIST> must address the following matters:

- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.

Section 325 of the Act specifies that a statutory declaration by both the recipient of this notice and the person who carries out the environmental <PICK FROM LIST> must accompany the environmental report. Statutory declaration forms are attached. The report on the environmental <PICK FROM LIST> must be submitted to the Department on or before:

- date

**TAKE NOTICE** that:

- The requirements of the notice to conduct or commission an environmental <PICK FROM LIST> take effect immediately upon service of the notice.
- This notice remains in force until further notice from the administering authority.
- You are responsible for meeting the costs of conducting or commissioning the environmental evaluation and preparing the environmental report.

**Notice to conduct or commission an environmental evaluation**

---

**C. Appeal Rights**

If you are dissatisfied with the decision to issue the notice to conduct or commission an environmental <PICK FROM LIST>, you may apply to the Department for a review of this decision within ten business days of the service of the notice. You may also apply to the Court for a stay of the decision to issue this notice.

If you are dissatisfied with the review decision, you may appeal against this decision to the Planning and Environment Court. Further information about the review and appeal process is attached to this notice. However, the information outlining the review and appeal process under the *Environmental Protection Act 1994* should be considered as general advice only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

**D. Penalty**

A person must comply with a requirement to conduct or commission an environmental <PICK FROM LIST>.

The maximum penalty for an individual is \$10,000.00.

The maximum penalty for a corporation is \$50,000.00.

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

**TAKE NOTICE** that under the *Environmental Protection Act 1994* a notice to conduct or commission another environmental <PICK FROM LIST> is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department).

The notice to conduct or commission another environmental <PICK FROM LIST> is issued in respect to the activities of recipient's name at premises/place on land described as Lot lot number on RP/SP plan number situated at address of premises/place (the premises).

#### **A. Grounds**

The notice to conduct or commission another environmental <PICK ONE> is issued on the following grounds:

- For example: A notice to conduct or commission an environmental [audit] OR [investigation] was given to you by the Department on [date].
- For example: An environmental report was submitted to the Department by you on [date].by you on [date].
- For example: The Department is satisfied the report does not adequately address the relevant matters for the environmental evaluation to which the report relates.

---

<sup>1</sup> An environmental evaluation may be either an environmental audit under section 322 or an environmental investigation under section 323.

**Notice to conduct or commission another environmental evaluation**

---

- For example: The Department requires the recipient to conduct or commission another environmental [audit] or [investigation].
- You are required to conduct or commission another environmental [audit] OR [investigation] and submit a report on the [audit] OR [investigation] to the Department.

The Department is satisfied the report provided by you on date does not adequately address the following relevant matters:

- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.
- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.
- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.
- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.
- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.
- State which matters in the original notice were not adequately addressed in the report and provide reasons why this is the case.

**B. Requirements**

The report on the environmental <PICK FROM LIST> must address the following matters:

- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.
- List the matters that the person must address in the report on the environmental audit/investigation.
- Ensure the requirements are specific, measurable, attainable, relevant and time specific.

Section 325 of the Act specifies that a statutory declaration by both the recipient of this notice and the person who carries out the environmental <PICK FROM LIST> must accompany the environmental report. Statutory declaration forms are attached. The report on the environmental <PICK FROM LIST> must be submitted to the Department on or before:

**Notice to conduct or commission another environmental evaluation**

---

- date

**TAKE NOTE** that:

- The requirements of the notice to conduct or commission an environmental <PICK FROM LIST> take effect immediately upon service of the notice.
- This notice remains in force until further notice from the Department.
- You are responsible for meeting the costs of conducting or commissioning the environmental evaluation and preparing the environmental report.

**C. Appeal rights**

There is no specific provision in the Act for review or appeal regarding a notice to conduct or commission another environmental evaluation. A person aggrieved by the decision to issue this notice may be able to make an application under the *Judicial Review Act 1991* for a statutory order of review pursuant to s20 or 21 of that Act or a request for a statement of reasons for the decision pursuant to s32 of that Act.

However, the information outlining the review and appeal process under the *Judicial Review Act 1991* should be considered as general advice only. You may have other legal rights and obligations and should seek and be guided by your own legal advice.

Should you have any queries in relation to this notice, please contact name of officer of the Department on telephone number telephone number.

## **Administrative Policy Outlining Exercise of Delegated Powers**

*The object of this policy is to ensure that the appropriate people are exercising powers in relation to their appointment as Project Directors and Project Managers for specific projects. This should lead to the better achievement of the objects of the relevant legislation. This policy is not to be construed as a fetter on the way in which processes are to be exercised by Project Directors and Project Managers.*

### **General provisions**

- The delegate is defined by position rather than by name. Under section 27A of the Acts Interpretation Act 1954, it is possible to delegate to a named office (as opposed to the person holding the office at the time). This approach has been adopted with these delegations. Therefore a person temporarily acting in a named office which holds a delegation is entitled to exercise those delegations associated with the position. However, delegates should note that they cannot delegate their powers to another person in a named office.
- When exercising a delegation you must ensure that due process is followed in accordance with the relevant legislation, policies and procedures and that advice is sought when necessary from Agency officers with appropriate expertise.
- Where a delegate is required to give reasons for their decision, section 27B (Content of statement of reasons for decision) of the Acts Interpretation Act 1954 applies. 'Ecotrack' provides for the recording of reasons for every decision.
- All work associated with a delegation must be carried out in a timely manner having regard to the circumstance of the case.
- In all cases where a person is required to perform an act or do any thing, a reasonable time for the performance of the act or thing must be allowed.
- Delegates need to be aware that all documentation (including information stored in 'ecotrack') can be subject to the Freedom of Information Act 1992.
- Delegates need to be aware that their decisions are open to judicial appeal under the Judicial Review Act 1991 as well as any other appeal or review procedures contained in the legislation under which they are making their decisions.

### **Specific provisions**

These provisions relate to the exercise of delegations under 'ecoaccess', i.e. they relate only to licensing and permitting.

- These delegations provide officers with very broad powers under a number of pieces of legislation rather than just under one piece of legislation. This administrative policy limits the situations in which

## Administrative Policy Outlining Exercise of Delegated Powers

---

officers may exercise their delegated powers. Officers must consider this policy when exercising their delegated powers under 'ecoaccess'.

- Project Directors who have been properly appointed for level 2-4 projects, may exercise all their delegations where necessary in relation to the projects to which they have been appointed. The delegated powers include the ability to make decisions whether to grant or refuse applications as well as any other powers which are necessary to assist the Project Manager with the smooth running of the project.
- If an officer has not been appointed as a Project Director or a Project Manager they may not exercise the powers which they have been delegated.
- Properly appointed Project Managers for level 2-4 projects, may exercise all their delegated powers which are necessary to carry out their role in managing the project. This does not include the powers necessary to make a decision whether to grant or refuse an application but does include powers such as issuing a request for further information.
- For level 1 projects, the Project Managers are LPCU officers. LPCU officers may exercise all their delegated powers which are necessary to manage projects which the Manager LPCU has allocated to them.
- For level 1 projects lodged with the LPCU, the Project Director is the Manager LPCU or Team Supervisor LPCU. These positions may exercise all their delegations in relation to the projects for which they are appointed as Project Director. Their delegated powers include the ability to make decisions whether to grant or refuse an application as well as any other powers which are necessary to assist the Project Manager with the smooth running of the project.
- For urgent applications for level 1 projects, which are walked into a regional office, District Managers, Senior Rangers and above, will exercise all the powers necessary to act as the Project Director.
- Where a project team member and the Project Manager is one and the same officer for the one project, the officer may exercise all the delegations necessary to carry out the role as a Project Manager and make a recommendation to the decision maker (the Project Director).
- There should be no situation where the Project Director and the Project Manager are the same for one project. A person cannot exercise the powers of an assessing officer (Project Manager) and a decision maker (Project Director) for the same project.
- It would be prudent for Project Managers to obtain all relevant information, including knowledge which may be possessed in the Agency. Nevertheless, a delegate, in making a decision, must comply with the instrument of delegation and therefore a knowledge of the relevant legislation and section 27A of the Acts Interpretation Act 1954 will be required.

Our reference: Our reference

Dear Sir/Madam

### Compliance inspection: Name of recipient's business

We write to inform you that the Department of Environment and Resource Management (the Department) will be carrying out a compliance inspection at the premises of name of recipient's business, situated at address of site where inspection to be carried out on date of inspection at time of inspection.

### Objectives and scope of the inspection

The objectives and scope of the inspection include:

- For example: The objectives include assessing your compliance with development approval number 12345.
- For example: The inspection will focus predominantly on water management.
- List the objectives and scope of the inspection.
- List the objectives and scope of the inspection.
- List the objectives and scope of the inspection.

It is anticipated that, subject to site conditions and excluding any site induction, Departmental officers will be present on-site for approximately insert anticipated time on-site.

### Requirements

Your assistance prior to, and during the inspection process will be greatly appreciated and will help facilitate an efficient site inspection. Please provide the Department with the following information by close of business on date:

1. Any health and safety requirements, including site induction requirements and personal protection equipment (PPE) required for this visit.
2. The name and contact details of the site representative who will accompany Departmental officers during the compliance inspection.
3. Insert required information (e.g. groundwater monitoring data, etc).
4. Insert required information (e.g. site based management plan, etc).
5. Insert required information (e.g. rehabilitation plan, etc).

On the day of the inspection please ensure that:

- key site personnel responsible for [focus of inspection e.g. water management] are available for discussion during the inspection
- all relevant records and documents are available for viewing.

### What will happen during the inspection?

During the inspection, Departmental officers may use photographic equipment to record details of the inspection and may take effluent, soil, surface water and/or groundwater samples . We may also need to speak with your staff about list relevant matters .

### Further information

If you require any further information please contact name of officer on insert phone number, email address.

Dear Recipient's name

#### **Proactive Environmental Compliance Inspection - Date of inspection**

I refer to the site inspection of client name at address where compliance inspection carried out conducted by environmental [officer] OR [officers] name(s) of DERM officer(s) of the Department of Environment and Resource Management (the Department).

The site inspection was conducted in the presence of [client name] [and] OR [or] employee, [employee name]. The purpose of the inspection was to evaluate compliance with the development approval DA number of Code of Compliance issued by the Department in date of issue of [DA] OR [Code of Compliance]. Thank you to you and your staff for providing your time and assistance during the site inspection.

The Department has finalised the inspection and identified a range of non-compliance matters outlined in Table 1. Under section 435 of the *Environmental Protection Act 1994*, it is an offence to contravene a development condition of a development approval. This is regarded as a serious offence, the maximum penalty for an individual being \$200,000.00 or two year's imprisonment. The maximum penalty for a corporation is \$1,000,000.00.

In response to the identified non-compliance matters and alleged offences, please provide a written report to the Department by the date by which report required outlining how these matters will be addressed and what measures will be implemented to bring them into compliance with the relevant legislation.

Additionally, please find attached at Table 2 with further observations of concern for your consideration.

Should you wish to discuss any of the matters raised in this letter, please liaise with Environmental officer's name and title who can be contacted by telephone on Officer's telephone number.

Yours sincerely

Dear Recipient's name

#### **Proactive Environmental Compliance Inspection - Date of inspection**

I refer to the site inspection of client name at address where compliance inspection carried out conducted by environmental [officer] OR [officers] name(s) of DERM officer(s) of the Department of Environment and Resource Management (the Department).

The site inspection was conducted in the presence of [client name] [and] OR [or] employee, [employee name]. The purpose of the inspection was to evaluate compliance with the development approval DA number of Code of Compliance issued by the Department in date of issue of [DA] OR [Code of Compliance]. Thank you to you and your staff for providing your time and assistance during the site inspection.

The Department has finalised the inspection and identified a range of non-compliance matters outlined in Table 1. Under section 435 of the *Environmental Protection Act 1994*, it is an offence to contravene a development condition of a development approval. This is regarded as a serious offence, the maximum penalty for an individual being \$200,000.00 or two year's imprisonment. The maximum penalty for a corporation is \$1,000,000.00.

In response to the identified non-compliance matters and alleged offences, please provide a written report to the Department by the date by which report required outlining how these matters will be addressed and what measures will be implemented to bring them into compliance with the relevant legislation.

Additionally, please find attached at Table 2 with further observations of concern for your consideration.

Should you wish to discuss any of the matters raised in this letter, please liaise with Environmental officer's name and title who can be contacted by telephone on Officer's telephone number.

Yours sincerely

# Notice

## Environmental Protection Act

### Prepare a draft transitional environmental program

---

*This statutory notice is issued by the administering authority pursuant to section 332 of the Environmental Protection Act 1994, to advise you of a decision or action.*

Your reference : <INSERT reference>

Our reference : <INSERT reference>

<INSERT recipient's name>

<INSERT street address>

<INSERT suburb, state and postal code>

Attention: < INSERT principal contact>,

**Re: Draft transitional environmental program for <INSERT reason for TEP> at <INSERT location for activity with TEP>.**

The Department of Environment and Resource Management has decided to require you to prepare, or commission the preparation of, a draft transitional environmental program. This requirement is because of a condition of your environmental authority number <INSERT EA no.>.

of a development condition of your development approval.

the person carrying out <INSERT activity> at premises/place on land described as <INSERT lot> on Plan <INSERT plan>, located at <INSERT street address>, is causing, or may cause, unlawful environmental harm.

you are unable to comply with an environmental protection policy, on its commencement.

you are unable to comply with an environmental protection regulation, on its commencement.

a condition of your environmental authority number <INSERT EA no.> is, or has been, contravened.

a development condition of your development approval, is, or has been, contravened.

a standard environmental condition of a code of environmental compliance is, or has been, contravened.

The draft transitional environmental program must be submitted to the Department of Environment and Resource Management at the address at the end of this notice by <INSERT date>.

The program is required based on the following grounds:

<INSERT grounds>

The program must address the following matters:

<INSERT specific issues to be addressed>

## Prepare a draft transitional management program

---

The transitional environmental program is to be carried out over the period <INSERT period>.

Fees apply for the assessment of a draft transitional environmental program and any subsequent annual returns. The fees are outlined in the attached operational policy *Transitional environmental program (EMP) fees*.

You may apply to the Department of Environment and Resource Management for a review of this decision within 10 business days of receiving this Notice. You may also appeal against this decision to the Planning and Environment Court.

Information outlining the review and appeal processes under the *Environmental Protection Act 1994* is included with this notice. This information is intended as a guide only. You may have other legal rights and obligations

Should you have any queries in relation to this notice, <INSERT contact officer's name> of the Department of Environment and Resource Management on telephone <INSERT phone number> would be happy to assist you.

## **Choosing the appropriate statutory tool to respond to non-compliance**

*This procedural guide provides assistance to officers in choosing the most appropriate statutory tools available for responding to alleged non-compliance under the Environmental Protection Act 1994 and the Sustainable Planning Act 2009. It should be read in conjunction with the procedural guides for each tool, which cover the tools in more detail.*

### **Introduction**

This procedural guide outlines the statutory tools that are available to the Department under the *Environmental Protection Act 1994* (EP Act) and *Sustainable Planning Act 2009* (SP Act). It provides guidance on which tools are suitable for use in different situations. When using statutory tools, bear in mind that there is no strict hierarchy to be followed when using tools, but that each tool does a different job. It may also be appropriate to use a combination of tools to achieve the desired outcome.

The tools outlined in this guide are all aimed at addressing the environmental consequences of a breach of either the EP Act or SP Act. They are used not to punish or deter people, but to make sure that environmental harm is minimised or prevented and that people comply with their obligations.

This guide does not discuss actions which are mainly aimed at punishing an offender or deterring future breaches, such as penalty infringement notices or warning notices.

### **Statutory tools**

#### **Environmental evaluation (Chapter 7 Part 2 EP Act)**

Environmental evaluations (EEs) are an evaluation of an activity or event to decide the source, cause or extent of environmental harm being or likely to be caused, and whether a transitional environmental program (TEP) is needed. There are two types of EE's: environmental audits and environmental investigations. Environmental audits are used where there has been a contravention of an environmental authority (EA), development approval (DA), regulation, environmental protection policy (EPP) or a TEP. Environmental investigations are used where an event or activity is causing actual or potential environmental harm.

EEs are best used where you do not know the cause, nature or extent of a problem or the solution to a problem. They answer the questions "What is happening", and "What is the solution"? EEs require the person responsible for the problem to investigate (or commission someone to investigate) the problem and submit a report to DERM. They do not in themselves fix the problem, but give you the information you need to then decide what needs to be done about the problem. The information in the reports are often used to decide whether a TEP, environmental protection order (EPO), amendment to a DA condition or other action is needed to address the problem.

Some advantages of using an EE include that they require a person to carry out an investigation by a specified date; the person carrying out the investigation has to sign a statutory declaration confirming that the information in the report is true and correct; and that it is an offence for a person not to comply with the notice to carry out the EE.

## Choosing the appropriate statutory tool to respond to non-compliance

---

For more information on environmental evaluations refer to the [Environmental Evaluations Procedural Guide](#). A template [notice to conduct or commission an environmental evaluation](#) is also available on Ecosteps.

### Transitional environmental program (TEP) (Chapter 7 Part 3 EP Act)

TEPs are specific programs that achieve compliance by reducing environmental harm or detailing the transition to an environmental standard. The Department may require a person or public authority to prepare and submit for approval a draft TEP in the following circumstances:

- As a condition of an EA or DA
- If an activity is causing or may cause environmental harm
- If it is not practicable for someone to comply with an EPP or regulation on its commencement
- If a condition of an EA or DA has been contravened
- If a standard environmental condition of a code of environmental compliance for a chapter 4 activity has been contravened

TEPs are a good tool to use when it is known what needs to be done to achieve a solution to an environmental problem, and the solution is likely to take a long period of time (months to years) to implement. A TEP should not involve an extensive investigation to work out what needs to be done; this should be done by an EE before the TEP is approved.

Once approved, a TEP gives the holder immunity from prosecution for continuing harm during the life of the TEP. This allows the “breathing space” to do the works needed in order to bring them into compliance. It also means that you must be confident that the activities proposed in a draft TEP will be sufficient to bring the person into compliance.

For more information on Transitional Environmental Programs refer to the [Transitional Environmental Programs Procedural Guide](#).

### Environmental protection order (Chapter 7, Part 5 EP Act)

An EPO is used to require someone either to take or to not take a certain specified action in order to prevent or minimise environmental harm. EPOs are a good tool to use when it is known what action needs to be taken and if the action needs to be undertaken over a relatively short timeframe. EPOs can be used in the following circumstances:

- If a person does not comply with a requirement to conduct or commission an EE
- If a person does not comply with a requirement to prepare a TEP
- If an EE shows that unlawful environmental harm is being or is likely to be caused by a activity
- To secure compliance with:
  - the general environmental duty;
  - an EPP;
  - a condition of an EA or DA;
  - a standard environmental condition of a code of environmental compliance for a chapter 4 activity;
  - a condition of a site management plan;

## Choosing the appropriate statutory tool to respond to non-compliance

- an audit notice;
- a surrender notice;
- a rehabilitation direction;
- a regulation; or
- an accredited environmental risk management plan.

EPOs should not be used where extensive work needs to be undertaken over a long period of time (use a TEP) or an investigation is required to work out what is causing harm or what needs to be done to rectify it (use an EE). EPOs may only be used in order to prevent or minimise environmental harm.

As with all statutory tools, it is important that once an EPO is issued, you follow up to make sure that the person to whom it is issued is complying with its requirements. If they are not complying, you should take appropriate follow up action (which could range from an informal warning, to issuing a penalty infringement notice or recommending that a matter be referred to the Investigations Team for investigation with a view to possible court action).

For more information on EPOs refer to the [Environmental Protection Orders Procedural Guide](#). An [Environmental Protection Order](#) template is also available on Ecosteps.

### Direction notice (Chapter 7, Part 5A EP Act)

Direction notices can be issued for offences relating to environmental nuisance (s 440 EP Act), for contravention of a noise standard (s 440Q EP Act), and for depositing prescribed water contaminants (s 440ZG EP Act). Because responsibility for most of these offences has been devolved to local government, departmental officers will generally only use direction notices where these offence have been committed by the State or a local government, a government owned corporation or an instrumentality or agency of the State or a local government. Direction notices can also be issued for contravening a provision of an accredited environmental risk management plan.

Direction notices can be issued if someone is committing an offence, or if they have committed an offence and it is likely that they will continue or repeat the offence. Direction notices cannot be issued if an offence has happened and it is not likely that the offence will be repeated. In other words, they are designed to make sure that an ongoing offence stops, or that an offence does not happen again.

A direction notice may only be issued if the matter relating to the contravention can be remedied, it is known what action should be taken and if it is appropriate to give the person an opportunity to remedy the matter.

For more information, refer to the [Direction Notices Procedural Guide](#). A [Direction Notice](#) template is available on Ecosteps.

### Clean-up notice (Chapter 7, Part 5B EP Act)

Clean-up notices may be issued to ensure that a contamination incident (contamination of the environment that has caused or is likely to cause serious or material environmental harm) is cleaned up. Clean-up notices can be issued to a wider range of people than an EPO, and can be issued to someone who is not directly responsible for a contamination incident. Clean-up notices can be issued to:

- someone causing or permitting, or who caused or permitted, a contamination incident to happen;
- a person who, at the time the incident happened, was the occupier of the place where the incident happened;
- a person who, at the time the incident happened, was the owner or person in control of a contaminant involved in the incident.

---

## Choosing the appropriate statutory tool to respond to non-compliance

---

For example, Company A operates a transport company. Company B consigns a load of chemicals to Company A, which loads it on to a truck operated by Mr C at the depot operated by Company A. During the loading, Mr C's negligence causes the chemicals to spill into a drain leading to a waterway. Serious environmental harm results. A clean up notice could be issued to Mr C (who caused the incident to happen), to Company A (which was the occupier of the premises where the incident happened) or to Company B (which was the owner of the chemicals involved in the incident).

The wide range of people who can be issued with a clean-up notice means that you can choose the most appropriate person to clean up the incident, depending on their capacity, resources and degree of responsibility. If someone who is not responsible for an incident is issued with a clean-up notice, they can recover any costs incurred by them from the person who was responsible.

To determine whether a contamination incident amounts to serious or material environmental harm consider the definitions of material environmental harm (section 16 EP Act) and serious environmental harm (section 17 EP Act).

A clean-up notice can require someone to:

- prevent or minimise contamination caused by the incident;
- assess the nature and extent of the environmental harm, or the risk of further environmental harm, caused by the incident;
- rehabilitate or restore the damage to the environment caused by the incident;
- or keep the administering authority informed about the incident or the actions taken under the clean-up notice.

For more information, refer to the [Clean-up Notice Procedural Guide](#). A [Clean-up Notice](#) template is also available on Ecosteps.

### **Cost recovery notice (Chapter 7, Part 5C EP Act)**

A cost recovery notice may be issued if a clean-up notice has not been complied with and an authorised person or someone operating under the instruction of an authorised person has undertaken the clean-up actions required in the clean-up notice.

The Department may issue a written notice to recoup costs and expenses incurred in taking the action specified in the clean-up notice or in monitoring the compliance of the recipient with the provisions of the clean-up notice.

This is only a useful tool where a clean-up notice has been issued, a person has failed to comply with it, and the Department has undertaken work to clean up the site and has incurred costs in the clean up.

### **Show cause notice (Chapter 7, Part 3, Division 2 SP Act)**

A show cause notice must be issued before an enforcement notice under the SP Act is issued (except in certain circumstances set out below). Show cause notices can be issued if the Department reasonably believes a person has committed or is committing a development offence under the SP Act. A show cause notice gives a person an opportunity to make representations regarding the offence before they are issued with an enforcement notice. The requirements for a show cause notice are set out in ss 588 and 589 of the SP Act.

If the assessing authority reasonably considers that it is not appropriate to give a show cause notice in the circumstances, the assessing authority may proceed directly to issuing an enforcement notice without giving a show cause notice. This may be appropriate where, for example, the enforcement notice needs to be issued urgently if it is to be effective.

---

## Choosing the appropriate statutory tool to respond to non-compliance

---

### Enforcement notice (Chapter 7, Part 4, Division 3 SP Act)

Enforcement notices may be issued where you **reasonably believe** that a person has committed, or is committing, a development offence under the SP Act (which includes offences such as carrying out assessable development without a permit, or contravening a development approval). Before you can issue an enforcement notice, you must issue a show cause notice unless it is not appropriate in the circumstances. For example, if an offence poses a threat to public health and safety, it may be appropriate to proceed directly to issuing an enforcement notice

If a show cause notice has been issued, you must consider any representations made in response to the show cause notice. You may only issue an enforcement notice if, having considered the representations, you consider that it is still appropriate to do so.

An enforcement notice requires someone to refrain from committing the development offence, or to remedy the commission of the offence. It may include requirements such as:

- to stop carrying out development;
- to stop a stated use of premises;
- restoring the premises to the way it was before the development started;
- taking action to ensure development complies with a development approval; or
- to prepare and submit to the assessing authority a compliance program demonstrating how compliance with the enforcement notice will be achieved.

Enforcement notices can be used where the incident is a development offence under the SP Act. They can also include a wider range of requirements than an EPO, because they are not limited by needing to be aimed at preventing or minimising environmental harm.

The requirements for an enforcement notice are set out in ss590-596 of the SP Act.

# Procedural guide

## Compliance

### Covert and overt recording in compliance and investigation

*This document sets out the circumstances in which appointed officers may covertly and overtly record a conversation or activity; sets the approvals required for the use of covert recording; and establishes guidelines to ensure the integrity of recorded evidence.*

#### Background

This document outlines the appropriate use of audio and video recording devices by Department of Environment and Resource Management (DERM) employees in compliance and investigative activities. Audio and visual recording devices may be overt or covert and different approval requirements apply as set out in this guide. The DERM Code of Conduct must also be considered when using recording devices.

Compliance activities are a critical component of DERM business, and authorised officers regularly investigate breaches of DERM administered legislation which may lead to enforcement action. The use of audio and video recordings can provide valuable evidence for enforcement actions. Digital media is now an accepted technology in recording, storing and presenting or replaying data in court proceedings or tribunals. This may be in MP3 or JPEG format and is usually stored on a hard drive storage device which may be transferred easily and securely without risk of modification or contamination.

Digital audio and video recordings provide an accurate and true account of conversations and interactions between officers and another party. Therefore, they are an effective means to avoid allegations of harassment and can be used to negate any concerns involving threat, promise or inducement.

#### Definitions

**Authorised officer** means a DERM employee who is appointed under an Act and is eligible to exercise compliance and enforcement powers under that Act. DERM authorised officers include:

- inspectors appointed under the *Biodiscovery Act 2004*
- authorised persons appointed under the *Environmental Protection Act 1994*
- authorised officers appointed under the *Environmental Protection Biodiversity Conversation Act 1999 (C'th)*
- forest officers appointed under the *Forestry Act 1959*
- inspectors appointed under the *Fisheries Act 1994*
- inspectors appointed under the *Great Barrier Reef Marine Parks Act 1975 (C'th)*
- inspectors appointed under the *Historic Shipwrecks Act 1976*
- inspectors appointed under the *Marine Parks Act 2004*
- conservation officers appointed under the *Nature Conservation Act 1992*
- authorised officers appointed under the *Recreation Areas Management Act 2004*

## Covert and overt recording in compliance and investigations

- authorised officers appointed under the *Vegetation Management Act 1999*
- authorised officers appointed under the *Water Act 2000*
- authorised officers appointed under the *Aboriginal Cultural Heritage Act 2005*
- authorised officers appointed under the *Torres Strait Islander Cultural Heritage Act 2005*
- authorised officers appointed under the *Land Act 1994*.

**Covert recording** is recording when one or more people being recorded are unaware that recording is taking place.

**Overt recording** is recording when all people being recorded are fully aware a recording is taking place.

**Private act** means showering or bathing; using a toilet; any activity when the person is in a state of undress; or a sexual activity not ordinarily performed in public.

**Private place** means a place where a person might reasonably be expected to be engaging in a private act.

**Recording device** has the same meaning as a listening device within the *Invasion of Privacy Act 1971*, and is defined as any instrument, apparatus, equipment or device capable of being used to overhear, record, monitor or listen to a private conversation simultaneously with its taking place. Examples of recording devices include tape recorders, digital voice recorders, mobile phones, still cameras, video cameras and telephone adaptations that enable recording of conversations.

**Visual recording devices** means any device capable of recording a photographic image including for example photographic stills and video recordings.

### Policy and procedural statements

#### Overt recording

Authorised officers and other DERM staff may overtly record a conversation with a recording device when communicating with a member of the public or carrying out investigation and enforcement duties under DERM administered legislation. It is the responsibility of the officer making the recording to ensure that all parties to the conversation are aware the conversation is being recorded, and such awareness should be evident within the recording itself. Parties should also be advised that the recordings will be kept on a Government file and may be used as evidence. This should occur at first contact or the beginning of the conversation.

A copy of the audio or video recording should be offered to each party to the conversation or activity upon its conclusion and, where the offer is accepted, the copy should be delivered as soon as practicable after the event.

#### Approval for overt recording

While approval is not required to undertake overt recording, care must be taken that all recordings made as part of DERM business are made, stored and used in appropriately manner. Disclosure of personal information (which is often contained in recordings) is prohibited by the *Information Privacy Act 2009*. Routine use of overt recordings by any unit or branch must be identified in the relevant business plan or work procedures.

#### Covert recording

##### Audio

At no time may any officer make a sound recording of a conversation to which they are not a party (covert audio recording). To do so would be an offence under the *Invasion of Privacy Act 1971*. Covert recording of

## Covert and overt recording in compliance and investigations

---

conversations to which the operator of the recording device is not a party may only be undertaken by police officers or persons with express statutory rights to do so.

The *Invasion of Privacy Act 1971* however, allows for the covert recording of private conversations by persons who are a party to the conversation. Permission is not required from the parties involved in a recorded conversation to use the conversation as evidence in a court; using a recorded conversation in other ways without permission is restricted and penalties apply.

DERM routinely uses remotely operated or unmanned video recording devices (for example, in wildlife monitoring). These devices often have audio capabilities and because of the restriction on covert audio recordings (outlined above), the audio capabilities must be disabled on unmanned visual recording devices.

### **Visual**

As indicated above, an authorised officer may, with the necessary approval (Table 1), covertly record an activity using a video or photographic recording device without being a party to the activity or conversation, provided that any audio recording capabilities on the visual recording device are disabled prior to commencing surveillance. When visual surveillance is being used for reasons other than compliance (e.g. wildlife monitoring), the incidental capture of evidence in relation to the commission of an offence under DERM legislation can only be legally used if any audio recording function on the visual recording device was disabled at the time of the recording.

The use of signs advising members of the public that surveillance equipment is being used is not a legal requirement but may improve evidentiary value of recordings. A visual recording device may be used in a public place but must not be used in private places or to record persons undertaking private acts. State lands, including protected areas and State forests, are generally considered public places; however care must be taken to avoid unintentionally filming a person undertaking a private act.

### **Approval for covert recording**

Appointed officers and other departmental officers may, with the necessary approval (Table 1), covertly record a conversation or activity to which they are a party when:

- the appointed officer is investigating whether parties are complying with DERM administered legislation; or
- the recording of the conversation or activity is likely to assist in the gathering of evidence regarding an alleged contravention of the legislation; or
- it is important that there is an accurate record of conversations or activities for safety/evidentiary reasons; or
- the use of overt recording may adversely affect the collection of evidence or interfere with an appointed officer in the execution of their duties.

The necessary approval to undertake covert recording (Table 1, below) must be sought and granted prior to commencing the recording.

### **Visual Recordings**

It should be noted, that the *Criminal Code Act 1899* prohibits the visual recording of a person where there is a reasonable expectation of privacy. This includes the recording of people undertaking private acts or in places intended for private acts, for example a toilet facility.

Covert and overt recording in compliance and investigations

**Approval requirements for covert recording**

The approval requirements for covert recording are set out in Table 1.

**Table 1 – Covert recording approval requirements**

<b>Queensland Parks and Wildlife Service (QPWS)</b>		
<b>Type of Covert Recording</b>	<b>Level of approval required</b>	<b>Method</b>
Covert audio used to gather evidence for planned low to mid level compliance and enforcement considerations/actions	Assistant Director-General, QPWS	Approval must be in writing (including email) and may be given:
Covert audio used for day to day purposes other than for planned compliance activities (for example collection of information for statistical and advice use)	Regional Manager or Director	– as part of an approved compliance plan,
Covert video (audio disabled)	Regional Manager or Director	– via an agreed work procedure, or – on a case by case basis.
<b>Other (RSD, ENRR etc)</b>		
<b>Type of Covert Recording</b>	<b>Level of approval required</b>	<b>Method</b>
All	Assistant Director-General	Approval must be in writing (including email) and may be given:
		– as part of an approved compliance plan,
		– via an agreed work procedure, or – on a case by case basis.
<b>State-Wide Investigations Team, Compliance and Investigations</b>		
<b>Type of Covert Recording</b>	<b>Level of approval required</b>	<b>Method</b>
All	Director, Compliance and Investigations	Approval must be in writing (including email) and may be given:
		– as part of an approved investigation plan,
		– via an agreed work procedure, or – on a case by case basis.

**Handling of surveillance equipment**

If an authorised officer covertly records a conversation or activity, the covert recording must be noted in the authorised officer’s official notebook as soon as practicable.

Where a visual recording device will be left unmanned (for example, during ongoing monitoring of a site) it must have a log book that is kept with it at all times. The use and maintenance of the recording device must be recorded in the log book including:

- date, time and location of each use; and
- name and operational unit of the operator; and

---

## Covert and overt recording in compliance and investigations

---

- a description of the activity undertaken.

The visual recording device must be installed and operated by a person experienced in the use of the equipment. New equipment must be field tested before use in compliance and investigation activities. New operators must be trained by an experienced operator and supervised in the use of the equipment before undertaking recordings for evidentiary purposes.

On each occasion a visual recording device is approved for unmanned use, prior to installation the equipment servicing must be up-to-date and the accuracy and operation of the equipment, including that the date and time set on the equipment must be checked. A record of these checks, including when and who undertook them must be entered into the log book.

When installing an unmanned visual recording device:

- record the details of the person who installed the equipment in the equipment log book;
- install the equipment so that a clear view of the subjects or location can be recorded, including important identifiers such as number plates; and
- make sure that the equipment is weatherproof, secure and protected to ensure evidence and valuable equipment is not lost.

Once installed an unmanned visual recording device should be checked on a regular basis and the checks recorded in the log book, including details of the condition and location of the equipment. While there is no set standard for the frequency with which checks should be undertaken, more regular checks improve evidence continuity.

In addition to equipment log books, the responsible business area (e.g. each QPWS region) must keep a register of locations subject to video or photographic surveillance for compliance or investigative purposes. The inclusion of wildlife and other environmental monitoring equipment in the register is encouraged but not mandatory.

### Processing and storage of recordings

Once a recording has been made, the following steps must be taken:

- Upload the recording to the appropriate file on the network drive as soon as practicable. This network drive must be secure and access limited to ensure that the electronic files are not changed or tampered with. Copies of the recording must be made from the electronic file located in the network drive.
- Save the recording to a compact disk without any modification.
- Label the compact disc with the date, the names of the persons present and location of the recording.
- Enter the compact disc details into the exhibit register and place the disc into a locked exhibit room or storage facility.
- Ensure the original recording is labelled and stored appropriately.

The above requirements are important because recordings may be used by DERM in litigation proceedings. In the event that litigation proceedings are instituted, the person who made the recording may be required to make a statement.

## Covert and overt recording in compliance and investigations

### Communication of recordings

Care must be taken in the use or distribution of all recordings. Clearance from the DERM Litigation Unit is required if recordings are to be used for a purpose other than as evidence in litigation or made available outside of DERM. Recordings can be distributed if agreed to by all recorded parties.

The DERM Litigation Unit can be contacted on (07) 3330 5663.

### Support

Support in the use of covert or overt recording can be given by Compliance and Investigations Support team within Compliance and Investigations. If assistance is required please refer to the Compliance and Investigations Intranet page for up to date contact information.

## **Dealing with unlicensed environmentally relevant activities (ERAs)**

*This procedural guide sets out the procedure to be followed in dealing with anyone found carrying out an environmentally relevant activity without an environmental authority, development approval or registration certificate.*

### **Issue**

From time to time Environmental Protection Agency officers may become aware of an environmentally relevant activity (ERA) being carried out without an environmental authority, development approval or registration certificate ("an unlicensed ERA"). What action should be taken?

### **Determination:**

The following procedure should be followed in relation to an unlicensed ERA:

- After becoming aware that an unlicensed ERA is being carried out, an Agency officer should meet with the person responsible for carrying out the ERA and advise the person of the requirements under the *Environmental Protection Act 1994* ("EP Act"). The officer should ask questions to establish that an ERA is being carried out without the necessary approval and that there are no mitigating circumstances. A record of conversation must be made in the officer's official notebook. Interview processes and procedures are outlined in the procedural guide *Taking Statements* located on ecosteps.

The officer must be an "authorised person" under the EP Act.

The meeting/site visit should be followed up with a short letter that refers to the meeting/site visit and confirms:

- (a) the requirements under the EP Act;
- (b) the information which leads the EPA to believe that the person may be carrying out an ERA without the necessary approval (e.g. the site visit);
- (c) that if an unlicensed ERA is being carried out, the person needs to make a valid application within 14 days, including the payment of the appropriate fee; and
- (d) that enforcement action may be taken if the person is carrying out an ERA and does not obtain the necessary approval.

Application forms and guidelines should be enclosed with this letter or, alternatively, the person should be referred to the forms and guidelines available on the EPA's web site. It should be considered whether the application is required to be made under the *Integrated Planning Act 1997* to the relevant Local Authority.

The letter should be sent by registered mail or served on the person.

- In certain circumstances where the person is diligent and has genuine reasons for not being able to meet the 14 days requirement, this period may be extended to 28 days with the approval of the relevant District Manager.
- If the application is not received within the timeframe indicated in the letter (or the further agreed period), the officer will collect evidence including photographs and record interviews in an official notebook to establish that an ERA is continuing to operate without the necessary approval. A simple brief of evidence should be prepared within 28 days of the date for lodging the application. The briefs should be straightforward, requiring little of the officer's time to complete. The Regional Director should refer the brief to the earliest Legal Compliance Meeting for decision and recommendation.

This procedure does not limit the Agency from taking immediate enforcement action, without the sending of a warning letter, in special circumstances. Special circumstances include, but are not limited to, a person carrying out an unlicensed ERA that is causing material or serious environmental harm and is failing to comply with the general environmental duty.

## Determining and influencing non-compliant behaviour

### Motivations for Non-Compliance

---

This “Motivations for Non-Compliance” procedural guide, together with the [Behaviour Assessment Tool](#) in Ecosteps provides background information and a method for assessing and best managing compliance behaviour issues.

#### Background

The Department of Environment and Natural Resource Management (DERM) is responsible for protecting Queensland’s environment and managing its natural resources. DERM administers a number of pieces of legislation to achieve this goal and one of DERM’s key functions is to ensure that the community complies with the legislation. Whilst the former constituent parts of DERM had a long history of managing reactive compliance programs, DERM is now expanding its proactive compliance activities. The goal of the proactive compliance function is to be evidence based, targeted and transparent. This will ensure:

- there is a solid basis for making decisions to pursue a particular compliance program;
- DERM’s resources are targeted at those areas where they will be most effective; and
- the manner in which regulatory activities are undertaken, and the outcomes of investigations, will be publicly available.

#### Purpose

The aim of this “Motivations for Non-Compliance” procedural guide is to help officers target their proactive compliance efforts where they will be best used. This document will primarily be used by regional project managers at the project planning stage of projects listed in the Annual Compliance Plan. Each year, the Annual Compliance Plan lists proactive compliance activities DERM will undertake. This document will assist project managers to identify behaviour types and reasons for non-compliance at the start of the compliance project, then choose tools to most effectively change that behaviour. This guide should be used in conjunction with the [Behaviour Assessment Tool](#). The Behaviour Assessment Tool can be found in Ecosteps and is an interactive tool to help decide both the “shape” of behaviour of your regulated community and the best response to influence that behaviour.

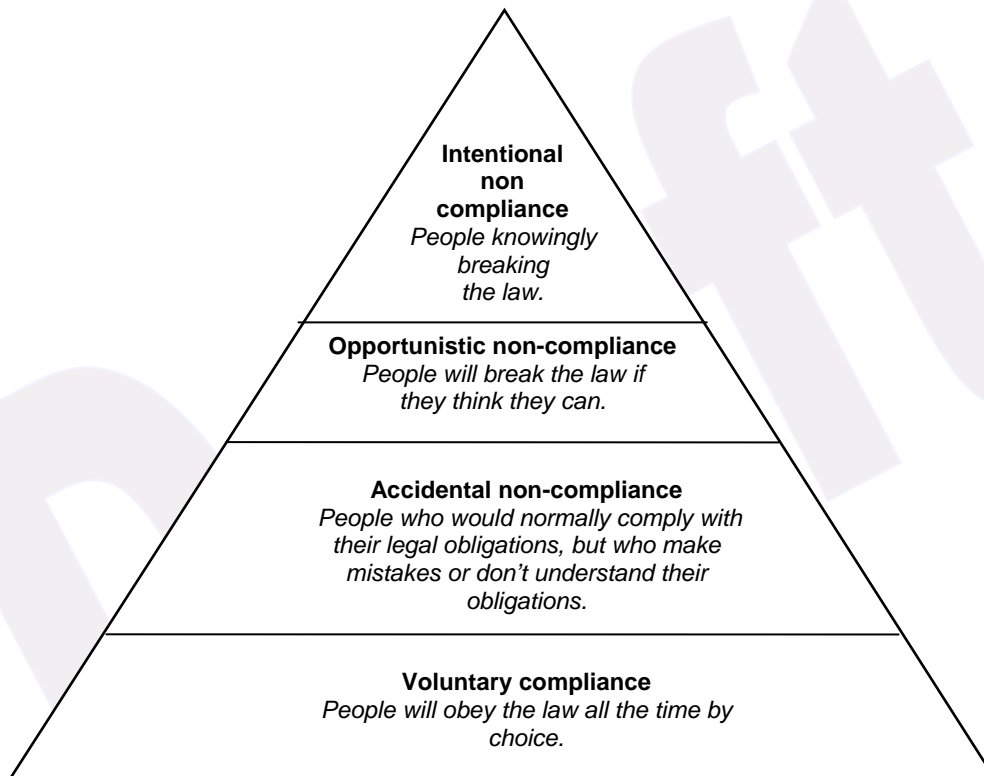

## Motivations for compliance and non-compliance

There are many reasons why people may choose to obey or not obey the law. These reasons fall broadly into the following four categories.

- 1. Intentional non-compliance** - this is where someone knows the law; knows that what they are doing is wrong; knows that there are penalties involved; and yet chooses not to obey. A simple example of intentional non-compliance is knowingly speeding. In this example, people are equipped to obey the law: in that cars are provided with speedometers, and streets are signed. It is also well known that police radars are used and that penalties will apply if caught, and yet, the offence is still committed. Hence, intentional non-compliance occurs where motivations outweigh the risks or benefits derived from doing the right thing. For instance, reasons for intentional non-compliance can include economic motivations, which can either be fees, like application costs for permits or licences, or costs associated with infrastructure or monitoring; and profits, which might be able to be increased through things like taking more water than allowed, or disposing of waste or chemicals inappropriately. It can also occur where the community perceives that there is only a low risk of detection; or where there is frustration, anger, or resistance to change. This is sometimes articulated as public protests, or acts of resistance, even where the chance of getting caught is almost guaranteed.
- 2. Opportunistic non-compliance** is very similar to intentional non-compliance; people know about the law and its penalty, and yet make an informed choice not to obey. The difference between opportunistic and intentional non-compliance is that this choice might change from instance to instance. For example someone who usually obeys speed limits may occasionally make an exception. He might drive faster on open roads or highways, particularly when there are no other cars present, or drive a few kilometres over the speed limit in familiar areas. People who opportunistically do not comply are influenced by their surroundings, and their behaviour will change from day to day. For instance, if a white van is parked on the side of the road ahead, most people will slow down. Similarly, if police presence is never noticed, it is possible for speeding to become more of a norm, and for these people to become intentional law breakers, who always drive too fast. Hence, behaviour in this instance is directly linked to the individuals' perception of capture and penalty. The reasons for intentional non-compliance therefore can be the number of investigations; whether others appear to be getting away with it; whether penalties and investigations are advertised; and whether it is believed that investigations occur and law breaking is penalised.
- 3. Accidental non-compliance** - This is where people make mistakes, or break the law by accident because they did not understand it, or how to meet their obligations. For example, if someone thought they were driving at the speed limit but their speedometer was not working correctly, or they did not know the speed limit in that particular area, they may drive faster than they were supposed to, but had they known they would have done the right thing. The reasons for accidental non-compliance can include a lack of understanding about obligations or administrative processes; a lack of access to information or advice; or a lack of access to tools or technology required.
- 4. Voluntary compliance** - in this situation, the person knows the law and obeys it. For example, where someone always drives at the speed limit, no matter where they are, or whether there are other vehicles or police around.

## The motivation pyramid

A pyramid is usually used to represent the distribution of the population within these categories of behaviour types, with most people doing the right thing (voluntary compliance at the base of the pyramid), and the least number intentionally breaking the law (intentional non-compliance at the top of the pyramid).

**Fig 1. Motivation pyramid**  
(adapted from Neil Gunningham, Peter Grabosky and Darren Sinclair “Smart regulation: designing environmental policy”, 1998 at p.397)

Whilst a pyramid is used to pictorially represent compliance and non-compliance, in reality the placement of individuals in the pyramid for any issue will be influenced by a range of factors – such as whether you will get caught; whether anyone is watching; how important you think the law is; whether you are afraid of getting into trouble; or what you believe will be the impact or severity of your crime. Whilst there are some instances where you will move around in the compliance pyramid, there are others where you will stand firm. For instance, a person who may intentionally steal a work pen would never commit armed robbery or murder. Voluntary compliance with these laws is not even debated. So when trying to understand your regulated community you need to be aware that every person is different, and that their motivations for non-compliance will vary for each law and obligation, and whilst absolutely committed to one set of objectives, another might not be a priority. This means that it is possible for the shape of the compliance ‘pyramid’ to vary according to the distribution of the population within each level. Hence, it is possible for the ‘pyramid’ to be inverted (where there is mostly non-compliant behaviour), hexagonal, or square.

## How to maximise compliance of your regulated community

There are a range of tools available to facilitate behaviour change, and to respond to non-compliance to maximise voluntary compliance. These can include enforcement activities, educational activities or incentives. In order to determine which tool is the most appropriate response, they need to be linked to the motivations for the non-compliant behaviour. This is why it is important to understand the behaviour of your regulated community.

When you are choosing a response to non-compliance, it is important to be as creative as possible, do not simply opt for the easy and obvious tools such as audits and recommending enforcement action. Consider tax incentives or fee simplification, using industry associations, peer pressure and supply chain pressure, or simplifying forms. The tools that will have the biggest impact are those that clearly state what needs to be achieved, make it easy to comply (for example, a simplified form) and make it popular to comply. In other words compliance becomes normal community behaviour.

The following comments are generalisations but in the main, smaller operations tend to have simple management structures and lower levels of expertise (including environmental and natural resource expertise). This can mean they respond better to education, training, building relationships, ensuring messages come from a credible source (the supplier or customer, rather than government), third party leverage (from banks, lawyers and insurance companies) and capacity building. Capacity building is particularly effective as it assists a person's ability and motivation to act. Larger operations on the other hand, tend to have more sophisticated management structures with more expertise or understanding of environmental management issues. Larger operations also tend to be more sensitive to reputation damage, including: impact on share price and potential investment opportunities, and standing with government. Larger operations tend to be easier to find because of their size and there are fewer of them. Because there is a higher volume of smaller operations, it can be difficult to investigate all of them.

## Behaviour assessment tool

The Behaviour Assessment Tool has been developed to allow you to work out the shape of the pyramid within the particular community that you are regulating. Knowledge of how many individuals are within each category will enable you to choose which is the best strategy to deal with the non-compliant behaviour for that regulated community. You can access the [Behaviour Assessment Tool](#) by clicking on the link.

## How to record Annual Compliance Plan Inspections in Ecotrack

*This document provides guidance on how to enter compliance inspections in Ecotrack and its use is recommended for compliance projects identified under Annual Compliance Plans (ACP).*

### Introduction

The Compliance Activity (CA) record in Ecotrack is for recording and tracking *compliance assessments initiated by the Department of Environment and Resource Management (DERM)*. All compliance inspections for compliance projects identified in DERM's Annual Compliance Plans are to be recorded in Ecotrack as per the steps outlined in this document. Any compliance inspections not identified in DERM's Annual Compliance Plans are to be entered as a Complaint/Record (CR) record in Ecotrack (this includes complaints, incidents and notification of a compliance issue by a company).

### Why record Compliance Inspections in Ecotrack?

Compliance data (including inspection data) recorded in Ecotrack is used for reporting, planning and management purposes. The more detailed and accurate the data, the more effective planning and management processes can be.

Compliance program outputs are regularly reported to management and the government; and include the number of complaints received and responded to on-time, number of reactive and proactive inspections by inspection type, number of enforcement measures issued and the client expenditure required to comply with those enforcement measures.

The compliance performance of each regulated industry is analysed to determine what industries to target in the Annual Compliance Plan (i.e. number of complaints and number of enforcement measures issued collectively for each industry).

The details of offences observed during compliance inspections is analysed to determine what illegal activities to target in the Annual Compliance Plan (i.e. high volume breaches in what locations).

The risk level of each regulated facility can be recorded in Ecotrack, which would assist in identifying the high-risk facilities warranting further/continued monitoring by the Department.

Compliance data recorded in Ecotrack also assists with enforcement tool selection and provides evidence of good decision making.

### Compliance Inspection – Ecotrack Steps

#### Compliance Activity Fields

The Compliance Activity fields *Program Type, Compliance Program, Client, and Activity Location* are **critical** fields to be completed in Ecotrack. These fields are required to ensure accurate quarterly reporting of compliance programs.

## How to record Annual Compliance Plan Inspections in Ecotrack

1. If the compliance inspection was conducted at licensed premises you must search for the permit record and create the Compliance Activity (CA) record from there. The client and activity location will automatically appear, and you can skip step 2.
  - i. Select **Permit – Permit Search** from the Ecotrack home page
  - ii. Enter the permit reference in the **Permit Ref** field and click on the search (magnifying glass) icon
  - iii. Click on the permit details icon (3 dots) for the Permit record to appear – ensure this is the correct permit (NB: you should link compliance inspections to the Registration rather than the Development Permit)
  - iv. Click on the Compliance Activity button (3<sup>rd</sup> from right) and a Compliance Activity record will open with the client and activity location details automatically appearing (check and remove any locations that aren't applicable to the compliance inspection by clicking **edit** then **remove row** (or Ctrl + R))
  - v. Go to step 3
2. Select **Compliance – Compliance Activity – Add New Compliance Activity** from the Ecotrack home page.
  - i. Enter the clients name in the **Name** field and click on the search (magnifying glass) icon
  - ii. Click on the **client detail icon** (3 dots) for the contact details to appear - ensure this is the correct location for the client. (If the search results find that there is no client under that name, you will need to create a new client by clicking on the **New** button and entering the details.)
  - iii. Click on the **Permit** Tab to ensure the correct licence for the client is listed
  - iv. Click on the **close** icon to close the screen
  - v. Click on the **Return Value** (return arrow symbol) for the client name, address and reference number to appear
  - vi. Enter the location of the compliance inspection in the **activity location** and click on the **search** (magnifying glass) icon. (This is the section where you will enter each different location on a licence as a compliance inspection has been completed. It is **critical** to create a running sheet action for each location inspected for it to be counted as an inspection.)  
If the search doesn't return any records you will need to add the location details to Ecotrack.
    - i. Click on the **new** button to add a new location
    - ii. Enter the **location name** and **location type**
    - iii. Enter the location details (e.g. street address, lot and plan, tenure) within the relevant Tab
    - iv. Once all relevant fields and information have been entered, click on the **save** (disk symbol) button and click **ok** (**NOTE: once saved, changes cannot be made**)
    - v. Click on the **close** icon to close out of this screen
3. Enter all information for each heading on the right hand side of the screen.
  - i. **Program Type** – click on the **search** (magnifying glass) icon and select either **Coastal/Water, Environment, Mining and PG, Not Applicable or Wildlife Management** from the list

## How to record Annual Compliance Plan Inspections in EcoTrack

**Compliance Program** – click on the **search** (magnifying glass) icon and select the relevant project from the current Annual Compliance Plan. The following are the compliance programs for 2011-12:

*2011/Mining/P&G/CSG & LNG/Environmental Services* this activity relates to inspections as part of CSG and LNG activities in the CSG/LNG compliance plan.

*2011-12/Mining/P&G/UCG/Environmental Services* this activity relates to inspections as part of UCG activities.

*2011-12/ Environment/ SEQ ERA ecoBiz candidates/ Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Environment/Environmental Management Practice Review project/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/ Environment/NPI reporting/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Mining/P&G/ General Petroleum and gas/Environmental Services* this activity relates to general petroleum and gas inspections that are not part of the CSG/LNG and UCG plans.

*2011-12/Coastal/water/Erosion and sediment control/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Environment/Port of Townsville material handling/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Environment/Landfill gas migration/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Environment/ERA inspections/Environmental Services* this activity relates to ERA inspections that are not linked to a specific ACP project

*2011-12/Mining/P&G/Mine water management/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Mining/P&G/Mining Financial Assurance/Environmental Services* this activity relates to inspections as part of this specific ACP project

*2011-12/Coastal/water/Other/Environmental Services*

*2011-12/Coastal/water/Riverine/Environmental Services*

*2011-12/Coastal/ water/Agriculture-ERMP/Environmental Services*

*2011-12/Coastal/ water/Agriculture-record keeping/Environmental Services*

- ii. **Status** – click on the **search** (magnifying glass) icon and select relevant status from the list
- iii. **Info Entered** – today's date will automatically appear
- iv. **Program Manager** – click on the **search** icon and select relevant name from the list
- v. **Responsible Office** – the responsible office will automatically appear (however if incorrect, click on the **search** (magnifying glass) icon and select relevant office from the list)

## How to record Annual Compliance Plan Inspections in Ecotrack

- vi. **Subject** – enter any additional details (e.g. Inspection Type)
4. Click on the **Admin Tab** and in the **File Ref** field type in the file reference number
5. Click on the **save** icon (disk symbol) to save all the data entered and click **ok**

### Running Sheet Fields

The Running Sheet fields *Date Commenced*, *Responsible Office*, *Action Type*, *Inspection Type* and *Outcome* are critical fields to be completed in Ecotrack. These fields are required to ensure accurate quarterly reporting of compliance programs.

6. Click on the **Running Sheet** button (3<sup>rd</sup> from left) to add the information collected from the compliance inspection (if all the entries in the Running Sheet entry are full, click on **edit** then **insert row** (or Ctrl + I) to add more lines)
7. Click on the **details** icon (3 dots) in the first empty line to add a new action (or if run out of lines Ctrl + I to insert lines)
8. Enter all information in each of the fields listed
  - i. **Source Ref** – the source ref will automatically appear
  - ii. **Date Commenced** – the date commenced will automatically appear (however if incorrect, click on the **search** (magnifying glass) icon and select date inspection commenced)
  - iii. **Officer Involved** – click on the **search** icon and select officer name from the list
  - iv. **Responsible Office** – the responsible office will automatically appear (however if incorrect, click on the **search** (magnifying glass) icon and select relevant office from the list)
  - v. **Action Type** – click on the **search** icon and select either Site **Inspection – Level A**, **Site Inspection Level B**, or **Site Inspection Level C** from the list (refer to procedural guide *Compliance Program – Audit Report* for inspection level definitions)
  - vi. **Inspection Type** – click on the **search** icon and select either **Proactive-Initial or Proactive-Follow up** from the list (*there are also reactive-initial and reactive –Follow up options but these are not to be used when recording a Compliance Activities, Proactive inspections are only recorded here*)
  - vii. **Enforcement Measure Type** – click on the **search** icon and select relevant enforcement measure from the list (only complete if relevant)
  - viii. **Referral To** – click on the **search** icon and select from the list (only complete if relevant)
  - ix. **Action** – type in a summary of details of inspection, including:
    - i. Conditions/activities/areas that were audited/inspected
    - ii. Non-compliance
    - iii. Reference to any Statutory Tools etc.
  - x. **Time Spent Hours** – click on the **search** icon and select relevant time from the list (refer to procedural guide *Compliance Program – Audit Report* for time definitions)
  - xi. **Time Spent Minutes** – click on the **search** icon and select relevant time from list (refer to procedural guide *Compliance Program – Audit Report* for time definitions)
  - xii. **Outcome** – click on the **search** icon and select relevant outcome from the list

## How to record Annual Compliance Plan Inspections in Ecotrack

- xiii. **Outcome Description** – type in additional outcome information, including:
    - i. Reference to the inspection report
    - ii. Recommended Enforcement Action
  - xiv. **Due Date** – click on the **search** icon and select date from the list (NB: the due date to complete this action)
  - xv. **Date Completed** – click on the **search** icon and select the completion date from the list (NB: the date this action is completed)
  - xvi. If you wish to attach documents (**NOTE limit of 2mb**) e.g. inspection reports, monitoring results, photos etc, select the **Documents** icon (2<sup>nd</sup> from right) and attach relevant files by selecting create (a description of the document can also be entered in the comments field)
9. Click on the **save** button and click **ok**
  10. Click on the **close** icon to close the screen
  11. The running sheet summary page will appear (to view information or change any of the information select the **details** icon (3 dots) button)
  12. Click on the **close** icon to close the screen

### Completion of Compliance Activity

13. The Compliance Activity Details screen will appear (the entering of the Compliance Inspection information in Ecotrack is now **complete**)
14. **Updates to Running Sheet** - ensure any status updates to the inspection are updated to the Running Sheet entries as required until the CA status can be changed to 'finalised'.
15. **Finalise** - once the CA record status is finalised update the status to '**finalised**' on the Compliance Activity screen. Print the report and Running Sheet entries and place on the relevant file.

# Procedural guide

## Compliance and Investigations

### Interviewing Potential Defendants

---

#### Essential Points

- Potential defendants should be interviewed at the earliest possible time to lock in their version of events and their explanation for WHY things happened the way they did.
- Often a second interview should be conducted to address in detail the elements of the potential charges and to fully explore any excuse, justification or explanation for non-compliance given by the person being interviewed.
- PREPARATION is the key to a successful interview of a potential defendant.
- Circumstances allowing, an interview of a potential defendant should be overtly tape-recorded.
- All statements made by a potential defendant, regardless of when, where or how, should be recorded by tape-recorders or in notebooks.
- The most important questions in an interview are the ones that explore the excuse, justification or explanation for non-compliance given by the person being interviewed.

#### Purpose

Conducting an interview with the person whom you believe to be responsible for a breach of legislation or in the case of a company, a person capable of speaking on the company's behalf, can be critical in establishing what has happened, who is responsible and why. It also gives an opportunity to the person being interviewed to explain their side of the story.

#### Preparation

Prepare for the interview to the extent possible given time constraints.

Preparation can include familiarising yourself with possible offences, the elements of those offences, any defences to those offences and powers able to be used by authorised offices; under the relevant legislation. It can also include identifying and familiarisation with policies, guidelines or procedures of the Agency that may be relevant.

Identify the likely defendant(s). Where a body corporate is involved this may require searches to determine the identity of the operator of a business. Prepare any physical evidence i.e. photographs or documents you may wish the interviewee to identify or comment on. If the person to be interviewed has any relevant licences be sure to check the conditions attached and if possible bring a copy of the licences and conditions along to the interview. Anything shown to a person being interviewed should be initialled by that person as evidence that they have seen it. Anything created by a person being interviewed (e.g. a sketch) should be retained as an exhibit.

There are different ways to prepare for an interview. Some people like to write out all the questions they want to ask in longhand. Some people prepare an outline of the matters they wish to cover in the interview along with some key questions. If the issues to be covered are lengthy, it is sometimes wise to divide the issues between

two interviewers. Sometimes a second investigator has the task of listening to the answers and asking follow-up questions. What is important in every interview is that:-

1. The interview is conducted fairly and not in an oppressive fashion.
2. There is sufficient flexibility in the process for the interviewers to explore issues raised by the interviewee.
3. That the interviewers explore the excuse, justification or explanation for non-compliance given by the person being interviewed.

Do not give advance notice of the questions to be asked or post to the interviewee the questions and receive the answers in writing back.

### **The Interview**

#### **For a Tape Recorded Interview**

Formally announce the fact that you propose to tape record the interview, produce the tape recorder and use it in plain sight. All participants must be aware that the interview is being recorded [refer to EPA policy on covert recordings].

Formally reintroduce yourself: My name is X and I am a Y officer with the Environmental Protection Agency and an authorised officer under the Z Act. If you have an identity card this should be produced for inspection. Have your corroborating officer introduce himself as well. Formally ask all other people present to identify themselves for the recording. Announce where you are and the time. Have the interviewee confirm the time.

Should it be necessary at any time to suspend the interview then this fact should be announced along with the time before turning off the tape. Do not discuss the matter in any way whilst the tape is off. When the interview is recommenced again announce the time and have the interviewee confirm that nothing concerning the matter was discussed whilst the tape was off.

For more details refer to the procedural guide on "When and How to Issue a Caution".

#### **For a hand recorded interview**

Announce that you will be making a written record of the interview and produce the notebook in which you will record the interview. Be sure to note all persons present along with the time the interview commenced. Record all questions and answers verbatim.

When the interview is finished ask the interviewee to read your notes and if he agrees with their contents to sign the bottom of each page. Then have him or her sign a declaration at the end of the interview to the effect that they have participated in the interview of their own free will and that the answers were not given as the result of any threats, promises or inducements. You should then sign your notes along with your corroborator. Should the interviewee refuse to do so this should be noted along with any reason advanced by them as to why they will not. Make a note as the time the interview concludes.

#### **For both Tape Recorded and Hand Recorded Interviews**

Announce the purpose of the interview and ask the interviewee whether they are prepared to be interviewed about the matter: eg. We are investigating an incident at A whereby B occurred we would like to interview you concerning this matter. Are you prepared to take part in this interview? Do not engage in any substantive conversation about the subject matter prior to the interview.

It may be appropriate at this point to administer a caution please refer to the procedural guide on "When and How to Issue a Caution".

Start with asking the interviewee their name, address and occupation. The course of the interview will often be dictated by the amount of cooperation shown by the interviewee however it is best to begin broadly with general open questions such as "what can you tell me about A?".

From a broad start to try to pin down particulars. Still use open questions, a good way to ensure this is by utilising questions that begin with What, Where, When, Who, How and Why.

When interviewing evasive witnesses it is sometimes better to ask the witnesses why they did something, instead of asking them if they did the thing. This is more likely to elicit an honest indication of what they have in fact done.

In all cases, where it has been established during the course of the interview that a person has done something, it is essential to ascertain why they acted in this way. The reasons for ascertaining the person's intention is that it places the whole of their conduct in context, allows a proper consideration of whether or not they have a defence at law and locks down their version of events so that subsequent alteration of the evidence is difficult.

When introducing physical evidence for the witness to look at (e.g. a document, picture or object) make it clear so that anyone reading the transcript will know what you were showing to the witness. Do not identify it yourself. Ask whether they recognise the thing and if so what it is. If possible then mark the item with a letter and /or number so that it can be identified later as being the object referred to in the interview.

If statements have been obtained from other witnesses who contradict a version of events put by the interviewee wait until after they have finished telling their version of events before telling them what the other witness says and asking for a comment. The same approach should be adopted if the interviewee contradicts themselves.

It is also important to establish what EPA policy documents, such as guidelines or operational policies, the interviewee may have had regard to and the extent, if any, they have relied upon those documents.

Be sure only to ask one question at a time. If an interviewee is asked a multipart question it can be difficult or impossible to determine what part of the question they are answering.

Do not be afraid to have the interviewee clarify or expand on an answer. One of the objects of the interview is to gather information.

At the end of the interview ask the person whether there is anything more that they would like to say about the matter. Confirm that they have participated in the interview of their own free will and that no threat, promise or inducement was made to them.

### **Particular pitfalls/problems**

#### **Lawyers/other parties**

If a person wants their lawyer with them when they are interviewed, you should not object to their presence, if to do so would be unfair. As to other people the person would like to be present, you will need to use your judgement. If the other person is a material witness then they should not be present particularly if they also a potential defendant. Interviewing multiple people simultaneously is inherently difficult and their statements are frequently inadmissible in court.

If the witness has a support person with them, do not allow the other person to answer on the interviewee's behalf. Politely but firmly inform the other person that they may observe the interview and in the case of a lawyer advise their client but they may not answer on their behalf. Should this happen, make sure that the interviewee adopts the statement made by the other person.

Keep in Control - you are conducting the interview and you ask the questions and the interviewee answers them. Take your time and keep your cool. An interviewee may become agitated or angry during the course of the interview, do not allow yourself to become upset in response. If you begin to raise your voice, start to bully the interviewee you will potentially void the interview and bring the EPA into disrepute.

During interviews under compulsion the interviewee (or their lawyer) may repeatedly ask what the relevance of a question is in order to determine whether they are compelled to answer the question. In this situation the investigator should say:-

“It is not my role to detail the relevance of a question nor to determine whether the basis for requiring your client to answer questions is defensible at law. Further I do not decide what charges may or may not be brought against your client. I do not know how you will answer the questions. I am not legally qualified to assess whether the answer will be incriminating. You must decide whether you think you might have committed an offence and if so, choose whether you wish to claim privilege. I will not adjudicate on that claim, but that does not mean that the claim will not be challenged at a later time. Do you understand?”

For more detail refer to the procedural guide on “When and How to Issue a Caution”.

### **Promises, Threats and Inducements**

It has long been a rule of evidence that admissions by an accused made as the result of a promise, threat or inducement will not be received into evidence.

A promise can be as simple as “things will go better for you if you cooperate” or “if you just tell us what happened it is likely no further action will be taken”. Defendants sometimes develop a dependence and friendship with investigators. Whilst it is OK to be empathetic to the interviewee’s feelings and sometimes advisable, you should be careful not to mislead them and perform your duties professionally.

Threats such as charging the person with a more serious offence or revoking licences or even of physical violence are not just wrong but also will leave you liable to civil and/or criminal penalties in addition to departmental disciplinary action. Ensuring that a person is comfortable and offered a drink and food is a good way of avoiding an allegation of implied threats.

An inducement is a catchall description meaning to cover anything that might persuade a person to make an admission other than by the exercise of their free will. Advising the interviewee that you are simply the investigator and don’t decide what should happen, is a good way of avoiding an allegation that you offered an inducement.

A good rule of thumb is to remember neither carrot nor stick.

### **What will happen now?**

This question is commonly asked during or at the end of an interview. The only answer that can be given is that once you have finished investigating the matter the information will be provided to others in the EPA who will decide what is to happen. Any other answer will risk having you make a promise/inducement.

### **Disclaimer:**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their professional advisors before embarking on any proposed course of action.

# Procedural guide

## Compliance and Investigations

### Investigation Planning

*This procedural guide is intended to assist Agency officers in adequately planning for investigations, particularly potentially significant legal compliance actions.*

#### Essential Points

- Each investigation should have a plan.
- The complexity of the investigation will determine the complexity of the plan.
- Plans should include objectives, elements of possible offences and investigative strategies, tasks, timeframes, any reporting and review requirements; and any co-ordination between Divisions.
- Environmental outcomes should be considered in creating an investigation plan.

#### Defining the Investigation

It is important at the outset of an investigation to establish a focus for, and set limits on, an investigation, to ensure that finite resources are used effectively to achieve environmental outcomes. Identification of the objectives and potential environmental outcomes for the investigation are essential in this regard. It is important at the outset to identify any relevant timeframes, both internally such as those provided for in the procedural guide 'Potentially significant legal compliance actions within the EPA', and those provided for by legislation (statutory time limits for commencing proceedings). An early review of available information also assists in ensuring that officers' time is well spent in the investigation, rather than collecting information already available to the Agency, either on file or in the public domain. Prioritisation of steps in the investigation assists in ensuring the investigation is as efficient and effective as possible. The identification of the relevant skills/knowledge required for the investigation; and the identification of the skills/knowledge present in available officers to assist in the investigation, ensures that the right tasks are allocated to the right people. It also helps in the early identification and management of areas where assistance may need to be sought from other units, or Divisions. A background information review is beneficial and assists in planning an effective investigation. Background information includes: any relevant licences, permits or approvals; relevant maps over the subject area; historical file data concerning other incidents or site history; any relevant company searches; any relevant title searches; and company information available in the public domain (such as internet sites).

#### Planning the Investigation

Investigation planning is essential to ensure that finite resources are used effectively in achieving environmental outcomes and that the investigation is carried out in a methodical and thorough way. This helps to ensure all the relevant evidence is identified and collected in a timely manner. The need for return site visits, and additional interviews is minimised. The investigation plan essentially sets out what needs to be done and how to do it; it is the road map of the investigation.

### Step 1 – Identify objectives

This is one of the most important aspects of the investigation plan and should be well defined and clear. Objectives can be as simple as determining the existence of a prima facie case for a breach of the relevant offence. On the other hand, objectives can be more complex where the goals of an investigation may also include other elements such as ensuring a site is cleaned up.

### Step 2 – Identify offences

It is important to identify the potential offences that may be involved. This serves two purposes; it focuses the investigation and it allows the effective planning of the investigation to ensure all the required evidence is identified. This ensures officers know what they need to obtain from the outset of the investigation.

After identifying the relevant offences, the next action is to examine the components of the offence (also known as the elements of the offence). This is called elementising an offence. This is important as it breaks down the offence into its components and allows officers to understand what exactly must be proved. It is necessary to obtain evidence in relation to each element of the offence. The standard of proof for criminal offences is that of “beyond a reasonable doubt”.

There are some elements, which are common to every offence, such as time, date, place and a person. Apart from the common elements, each word or phrase of the offence must be examined to see if it involves a particular issue of law or fact. For example:

**Offence:** *A person must not contravene a condition of the authority*

**Elements:-**

<i>Time, date and place</i>
<i>A person (can be an individual or company)</i>
<i>Must not contravene (if the term is not defined in the Act refer to a dictionary, which provides that it is to violate, infringe or transgress)</i>
<i>A condition (e.g. A2-1)</i>
<i>Of the authority (an environmental authority i.e. MIMXXXXXX)</i>

### Step 3 – Identify evidence required

The next step is to identify the types of evidence that would be needed to prove the elements of the offence and negate any potential defences. It is important to identify any evidence that may only be available for a limited amount of time (e.g. physical evidence can dissipate). Consideration should be given here also to any existing material held by the Agency on files, or already provided to the Agency by the alleged offender. It may be that some of the evidence needed is already in our possession and this evidence should be identified e.g. any applicable licences, permits or approvals. It is also useful to identify any background information such as general discussion of the processes undertaken on the site; identification of any previous incidents, or previous enforcement action.

By way of example, elements such as time, date and place could be proved by the observations of the investigator and witnesses, any relevant records (such as records of flow), maps etc. An element such as the person (a person can be a company) may be proved by observations of the investigator or witnesses. Other evidence may include company searches. Evidence of contravention can be provided by a number of different sources such as observations of witnesses, photographs or satellite images, admissions by the person or

someone authorised to speak of behalf of and make admissions for the company, supervisor’s reports or other company records, experts reports or statements etc. What particular evidence is required will depend on the factual circumstances of each case. It will be necessary to review the evidence required periodically, as the investigation proceeds, and as evidence is obtained. An example of how to complete this aspect of the Investigation Plan is provided below.

Elements of the Offence	Existing Evidence	Avenues of Inquiry/Evidence to be obtained

**Step 4 – Identify project team**

Consider what skills and knowledge are required for the investigation. This step involves identifying the people to be involved in the investigation and ensures that all the relevant skills and knowledge are provided and that the investigation is adequately resourced.

**Step 5 – Identify tasks and timeframes (including consideration of safety issues)**

It is very important to identify what tasks need to be undertaken to collect the evidence required. Do experts need to be involved? What interviews need to occur? What documents are needed? Is a search warrant required? Who needs to do what? Any strategies for the overall investigation should be considered in this step. All tasks in the compliance process need to be considered, including for example the preparation of the brief of evidence.

In this step it is also necessary to identify the timeframes within which these tasks need to be done to fit within the overall investigation timeframes established when you defined the investigation. This step also includes the identification of any particular resourcing (staff and equipment) needs for the investigation, such as the use of staff from the Herbarium or Environmental Sciences Division. It also includes an overall consideration of any relevant personal protective equipment needed and any safety issues that may arise within the course of the investigation.

**Step 6 – Identify procedures**

The next step is to establish whether there are any relevant procedural guides or policies that may apply to the investigation or any individual tasks within the investigation. This covers both procedures concerning work by the investigators and procedures concerning actions taken by the alleged offender. For example, a guideline on levels of contaminants in a tailings dam may exist or the guideline on interviewing a potential defendant may be relevant.

**Step 7 – Finalise the Investigation Plan**

The investigation plan is a plan that will need to be reviewed/updated as the investigation proceeds.

**Disclaimer**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

## Compliance and Investigations

### Making a Complaint and Summons

---

#### Essential Points

- A complaint is made by outlining the basis of the complaint and referring to the provision said to be offended to a JP who then issues a summons.
- A person should only make a complaint if they have a reasonable belief that the offence contained in the complaint was committed. Note that the person does not have to form a legal opinion on whether the court will convict the person charged of the offence alleged.
- The Complaint and Summons must be filed with the Court within three days after the issuing of the JP's summons.
- The Complaint and Summons must be served and an oath as to service deposited to and taken by a JP and then filed with the Court.
- Complaints normally must be made within one year of the offence.

#### What is a Complaint and Summons?

A complaint is a document signed before a Justice of the Peace ("JP") signifying that a complaint has been made to the JP and upon the making of the complaint the JP issues the JP's summons. The summons requires the attendance of the defendant before the Court to answer the charge or charges set out in the complaint. The person who makes the complaint to the JP is known as the complainant.

Complaints can also be sworn but this is only necessary if a warrant is to be issued. It is anticipated that this will occur so rarely that if necessary specific instructions can be sought.

#### How to make a complaint and have a summons issued

- Following an investigation the decision will have been made to institute a prosecution.
- You will be provided with copies of the complaint and the summons.
- The first step is to find a JP. Counter staff at Magistrates Courts are JP's and can assist but there is no legislative prohibition against using a JP who is employed by the EPA.
- Having found a JP, the complainant must outline the basis of the complaint, that is to briefly but succinctly describe what has occurred and what provision it is alleged that this conduct offends against.
- The JP must be satisfied that the allegations are sufficient to found the offence. Note this does *not* mean that the JP needs to review the evidence just that what is alleged would appear to amount to an offence.
- The JP then issues his summons that you will have to give to the JP for his signature.
- The Complaint and Summons must then be filed in the Magistrates Court Registry within three days of the issuing of the summons. Note the complaint and summons does not need to be served prior to the filing.
- The Registry will be the one for the court to whom the defendant has been summons to appear.

## Service

- Having made the complaint and the JP having issued his or her summons it is now necessary to serve the complaint and summons on the defendant as soon as possible.
- Wherever possible, personal service is preferable.
- The copy of the complaint and summons with the oath of service completed on its back should be filed with the court. This can be the copy required to be filed within three days of the issuing of the summons if service is affected in that time.

## Trouble Shooting

Assuming that the complaint has been properly drafted and has everyone's names properly spelt and in the right places (eg. the complainant is not named as the defendant), and that the information in relation to the address for service is accurate at the time of service. Then the only real difficulty lays in two areas the complaint being out of time and the complaint not being properly made.

## Time

- The *Justices Act 1886* provides that in the absence of any other legislative provision that a complaint must be made within one year from the time the matter of complaint arose.
- Note that this refers to the making of the complaint and not service or even the issuing of the complaint.
- The EP Act provides that a summary proceeding must start either within a year of the commission of the offence or within a year of it coming to the knowledge of the complainant and within two years of the commission of the offence.
- A complainant that is out of time can upon objection being taken to it be dismissed with costs against the complainant.
- Note that if it is proposed to proceed on indictment and have the matter eventually dealt with in the District Court then no legislative time limits apply.

## Complaint not properly made

- An objection can successfully be taken to a complaint if it can be shown that the complainant has failed to outline the nature of the complaint and simply has had the JP sign the complaint as if witnessing the complainant's signature.
- Whilst no objection can be taken to a complaint simply because of the fact that the complainant and the JP work in the same department or even the section, care still needs to be taken. A JP has to act independently if the JP works in a subordinate position to the complainant a Court may have sufficient doubt as to the JP's having considered the matter independently rather than at the dictation of the complainant.
- A good idea if using a JP who also works for the EPA is to find one who is of equal or greater classification and/or who works in a different section and who reports to a different superior than you.

# Procedural guide

## Compliance and Investigations

### Obtaining and Executing Warrants

*This document provides guidance as to the procedures to be followed for obtaining and executing warrants in relation to any of the legislation administered by the Department. Authorised officers MUST NOT make an application for a warrant or attempt to execute a warrant without the required approval set out in this document.*

<b>Essential Points .....</b>	<b>2</b>
<b>What is a warrant? .....</b>	<b>3</b>
Warrants under legislation administered by DERM .....	3
Warrants for a place – <i>Environmental Protection Act 1994</i> .....	3

Common Mistakes .....	9
Avenues for Contesting Warrants .....	10
<b>Alternate Means of Applying for a Warrant .....</b>	<b>10</b>
<b>Assistance .....</b>	<b>10</b>

## Essential Points

Warrants **MUST NOT** be applied for or executed without the prior approval of an employee in one of the following positions:

- Director, Compliance and Investigations
- General Manager, Operations, Environment and Natural Resource Regulation
- Assistant Director-General, Operations and Environmental Regulator Division
- Associate Director-General, Operations and Environmental Regulator Division
- Regional Service Director, Regional Service Delivery Division

Only an authorised officer (appointed under the relevant legislation) can apply for and execute a warrant.

Warrants should not be executed without the presence of a member of the Investigations Team.

Executing warrants is a standard step in the conduct of an investigation. However, it is an activity that can easily create a conflict situation and attract public and media interest. It is therefore important to carefully plan the execution of a warrant. It is also critically important to manage the execution of the warrant and subsequent related investigative steps to limit conflict and manage the public interest issues.

Failure to execute a warrant appropriately can result in evidence being found to be inadmissible in court and damage the prospects of successful criminal and civil litigation.

Communication surrounding the execution of warrants is critical:

- The Assistant Director-General, Operations and Environmental Regulator must be advised of the proposed execution of a warrant **PRIOR TO** the warrant being executed. Further guidance regarding the form and content of briefing material is provided below.
- At least one Situation Report (SitRep) must be provided to the Assistant Director-General, Operations and Environmental Regulator during or after the execution of the warrant.
- Communication and interaction with any person present at the place where a warrant is executed must be managed by the officers executing the warrant so that execution of the warrant is to the extent possible cooperative and conflict is minimised.
- The Warrant holder, Manager Investigations and/or Director Compliance and Investigations should consult with the Media Unit prior to executing the warrant to determine a media strategy, which may include the preparation of a proactive or reactive media statement.

If a decision has been made to execute a warrant, the Department will be in the course of fulfilling its responsibilities to investigate an alleged offence in relation to the legislation it administers. It is not appropriate to enter into a formal agreement with an alleged offender, the occupier of a place where a warrant is being executed or any representative of those persons regarding the way in which the warrant will be executed. An Information Sheet as to the way in which departmental officers ordinarily execute warrants (particularly where this involves the seizure of electronic materials) can be provided to such persons. The steps set out in the Information Sheet generally assume that the other party will be cooperative. If cooperation is not forthcoming, the Department will determine the appropriate alternative steps.

Failure to deal with claims of legal professional privilege and, particularly in the case of seizure of electronic material, relevance, can damage the prospects of successful criminal and civil litigation.

The execution of a warrant can only be covertly recorded with the **PRIOR APPROVAL** of the Director Compliance and Investigations, Assistant Director-General or Associate Directorate General (in accordance with the Covert Recording Procedural Guide.)

## What is a warrant?

A warrant under the legislation administered by DERM is a form of order granted by a magistrate upon a sworn application, which authorises the applicant to enter a premises with necessary and reasonable help and force to exercise their powers under the relevant Act, which may include searching for and seizing particular evidence for which the warrant has been issued.

## Warrants under legislation administered by DERM

Each of the Acts administered by DERM contain different requirements to ground an application and different procedural requirements for obtaining warrants. In the case of the *Nature Conservation Act 1992*, it provides for two different types of warrants, each with different requirements. When applying for a warrant, it is important to carefully consider and follow the provisions of the relevant legislation. Legislation can be accessed online at [www.legislation.qld.gov.au?OQPChome.htm](http://www.legislation.qld.gov.au?OQPChome.htm).

### Warrants for a place – *Environmental Protection Act 1994*

A warrant for a place is used to obtain evidence of offences suspected to have been committed against the *Environmental Protection Act 1994*. A warrant is only granted if a magistrate is satisfied that there are reasonable grounds for suspecting:

- that a particular thing or activity may provide evidence of the commission of an offence against the *Environmental Protection Act 1994*; and
- the particular thing or activity is or may be at the place within seven days of the making of the application.

The application must set out the reasonable grounds for the suspicion. A suspicion that something exists is more than a mere idle wondering whether it exists or not; it is positive feeling of actual apprehension or mistrust amounting to a slight opinion, but without sufficient evidence.

### Monitoring warrants – *Nature Conservation Act 1992*

A monitoring warrant is used for the purpose of finding out whether the *Nature Conservation Act 1992* is being complied with. It does **NOT** allow evidence to be seized. It will only be granted if a magistrate is satisfied that it is reasonably necessary that the conservation officer have access to the place for the purpose of finding out whether the Act is being complied with. A monitoring warrant **CANNOT** be issued for residential premises.

### Offence related warrant – *Nature Conservation Act 1992*

An offence related warrant is used to obtain evidence of offences suspected to have been committed against the *Nature Conservation Act 1992*. A warrant is only issued if a magistrate is satisfied that there are reasonable grounds for suspecting:

- that a particular thing may afford evidence of the commission of an offence against the Act; and
- that the particular thing is or may be in or on the place within seven days of the making of the application.

### Warrant – *Forestry Act 1959*

A warrant under the Forestry Act is used to obtain access to a premises that is used as a dwelling in order to seize forest products or quarry material that have been got or interfered with contrary to the Act, or equipment,

documents or other things that are evidence of such getting or interfering. A warrant is only issued if a magistrate is satisfied that there is reasonable cause to suspect:

- (i) that forest products or quarry materials are at the place; and
- (ii) those forest products or quarry materials have been got or interfered with contrary to the Act.

## **Templates**

There are template forms for applications for warrants and warrants available on Ecosteps (for legislation administered by the former EPA) and from the Investigations Team, Compliance and Investigations Branch, Environment and Natural Resource Regulation.

## **Warrant applications and court process**

### **Application**

Warrants **MUST NOT** be applied for or executed without the prior approval of an employee in one of the following positions:

- Director, Compliance and Investigations
- General Manager, Operations, Environment and Natural Resource Regulation
- Assistant Director-General, Operations and Environmental Regulator Division
- Associate Director-General, Operations and Environmental Regulator Division
- Regional Service Director, Regional Service Delivery Division

The preferred course is to request approval from the Director, Compliance and Investigations via memorandum, email or phone (with follow up confirmation email). If the Director, Compliance and Investigations is unavailable and a warrant is urgently required, it is appropriate to escalate to one of the other officers and to seek advice and assistance from the Director, Litigation. "Urgent" means that evidence will be lost, or material or serious environmental harm or other another significant adverse impact is likely, if the application is delayed until the Director Compliance and Investigations is available.

- The authorised officer applying for the warrant is to prepare both the application for the warrant and the warrant.
- The grounds of the application **MUST** show a nexus or connection between the place, the evidence sought and the offence(s) nominated.
- The grounds should be set out in a chronological or otherwise logical order and the paragraphs should be numbered.
- The grounds should address the requirements for the particular type of warrant being applied for (see above).
- The offences nominated in the application and the warrant should be included as section number and name of Act. The full wording of the offence should then follow.
- All available, accessible and relevant DERM information should be considered in terms of the grounds for the application.
- The application must include both a street address and the lot on plan description of the premises, as well as a description of the premises, for example, "Industrial premises owned by J Bloggs Pty Ltd".

- The Search Warrant Register kept by the Investigations Team should be consulted prior to completing the application to ascertain whether there is any relevant intelligence about the premises or occupier. Any relevant information should be referred to in the warrant application.
- The application is required to be sworn in the presence of a Justice of the Peace, Commissioner for Declarations or solicitor. It may be sworn in front of the magistrate.

### Court process

- The authorised officer making the application should make contact with the nearest Magistrates Court to find out when an application for warrants will be heard.
- Departmental officers attending court are to be mindful that they are representing the Department and should be dressed accordingly and portray a professional image. (Refer also to the Code of Conduct.)
- The authorised officer **MUST** take his or her authorised officer identification card to Court.
- The authorised officer **MUST** take a copy of the relevant Act to Court.
- Departmental officers are to address a magistrate as “Your Honour.”
- The practice in most Magistrates Courts is to hear applications for warrants in private in chambers (the magistrate’s office). The following procedures apply if the application is being heard in open court:
  - Upon entering and leaving the Court, officers are to follow appropriate court etiquette (such as bowing towards the Coat of Arms as a courtesy).
  - Officers are to correctly swear as to the contents of the warrant. Officers are to be guided by the clerk of the Court or Magistrate as to which oath or affirmation to swear. The form of the basic oath is *“I swear that the contents of this document and any further information I may supply either orally or in writing are true and correct, so help me God.”*
  - In the instance of officers being asked complex or legally-based questions that they are unable to answer, officers should request an adjournment and make immediate contact with the Director Compliance and Investigations, Director Litigation or a principal lawyer in relation to the issue.

### Warrant execution

#### Briefing up

- The Assistant Director-General, Operations and Environmental Regulator must be advised of the proposed execution of a warrant **PRIOR TO** the warrant being executed. For routine matters (for example, where significant conflict, public interest or media interest) is not anticipated, briefing will take the form of dot points sent by email to the Director, Compliance and Investigations and Assistant Director-General. For all other matters, briefing will be by Associate Director-General Briefing Note.
- The relevant Senior Director (QPWS) or Regional Service Director (Regional Service Director) **MUST** also be advised of the intended execution of the warrant.
- At least one Situation Report (SitRep) must be provided to the Assistant Director-General, Operations and Environmental Regulator during or after the execution of the warrant. In the case of complex warrant scenarios (such as where multiple related warrants are executed at the same time, and/ or a large number of exhibits are seized, and/ or the execution of the warrant has significant consequences for the occupier of the place, and/ or there is significant conflict, public interest or media interest) then multiple SitReps (by email) and or formal briefings may be required. The Manager Investigations should determine this in consultation with the Director, Compliance and Investigations.

### Planning, Safety and Operational Orders

- The warrant holder (and other officers involved in execution of the warrant if appropriate) should familiarise himself or herself with the premises the subject of the warrant by conducting a covert drive past of the address, consulting other departmental staff who have previously attended the address and viewing maps of the area.
- If the subject premises may contain environmental hazards, environmental officers or scientific staff **MUST** be consulted prior to executing the warrant. A job safety analysis **MUST** also be conducted.
- If it is likely that the occupier of the premises will refuse entry, or if it is likely that the occupier will be aggressive towards DERM officers, the assistance of the Queensland Police Service **MUST** be sought.
- A warrant action plan or operational order **MUST** be completed and provided to the Manager Investigations **PRIOR TO** the execution of the warrant.
- A briefing should be conducted in accordance with the SMEAC formula (Situation, Mission, Execution, Administration and Logistics, Command and Communication). The action plan or operational order should be used in the briefing stage.
- The main outcome of the briefing is that all attending staff should be aware of their respective roles and responsibilities (executing officer, property officer, searching officers, assisting officers, scientific officers, miscellaneous officers) during the execution of the warrant.
- In the execution of large-scale warrants, consideration should be given to conducting a separate briefing with Team Leaders and delegating responsibility and tasks to such persons.
- A search warrant bag containing appropriate search-related resources should be prepared, checked and taken on search warrants.
- An appropriate form-up point or parking spot should be used in attending the subject premises.
- Officers attending the execution of warrants **MUST** notify a non-attending staff member of their whereabouts for operational safety purposes.

### Execution

- If an officer's health or safety is threatened at any time during the execution of the warrant, officers **MUST** immediately leave the premises.
- The warrant holder **MUST** inform the Manager Investigations (or other person as per the Operational Order) when they have entered the premises, and again when they leave.
- Appropriate PPE **MUST** be worn during the execution of the warrant.
- On arriving at the premises, the warrant holder should introduce him/herself as the warrant holder, introduce any other persons accompanying him/her, explain the purpose of the warrant and the powers under it.
- Official notebooks should be used for recording observations, occurrences and events in relation to the warrant.
- Officers should electronically record the entire execution of the warrant. Unless operational circumstances require otherwise, the warrant execution should be overtly recorded with the knowledge of all people present.
- Consideration should be given to video recording the execution of the warrant.
- Officers **MUST** display their authorised officer identification cards with them when executing warrants.

- Officers questioning alleged offenders in relation to an offence should first caution the alleged offender about their right not to answer questions or make statements that may tend to incriminate them. The caution should be electronically recorded. Refer to the procedural guide on cautioning published on EcoSteps.
- For operational and administrative reasons, the warrant holder of the operation should be introduced as such (and identified as the lead person) during the execution of the warrant.
- Officers should ask for cooperation from the occupiers of the premises (and any employees or other persons present) as necessary during the execution of the warrant. If an occupier of the premises refuses to give reasonable help for the exercise of powers under the warrant, officers should warn them that it is an offence to obstruct an authorised officer during the performance of his or her duties.
- A copy of the warrant **MUST** be given to the occupier of the premises. The original warrant should be on hand and shown on request, but not physically given to the occupier of the premises.
- The basic details of the warrant should be read out to the occupier of the premises (outline the offence(s), the property sought, the expiry date of warrant, and the powers under the warrant).
- The execution of the warrant should not be stopped simply because the occupier or occupier's solicitor requests (over the telephone or in person) that the execution stop. In these circumstances they should be referred to the Director Litigation or a principal lawyer, Litigation Branch.
- The property seizure guidelines should be followed when seizing property. A centrally designated exhibit point at the site and an appointed exhibit officer should be used in the management of exhibits.
- The warrant holder (and other officers involved) must make detailed notes of the warrant execution. Notes of the time, specific location and the officer locating any seized property should be made. Full continuity notes should be maintained. Photos of exhibits in situ and the general layout of the searched site should be taken, and sketches made as appropriate.
- A property seizure receipt must be completed for all property seized under a warrant, and must be given to the occupier of the premises before officers leave the premises. The receipt should be signed by the occupier of the premises.
- Any damage caused during the execution of the warrant must be noted and recorded, and the record signed by the occupier.
- The warrant holder (the person who applied for the warrant) **MUST NOT** leave the premises while the warrant is still being executed. Returning to the premises after having left them may be unlawful.
- The execution of the warrant should conclude by telling the occupier that the execution of the warrant has ended and that the officers are leaving the premises.

#### **Execution: Computer hardware and electronic documents**

It is increasingly common for "documents" to be in electronic form. As such, it has become regular investigative practice to seize electronic material, often by utilising an information technology forensic specialist to create "images" of data. The following guidance applies to that practice:

- Care should be taken with computer equipment, as data can be lost or corrupted if it is not handled appropriately. Advice should be sought from an IT expert.
- An alternative to seizure of computer hardware is the imaging of electronic data.
- When determining whether to seize IT hardware or image data officers should:

- **PRIOR TO** seizure establish that the hardware or image includes material that is relevant to the investigation (see further guidance below); and
  - consider what action is likely to be most cost-effective; and
  - consider what action is likely to be most effective in conducting the investigation; and
  - give particular consideration to the likely disruption caused to business or other activities as a result of seizure; and
  - during the execution of the warrant, but without compromising the investigation, consider how to minimise any such disruption.
- With respect to relevance, it is critically important that the IT equipment be inspected to determine whether electronic material on each piece of equipment is relevant and within the ambit of the warrant. If possible, this should be done with an IT Expert.
  - Other regulators have failed at prosecution due to electronic data being seized without relevance first being established. It is possible that all material seized in such a way (such as by imaging all electronic material) will later be considered inadmissible.
  - When IT experts are crafting search strings to establish whether electronic material is relevant, it is important that the search string does not allow for “false hits”. For example, if executing a warrant in relation to a facility known as “Townsville Harbour” in relation to alleged disposal of spent abrasive blasting waste, a search for documents with that string of words is not adequate as it is conceivable that all manner of irrelevant material will contain those words. However, it may be appropriate to look for a string such as “abrasive blasting waste disposal”. The warrant holder and IT expert should determine appropriate search strings together.

### **Dealing with claims that documents are legally professionally privileged and/ or irrelevance**

- The warrant holder should not invite (expressly or impliedly) a claim of legal professional privilege. However, if a claim of legal professional privilege (or “privilege” generally) is made, the warrant holder should do the following:
  - Receive (that is, listen to and note) the claim of privilege.
  - Ask the person making the claim to indicate the grounds upon which the claim is made and in whose name the claim is made (ie, who does he or she claim privilege attaches to).
  - Hard copy documents in which respect of which legal professional privilege is made should be placed in a separate container (for example, a box). A list of the documents (identifying sufficient general information as is required to identify it, for example, “Letter from T Brown, Lawyers to A Smith Pty Ltd dated 1 June 2009”) should also be prepared and be endorsed by the warrant holder and preferably also the person claiming privilege. The list should go into the box with the documents, which should then be sealed. The person claiming privilege should be allowed to copy the documents before they are placed in the box if he or she wishes, and if that is possible and practicable.
  - The list and the box should be marked and endorsed to the effect that the documents are not seized under the warrant, and should be delivered as soon as possible into the custody of the Clerk of the Court in the Magistrates Court District in which the warrant was granted pending resolution of the claim of privilege. If the Clerk of the Court or Court staff refuse to take possession of the box, the warrant holder should telephone and seek the advice of the Manager Investigations, Director Compliance and Investigations or Director Litigation.

- If the claim of privilege is in relation to electronic material (when an entire hard drive is being imaged) then it is preferable that the warrant holder arranges for the IT expert to effectively isolate those documents, produce hard copies of them and deal with them in accordance with the procedures above for hard copy documents. In that case, it is preferable that analysis of the imaged electronic data occurs in the presence of the warrant holder and person claiming privilege to enable the claims of privilege to be dealt with appropriately. If necessary, seek advice from the Manager Investigations and/or the IT expert.
- If during the execution of the warrant it is claimed that documents sought to be seized under warrant are irrelevant (as they are considered relevant by the warrant holder), those documents **MAY** be appropriately marked to that effect. If the warrant holder considers the documents are relevant and within the scope of the warrant the material should be seized. Determinations on admissibility (including whether the documents are relevant or have any probative value) is a matter for the Court at a later time.

### **Post- warrant**

- A de-briefing should be conducted at the conclusion of the warrant at an appropriate location.
- All seized property should be handled with care. Contamination and continuity issues should be considered at every stage of property handling and management. Seized property should be placed in the exhibits facility at the Investigations Unit in accordance with operational policy.
- Images of electronic material must be kept securely.
- The result of the execution of the warrant should be included in the Search Warrant Register.
- The Manager Investigations should be briefed in relation to the outcome of the warrant.
- The warrant should be completed with the appropriate details relating to its execution.
- Comprehensive file notes/notebook entries should be made in regard to the execution of the warrant.
- The original warrant should be treated as an exhibit and retained for court purposes.
- The recordings made of the execution of the warrant are to be treated as exhibits. A copy of the recordings should be made for back-up and transcription purposes.

### **Common mistakes and avenues for disputing admissibility of evidence obtained under warrant**

#### **Common Mistakes**

- Execution of warrant is not recorded electronically. Check batteries prior to executing the warrant.
- Warrant is executed at incorrect address. Illegal and incorrect search addresses are not only embarrassing, they can lead to formal complaints or legal proceedings being brought against the Department.
- Property seized from the premises is not handled correctly, or is left behind, or is lost. Due care must be exercised in dealing with exhibits and seized property.
- Property seizure receipts not being completed and left with occupier. This can lead to disputes about what was actually seized.
- Officers not introducing themselves on tape. This creates difficulties during the transcription process.

- Suspects not being cautioned when appropriate. Admissions may not be admissible in court proceedings.
- Premises being searched when no person is at the premises. Allegations of impropriety can be made against the Department. Officers should contact a relevant person to be present during the search, for example a company representative, police officer, or Justice of the Peace. The warrant must not be executed unless a relevant person is present.
- Execution of the warrant does not occur within the time specified in the warrant. Ensure that the magistrate granting the warrant has correctly completed the expiry date and signed the warrant.

### **Avenues for contesting warrants**

- The nominated address on the warrant must be correct and thoroughly descriptive.
- The offence must be one that is suspected to have already occurred, and not one that will occur in the future.
- The grounds for the warrant must show a nexus being between the nominated offence(s), the subject premises and the evidence sought. Warrants may not be "fishing expeditions".
- All aspects relating to the grounds of the warrant can be disputed in court in order to argue that evidence should be excluded. Reasonable suspicion is a subjective test – "must amount to a positive feeling of actual apprehension or mistrust amounting to a slight opinion, but without sufficient evidence".
- The application must be sworn correctly under oath or affirmation.
- A distinction must be made between whether the evidence is at the premises, or may likely be at the premises within the relevant time set out in the legislation. The grounds must differentiate between these two alternative aspects.
- The search must not continue once all of the nominated evidence has found. Once the warrant has been executed and the evidence sought is located, the warrant ceases. Continued searches in this instance can be legally challenged.
- Officers must state their name and position, and display their authorised officer identification card.

### **Alternate means of applying for a warrant**

In urgent or special circumstances, and where permitted by the relevant legislation, a warrant may be applied for by phone, fax, radio or other form of communication.

### **Assistance**

The legislation generally allows the warrant holder to use reasonable assistance in executing it. This means that other persons can assist in the execution of the warrant. If resistance is expected during the execution of the warrant, the assistance of the Queensland Police Service **MUST** be sought prior to the execution of the warrant.

If resistance is encountered during the execution of the warrant, and there is **ANY** risk of violence, the officer **MUST** immediately leave the premises and contact the Queensland Police Service.

It is prudent to contact the local police station before a warrant is executed even if no resistance is expected, to advise them of the time and place you will be executing the warrant in case difficulties are encountered.

Consideration should also be given as to whether other DERM officers or external experts should be taken to the premises to assist with technical matters (for example, sample taking or species identification).

### Obtaining evidence that a company has committed an offence

---

*The objective of this guideline is to clarify how evidence is to be collected and what evidence is required to prove that a company has committed an offence.*

#### Essential points

- Identify the company and the people that directly or indirectly control the company.
- Establish the chain of command and the identity of the most senior person that has both a supervisory responsibility for the events in question and authority to speak on behalf of the company.
- Establish the instructions given to any employees and the level of supervision.
- Companies have no privilege against self-incrimination unless given it by legislation.
- Be aware that with larger companies, the board of directors may be genuinely eager to assist investigators in remedying inappropriate conduct in the workplace.

#### General rules on liability

There are some general rules to identify whether someone is responsible for a criminal or other act. You must identify the actual act or omission the subject of the investigation or query, in order to be able to identify who is responsible for that act or omission.

Once you know the act or omission, identify who did the act, or had the responsibility to take an action (in cases of offence arising from an omission to take an action). A company is liable for acts or omissions committed by its officers or employees when they were acting in the course of their employment.

#### What is a company?

A company is an artificial legal entity which is granted certain of the legal rights and capabilities of a real person.

A business name is **not** a separate legal entity capable of being sued.

While companies have their own legal identity, it is through people that they make decisions and take actions. Identifying which people have made decisions or taken actions is important for working out whether a company has committed an offence.

There are a number of groups of people who make up a company. **Shareholders** are the owners of the company, and hold one or more shares in the company. A company will not normally be liable for the acts or omissions of its shareholders. **Employees** take actions on behalf of a company, and a company can be liable for things that its employees do or fail to do. Employees (except very senior employees) normally cannot speak on behalf of a company – that means that things that employees say when being asked questions about an alleged offence will not normally be admissions of the company. **Directors and executive officers** are the

---

## Obtaining evidence that a company has committed an offence

---

controllers of a company. They have the authority to speak on behalf of a company, so that any admissions that they may make while being asked questions are admissions of the company itself. Directors and executive officers may also be personally liable for offences committed by a company.

### Who can speak for a company?

Who can speak on behalf of the company often depends on the size and nature of the company's operations.

Directors, executive officers (such as the chief executive officer) and some senior employees are able to speak on behalf of the company. A person can also be authorised to speak on behalf of the company.

In asking questions of people in a company, you should ask them whether they have authority to speak on behalf of the company. You can also ask questions to identify their role in the company, who they report to and the nature of their responsibilities as a way of establishing whether they have sufficient authority within the company to speak on behalf of it.

### Proving a company has committed an offence

#### Identify the company

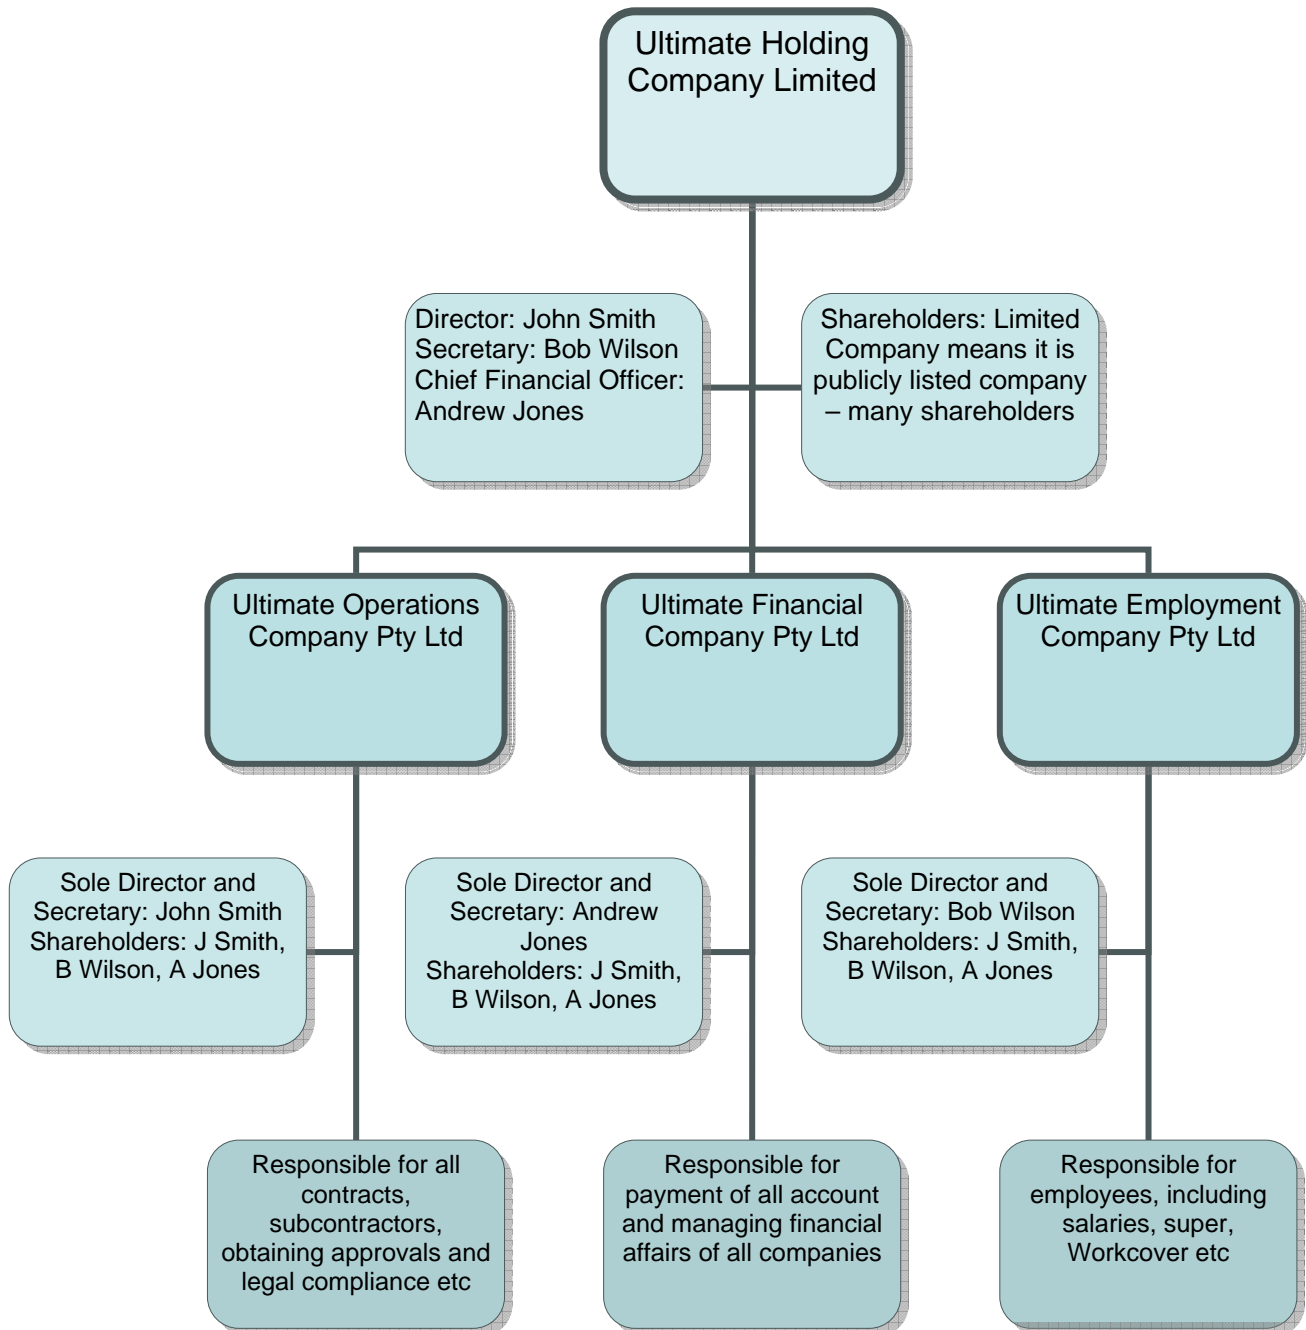

You can identify what company you are investigating by:

- interviewing workers on site to identify their employer and superiors;
- looking at employees' pay slips and group certificates;
- if the offence occurred on private land, by determining the ownership of the land;
- if a business name has been identified, by performing a business name search;
- searching licences issued by the department or relevant local authority; and
- searching motor vehicle registrations.

Often for tax reasons, businesses split their identity between companies. If this appears to be the case, collect as much information as you can (including doing company searches, identifying related entities and holding/subsidiary companies) and seek legal advice.

## Obtaining evidence that a company has committed an offence

Where your investigation involves multiple companies, you should prepare a chart to explain who sits where, for example:

### Obtain a company search

A company search will tell you important information about the company such as the identity of the directors, secretaries and shareholders, whether the company is a wholly owned subsidiary of another company (or is a holding company itself), the registered office of the company and other important information.

### Interview the company, employees, agents and subcontractors

Points to consider when dealing with a small company with not many employees include:

- Speak to the most senior officer possible (such as the managing director or general manager).

## Obtaining evidence that a company has committed an offence

---

- Establish that he or she can speak on behalf of the company.
- Ask what is the nature of the business conducted by the company.
- Establish that the company was at the place of the offence (for example, was engaged to clear bush along the boundary of a national park).
- Ask whether the company is undertaking work on behalf of another person. If so, ascertain who this is and whether there is any formal agreement about the activity.
- If the act or omission has been done by someone other than the person that you are speaking to, determine whether the person is an employee, subcontractor or agent of the company, or is some other officer or director of the company.
- Determine the extent of instructions given to employees, subcontractors or agents and the level of supervision.
- If admissions are made by employees these should be put to the representative of the company to confirm or adopt.
- If the relevant act or omission was done by an employee or agent of the company determine whether the act or omission was within the scope of that person's authority. If employees ignore directions or procedures put in place by the company, this may mean that the company is not liable for the employee's actions.

Points to consider when dealing with large companies with many employees or multiple offices include:

- Talk to the people doing the work – find out who do they report to. Try to find out what the chain of command is in the company (investigate from bottom up when on site) and what their relationship is with the company (such as subcontractor or employee).
- Determine who is the most senior person in the area who can speak to you (this can be done through on site investigations, a company search and other enquiries).
- If you are not at the main office of the company, ask whether the person you are speaking to has the authority to speak on behalf of the company in relation to the matter being investigated.

### Environmental officers

Persons appointed by companies to ensure that the company complies with environmental legislation can be a good source of information, and you should consider asking them questions about the incident, and similar past incidents and the systems that are in place to manage environmental risks.

For more complex matters, you may also consider interviewing former environmental officers to see whether they had made recommendations relevant to the matter being investigated.

### Use of compulsory powers and the privilege against self-incrimination

In the absence of a specific legislative provision, a company does not have the right to decline to answer questions or to provide information or documents under a compulsory legislative power on the basis that to do so might tend to incriminate it.

If required to produce a document under section 466 of the *Environmental Protection Act 1994* a company could not refuse on the grounds that the contents of the document might tend to incriminate it. However a company could decline to answer a question it was required to answer under section 465 of that Act as section 476

---

## Obtaining evidence that a company has committed an offence

---

provides that it is a reasonable excuse for a person to fail to answer a question on the grounds that answering it may tend to incriminate the person.

Executive officers may be able to decline to answer questions on the basis of self-incrimination as they are potentially liable for offences committed by the company.

Always be conscious that other individuals could also be personally responsible for an offence, which means that they have a right to decline to answer questions. **Disclaimer**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Department of Environment and Resource Management should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

### Penalty Infringement Notices – Offence Codes – Environmental Protection

This document lists the offences codes that officers will use when filling out a penalty infringement notice (PIN) in relation to an alleged offence under the Environmental Protection Act and subordinate legislation detailed below. The offence code field is one of the mandatory fields in the PIN. Please refer to the Procedural Guide on Infringement Notices for further guidance concerning the issuing of PINs. **Please ensure you have the most up to date version of this document and reference to the relevant offence section in the relevant act is ALWAYS required.**

Persons external to the Department of Environment and Resource Management should

satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

# Procedural Guide

## Compliance and Investigations

### Power to enter land, vehicles or dwellings

---

*The objective of this guideline is to clarify how you should exercise your powers in undertaking functions of the Department.*

#### Essential points

- In addition to any powers granted by legislation, you have the same rights as an ordinary member of the public.
- Before resorting to the use of powers granted under legislation see if the person being dealt with will cooperate. It is a trap to think that statutory powers make investigations easy. Good manners, an inquisitive mind and hard work are always far more effective than statutory powers.
- The powers of an authorised person under the Department's various legislation can be limited by the person's instrument of appointment. Look at your instrument of appointment to ensure that you possess the power to take a particular course or action.
- When exercising your powers, you must either produce your identity card or have it clearly displayed.

#### Powers of an authorised person generally

Outside legislative provisions an authorised person retains the same rights as a member of the public, including liberty to go where a member of the public can go and the freedom to speak to people. One of the most effective investigation tools can be to simply ask nicely. If you want to know who someone is or wish to see something or how to obtain a copy or image of something, ask. A simple 'do you mind...' can work wonders. Of course if the answer is "No" then recourse can be had to the powers under the relevant legislation. Seeking the cooperation of the person can, however, be quicker and easier.

In terms of an authorised person's right to enter upon premises other than under legislation, the public has the right to enter and be on public land. In relation to private land where a business is being conducted which is open to the public (a shopping centre, for example) a general licence exists to allow people to enter. In relation to private homes, in the absence of signs to the contrary a presumed licence exists to allow persons to enter upon the property in order to contact the occupiers of the property.

#### Powers of entry to land or structures

Under the various legislation administered by the Department, powers are granted to authorised persons (and other specified persons) to enter land in certain circumstances.

Annexure A is a table outlining various powers of entry under legislation administered by the Department. This table does not include all powers of entry, but provides general guidance on when these powers can be exercised. **Always check the specific provisions of the legislation before entering land using a power.**

## What you can do when you enter land

What you are authorised to do following entry depends on what the particular legislation says, and if powers are authorised by a warrant, what the warrant says. **Always check the specific provisions of the legislation before exercising a power.**

Common powers that are able to be exercised include:

- enter the land, place or structure;
- inspect, measure, test, photograph or film any part of the place or anything at the place;
- take samples (including extracting a sample for further analysis) or copies of documents;
- take into or onto the place any equipment and materials that are reasonably required to exercise your powers;
- require a person to assist, provide information or answer questions during the exercise of the power of entry. There are a number of specific limitations and qualifications on this power, which are outlined in the particular legislation you are administering – ensure you comply with your particular legislative provisions; and
- install, check or maintain monitoring equipment.

## Damage to property and compensation

Where damage is caused to someone's property during the exercise of power to enter a place, you need to ensure that the damage done is fully documented (including photographs and notes), to ensure that any compensation paid to the person arising from the damage is limited to that damage caused by the Department.

If damage occurs, you must inform your manager as soon as possible.

## Your conduct as a public servant

As you are employed by the State Government, you are a public servant. Your conduct as a public servant is regulated under certain legislation and codes including:

- [Public Sector Ethics Act 1994](#);
- [Public Service Act 2008](#); and
- the Department's [code of conduct](#).

In exercising your functions as an officer of the Department, always ensure that you comply with your duties and obligations arising under these statutes and codes.

As guiding principles, your conduct should:

- serve the community and the government, always with the public interest and Departmental priorities in mind;
- maintain impartiality and integrity;
- comply with the 'ethics principles', being:
  - respect for the law and the system of government;
  - respect for persons;
  - integrity;

- diligence;
- economy; and
- efficiency;
- seek to improve the quality of service delivery to the community and government;
- ensure the effective, efficient and appropriate use of public resources;
- promote equality and diversity;
- observe and comply with laws;
- not reflect adversely on the reputation of the public service.

You should continually refresh your knowledge about your obligations, to both protect yourself against inadvertently breaching those obligations and to ensure that the Government continues to observe those principles in the exercise of your powers as a public servant.

## Annexure A – powers of entry

The following table outlines a number of statutes administered by the Department. This table does not include all legislation that authorises the exercise of powers for entry to premises, vehicles or dwellings etc. **You must check the legislation to ensure you have the power before you undertake entry.**

Legislation	Who?	Under what circumstances	Powers after entry
<a href="#">Aboriginal Cultural Heritage Act 2003</a>	Authorised officer	<p>May enter if:</p> <ul style="list-style-type: none"> <li>the occupier consents to the entry; or</li> <li>it is a public place and the entry is made when the place is open to the public; or</li> <li>the entry is authorised by a warrant.</li> </ul> <p>A warrant may only be issued if there are reasonable grounds for suspecting:</p> <ul style="list-style-type: none"> <li>there is a particular thing or activity (the <i>evidence</i>) that may provide evidence of an offence against this Act; and</li> <li>the evidence is at the place, or may be at the place within the next 7 days.</li> </ul>	<p>For enforcing compliance with this Act, the authorised officer may:</p> <ul style="list-style-type: none"> <li>search any part of the place; or</li> <li>inspect, measure, test, photograph or film any part of the place or anything at the place; or</li> <li>take a thing, or a sample of or from a thing, for analysis or testing; or</li> <li>take an extract from, or copy, a document at the place; or</li> <li>take into or onto the place any person, including an Aboriginal party or representative of an Aboriginal party, the authorised officer reasonably requires for exercising a power under this Act; or</li> <li>take into or onto the place any equipment and materials the authorised officer reasonably requires for exercising a power under this Act; or</li> <li>require the occupier of the place, or a person at the place, to give the authorised officer reasonable help to exercise the authorised officer's powers under the above paragraphs; or</li> <li>require the occupier of the place, or a person at the place, to give the authorised officer information to help the authorised officer ascertain whether this Act is being complied with.</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
<a href="#"><u>Coastal Protection and Management Act 1995</u></a>	Authorised person	<p>In the absence of an urgent circumstance, entry is permitted:</p> <ul style="list-style-type: none"> <li>• to obtain the agreement of the occupier or, if there is no occupier, the owner of the land; or</li> <li>• if the officer gives at least 7 days notice to the person occupier/owner of:               <ul style="list-style-type: none"> <li>○ the authorised person's intention to enter the land; and</li> <li>○ the reason for entering the land; and</li> <li>○ the day and time when the authorised person proposes to enter the land.</li> </ul> </li> </ul>	<p>The power to enter land includes power to:</p> <ul style="list-style-type: none"> <li>• re-enter the land; and</li> <li>• remain on the land for the time that is reasonable and necessary for the purpose of the entry; and</li> <li>• take assistants, vehicles, materials, equipment or things that are reasonable and necessary for the purpose of the entry.</li> </ul> <p>The power to enter may be exercised to:</p> <ul style="list-style-type: none"> <li>• inspect or survey the land or works on the land; or</li> <li>• dig and bore into the land to find out the nature of the soil; or</li> <li>• do everything necessary for paragraphs the above including, for example:               <ul style="list-style-type: none"> <li>○ measuring, photographing or filming anything on the land; or</li> <li>○ taking samples of or from anything on the land.</li> </ul> </li> </ul>
<a href="#"><u>Environmental Protection Act 1994</u></a>	Authorised person	<p><b>General power of entry</b></p> <p>An authorised person may enter a place if:</p> <ul style="list-style-type: none"> <li>• The occupier consents to the entry and, if the entry is for exercising a power under chapter 7, part 5B or 8 of the</li> </ul>	<p><b>General</b></p> <p>An authorised person who enters a place, or enters or boards a vehicle may:</p> <ul style="list-style-type: none"> <li>• search any part of the place or vehicle; or</li> <li>• inspect, examine, test, measure, photograph or film the place or vehicle or anything in or on the place or vehicle; or</li> <li>• take samples of any contaminant, substance or thing in or on the place or</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>EP Act, its owner consents; or</p> <ul style="list-style-type: none"> <li>• it is a public place and the entry is made when the place is open to the public; or</li> <li>• it is a place to which an environmental authority relates and the entry is made when: <ul style="list-style-type: none"> <li>○ the mining or chapter 5A activity to which the authority relates is being carried out; or</li> <li>○ the place is open for conduct of business; or</li> <li>○ the place is otherwise open for entry; or</li> </ul> </li> <li>• it is a place to which a registration certificate, a development approval subject to a development condition or a code of environmental compliance relates and the entry is made when— <ul style="list-style-type: none"> <li>○ the chapter 4 activity to which the certificate, approval or code relates is</li> </ul> </li> </ul>	<p>vehicle; or</p> <ul style="list-style-type: none"> <li>• record, measure, test or analyse the release of contaminants into the environment from the place or vehicle; or</li> <li>• take extracts from, or make copies of, any documents in or on the place or vehicle; or</li> <li>• take into or onto the place or vehicle any persons, equipment and materials the authorised person reasonably requires for the purpose of exercising any powers in relation to the place or vehicle; or</li> <li>• install or maintain any equipment and materials in or on the place or vehicle the authorised person reasonably requires for the purpose of conducting a monitoring</li> <li>• program for the release of contaminants into the environment from the place or vehicle; or</li> <li>• require the occupier of the place, or any person in or on the place or vehicle, to give to the authorised person reasonable help for the exercise of the powers mentioned above; or</li> <li>• if the authorised person enters or boards a vehicle—by written notice given to the person in control of the vehicle, require the person: <ul style="list-style-type: none"> <li>○ to take the vehicle to a stated reasonable place by a stated reasonable time; and</li> <li>○ if necessary, to remain in control of the vehicle at the place for a reasonable time;</li> </ul> </li> </ul> <p>to enable the authorised person to exercise the powers mentioned above.</p>

Legislation	Who?	Under what circumstances	Powers after entry
		<ul style="list-style-type: none"> <li>being carried out; or</li> <li>○ the place is open for conduct of business; or</li> <li>○ the place is otherwise open for entry; or</li> <li>● it is a place where an industry is conducted and the entry is made when—               <ul style="list-style-type: none"> <li>○ the place is open for conduct of business; or</li> <li>○ is otherwise open for entry; or</li> <li>○ the entry is authorised by a warrant; or</li> <li>○ for land mentioned in chapter 7, part 5B or 8— the entry is authorised by an order under section 458; or</li> </ul> </li> <li>● the authorised person may enter the place under section 453, 454 or 455.</li> </ul> <p><b>Environmental harm</b></p>	<p><b>Finding source of contaminant</b></p> <p>An authorised person may enter land for the purpose of finding out or confirming the source of the release of the contaminant.</p> <p><b>Contaminated land</b></p> <p>An authorised person may, under this section, enter the land to conduct a preliminary investigation.</p> <p><b>To do work</b></p> <p>You need an Order of a Magistrate before entry to do work in the absence of a specific power to enter and conduct work – see section 458 EP Act.</p>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>Entry may occur if unlawful environmental harm has occurred.</p> <p><b>Contaminated land</b></p> <p>May enter land if the administering authority believes on reasonable grounds land is contaminated land.</p> <p><b>Necessary or desirable access</b></p> <p>If it is necessary or desirable to cross land to access other land (i.e. landlocked land), entry may occur – see section 455 EP Act.</p> <p><b>Warrant for entry</b></p> <p>Entry may be obtained via a warrant.</p>	
<p><a href="#"><i>Forestry Act 1959</i></a></p>	<p>Any person performing duties under this Act or otherwise authorised by the chief executive in writing</p>	<p><b>Entering land</b></p> <p>The person may without any previous notice enter upon any land or waters whatsoever for the purpose of inspecting any forest products thereupon or therein, whether growing or otherwise, or for giving effect to any of the provisions of this Act and upon such entry</p>	<p>Make surveys and examine any timber or other forest products and any quarry material</p> <p>Do anything necessary for ascertaining the suitability of the land or waters for any forestry purposes or for the purposes of this Act.</p> <p>Power to seize timber, vehicles etc.</p>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>carry out such purpose.</p> <p><b>Entering a dwelling</b></p> <p>A forest officer enters any part of a place, must first obtain permission of the occupier to enter that dwelling.</p> <p>Alternatively, a justice may issue a warrant to enter the dwelling, if there is reasonable cause to suspect:</p> <ul style="list-style-type: none"> <li>• that there are in any place forest products or quarry material; and</li> <li>• that such forest products or quarry material have been got or interfered with contrary in any respect to this Act.</li> </ul>	
<p><a href="#"><u>Land Act 1994</u></a></p>	<p>Authorised person</p>	<p>For the purpose of the Land Act 1994 or the <i>Vegetation Management Act 1999</i>, may enter on land at any reasonable time.</p>	<p>Upon entry, may:</p> <ul style="list-style-type: none"> <li>• inspect the land and the uses made of the land;</li> <li>• photograph or film anything on the land;</li> <li>• take samples of or from anything on the land;</li> <li>• for lease land, licence land or permit land for agricultural, grazing or pastoral purposes, establish on the lease land, licence land or permit land sites (each a</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
			<p><i>monitoring site</i>) to monitor compliance with:</p> <ul style="list-style-type: none"> <li>○ this Act; or</li> <li>○ the lease, licence or permit; or</li> <li>○ a land management agreement; or</li> <li>○ a remedial action notice; or</li> <li>○ a remedial action order;</li> </ul> <ul style="list-style-type: none"> <li>• place a marker to show where a monitoring site is;</li> <li>• install or place at a monitoring site a device (<i>a monitoring device</i>) to carry out the monitoring;</li> <li>• read a monitoring device;</li> <li>• check the accuracy of, or repair or replace, a monitoring device;</li> <li>• do anything reasonable and necessary to exercise a power above.</li> </ul>
<p><a href="#"><u>Marine Parks Act 2004</u></a></p>	<p>Inspector</p>	<p><b>General power to enter</b></p> <p>An inspector may enter a place if—</p> <ul style="list-style-type: none"> <li>• its occupier consents to the entry; or</li> <li>• it is a public place and the entry is made when it is open to the public; or</li> <li>• the entry is authorised by a warrant; or</li> </ul>	<p>The inspector may do all or any of the following:</p> <ul style="list-style-type: none"> <li>• search any part of the place;</li> <li>• inspect, measure, test, photograph or film any part of the place or anything at the place;</li> <li>• mark or seal a container or other thing at the place;</li> <li>• open a container if the inspector considers it is necessary for exercising a power;</li> <li>• take a sample of or from anything at the place;</li> <li>• take an extract from, or copy, a document at the place;</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<ul style="list-style-type: none"> <li>• it is an authority holder's place of business stated in the authority and is:               <ul style="list-style-type: none"> <li>○ open for carrying on the business; or</li> <li>○ otherwise open for entry; or</li> <li>○ required to be open for inspection under the authority.</li> </ul> </li> </ul> <p>A warrant can be issued by a Magistrate to authorise the entry.</p>	<ul style="list-style-type: none"> <li>• take into or onto the place any person, equipment and materials the inspector reasonably requires for exercising a power under this division.</li> </ul>
<p><a href="#"><u>Nature Conservation Act 1992</u></a></p>	<p>Conservation officer</p>	<p><b>General power of entry</b></p> <p>A conservation officer may:</p> <ul style="list-style-type: none"> <li>• enter any place at any reasonable time of the day or night; and</li> <li>• exercise the powers set out in section 147 Nature Conservation Act 1992.</li> </ul> <p>This power may be exercised only if:</p>	<p><b>General powers</b></p> <p>The following powers can be exercised:</p> <ul style="list-style-type: none"> <li>• search any part of the place;</li> <li>• inspect, examine, photograph or film anything in or on the place;</li> <li>• take extracts from, and make copies of, any documents in or on the place;</li> <li>• take into or onto the place such persons, equipment and materials as the conservation officer reasonably requires for the purpose of exercising any powers in relation to the place;</li> <li>• require the occupier or any person in or on the place to give to the conservation officer reasonable assistance in relation to the exercise of the powers mentioned</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<ul style="list-style-type: none"> <li>• the occupier of the place consents to the entry or exercise of the power; or</li> <li>• a warrant under section 148 Nature Conservation Act 1992 authorises the entry or exercise of the power; or</li> <li>• the place is a place to which the public are admitted (whether or not for consideration) and the entry is made when members of the public attend or the premises are open for admission by the public; or</li> <li>• the place is premises, or the part of premises, that:               <ul style="list-style-type: none"> <li>○ are licensed under a regulation and the entry is made when the premises are open for conduct of business or otherwise open for entry; and</li> <li>○ are not used exclusively for residential purposes.</li> </ul> </li> </ul> <p><b>Entry on offence or evidence</b></p>	<p>in the above paragraphs;</p> <ul style="list-style-type: none"> <li>• the powers mentioned in the following provisions—           <ul style="list-style-type: none"> <li>○ section 151 Nature Conservation Act 1992;</li> <li>○ section 152 Nature Conservation Act 1992;</li> <li>○ section 154(1)(b) to (e) Nature Conservation Act 1992;</li> </ul> </li> <li>• Seize evidence.</li> </ul> <p><b>Power on offence or evidence</b></p> <p>If the conservation officer enters the place and finds the evidence, the following provisions have effect:</p> <ul style="list-style-type: none"> <li>• the officer may seize the evidence;</li> <li>• the officer may keep the evidence for 6 months or, if a prosecution for an offence against this Act in the commission of which the evidence may have been used or otherwise involved is instituted within that period, until the completion of the proceeding for the offence and any appeal in relation to the proceeding;</li> <li>• if the evidence is a document—while the officer has possession of the document, the officer may take extracts from and make copies of the document, but must allow the document to be inspected at any reasonable time by a person who would be entitled to inspect it if it were not in the officer’s possession.</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>If there are reasonable grounds for suspecting that there is in a place a particular thing (<b><i>the evidence</i></b>) that may afford evidence of the commission of an offence against this Act, the officer may—</p> <ul style="list-style-type: none"> <li>• enter the place; and</li> <li>• exercise the powers set out in section 147.</li> </ul> <p>Where the entry is not by consent, a warrant is required.</p>	
<p><a href="#"><u>Queensland Heritage Act 1992</u></a></p>	<p>Authorised person</p>	<p>An authorised person may enter a place if:</p> <ul style="list-style-type: none"> <li>• its occupier consents to the entry; or</li> <li>• it is a public place and the entry</li> </ul>	<p>An authorised person may exercise any of the following powers:</p> <ul style="list-style-type: none"> <li>• search any part of the place;</li> <li>• inspect, examine, photograph or film anything in the place;</li> <li>• take extracts from, and make copies of, any document in the place;</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>is made when it is open to the public; or</p> <ul style="list-style-type: none"> <li>• the entry is authorised by a warrant; or</li> <li>• it is a place of business and is:               <ul style="list-style-type: none"> <li>○ open for carrying on the business; or</li> <li>○ otherwise open for entry.</li> </ul> </li> </ul> <p>Alternatively, entry can occur under a warrant.</p>	<ul style="list-style-type: none"> <li>• take into the place any persons, equipment and materials the authorised person reasonably requires for exercising a power under this division;</li> <li>• require a person in the place to give the authorised person reasonable information or help and provide reasonable facilities to exercise the powers mentioned in the above paragraphs.</li> </ul>
<p><a href="#"><u>Torres Strait Islander Cultural Heritage Act</u></a></p>	<p>Authorised officer</p>	<p>An authorised officer may enter a place if:</p> <ul style="list-style-type: none"> <li>• its occupier consents to the</li> </ul>	<p>The authorised officer may:</p> <ul style="list-style-type: none"> <li>• search any part of the place; or</li> <li>• inspect, measure, test, photograph or film any part of the place or anything at the</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
<a href="#">2003</a>		<p>entry; or</p> <ul style="list-style-type: none"> <li>• it is a public place and the entry is made when the place is open to the public; or</li> <li>• the entry is authorised by a warrant.</li> </ul> <p>An ordinary warrant can be obtained or a special warrant if there are urgent or other special circumstances requiring a non-written (or faxed copy) of a warrant.</p>	<p>place; or</p> <ul style="list-style-type: none"> <li>• take a thing, or a sample of or from a thing, for analysis or testing; or</li> <li>• take an extract from, or copy, a document at the place; or</li> <li>• take into or onto the place any person, including a Torres Strait Islander party or representative of a Torres Strait Islander party, the authorised officer reasonably requires for exercising a power under this Act; or</li> <li>• take into or onto the place any equipment and materials the authorised officer reasonably requires for exercising a power under this Act; or</li> <li>• require the occupier of the place, or a person at the place, to give the authorised officer reasonable help to exercise the authorised officer's powers under the above paragraphs; or</li> <li>• require the occupier of the place, or a person at the place, to give the authorised officer information to help the authorised officer ascertain whether this Act is being complied with; or</li> <li>• seize evidence.</li> </ul>
<a href="#">Vegetation Management Act 1999</a>	Authorised officer	<p>An authorised officer may enter a place if:</p> <ul style="list-style-type: none"> <li>• an occupier of the place consents to the entry; or</li> </ul>	<p>The authorised officer may:</p> <ul style="list-style-type: none"> <li>• search any part of the place; or</li> <li>• inspect, measure, test, photograph or film any part of the place or anything at the place; or</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<ul style="list-style-type: none"> <li>• it is a public place and the entry is made when it is open to the public; or</li> <li>• the place is the subject of:               <ul style="list-style-type: none"> <li>○ a development approval; or</li> <li>○ a lease, licence or permit under the <i>Land Act 1994</i>; or</li> <li>○ a stop work notice or restoration notice; or</li> <li>○ an enforcement notice under the Sustainable Planning Act 2009 relating to the contravention of a vegetation clearing provision; and</li> </ul> </li> <li>• the place is entered during daylight hours; or</li> <li>• the entry is for the purpose of giving an occupier a stop work notice requiring the occupier to immediately stop committing a vegetation clearing offence; or</li> <li>• the entry is authorised by a warrant; or</li> <li>• a person proposing to conduct a</li> </ul>	<ul style="list-style-type: none"> <li>• take a thing, or a sample of or from a thing, at the place for analysis or testing; or</li> <li>• copy a document at the place; or</li> <li>• take into or onto the place any person, equipment and materials the authorised officer reasonably requires for the exercise of certain powers under the <i>Vegetation Management Act 1999</i>; or</li> <li>• require an occupier of the place, or a person at the place, to give the authorised officer reasonable help to exercise the authorised officer's powers under the above paragraphs; or</li> <li>• require an occupier of a place, or a person at the place, to give the authorised officer information to help the authorised officer ascertain whether the Act or a vegetation clearing provision is being complied with.</li> </ul> <p>If the authorised officer enters the place under section 30(1)(d) <i>Vegetation Management Act 1999</i> for the purpose of giving an occupier a stop work notice, the authorised officer may only:</p> <ul style="list-style-type: none"> <li>• give the occupier the stop work notice; and</li> <li>• take into or onto the place any person the authorised officer reasonably requires for giving the notice.</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry
		<p>native forest practice at the place has given the chief executive a notice under section 19Q <i>Vegetation Management Act 1999</i> for the place; or</p> <ul style="list-style-type: none"> <li>• a person proposing to clear regulated regrowth vegetation under the regrowth vegetation code at the place has given the chief executive a clearing notification for the place.</li> </ul> <p>Entry can also be made under a warrant.</p>	
<p><a href="#"><u>Water Act 2000</u></a></p>	<p>Authorised officer</p>	<p>An authorised officer may, at any reasonable time, enter land to:</p>	<p>Upon entry, the authorised officer may:</p>

Legislation	Who?	Under what circumstances	Powers after entry
		<ul style="list-style-type: none"> <li>• monitor compliance with the Water Act 2000, including to:</li> <li>• to construct monitoring equipment on the land;</li> <li>• check the accuracy of, or repair or replace, the device;</li> <li>• calculate or measure the water taken, interfered with or used;</li> <li>• ensure the conditions of the authorisation or the provisions of a plan under this Act for the taking of, interfering with or use of the water are being complied with;</li> <li>• if there is monitoring equipment on the land:               <ul style="list-style-type: none"> <li>○ to read the equipment; or</li> <li>○ to recalibrate, repair or replace the equipment; or</li> </ul> </li> <li>• there is no monitoring equipment on the land — to calculate or measure on the land rainfall, water flow, water levels other resources or for</li> </ul>	<ul style="list-style-type: none"> <li>• search any part of the place;</li> <li>• inspect, measure, test, photograph or film any part of the place or anything at the place;</li> <li>• take a thing, or a sample of or from a thing, at the place for analysis or testing;</li> <li>• copy a document at the place;</li> <li>• regulate or prevent the taking of water or other resources under this Act so as to comply with the quantity authorised to be taken under this Act;</li> <li>• take all steps and do all acts and things necessary for advancing the purposes of this Act;</li> <li>• take into or onto the place any person, equipment and materials the authorised officer reasonably requires for the exercise of a power under this division;</li> <li>• require the occupier of the place, or a person at the place, to give the authorised officer reasonable help to exercise the authorised officer's powers under the above paragraphs;</li> <li>• require the occupier of a place, or a person at the place, to give the authorised officer information to help the authorised officer ascertain whether the Act is being complied with.</li> </ul>

Legislation	Who?	Under what circumstances	Powers after entry

<sup>1</sup> The *Risk Assessment Tool* can be found in Ecosteps and is a tool that calculates the risk as per the steps in this procedural guide

## Introduction

The release, be it licensed or otherwise, of contaminants into the environment has the potential to result in adverse human and/or ecological impacts. Risk assessment, in the context of industrial activity, is the process of systematically identifying credible hazards to human and ecological health and analysing the likelihood and severity of the potential consequences. Risk management involves a further and essential step of implementing action to manage the resulting level of risk.

Risk is defined using the following model:

$$\text{Site Risk} = \text{Hazard (Consequence)} \times \text{Exposure (Likelihood)}$$

## Risk Assessment

Risk assessment is used extensively both in Australia and overseas as a factor in government approvals on the acceptability of new developments such as approvals for new Environmentally Relevant Activities (ERA's) or other business and industry activities. Risk assessment processes are also increasingly being used by governments to identify, prioritise and justify compliance activities and compliance and enforcement actions.

This procedural guide utilises risk assessment concepts such as, hazard, likelihood and consequence (see Appendix A) to assist Agency staff in setting site priority and inspection level. The steps outlined below guide you through the risk assessment process.

## Risk Assessment Steps

To establish the level of risk an ERA or non-ERA business or industry facility or site poses, take the following steps:

### 1. Likelihood

Considering the type of activity occurring at a site, the characteristics of the identified risks, and the performance of the business operator, use *Table 1 - Likelihood Matrix* to determine the likelihood of environmental harm occurring. Refer to Table 1.1 to determine the client performance and then identify the Aggregate Environmental Score (AES). When assessing a site with multiple ERA's use the highest AES of all ERA's occurring at that site. When focussing on a specific ERA for the site, use the AES of that ERA.

**Table 1 – Likelihood Matrix (based on client performance and client activity)**

Client Performance	Client Activity Definitions <sup>2</sup>				
	Non-ERA (known)	Non-ERA (unknown) OR AES (0-25)	AES (26-50)	AES (51-125)	AES (126-325)
Unknown	Possible	Possible	Likely	Almost certain	Almost Certain
Poor	Unlikely	Possible	Possible	Likely	Almost Certain
Moderate	Rare	Unlikely	Possible	Likely	Likely
Good	Rare	Rare	Unlikely	Possible	Likely
Very Good	Rare	Rare	Unlikely	Possible	Possible

<sup>2</sup> Aggregate Environmental Score (AES) are listed in Schedule 2 of the *Environmental Protection Regulation 2008* and in the *Risk Assessment Tool*

**Table 1.1 – Likelihood – client performance descriptors**

	Client Performance
Unknown	No inspections logged in Ecotrack = site performance unknown
Poor	Serious environment harm or major non-compliance; OR Material environment harm or repeated minor non-compliance For example, PIN, EPO, TEP, EE issued
Moderate	Evidence of environmental nuisance or minor non-compliance For example, Warning Notice/Letter issued
Good	Inspection conducted and site compliant
Very Good	Inspection conducted and site compliant Evidence of best practice

## 2. Consequence

Considering the types and quantities of emissions released from a site (NPI Risk Score), and the value of the surrounding environment type, use *Table 2 - Consequence Matrix* to determine the severity of the consequence occurring. Refer to Table 2.1 to determine the value of the predominant surrounding environment type and then identify the NPI Risk Score. When assessing Mobile and Temporary activities where locations are not known consider the most likely predominant surrounding environment type. Refer to Appendix C for assistance with Wetlands and Biodiversity Ecomaps layers. Client activity risk is based on NPI reporting data – whether a site releases emissions, whether emission rates/types are known, and the quantity and types of emissions released. Refer to Appendix B for NPI site Ecomaps layers.

**Table 2 – Consequence Matrix (based on environment type and client activity)**

Predominant Surrounding Land Use (Environment Type)	Client Activity Risk				
	Non-NPI site (no emissions or emissions known) Risk Score 1 <sup>3</sup>	NPI Risk Score 2	NPI Risk Score 3	NPI Risk Score 4	Non – NPI site (emissions unknown) OR NPI Risk Score 5
Highly Significant Value	Severe	Severe	Major	Catastrophic	Catastrophic
Significant Value	Minor	Severe	Severe	Major	Catastrophic
Moderate Value	Insignificant	Minor	Severe	Major	Major
Low Value	Insignificant	Insignificant	Minor	Severe	Major
Very Low Value	Insignificant	Insignificant	Minor	Severe	Severe

<sup>3</sup> Low risk compared to Non – NPI site (emissions unknown) OR NPI Risk Score 5 which is high risk

**Table 2.1 – Consequence – environment type**

	<b>Predominant Surrounding Environment Type</b>
Highly Significant Value	Site located within 100 metres of a wetland AND either within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Significant Value	Site located within 100 metres of a wetland or within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Moderate Value	Site located between 100 metres and 200 metres from a wetland system, wetland drainage, or a wetland spring OR between 100 metres and 200 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in Biodiversity Planning Assessment
Low Value	Site located between 200 metres and 500 metres from a wetland OR between 200 metres and 500 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Very Low Value	Site located greater than 500 metres from a wetland OR greater than 500 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment

### 3. Environmental Risk

Determine the level of risk by combining the results of Table 1 (likelihood) and Table 2 (consequence) by using *Table 3 - Environmental Risk Matrix*.

**Table 3 – Environmental Risk Matrix (ERA and non-ERA industry / business activities)**

		<b>Consequence</b>				
		<b>Insignificant</b>	<b>Minor</b>	<b>Severe</b>	<b>Major</b>	<b>Catastrophic</b>
<b>Likelihood</b>	<b>Almost certain</b>	3 / Moderate	3 / Moderate	4 / High	5 / Very High	5 / Very High
	<b>Likely</b>	2 / Low	3 / Moderate	3 / Moderate	4 / High	5 / Very High
	<b>Possible</b>	1 / Very Low	2 / Low	3 / Moderate	4 / High	4 / High
	<b>Unlikely</b>	1 / Very Low	1 / Very Low	2 / Low	3 / Moderate	4 / High
	<b>Rare</b>	1 / Very Low	1 / Very Low	2 / Low	3 / Moderate	3 / Moderate

### 4. Inspection

Determine the inspection type and frequency for the site using the result from Table 3 by using *Table 4 - Inspection Frequency*.

**Table 4 – Inspection Frequency**

The frequency of compliance inspections for premises is to be determined by the individual Region. The frequency and level of inspection required at a facility is based on the type of activity/activities undertaken on

## Risk Assessment (ERA and non-ERA) industry / business activities

site; the types and quantities of emissions released from a site the proximity of the site to environmentally sensitive areas; and the proximity of the site to areas of social vulnerability.

The compliance inspections conducted by the Regions will take into account the level of environmental impact or risk that may be involved and the environmental outcomes that may be achieved.

Environmental Risk	Inspection Frequency (min)	Inspection Level
1 / Very Low	As issues arise	A
2 / Low	As issues arise	A or B
3 / Moderate	Biennially	B
4 / High	Annually	B or C
5 / Very High	Annually – Taskforce	C

### Inspection Type

Inspections of differing degrees of detail are conducted, and will be either compliance inspection Level A; compliance inspection Level B; or compliance inspection Level C.

#### **A / Basic Inspection**

Level A Inspections are compliance inspections at the lowest level of detail for Agency interests. They tend to be targeted to a particular environmental issue, are inspections of low risk, non complex and non-regulated sites, or are planned inspections where little is known of the premises and an initial risk assessment of the site is necessary. Such inspections may comprise a quick visual check of a premises or a more detailed assessment of only a portion of the operations such as, for example, stormwater management. Level A Inspections can also be undertaken as follow-up inspections to establish compliance with enforcement actions (e.g. a Transitional Environmental Program or Environmental Protection Order) taken by the EPA at a given site. (Refer to [Preliminary Assessment Form / Level A Inspection Checklist](#) in Ecosteps).

#### **B / Condition Inspection**

Level B Inspections are the most common level of inspection undertaken at licensed premises. A licensed premise will usually have a statutory document issued by the EPA for the activity – a development approval. Compliance with any EPA issued statutory documentation is assessed as a minimum (usually an assessment of performance against approval conditions), however Level B Inspections may also include assessment of other documentation (such as a site based management plan) and the taking of samples. (Refer to [Compliance Audit Report](#) in Ecosteps).

#### **C / Audit**

Level C Inspection is the highest and most detailed level of compliance assessment that the EPA will undertake. They are expected to be pre-planned and scoped, involve a multi-disciplinary team for a specified period of time, and examine compliance with all aspects of issued statutory documents and the broader legislation. Extensive documentary evidence of compliance is expected. Level C Inspections will usually include the taking of samples or performance of onsite monitoring to determine or validate the presence or absence of environmental impacts. (Refer to [Compliance Audit Report](#), [Audit Plan](#) and [Compliance Program Audit Checklist](#) in Ecosteps).

## Risk Assessment Examples

### Example 1

A pre-inspection file review of annual returns and supporting information for a pesticide manufacturer indicates that the business has advised the EPA that soil and groundwater samples in the vicinity of its stormwater discharge are showing levels of Chlorpyrifos present above environmental threshold values. The business is located adjacent to an undisturbed freshwater stream. The presence of contamination suggests the business has inappropriate stormwater controls in place or an incident has recently occurred. There is both a risk that the business is in breach of its development approval conditions relating to stormwater controls (non-compliance risk) and a risk of environmental harm occurring (fish kill).

A further review of the file indicates that the business operator was operating in compliance at the time of the last site inspection (2 years earlier). However, until a more recent site inspection is undertaken, the operator's current performance remains unknown.

Referring to Table 1 and Table 1.1, determine the *likelihood* of a risk event occurring. The development approval indicates that the pesticide manufacturer has an approval for ERA 7(b) Chemical Manufacturing and therefore an AES of 114. The compliance performance of the business is "unknown" (Table 1.1), so Table 1 gives the likelihood of environmental harm occurring or the business operating in breach of environmental legislation as ALMOST CERTAIN.

An Ecomaps survey of the site and surrounding environment indicates that the site is within 100 metres of wetland drainage (but not within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment). The site reports to the NPI and has an NPI Risk Score of 4.

Referring to Table 2 and Table 2.1, determine the *consequence* of a risk event occurring, or hazard having an impact. Table 2 gives the consequence of environmental harm occurring or the business operating in breach of environmental legislation as MAJOR.

Using the results from Table 1 (almost certain) and Table 2 (major) in Table 3 gives an overall risk for this industry/business site of 5/Very High. Level C audits should be conducted annually for this site (see Table 4).

### Example 2

DERM has received a number of complaints from the community about odour originating from a landscape supplies and compost manufacturing business described as foul and similar to dynamic-lifter type fertilizer. The presence of odours suggests the business may be receiving or selling products that DERM is not aware of or undertaking composting activities inappropriately. There is both a risk that the business is in breach of its development approval conditions, including those relating to odour releases (non-compliance risk) and a risk of environmental nuisance occurring.

Referring to Table 1 and Table 1.1, determine the *likelihood* of a risk event occurring. The development approval indicates that the soil conditioner has an approval for ERA 53 and therefore an AES of 18. There appears to be an environmental nuisance at the site, so the operator's performance is "moderate" (Table 1.1). Table 1 gives the likelihood of an event occurring as UNLIKELY.

An Ecomaps survey of the site and surrounding environment indicates that the site is located within 100 metres of an area mapped as State Significance in the Biodiversity Planning Assessment (but not within 100 metres of a wetland or within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment). The site reports to the NPI and has an NPI Risk Score of 2.

---

## Risk Assessment (ERA and non-ERA) industry / business activities

---

Referring to Table 2 and Table 2.1, determine the *consequence* of a risk event occurring or hazard having an impact. Table 2 gives the consequence of environmental nuisance occurring or the business operating in breach of environmental legislation as SEVERE.

Using the results from Table 1 (unlikely) and Table 2 (severe) in Table 3, gives an overall risk for this industry/business site of 3/MODERATE. Level B site inspections should be conducted biennially for this site (see Table 4).

## Appendix A

### Risk Assessment Concepts

**Hazard** is the potential for mishap or harm. A hazard is not necessarily dangerous. Danger implies a reasonable likelihood of a mishap or harm actually happening. A hazard is simply the potential for that to happen; if sufficient precautions are taken to prevent the potential from being realised, then the hazard may be “safe”.

**Risk** is the chance of something happening that will have an impact upon objectives (for example, to prevent harm to the environment). It is measured in terms of consequences and likelihood.

**Consequence** is the outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, and disadvantage or gains (e.g. a frequency of an overflow or release during a 1 in 10 year storm event).

**Likelihood** is a qualitative description of probability or frequency. Likelihood may be a probability (e.g. a 1% probability of an overflow or release of contaminated water during a storm event), or a frequency (e.g. a frequency of an overflow or release being a 1 in 10 year storm event).

**Risk assessment** as defined in AS/NZS 4360:2004<sup>4</sup>, is the overall process of risk identification, risk analysis and risk evaluation. Risk assessment is an integral component of the **Risk Management** process. Risk management can be applied at many levels in an organisation. It can be applied at a strategic level and at tactical and operational levels. It may be applied to specific projects, to assist with specific decisions or to manage specific recognised risk areas.

The main elements of the Risk Management process are the following:

- (a) Establish the context – Establish the external, internal and risk management context in which the risk management process will take place. Criteria against which risk will be evaluated should be established and the structure of the analysis defined.
- (b) **Identify risks** – Identify where, when, why and how hazard events could prevent, degrade, delay or enhance achievement of the objectives.
- (c) **Analyse risks** – Identify and evaluate existing controls. Determine consequences and likelihood and hence level of risk. This analysis should consider the range of potential consequences and how these could occur.
- (d) **Evaluate risks** – Compare estimated levels of risk against pre-established criteria and consider the balance between potential benefits and adverse outcomes. This enables decisions to be made about the extent and nature of treatments required and about priorities.
- (e) Treat risks – Develop and implement specific cost-effective strategies and action plans for increasing potential benefits and reducing potential impacts.
- (f) This element of the Risk Management process is addressed via DERM’s tools and strategies outlined in the Department’s Enforcement Guidelines.
- (g) Monitor and review – It is necessary to monitor the effectiveness of all steps of the risk management process. This is important for continuous improvement.

Risk Assessment

This element of the Risk Management process is addressed via DERM’s ongoing commitment to follow-up compliance inspections and enforcement action to address environmental risk associated with ERA and non-ERA industry and business activities. Risks and the effectiveness of treatment measures need to be monitored to ensure changing circumstances do not under or overstate the risk potential of a managed activity.

## Appendix B

### How to obtain NPI Scores

- Open [Ecomaps](#) (click on link)
- Select add/remove layers
- Select “Facilities and Structures” then tick “National pollutant inventory sites”
- Close add/remove layers window
- Ensure “National pollutant inventory sites” is ticked on left hand side and click on refresh maps
- Zoom into desired area. Select “locate” button in top menu then select “built environment” if searching by address or select “administrative” if searching by lot plan.
- Locations listed on NPI are highlighted BLUE
- Click on “Information” button in top menu and “Identify by” window will open
- Select “Point select” then click on desired location (blue dot)
- Query/selection result window will open listing site and NPI Risk Score

Risk Assessment (ERA and non-ERA) industry / business activities

Query/Selection Results - Microsoft Internet Explorer provided by Environmental Protection Agency

**eco maps** Info Results

Save Results    Print Results    Close Results

## Appendix C

### How to obtain Wetlands and Biodiversity Ecomaps layers

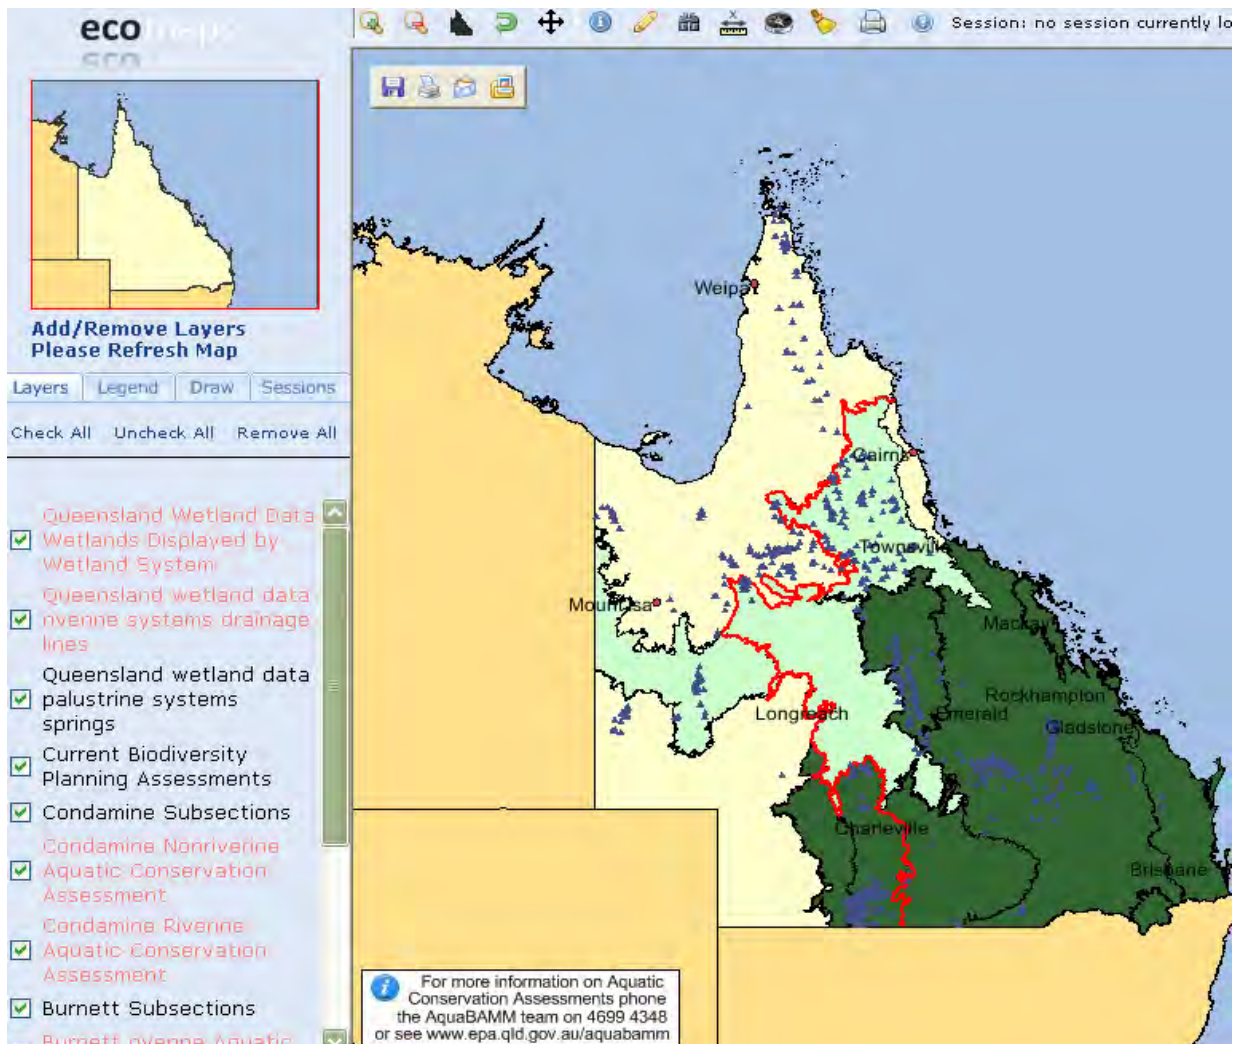

- Open [Ecomaps](#) (click on link) or select the GIS (green) button from the Permits screen in Ecotrack and it will take you to the exact location in Ecomaps
- Select add/remove layers
- Select **“Biologic & Ecologic”**
- Select **“Aquatic Conservation Assessments”** and tick relevant area (if in doubt tick them all)
- Select **“Biodiversity Planning Assessments”** and tick the relevant area (if in doubt tick them all)
- Select **“Wetland Programme”** then tick:
  - Queensland Wetland Data Wetland Displayed by Wetland System
  - Queensland Wetland Data riverine systems drainage line
  - Queensland Wetland Data palustrine system springs

- Close add/remove layers

Risk Assessment (ERA and non-ERA) industry / business activities

- Ensure relevant layers are ticked on the left hand side and refresh maps
- Select “legend” tab to identify the areas of State or Regional significance and very high or high in the Aquatic Conservation Assessment
- Zoom into desired area (this step is not required if you have accessed Ecomaps via Ecotrack). Select “locate” button in top menu then select “built environment” if searching by address or select “administrative” if searching by lot plan.
- Click on “information” button in top menu and “identify by” window will open
- Select “point select” then click on desired location (yellow/green dot)
- Query/selection result window will open listing wetlands information

# Procedural Guide

## Compliance and Investigations

### Seizure

*The purpose of this procedural guide is to provide officers with guidance on exercising the power to seize property pursuant to legislation administered by the Department*

#### Essential points

- Property is seized only to preserve evidence of an offence or to prevent the commission, continuation, or repetition of an offence.
- Property **must not** be seized as a punishment or threat.
- Property seized normally must be returned. Compensation may be ordered by a court for loss or expense suffered as the result of property being seized.
- Care must be taken to make a record of what was seized, what condition the seized item was in and whether steps were taken to minimise the inconvenience to the person caused by the seizure. The person from whom the property was seized should sign this record.
- Care must be taken to ensure that the property seized is preserved in exactly the condition it was at the time of the seizure.

#### Power to seize property

Some legislation administered by the Department gives officers authorised under that legislation the power to seize property in certain circumstances. Before seizing any property, you **must**:

- know which Act you are acting under;
- be sure that the Act gives you the power to seize property;
- check the reasons for which you can seize the property (for example, to preserve evidence of an offence); and
- have satisfied all requirements for exercising the power (for example, have you lawfully entered the place where the property is located?).

#### Purpose of seizure

Property is seized to preserve evidence of an offence. Reasons why property may be seized include the following:

1. The property is needed for testing and a sample will not suffice or it is too difficult to obtain a sufficient sample (for example, residue at the bottom of a container).
2. To ensure that the property will be available for use as an exhibit in court if a prosecution is commenced.
3. The property is evidence and it may be used to commit, continue or repeat an offence.

Property **must not** be seized simply by way of punishment whether for the suspected offence or for a perceived lack of cooperation on behalf of the owner during an investigation. Most importantly, property **must not** be seized as a threat in order to secure cooperation whether during a search or an interview.

## Before seizing property

Before seizing property, ask yourself the following questions:

- Do I have the power to seize the property?
- Have I considered alternatives to exercising the power of seizure?
- Is it reasonable in all the circumstances for me to seize the property?
- Is it safe for me to seize the property? **If your safety cannot be assured, you must NOT seize the property.**
- Am I able to transport the seized property, and keep it safe and secure following seizure?
- If I am not able to transport the seized property, am I able to render the property inoperable (if applicable), prevent it from being interfered with by the owner, and ensure that it is kept safe and secure?

If possible, take photographs of the property to be seized, to establish the condition of the property before it is seized. This will help to prevent disputes about whether the property is damaged while in the Department's custody.

## Seizure of wildlife

For specific requirements relating to the seizure of wildlife under the *Nature Conservation Act 1992*, refer to the procedural guide ["Seizure of wildlife"](#) located on Ecosteps.

## After seizure

You must give the person from whom the property was seized a receipt for the seized property. Check the provisions of the Act under which you are seizing the property to determine whether there is any information that is required to be included in the receipt. If there are no specific requirements set out in the Act, the receipt should include at a minimum a description of each item seized, its condition, the date, time and place of seizure and the name of the officer seizing the property. If possible, have person from whom the property is seized sign the receipt.

The receipt must be given to the person from whom the property is seized. If that is not possible, leave the receipt at the place where the property was seized. Also check the Act under which you are seizing the property for any particular requirements for giving receipts where the person entitled to the property is not present. Keep a copy of the receipt for the file.

Some Acts give the person from whom the property is seized rights to inspect the property, or to take copies of documents that have been seized. Ensure that you are familiar with any such requirements for the Act under which you are seizing the property.

The Department has a responsibility to ensure that seized property is cared for. You must ensure that the property is securely and safely stored. Because the property may be used as evidence, you must ensure that chain of custody procedures are followed and that property is kept in a secure, locked location.

If the seized property is to be left in situ, you must ensure that it is secured and protected from the elements.

## Return of seized property

Seized property must be returned within a certain time period. Check the Act under which you have seized the property to determine the date by which the property must be returned. Make a diary note of that date, and return the property on or before that date. Note that if a prosecution is commenced and the seized property is required as evidence in the prosecution, the Department may usually retain the property until the conclusion of

the prosecution and any appeal.

### Damage and compensation

Most Acts provide for the payment of compensation for property that is damaged by Departmental officers. This can include damage that occurs after property is seized. Compensation may also be payable if the person from whom the property is seized suffers loss because of the seizure.

If seized property is damaged either before, during or after seizure you must inform the person from whom the property was seized about the damage. Check the Act under which the property was seized for any particular requirements about notification. You must also inform your manager or supervisor. If the damage is significant, you should also consider informing the Litigation Branch.

## Compliance and Investigations

### Taking Statements

#### What is a Statement?

A statement is simply a written document containing the evidence a person can or will give as a witness in a matter. An informal statement simply contains the witnesses evidence and preferably is signed by the witness, it does not have to follow any particular format and can contain inadmissible evidence eg hearsay. A formal statement is one that follows the requirements of section 110A of the *Justices Act 1886* and is capable of being tendered in a committal proceeding in the Magistrates Court. It is best if statements follow these requirements.

Precise, detailed and signed statements are a very powerful way for investigators to ensure that witnesses remain committed to their version of events. In many cases a precise, detailed and signed statement is more powerful than a tape-recorded interview.

Statements are used by lawyers to form a view of what evidence a witness is likely to give in court, to assist witnesses in recollecting their evidence and to deal with witnesses that change their evidence without reasonable explanation.

#### Contents

A statement should contain the following.

The name, occupation and address of the person making the statement. Note if the person is reluctant to have their address identified it is sufficient to state that the address is known to the investigating authority.

The statement should then set out, preferably in chronological order, those matters which the witness can give evidence. The statement should be broken up into numbered paragraphs.

Formal statements should only contain admissible evidence. In most cases this will simply be what the witness has seen and heard and if relevant smelt, tasted and touched. There should be no hearsay and unless the maker of the statement is an expert no opinion evidence.

The descriptions of what the witness did should be in their own words and not yours. If they are recounting what they said or if permissible what was said to them, it should be made clear whether or not what is recounted is purported to be a verbatim account or has been paraphrased. A good way of doing so is using a form of words like: 'then I said words to the effect of...'

For a formal statement the bottom of each page of the statement should be signed and witnessed. The pages should be numbered in the following manner: this is page x of a statement comprising z pages.

At the end of a formal statement either of the following needs to appear:

"I A.B. do solemnly and sincerely declare that the contents of this statement are true to the best of my knowledge and belief and I make this solemn declaration conscientiously believing the same to be true and by virtue of the provisions of the Oaths Act 1867."

Or

"I acknowledge by virtue of section 110A(5)(c)(ii) of the Justices Act 1886 that:

- (1) This written statement by me dated ..... and contained in the pages numbered 1 to ... is true to the best of my knowledge and belief; and
- (2) I make this statement knowing that, if it is admitted as evidence, I may be liable to prosecution for stating in it anything that I know to be false.”

The declaration or acknowledgement should be signed and dated by the person making the statement along with a description of where it was signed.

Before asking a person to sign their statement ensure that they read it and ask them if they wish to add or change any details.

If a statement is being taken from a person that could potentially be charged, then the investigator must:-

- a) Consider cautioning the witness; and
- b) Ask the witness why they did what they did.

The advantage of asking a witness why they did what they did is that it prevents them from developing an alternative excuse at the time of the trial and allows the investigator to check out the excuse to see whether it has substance.

Normally a record of interview of a potential defendant should be conducted immediately or as soon as reasonable. Note that the record of interview does not have to be formal, but an informal record of interview should be followed up with a formal record if enforcement action is favoured.

If the record of interview is tape recorded, the original tape should be preserved and a copy used for transcription.

### **Disclaimer:**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their professional advisors before embarking on any proposed course of action.

### Understanding Legal Entities

*This procedural guide is to be used to assist with understanding the individuals/businesses that the Department of Environment and Resource Management (DERM) regulates and the importance of making certain that licences/permits and/or statutory notices are issued to the correct legal entity to ensure their enforceability.*

#### **General**

The legislation administered by the Department of Environment and Resource Management (DERM) as it relates to licensing and compliance activity refers to the clients regulated by DERM as “a person”.<sup>1</sup>

Section 32D of the *Acts Interpretations Act 1954* provides that references to “a person” generally include an individual and a corporation.<sup>2</sup>

Licences, permits and notices can only be issued to **legal entities**, generally an individual or a corporation (or multiple individuals and/ or corporations).

It is therefore a critical part of administrative decision-making that you understand who you are dealing with. This will enable you to correctly apply the legislation; and to correctly draft, address and serve licenses, permits and notices.

This Procedural Guide is deliberately focused on commercial clients, rather than individuals, such as independent visitors to protected estate.

#### **Statutory Notice Requirements**

When issuing a notice pursuant to legislation, it is critical that you first look at the requirements set out in the legislation not only to identify who the notice can be issued to, but also to ensure that you have followed all other procedural requirements.

Depending upon the type of notice and legislation involved, there are a number of entities to whom a notice could potentially be addressed to. You must first ensure that you know who you need to deal with. The *Good Decision-Making Guide* published by the Queensland Ombudsman and the Department’s *Enforcement Guidelines* can assist you with this process.

You should also refer to any Procedural Guides that relate to the specific licence, permit or notice you are dealing with.

#### **What is the effect if a notice is not issued to a legal entity?**

If a licence, permit or notice is not issued to the correct legal entity (or entities), then it is not enforceable. This means that DERM may not be able to take legal action in the event of non-compliance at a later stage.

---

<sup>1</sup> It is critical to refer to the legislation. There are instances where the legislation refers to “corporations” specifically or describes the regulated client in other terms.

<sup>2</sup> In some cases, the contrary intention (ie that “person” means a natural person only) is manifested in the legislation.

---

## Understanding Legal Entities

---

### What is a legal entity?

- A legal entity is an entity on which a legal system confers rights and imposes duties.
- A legal entity includes a natural person (“an individual”), and artificial bodies such as a company (also commonly referred to as a “corporation”), a body corporate and an incorporated association. Incorporation of a company, body corporate or association has the effect of creating a legal “person”.
- For other entities created by legislation (statutory bodies), you will need to refer to the specific legislation to understand its status.

### What is not a legal entity?

- A business
- A partnership
- A joint venture
- A division of a corporation
- A management committee that is not a body corporate
- A community group that is not an incorporated association
- An unincorporated association
- Trusts that are not bodies corporate
- Any unincorporated body

### Understanding Business Structures and Terms

Many of the clients DERM regulates are commercial. In other words, they carry out activities and/or otherwise conduct business for fee or profit.

However a **business is not a legal entity**. It is the person or incorporated body that carries on the business venture that is a legal entity, and to which notices can be issued.

The information in this section is designed to help you understand the most common business structures and the terms used to describe them. In some instances it refers to provisions in the *Environmental Protection Act 1994* (EP Act) as the legislation is commonly applied to commercial clients carrying on environmentally relevant activities. The principles apply equally to all of the other legislation administered by DERM.

As a preliminary point, in most (not all) instances, DERM deals with **individuals** and **companies**.

This can be a complicated area of the law. If you are in doubt, you should seek further advice from the Litigation Unit within DERM (details are on ROBIN).

#### Sole Trader

This is one of the simplest business structures. It is where an individual (the sole trader) owns and controls the business as an independent individual. There is no requirement for a sole trader to register a business name, although he or she can do so.

When dealing with a sole trader, you are dealing with an individual.

Licences, permits and notices **must** be issued in the name of the person. It is optional to also include the business name or trading name.

#### Example 1

John Smith operates a drum reconditioning facility at 123 Main Road, Brisbane, Qld, 4123. The facility is known as “Smith’s Drum Exchange”.

---

## Understanding Legal Entities

---

### Correct Name

Mr John Smith

Or

Mr John Smith trading as Smith's Drum Exchange

Or

Mr John Smith T/as Smith's Drum Exchange

### Wrong Name– do not use business name only

Smith's Drum Exchange

### **Partnership**

A partnership is two or more people carrying on a business in common with a view to profit. This partnership can be (but is not always) established by a partnership deed or partnership agreement. **A partnership is not a legal entity.** DERM deals with the legal entities (they can be individuals and/ or companies) that make up the partnership.

#### *Example 2*

John Smith and Paul Thomson operate a drum reconditioning facility at 123 Main Road, Brisbane, Qld, 4123. The facility is known as "Smith's Drum Exchange".

### Correct Name

Mr John Smith and Mr Paul Thomson

Or

Mr John Smith and Mr Paul Thomson trading as Smith's Drum Exchange

Or

Messrs John Smith and Paul Thomson (in partnership) T/as Smith's Drum Exchange

### Wrong Name– do not use business name only

Smith's Drum Exchange

#### *Example 3*

John Smith and Thomson's Drums Pty Ltd operate a drum reconditioning facility at 123 Main Road, Brisbane, Qld, 4123. The facility is known as "Smiththom's Drum Exchange".

### Correct Name

Mr John Smith and Thomson's Drums Pty Ltd T/as Smiththom's Drum Exchange

## Understanding Legal Entities

---

Or

Individual names as outlined in example 2 is also be acceptable

### Wrong Name – do not use business name

Smiththom's Drum Exchange

### **Joint Venture**

A joint venture (JV) is an association of persons for particular trading or other financial endeavours with a view to mutual profit. Commonly they can be used to undertake a commercial activity such as a development project. **JVs are not legal entities.** Rights are conferred on, and duties/liabilities flow to the joint venturers. DERM deals with the legal entities that are the joint venturers, in other words those that make up the JV (they can be individuals and/ or companies).

#### *Example 4*

Qld Big Road Builders Pty Ltd and Qld Tunnelling Ltd successfully win a tender to build a tunnel from the Gold Coast to the Sunshine Coast. The project is known as "The Brisbane Bypass Tunnel". The two companies trade as "The Brisbane Bypass Alliance".

### Correct Name and Address

Qld Big Road Builders Pty Ltd and Qld Tunnelling Ltd

Or

Qld Big Road Builders Pty Ltd and Qld Tunnelling Ltd Joint Venture

Or

Qld Big Road Builders Pty Ltd and Qld Tunnelling Ltd Joint Venture t/as The Brisbane Bypass Alliance

### Wrong Name– do not use joint venture name only

The Brisbane Bypass Alliance

### **Trusts**

A trust is an arrangement and relationship where a person holds property for the benefit of another. A trust can impose an obligation upon a person (the "trustee") to deal with property for the benefit of another person (the "beneficiary"). A trustee may be a natural person or a body corporate. **Trusts are not legal entities.** When dealing with trusts, DERM deals with the trustee, and in particular the person or company that is the trustee.

### **Co-operative**

A co-operative is given legal standing and effect in Australia through state government legislation, being the *Cooperatives Act 1997* and regulations. It is a business enterprise organised, owned and controlled by the persons who use its services. Some sugar mills are structured as co-operatives.

#### *Example 5*

---

## Understanding Legal Entities

---

### Correct Name (as listed on ASIC and is incorporated)

Mackay Sugar Co-operative Association Ltd

### **Companies**

Companies and corporations are a creation of law, and are separate legal entities. As stated above under the *Acts Interpretation Act 1954* a company is a legal 'person'.

A corporate body that is registered under the *Corporations Act 2001* may be a licence holder. Corporate bodies registered under the *Corporations Act 2001* are issued an Australian Company Number (A.C.N.) and are required to provide this. They are registered with Australian Securities and Investment Commission (ASIC). The A.C.N. will form part of the corporate body's Australian Business Name (A.B.N.).

A public company has "Limited" (Ltd) after its name. A private company has "Propriety Limited" (Pty Ltd) after its name. Private companies have a minimum of 1 Director. In a public company, the board runs the day to day business in accordance with its constitution.

Directors have duties, and the owners are the shareholders or "members", who influence the company through voting rights. Under the *Environmental Protection Act 1994* there are provisions that extend executive officer liability to those people who influence the company and/ or are in positions of control. This extends beyond the directors.,

It is important to ensure that the correct and full title of companies is used on any paperwork, as there can sometimes be a number of companies with similar names. To help avoid confusion, the company's A.C.N. should be included after its name.

### **Incorporated Association**

An association (incorporate or not) is any group of persons who have agreed to join together in pursuit of one or more common objects or purposes.

Incorporation of an association or club means that it becomes a legal entity in its own right (similar in effect to incorporation of a company), which is separate from the individual members. Put another way, the association is considered at law to have a distinct identity that continues regardless of changes to the membership. This type of association has rules and is a separate legal entity. Any notice would be issued to the association itself.

### **Unincorporated Association**

DERM does not often deal with unincorporated associations. An unincorporated association is not separate from its members and it would be rare for DERM to deal with the individuals that make up this association (e.g. sporting club). Any notice would need to be sent to the individuals that together form the association.

### **Body Corporate**

The major difference between a body corporate and an unincorporated body is that a body corporate is a legal identity separate from the people who are members of the body corporate.

A body that is not a corporate body does not have a separate legal identity to its members and therefore its members must carry any liability incurred by the association.

---

## Understanding Legal Entities

---

### Business Names

A business name is a name under which a legal entity conducts its business. Business names are sometimes called “trading names”. It is important to remember that **a business is not a separate legal entity**. A licence or notice should be issued to the registered owner of the name (often called “registered proprietor”) if it is registered. Not all business names are registered. The registered owner is the individual or corporate body that can be held responsible for activities carried out under that business name.

For example -

XYZ Pty Ltd (a corporation)

XYZ Pty Ltd trading as ABC Paints (a corporation which operates under trading name)

John Smith trading as ABC Paints (an individual who operates under a trading name)

In this example, a licence or notice should not be issued to ABC Paints as it is only the trading name used by a legal entity (individual or corporation) and not a legal entity on its own.

### Pitfalls

An applicant at the time of an application for an Environmental Authority (EA), Development Approval (DA) or Registration Certificate is the first source of information for details on who to issue a notice to, but it is important to be aware of the terms above and understand who it is that should be named on the document.

However, it is also important to check that the entity who applied for a licence, for example, is in fact the same that is operating currently. Sometimes there are changes in ownership and DERM is not always notified. Or it may be that the holder of a DA is different to the person operating on the land. When in doubt, it is best to carry out a search on ASIC (company names and details) or CITEC (title searches for ownership of property) - see below under “searching”. Another important consideration is time. When issuing a notice be sure to understand the time period for which you wish to regulate and who was in charge at that time of the alleged non-compliance. This may alter who is to be served and issued with the notice.

In understanding **WHO** DERM regulates, it is important to assess each situation on its own merits and be aware of all potential parties involved. Do not assume they will be the same.

Difficulties can also arise where there are **multiple parties** who may be responsible for a particular non-compliance. An example would be where you have a main company as well as a contractor conducting an activity. Another common example is where one family owned company owns land, and another family owned company (with the same office holders and members) carries on the business activity on the land. In this instance it is necessary to make enquiries to establish where legal / environmental responsibility lies. Where there are **two or more entities**, it is usually necessary to issue multiple notices. For example, where two parties were equally responsible for a particular non-compliance, the same notice may be issued to both (but addressed to the separate entities). If there are different levels of responsibility, the requirements of the notices may differ to reflect this. You still may wish to send copies to the respective parties.

In some circumstances a company may be in **liquidation**. When this occurs an administrator is appointed to manage the affairs of the company. Therefore should a notice need to be issued, you must serve the company as well as the administrator. Details should be available from a CITEC search or for further advice send a request to the Litigation Unit within DERM (details on ROBIN)

## Understanding Legal Entities

---

### Searching

For company searches, use ASIC – it is a free service but is only limited and does not always provide all the detail you require.

<http://www.search.asic.gov.au>

For other searches, such as business names, company and land title searches, as well as motor vehicle registration searches – use CITEC. There is a fee for this searches and most divisions will have there own log in and password.

<http://www.confirm.citec.com.au/>

### Using CITEC

The starting point will depend upon the situation and what you need to know. The name that you may recognise is the business name or trading name, through doing a **business name search**, this will confirm the trading name and who is carrying out the business. If the search indicates that a business is carried on by a company, then a company search is often the next logical step.

A **company search** will provide information on the director/s, the registered office (for service of documents), the shareholder/members and details of any external administration

A **land title search** may be useful in a range of situations, such as understanding who owns the land on which licensed or unlicensed activities are taking place.

### Addressing Statutory Notices – Who?

See examples provided above

For an individual, address the notice to their full name.

E.g John Smith

For a corporation, address notice with the full organisation name and the ACN

E.g Bolten Industries Pty Ltd (ACN 555 662 481)

### Serving Statutory Notices – Where?

Under the *Acts Interpretation Act 1954* –

For an individual at their last known place of business or residence (usually place of business if it is a DERM matter which we regulate)

For a corporation, serve the notice at the registered office (as listed on CITEC or ASIC search). It may also be necessary to serve a copy at the principal place of business, especially if the main office is in another State. It is also important to be aware of other parties involved, such as lawyers or consultants and depending on the circumstances serving a copy with these parties may be useful and/or practically necessary.

Service of notices –Registered post to track and confirm receipt (signed receipt option). For letters, normal post is sufficient.

---

## Understanding Legal Entities

---

### Issuing Notices to Government Bodies

Statutory notices can be issued to both state and local government bodies. Under Section 22 of the *Environmental Protection Act 1994* it is outlined that the Act binds all persons, which includes the State, other States and the Commonwealth.

If a situation arises where enforcement action is to be taken against these bodies, it is important to be aware of the parties involved and brief up where appropriate. Speak with your Supervisor for guidance. Generally notices may not need to be briefed to the top level when involving local governments but where a State Government Department is involved it is likely that a brief to the Director-General and /or Minister is to be done, so that they are aware of the proposed action and approval may also be required from them. This also extends to when there has been any non-compliance of previous enforcement action that involves these bodies (such as failure to undertake or complete works in accordance with a notice). The Ombudsman's *Good Decision Making* guide and the Department's *Enforcement Guidelines* are both important documents that must be considered in this process.

In issuing a notice to a State Government Department or Agency, it should be addressed to the Chief Executive of the Department. State Departments are government entities and therefore it is advisable to address to the individual in charge of the governing body. For full names and details of the Acts each Department administers, refer to the Administrative Arrangements Order (No 1) 2009 (accessed via the Department of the Premier and Cabinet Website - <http://www.premiers.qld.gov.au/publications/admin-arrange-order.aspx>).

Where a corporation is a government owned body the notice is to be issued to the relevant corporation. An ASIC search will assist with obtaining the correct details of the Government Owned Corporation (GOC). While these types of corporations are owned by Government bodies, such as Ergon for example, they are incorporated and therefore legal entities in their own right. For further information refer to *Government Owned Corporations Act 1993* and *Corporations (Queensland) Act 1990*.

### Issuing Notices to Local Government

Under the *Local Government Act 1993*, as per section 35 and 36 any proceedings brought against a local government are to be brought in the name of the relevant council e.g Brisbane City Council.

The name of a local government is the 'City of', 'Town of ' or 'Shire of' followed by the name of the local government area; or the name of the local government area followed by 'City', 'Town' or 'Shire' (s.34).

Where there are local government business units, such as Gold Coast Water within Gold Coast City Council, the correct name to be used is the name of the Council (Gold Coast City Council, in the above example).

### Other Tips

- Ensure details are correct
- When in doubt obtain legal advice
- Keep detailed records
- Be careful about spelling mistakes or typos on licences/permits or notices

# Procedural Guide

## Compliance and Investigations

### Use of official note books

*The objective of this guideline is to clarify when and how authorised persons should use an official note book. Where it is not reasonably practicable to use an official note book, you need to ensure that accurate, comprehensive and contemporaneous notes are made of any incident and that those notes are saved and stored on file.*

#### Reasons for taking notes

Taking notes of incidents is important for ensuring that there is a record for later reference, and to assist in proving what happened during an incident.

Note-taking not only helps in remembering the details of an incident later, but it assists in focusing on relevant points and to make later processes more efficient (such as preparing briefing notes or giving evidence in court).

If an authorised person is investigating an incident or complaint and is later called on to give evidence about it, your notes can be relied on in court only if they are accurate and contemporaneous (made at the same time as the incident or as soon as possible after it). Without these notes, you will need to rely on your memory of the incident without any assistance.

Part of the role of an authorised person is to use his or her official notebook when taking notes. If for some reason it is not possible to use the official notebook it is important that:

- accurate and contemporaneous notes are taken (on whatever paper is available);
- as soon as practicable after the incident, notes are made of the incident in the official notebook based on the field notes; and
- the field notes are placed on file.

#### Essential requirements

- All entries in the official notebook must be made in ink and be in chronological order.
- Every entry must state the time and date on which it was made.
- At the end of each entry a line must be drawn and the next entry must commence immediately below the line. (Do not leave spaces in the official note book to fill in later).
- Pages must not be torn out of any official notebook.
- If an alteration is necessary then the proper procedure is to draw a line through the original notes and insert the new notes, in such a manner as to leave the original entry in legible form.
- All entries in an official notebook should be made in the handwriting of the authorised person who the official notebook was issued to. If an authorised person makes entries in another authorised person's notebook, they must make it clear the reasons and who is making the entry in the notebook.

## Use of official notebooks

An official notebook is issued to an authorised person for use for Departmental matters.

Official note books are to be used only for the purpose of recording notes about the person's official duties and must not be used to record notes or private matters.

An incident that may not seem like a compliance or investigation issue at the time may become an issue at a later date. Authorised persons should, whenever in doubt, record information in the official notebook.

For the purpose of accuracy of references and admissibility of the notes as evidence, notes should be made at the time the events being recorded are taking place, or as soon as possible afterwards so that the facts are still fresh in the memory of the person making the notes.

Where an alteration to an authorised person's official note book is likely to be significant, the person should bring the alteration to the notice of another authorised person or a manager and obtain that person's signature next to a statement in the official note book explaining fully what has been done.

## Use of notes to refresh witness' memory

A witness giving evidence in court is usually allowed to refer to notes, or other records, for the purpose of refreshing their memory provided that:

- the facts or conversation cannot be accurately recalled without reference to the notes;
- either the authorised person made the notes, or read the notes of the partner at a time when the facts were still fresh in the memory of the authorised person.

The witness must testify to these facts and may be cross-examined regarding the manner, time and other circumstances relating to the making of the notes.

The usual procedure is for the witness to give as much evidence as possible from memory. When the authorised person cannot accurately remember the facts or conversation, the permission of the court will be sought for the authorised person to refer to the notes. The prosecutor will usually lead the authorised person through this process.

Notes may be used to refresh the memory at any time prior to a court hearing and a witness should have no hesitation in saying that notes have been referred to prior to the hearing to refresh the person's memory. If any of the persons interviewed during the course of the investigation are to be called as a witness, that person may also refer to the original statement if they have been given the opportunity to read the statement and sign it as a correct record whilst the facts were still fresh in their memory.

## How to obtain an official notebook

Each regional office may have its own internal procedures for obtaining official notebooks. Check with your manager.

### Identification of an official notebook

Authorised persons issued with official note books must immediately:

- enter their name inside the front cover;
- sign the cover page;
- record the name of the person who issued the official note book; and
- the location and date it was issued.

The authorised person being issued the official notebook must also sign the register identifying the number of the official notebook and the authorised person it was issued to.

When the official notebook is filled, it must be stored in a safe place for a period of at least three years.

## Warning Notices

---

*The purpose of this procedural guide is to provide guidance for authorised officers in determining those circumstances considered appropriate for issuing a warning notice. It also provides guidance in completing and issuing such notices.*

### What is a warning notice?

The Department of Environment and Resource Management (DERM) Enforcement Guidelines provide guidance for agency personnel involved in compliance and investigative duties as to how the issue of enforcement is to be approached.

The guidelines provide in part that “if an alternative to enforcement action will be more effective in achieving the objects of the Act being administered, then that alternative will be considered”.

DERM has a wide range of enforcement measures available for managing compliance with legislation administered by the agency. These enforcement measures include the option to issue verbal warnings and warning letters.

To facilitate and simplify the process of issuing warnings, a [warning notice](#) has been developed to enable relatively minor instances of non-compliance to be dealt with ‘on-the-spot’. The issue of a warning notice will be recorded, and where subsequent checks reveal a previous warning(s) has been issued to the same person/organisation for similar breaches, then further enforcement action may be taken.

### Who can issue a warning notice?

Only those officers who are appointed authorised officers for the particular act being administered are permitted to issue warning notices.

### When can a warning notice be issued?

Warning notices should be issued for minor instances of non-compliance, where a penalty infringement notice is not appropriate and where issuing a warning notice is likely to encourage the person to rectify the non-compliance.

### Considerations to be made prior to issuing warning notices

Authorised officers detecting breaches/offences should carefully assess each case to determine the most appropriate course of action to be taken in the circumstances. As a means of assisting officers in this process, the DERM Enforcement Guidelines should be adopted as a guiding principle in determining those circumstances considered appropriate for the issue of a warning notice.

The issue of a warning notice should be confined to an alleged offence where:

- the offence/breach is a one-off situation;
- the offence/breach is considered minor or technical in nature;
- the operator is generally compliant;

- the operator has not previously been issued with a penalty infringement notice (PIN) or a warning for a similar offence;
- the harm or potential harm to the environment is considered minimal; and
- the issue of a warning notice is likely to be a deterrent.

### **Format of a warning notice**

Warning notices are contained in books of 30, each notice being numbered with two copies.

The copies are dealt with as follows:

- Original – (DERM copy – remains on file at issuing office);
- Duplicate – (served on person named in the notice).

### **Completing the notice**

When an authorised officer considers that circumstances are appropriate for the issue of a warning notice, the following points are to be observed when completing and issuing the notice:

- ensure the cardboard separator is placed immediately after the copy of the notice to be served on the person concerned;
- complete the notice with a ball-point pen, printing clearly and legibly in block letters;
- complete details relating to name, address, date of inspection/observation etc;
- specify location of inspection/observation;
- outline details of DERM concerns;
- identify legislation against which breach/offence has been committed;
- where appropriate, include date for any follow-up inspection considered necessary;
- complete issuing officer's details and details of the positional title and phone number to which inquiries relating to the issue of the notice should be directed;
- check for possible mistakes.

Following completion, the duplicate copy is to be delivered to the person named in the notice with an explanation as to the reasons the notice has been issued and what, if any, action is required of them. The advice given should be consistent with that appearing at the foot of the notice. Where any follow-up inspection is considered necessary, the person concerned is to be advised accordingly.

### **Making notes for evidence**

After the notice has been served, the authorised officer should record details of any conversations concerning the incident and observations in their official notebook.

These details may be required if further enforcement action is taken with respect to the operator at a later date.

### **Data entry**

Particulars included on warning notices are to be recorded in the compliance component of Ecotrack. This is an important step, and will make sure that the full compliance history for an operator is recorded so that future non-compliances can be dealt with appropriately. Following the recording of relevant information, the DERM (original) copy of the notice is to be filed at the issuing office.

# Procedural guide

## Compliance and Investigations

### When and How to Issue a Caution

---

#### Essential Points

- A Caution is a warning from an investigator to an interviewee as to their right to silence and their right to the privilege against self-incrimination.
- The purpose of a caution is to ensure that the interview is fair and that any confessions or incriminating information supplied is supplied voluntarily.
- There is no need to give a general caution when interviewing a company.
- If using your powers under the *Environmental Protection Act 1994* ("EP Act") or the *Nature Conservation Act 1992* ("NC Act") to compel answers or give information always give the warning required by the respective Acts.
- Have a written copy of the caution to read from to ensure accuracy.

#### What is a Caution?

A caution is simply a warning to a real person about to be interviewed by an investigator as to their rights, specifically their right to silence and their right to the privilege against self-incrimination. Except if a statute specifically states otherwise a person does not have to participate in a record of interview, nor make any statement or supply any information that may implicate them in the commission of an offence.

The historical basis for the giving of the warning was the issuing of the Judges Rules. These were guidelines issued by the English judges for the benefit of the English Police. The Judges Rules have never been part of the law in Queensland however they have been referred to by Courts in deciding whether a confession has been obtained voluntarily and fairly.

#### When to Caution

You will need to use your judgement in every given case but the following are some guidelines and pointers to assist. You should consider:

- The privilege against self incrimination does not extend to companies so there is no need to give the general caution when interviewing a company, however be careful if you also think that the person being interviewed on behalf of the company may have committed offences personally. If an employee of a company who is not the focus of your investigation claims privilege against self-incrimination, you can probe as to why they feel the need to claim privilege. You can also tell the employee that they are not the focus of the investigation. You can also tell them that if their answers suggest that they should be the focus of the investigation, you will tell them and issue or reissue a caution to them. Under no circumstances can you give the employee an indemnity or tell them that they will not be prosecuted.
- The seriousness of the offence you are investigating. If it is an indictable offence such as wilfully and unlawfully committing material or serious environmental harm then it would be advisable to issue a caution.

- Have the Queensland Police Service been involved? If for whatever reason the Police have been involved in the investigation and you are interviewing the person it can be a good idea to issue a warning, in case it is assumed that the police presence has caused the person to participate rather than the exercise of his or her own free will.
- The person's level of education. If you believe that the person you are interviewing or about to interview does not understand that they do not have to speak to you unless they want to then you should issue a caution.
- The person's demeanor. A member of the public not used to dealing with investigators may be overawed by your presence, particularly if you are in a uniform, and not appreciate that they do not have to speak to you.

The important thing to remember is that a Court in assessing what evidence should be considered can rule out interviews on the grounds of unfairness or on the grounds that the statements in the interview were not made voluntarily. A caution can help to show that the person involved participated of their own free will and knew that they did not have to answer the questions asked of them.

### **Form of the Caution**

If you decide to give a caution then the best idea is to give the same warning. Police are required to give. The caution is in the following terms:

“ Before I ask you any questions I must tell you that you have the right to remain silent.  
This means you do not have to say anything, answer any question or make any statement unless you wish to do so.  
You are not at this point required by me or by the law to make a statement.  
If this position changes I will clearly indicate it to you.  
You may wish to make a statement to explain your involvement in the matters I am investigating or to provide information to demonstrate you or another's innocence.  
However, no inference will be drawn from a failure to provide information during this interview.  
If you do choose to say something or make a statement, it may later be used as evidence.  
Do you understand?.”

It is not a bad practice to give a written copy of the caution to the witness while you are reading it.

If a lawyer is present, you may address them this way:-

“Mr/Ms \_\_\_\_\_ could you please indicate who you are representing today. “ (Answer)

“Mr/Ms \_\_\_\_\_ at the close of the interview I will allow you to place on the record any submissions you wish. Throughout the interview you will be permitted to advise your client and call brief adjournments to talk to your client in private. However, I direct that you not answer questions addressed to your client or otherwise obstruct me in the exercise of my duties. You are here today to look after the interests of this witness. Any submissions or objections not relating to this witness will be disregarded.”

If multiple people are in the room, you should address them collectively:

“The courts have repeatedly stated that witnesses should be interviewed separately. I would prefer to interview you separately so that there is no confusion as to what each witness's evidence is and no suggestion that there has been any collaboration between you. Are you willing to be interviewed separately?”

### Special Cases – Cautions to be given upon the use of Compulsory Powers

An authorised person under section 465 of the EP Act and a conservation officer under section 152 of the NC Act, may, if they suspect on reasonable grounds that an offence against the relevant act has occurred and that a person may be able to give information about the offence, require that person to answer a question (EP Act) or give information about the offence (NC Act).

Under each Act a warning must be given that it is an offence to fail to comply with the requirement without a reasonable excuse. Each Act goes on to provide that it is a reasonable excuse if complying might tend to incriminate the person.

The caution to give when making a requirement should be as follows:

“I now require you pursuant to section \_\_\_\_\_ of the \_\_\_\_\_ Act to give me information about [describe the offence you are investigating]. I must warn you that it is an offence under that Act to fail to comply with this requirement unless you have a reasonable excuse. The Act provides that it is a reasonable excuse for you to fail to give the required information if the giving of it may tend to incriminate you. Do you understand?”

Please refer to the procedural guide on “Obtaining Evidence that a Company has committed an Offence” for further details with respect to a company being able to decline to answer if it was required to answer under s 645 of the EP Act, on the grounds that it might tend to incriminate the company.

### Final Tips

Have the relevant cautions written down so that you can be sure that you have delivered them accurately.

Should a person answer that they do not understand the caution, explain the caution to them using simpler terms, if they have a lawyer with them allow the lawyer to explain it.

### Disclaimer:

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their professional advisors before embarking on any proposed course of action.

### **Procedures for managing regulatory service complaints**

*This guideline provides an overview of the Operational Policy 'Requests for Regulatory Service and Complaints about the Service' to assist Environmental Operations Division (EO) officers in handling complaints about regulatory services provided by the Division. This guideline is to be read in conjunction with the Operational Policy.*

#### **Complaints about regulatory service**

EO receives requests from individuals and community groups, to take action in respect of alleged breaches of the Acts it administers, for example in relation to complaints about excessive emissions from industrial activities. EO responds to such requests for regulatory intervention in accordance with the operational policy "[Requests for Regulatory Service and Complaints about the Service](#)".

Not everyone is satisfied with the response actions taken by EO, resulting in complaints about the nature of the regulatory action taken. This guideline outlines how such complaints need to be addressed, and should be read in conjunction with the [operational policy](#).

#### **Procedure for receiving and resolving complaints**

The operational policy "[Requests for Regulatory Service and Complaints about the Service](#)" sets out the procedure for effectively resolving regulatory service complaints within target timeframes. It does not apply to other complaints such as those concerning breaches of the EPA's code of conduct, or those concerning official misconduct.

Complainants must at all times be dealt with in a fair, transparent, responsive and respectful way. The steps involved are summarised as follows.

##### **Step 1 – Receipt of the Complaint**

A regulatory service complaint may be received in a number of ways, such as in person, by telephone or by letter. Complainants should be requested at all times to provide their name, residential address, and contact telephone number. Complainants should also provide details of the specific decision or action by EO that has led to the complaint, the grounds or reasons why they are dissatisfied, and any evidence or information they have concerning the matter or supporting their allegations.

EO will keep the complainant's personal details confidential, but will always advise complainants this may not be possible in all cases.

Wherever possible, assistance should always be provided wherever possible to persons wishing to make a regulatory service complaint, including an explanation of our complaint process. A simple information brochure is available to assist with this. Remember the 'Customer First' initiative and EOs commitment to excellence in customer service.

## Procedure for regulatory service complaints

---

### Step 2 – Categorisation of the Complaint

Regulatory service complaints are to be categorised according to the potential impact on the environment, and the level of seriousness and complexity involved. This categorisation will help identify complaints that can be addressed almost immediately by front-line managers, and those that may need further actions for their resolution. Complaints will either be:

- 1) **Insignificant** – minimal impact or risk to the environment. For instance, serial or repetitive complainants where history has shown little or no substance to the complaints, or complaints about minor or trivial matters such as the leaves blowing into a person's yard.
- 2) **Minor** – issue resolvable at the point of service. Has something simple been overlooked? Is the matter outside of the jurisdiction of the EPA? Can we provide some more information concerning our decision/action and explain applicable policies or legislation? These matters are resolvable at the point of service.
- 3) **Moderate** – low impact or risk to the environment. These issues are the ones that require a little more analysis or investigation. Many nuisance issues would fall within this category, such as where a complaint was made about odour from a landfill and EO officers were unable at the time to detect the odour on site visits, but the issue has continued. These matters may require further assessment or investigation.
- 4) **Major** – potential high impact on the environment. These issues are significant, such as allegations of dumping of waste where serious or material environmental harm may be involved and the complainant is unhappy with the level of service we have provided. For example the allegation may be that all avenues weren't investigated. These matters require investigation.
- 5) **Extreme** – high level of potential or actual impact on the environment. Serious complex issues that require high-level investigation. These are issues that involve potential or actual serious or material environmental harm, and the complainant is completely dissatisfied with our service or may allege that there was no service. These matters require investigation.

This step also involves recording the relevant details of the complaint in ECOTRACK. When the complaint was received, details of the complaint, the category of the complaint, applicable timeframes and the responsible officer should all be recorded in ECOTRACK. In later steps when the complaint is resolved, details of actions taken and the decision will also be recorded in the system. Even complaints which are resolved almost immediately, such as oral complaints or those not within the EPA's jurisdiction, should be recorded in ECOTRACK.

### Step 3 – Acknowledgement of receipt of complaint

Regulatory service complaints are to be acknowledged within **5 days**. There are no restrictions on how this occurs i.e. it can occur formally by letter or informally by telephone. It is suggested that the acknowledgement reflects the way the complaint was communicated to the EPA and the seriousness of the complaint. Remember to record the details of this acknowledgement in ECOTRACK.

### Step 4 – Front-line handling of complaints by Managers or Regional Directors

Initially, complaints are to be dealt with within **14 days**. If complaints are not able to be resolved within this timeframe, a progress report is to be made to the complainant within **14 days**. Managers will usually be the first point of contact, and wherever possible they should try to resolve the complaint in the first instance. Any complaints can be handled informally at this stage by providing appropriate advice concerning the action taken or decision made. This includes explaining carefully to the complainant the reasons for any decision or action

## Procedure for regulatory service complaints

---

and providing any relevant policies or legislation that provides the basis for the decision or action. The response to the complaint (either orally or in writing) is also to include an explanation of the available complaint process as well as information concerning any other review rights the complainant may have (e.g. some decisions will have review or appeal rights under the relevant legislation).

Principles for the effective resolution of complaints are detailed in the operational policy. Action should be taken if appropriate and it is within the Manager's authority.

Managers may refer complaints to the Regional Director for resolution in the situations outlined in the operational policy. The Manager will ensure that the appropriate recording of details concerning the complaint, action taken, and its resolution are made in ECOTRACK in accordance with the operational policy. The Manager will also ensure that the outcomes of the complaint resolution are communicated to any relevant officers.

Where possible, contact should be made with the complainant around a week after the resolution of the complaint to verify that the matter is resolved for the complainant. This information should also be entered into ECOTRACK.

### Step 5 – Internal Review

Where a complainant is dissatisfied with the way EO has handled their complaint, they can make a further written application for an internal review. Internal review is a reconsideration of the decision made or action taken including a review of all the information available relevant to the decision.

An application for internal review **MUST** be written and the complainant must provide further information such as any evidence supporting their allegations, and copies of relevant correspondence or other documents.

A progress report concerning the review will be given within **21 days** of the receipt of the complaint. The matter will be finalised within **35 days** of the receipt of the complaint.

The reviewer provides a written response to the complainant which explains the outcome and reasons for the outcome, including any supporting material such as relevant legislative provisions, as well as explaining the complaint process. Principles for the effective resolution of complaints are detailed in the operational policy. The reviewer will ensure that the appropriate recording of details concerning the complaint, action taken and its resolution are made in ECOTRACK in accordance with the operational policy. The reviewer will ensure that the outcomes of the review are communicated to the original decision maker.

Applications for internal review should be made to the Regional Director, where a Manager has dealt with the original regulatory service complaint. In cases where the regulatory service complaint had been referred to the Regional Director by the Manager, the application for internal review should be directed to the Executive Director, EO.

Where an internal review is completed by the Regional Director, if a complainant is still unsatisfied, they can make a written application for a further internal review by the Executive Director, EO. When the Executive Director completes an internal review, and the complainant still has unresolved concerns, the complainant will be referred to the Queensland Ombudsman.

### Step 6 – Continuous Improvement

Managers, Regional Directors, or the Executive Director if relevant, will ensure that where relevant observations and outcomes from complaint resolution or internal reviews, provide opportunities for continuous improvement that appropriate changes to policies or procedures are made.

**Disclaimer**

While this document has been prepared with care, it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

# Application form

## Environmental Protection Act

### Program notice of relevant event

#### OFFICIAL USE ONLY

DATE RECEIVED

--	--	--

FILE REF

--

PROJECT REF

--

COMPLETE FORM

CORRECT AA

ENTERED BY [SIGNATURE]

--

DATE

--	--	--

A relevant event is an act or omission that has caused or threatened environmental harm in the carrying out of an activity by the person, and is lawful apart from the *Environmental Protection Act 1994*.

For example, you might provide details of the general activities that you were undertaking at the time, the act or omission and how it occurred, and any further action that was taken.

This form is to be used where a person wishes to provide a program notice under section 350 of the *Environmental Protection Act 1994* of an act or omission that has caused or threatened environmental harm.

#### Program notice details

##### 1. Provider of program notice of relevant event

--

##### 2. Responsible person

--

##### 3. Current registration certificate or environmental authority number (if applicable)

--

##### 4. When did the relevant event occur?

--

##### 5. Description of the relevant event

--

For example, you might provide details of the proximity of the relevant event to sensitive places (e.g. parks or nearby waterways).

**6. Location of relevant event**

NAME OR TYPE OF PLACE	
STREET ADDRESS	
LOT(S)	
PLAN(S)	
LOCAL GOVERNMENT	

**7. Description of the nature and extent of environmental harm caused or threatened as a direct or indirect result of the relevant event**

**8. What action has been taken to contain, clean up, rehabilitate and restore the environmental impact in relation to the relevant event?**

**Privacy statement**

The Department of Environment and Resource Management (DERM) is committed to protecting the privacy, accuracy and security of your personal information in accordance with the *Information Privacy Act 2009*.

DERM is collecting your personal information in accordance with s. 350 of the EP Act in order to assess your program notice. The information will only be accessed by authorised employees within the department.

Your information will not be given to any other person or agency unless you have given us permission or we are authorised or required by law.

All information supplied on this form may be disclosed publically in accordance with the *Right to Information Act 2009* and *Evidence Act 1977*. For queries about privacy matters email: AdminReview@derm.qld.gov.au or telephone: (07) 3896 3705.

**9. Declaration**

Note: If you have not told the truth in this application you may be liable for prosecution under the relevant Acts or Regulations.

- I am aware that section 351 of the *Environmental Protection Act 1994* states:
  - “(1) If the relevant event stated in the program notice constitutes an offence against this Act (the “original offence”), the giving of the program notice, the program notice and any documents submitted with it are not admissible in evidence against the person in a prosecution for the original offence.
  - “(2) Subsection (1) does not prevent other evidence obtained because of the giving of the program notice, the program notice or any documents submitted with it being admitted in any legal proceeding against the person.”
- I will prepare and submit to the administering authority a transitional environmental program in accordance with section 333 of the *Environmental Protection Act 1994* for the relevant event.
- I do solemnly and sincerely declare that the information provided is true and correct to the best of my knowledge. I understand that it is an offence under section 480 of the EP Act to give to the administering authority or an authorised person a document containing information that I know is false, misleading or incomplete in a material particular.
- I understand that all information supplied on or with this application form may be disclosed publicly in accordance with the *Right to Information Act 2009* and the *Evidence Act 1977*.

<sup>1</sup> The *Risk Assessment Tool* can be found in Ecosteps and is a tool that calculates the risk as per the steps in this procedural guide

## Introduction

The release, be it licensed or otherwise, of contaminants into the environment has the potential to result in adverse human and/or ecological impacts. Risk assessment, in the context of industrial activity, is the process of systematically identifying credible hazards to human and ecological health and analysing the likelihood and severity of the potential consequences. Risk management involves a further and essential step of implementing action to manage the resulting level of risk.

Risk is defined using the following model:

$$\text{Site Risk} = \text{Hazard (Consequence)} \times \text{Exposure (Likelihood)}$$

## Risk Assessment

Risk assessment is used extensively both in Australia and overseas as a factor in government approvals on the acceptability of new developments such as approvals for new Environmentally Relevant Activities (ERA's) or other business and industry activities. Risk assessment processes are also increasingly being used by governments to identify, prioritise and justify compliance activities and compliance and enforcement actions.

This procedural guide utilises risk assessment concepts such as, hazard, likelihood and consequence (see Appendix A) to assist Agency staff in setting site priority and inspection level. The steps outlined below guide you through the risk assessment process.

## Risk Assessment Steps

To establish the level of risk an ERA or non-ERA business or industry facility or site poses, take the following steps:

### 1. Likelihood

Considering the type of activity occurring at a site, the characteristics of the identified risks, and the performance of the business operator, use *Table 1 - Likelihood Matrix* to determine the likelihood of environmental harm occurring. Refer to Table 1.1 to determine the client performance and then identify the Aggregate Environmental Score (AES). When assessing a site with multiple ERA's use the highest AES of all ERA's occurring at that site. When focussing on a specific ERA for the site, use the AES of that ERA.

**Table 1 – Likelihood Matrix (based on client performance and client activity)**

Client Performance	Client Activity Definitions <sup>2</sup>				
	Non-ERA (known)	Non-ERA (unknown) OR AES (0-25)	AES (26-50)	AES (51-125)	AES (126-325)
Unknown	Possible	Possible	Likely	Almost certain	Almost Certain
Poor	Unlikely	Possible	Possible	Likely	Almost Certain
Moderate	Rare	Unlikely	Possible	Likely	Likely
Good	Rare	Rare	Unlikely	Possible	Likely
Very Good	Rare	Rare	Unlikely	Possible	Possible

<sup>2</sup> Aggregate Environmental Score (AES) are listed in Schedule 2 of the *Environmental Protection Regulation 2008* and in the *Risk Assessment Tool*

**Table 1.1 – Likelihood – client performance descriptors**

	Client Performance
Unknown	No inspections logged in Ecotrack = site performance unknown
Poor	Serious environment harm or major non-compliance; OR Material environment harm or repeated minor non-compliance For example, PIN, EPO, TEP, EE issued
Moderate	Evidence of environmental nuisance or minor non-compliance For example, Warning Notice/Letter issued
Good	Inspection conducted and site compliant
Very Good	Inspection conducted and site compliant Evidence of best practice

## 2. Consequence

Considering the types and quantities of emissions released from a site (NPI Risk Score), and the value of the surrounding environment type, use *Table 2 - Consequence Matrix* to determine the severity of the consequence occurring. Refer to Table 2.1 to determine the value of the predominant surrounding environment type and then identify the NPI Risk Score. When assessing Mobile and Temporary activities where locations are not known consider the most likely predominant surrounding environment type. Refer to Appendix C for assistance with Wetlands and Biodiversity Ecomaps layers. Client activity risk is based on NPI reporting data – whether a site releases emissions, whether emission rates/types are known, and the quantity and types of emissions released. Refer to Appendix B for NPI site Ecomaps layers.

**Table 2 – Consequence Matrix (based on environment type and client activity)**

Predominant Surrounding Land Use (Environment Type)	Client Activity Risk				
	Non-NPI site (no emissions or emissions known) Risk Score 1 <sup>3</sup>	NPI Risk Score 2	NPI Risk Score 3	NPI Risk Score 4	Non – NPI site (emissions unknown) OR NPI Risk Score 5
Highly Significant Value	Severe	Severe	Major	Catastrophic	Catastrophic
Significant Value	Minor	Severe	Severe	Major	Catastrophic
Moderate Value	Insignificant	Minor	Severe	Major	Major
Low Value	Insignificant	Insignificant	Minor	Severe	Major
Very Low Value	Insignificant	Insignificant	Minor	Severe	Severe

<sup>3</sup> Low risk compared to Non – NPI site (emissions unknown) OR NPI Risk Score 5 which is high risk

**Table 2.1 – Consequence – environment type**

	<b>Predominant Surrounding Environment Type</b>
Highly Significant Value	Site located within 100 metres of a wetland AND either within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Significant Value	Site located within 100 metres of a wetland or within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Moderate Value	Site located between 100 metres and 200 metres from a wetland system, wetland drainage, or a wetland spring OR between 100 metres and 200 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in Biodiversity Planning Assessment
Low Value	Site located between 200 metres and 500 metres from a wetland OR between 200 metres and 500 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment
Very Low Value	Site located greater than 500 metres from a wetland OR greater than 500 metres from an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment

### 3. Environmental Risk

Determine the level of risk by combining the results of Table 1 (likelihood) and Table 2 (consequence) by using *Table 3 - Environmental Risk Matrix*.

**Table 3 – Environmental Risk Matrix (ERA and non-ERA industry / business activities)**

		<b>Consequence</b>				
		<b>Insignificant</b>	<b>Minor</b>	<b>Severe</b>	<b>Major</b>	<b>Catastrophic</b>
<b>Likelihood</b>	<b>Almost certain</b>	3 / Moderate	3 / Moderate	4 / High	5 / Very High	5 / Very High
	<b>Likely</b>	2 / Low	3 / Moderate	3 / Moderate	4 / High	5 / Very High
	<b>Possible</b>	1 / Very Low	2 / Low	3 / Moderate	4 / High	4 / High
	<b>Unlikely</b>	1 / Very Low	1 / Very Low	2 / Low	3 / Moderate	4 / High
	<b>Rare</b>	1 / Very Low	1 / Very Low	2 / Low	3 / Moderate	3 / Moderate

### 4. Inspection

Determine the inspection type and frequency for the site using the result from Table 3 by using *Table 4 - Inspection Frequency*.

**Table 4 – Inspection Frequency**

The frequency of compliance inspections for premises is to be determined by the individual Region. The frequency and level of inspection required at a facility is based on the type of activity/activities undertaken on

## Risk Assessment (ERA and non-ERA) industry / business activities

site; the types and quantities of emissions released from a site the proximity of the site to environmentally sensitive areas; and the proximity of the site to areas of social vulnerability.

The compliance inspections conducted by the Regions will take into account the level of environmental impact or risk that may be involved and the environmental outcomes that may be achieved.

Environmental Risk	Inspection Frequency (min)	Inspection Level
1 / Very Low	As issues arise	A
2 / Low	As issues arise	A or B
3 / Moderate	Biennially	B
4 / High	Annually	B or C
5 / Very High	Annually – Taskforce	C

### Inspection Type

Inspections of differing degrees of detail are conducted, and will be either compliance inspection Level A; compliance inspection Level B; or compliance inspection Level C.

#### **A / Basic Inspection**

Level A Inspections are compliance inspections at the lowest level of detail for Agency interests. They tend to be targeted to a particular environmental issue, are inspections of low risk, non complex and non-regulated sites, or are planned inspections where little is known of the premises and an initial risk assessment of the site is necessary. Such inspections may comprise a quick visual check of a premises or a more detailed assessment of only a portion of the operations such as, for example, stormwater management. Level A Inspections can also be undertaken as follow-up inspections to establish compliance with enforcement actions (e.g. a Transitional Environmental Program or Environmental Protection Order) taken by the EPA at a given site. (Refer to [Preliminary Assessment Form / Level A Inspection Checklist](#) in Ecosteps).

#### **B / Condition Inspection**

Level B Inspections are the most common level of inspection undertaken at licensed premises. A licensed premise will usually have a statutory document issued by the EPA for the activity – a development approval. Compliance with any EPA issued statutory documentation is assessed as a minimum (usually an assessment of performance against approval conditions), however Level B Inspections may also include assessment of other documentation (such as a site based management plan) and the taking of samples. (Refer to [Compliance Audit Report](#) in Ecosteps).

#### **C / Audit**

Level C Inspection is the highest and most detailed level of compliance assessment that the EPA will undertake. They are expected to be pre-planned and scoped, involve a multi-disciplinary team for a specified period of time, and examine compliance with all aspects of issued statutory documents and the broader legislation.

Extensive documentary evidence of compliance is [REDACTED] determine or validate the presence or absence of environmental impacts. (Refer to [Compliance Audit Report](#), [Audit Plan](#) and [Compliance Program Audit Checklist](#) in Ecosteps).

## Risk Assessment Examples

### Example 1

A pre-inspection file review of annual returns and supporting information for a pesticide manufacturer indicates that the business has advised the EPA that soil and groundwater samples in the vicinity of its stormwater discharge are showing levels of Chlorpyrifos present above environmental threshold values. The business is located adjacent to an undisturbed freshwater stream. The presence of contamination suggests the business has inappropriate stormwater controls in place or an incident has recently occurred. There is both a risk that the business is in breach of its development approval conditions relating to stormwater controls (non-compliance risk) and a risk of environmental harm occurring (fish kill).

A further review of the file indicates that the business operator was operating in compliance at the time of the last site inspection (2 years earlier). However, until a more recent site inspection is undertaken, the operator's current performance remains unknown.

Referring to Table 1 and Table 1.1, determine the *likelihood* of a risk event occurring. The development approval indicates that the pesticide manufacturer has an approval for ERA 7(b) Chemical Manufacturing and therefore an AES of 114. The compliance performance of the business is "unknown" (Table 1.1), so Table 1 gives the likelihood of environmental harm occurring or the business operating in breach of environmental legislation as ALMOST CERTAIN.

An Ecomaps survey of the site and surrounding environment indicates that the site is within 100 metres of wetland drainage (but not within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment or State or Regional Significance in the Biodiversity Planning Assessment). The site reports to the NPI and has an NPI Risk Score of 4.

Referring to Table 2 and Table 2.1, determine the *consequence* of a risk event occurring, or hazard having an impact. Table 2 gives the consequence of environmental harm occurring or the business operating in breach of environmental legislation as MAJOR.

Using the results from Table 1 (almost certain) and Table 2 (major) in Table 3 gives an overall risk for this industry/business site of 5/Very High. Level C audits should be conducted annually for this site (see Table 4).

### Example 2

DERM has received a number of complaints from the community about odour originating from a landscape supplies and compost manufacturing business described as foul and similar to dynamic-lifter type fertilizer. The presence of odours suggests the business may be receiving or selling products that DERM is not aware of or undertaking composting activities inappropriately. There is both a risk that the business is in breach of its development approval conditions, including those relating to odour releases (non-compliance risk) and a risk of environmental nuisance occurring.

Referring to Table 1 and Table 1.1, determine the *likelihood* of a risk event occurring. The development approval indicates that the soil conditioner has an approval for ERA 53 and therefore an AES of 18. There appears to be an environmental nuisance at the site, so the operator's performance is "moderate" (Table 1.1). Table 1 gives the likelihood of an event occurring as UNLIKELY.

An Ecomaps survey of the site and surrounding environment indicates that the site is located within 100 metres of an area mapped as State Significance in the Biodiversity Planning Assessment (but not within 100 metres of a wetland or within 100 metres of an area mapped as very high or high in the Aquatic Conservation Assessment). The site reports to the NPI and has an NPI Risk Score of 2.

---

## Risk Assessment (ERA and non-ERA) industry / business activities

---

Referring to Table 2 and Table 2.1, determine the *consequence* of a risk event occurring or hazard having an impact. Table 2 gives the consequence of environmental nuisance occurring or the business operating in breach of environmental legislation as SEVERE.

Using the results from Table 1 (unlikely) and Table 2 (severe) in Table 3, gives an overall risk for this industry/business site of 3/MODERATE. Level B site inspections should be conducted biennially for this site (see Table 4).

## Appendix A

### Risk Assessment Concepts

**Hazard** is the potential for mishap or harm. A hazard is not necessarily dangerous. Danger implies a reasonable likelihood of a mishap or harm actually happening. A hazard is simply the potential for that to happen; if sufficient precautions are taken to prevent the potential from being realised, then the hazard may be “safe”.

**Risk** is the chance of something happening that will have an impact upon objectives (for example, to prevent harm to the environment). It is measured in terms of consequences and likelihood.

**Consequence** is the outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, and disadvantage or gains (e.g. a frequency of an overflow or release during a 1 in 10 year storm event).

**Likelihood** is a qualitative description of probability or frequency. Likelihood may be a probability (e.g. a 1% probability of an overflow or release of contaminated water during a storm event), or a frequency (e.g. a frequency of an overflow or release being a 1 in 10 year storm event).

**Risk assessment** as defined in AS/NZS 4360:2004<sup>4</sup>, is the overall process of risk identification, risk analysis and risk evaluation. Risk assessment is an integral component of the **Risk Management** process. Risk management can be applied at many levels in an organisation. It can be applied at a strategic level and at tactical and operational levels. It may be applied to specific projects, to assist with specific decisions or to manage specific recognised risk areas.

The main elements of the Risk Management process are the following:

- (a) Establish the context – Establish the external, internal and risk management context in which the risk management process will take place. Criteria against which risk will be evaluated should be established and the structure of the analysis defined.
- (b) **Identify risks** – Identify where, when, why and how hazard events could prevent, degrade, delay or enhance achievement of the objectives.
- (c) **Analyse risks** – Identify and evaluate existing controls. Determine consequences and likelihood and hence level of risk. This analysis should consider the range of potential consequences and how these could occur.
- (d) **Evaluate risks** – Compare estimated levels of risk against pre-established criteria and consider the balance between potential benefits and adverse outcomes. This enables decisions to be made about the extent and nature of treatments required and about priorities.
- (e) Treat risks – Develop and implement specific cost-effective strategies and action plans for increasing potential benefits and reducing potential impacts.
- (f) This element of the Risk Management process is addressed via DERM’s tools and strategies outlined in the Department’s Enforcement Guidelines.
- (g) Monitor and review – It is necessary to monitor the effectiveness of all steps of the risk management process. This is important for continuous improvement.

Risk Assessment

This element of the Risk Management process is addressed via DERM’s ongoing commitment to follow-up compliance inspections and enforcement action to address environmental risk associated with ERA and non-ERA industry and business activities. Risks and the effectiveness of treatment measures need to be monitored to ensure changing circumstances do not under or overstate the risk potential of a managed activity.

## Appendix B

### How to obtain NPI Scores

- Open [Ecomaps](#) (click on link)
- Select add/remove layers
- Select “Facilities and Structures” then tick “National pollutant inventory sites”
- Close add/remove layers window
- Ensure “National pollutant inventory sites” is ticked on left hand side and click on refresh maps
- Zoom into desired area. Select “locate” button in top menu then select “built environment” if searching by address or select “administrative” if searching by lot plan.
- Locations listed on NPI are highlighted BLUE
- Click on “Information” button in top menu and “Identify by” window will open
- Select “Point select” then click on desired location (blue dot)
- Query/selection result window will open listing site and NPI Risk Score

Risk Assessment (ERA and non-ERA) industry / business activities

Query/Selection Results - Microsoft Internet Explorer provided by Environmental Protection Agency

**eco maps** Info Results

Save Results    Print Results    Close Results

**National Pollutant Inventory Sites**

No.	Name	Address	ANZSIC Classification	Risk Score	Reports
1	DIGGERS PARK LANDFILL (CLOSED)-ROCKHAMPTON CITY COUNCIL	DIGGERS PARK NORMANBY ST ROCKHAMPTON QLD	Waste Disposal Services	4	25257
2	PELTOPHORUM STREET LANDFILL (CLOSED)-ROCKHAMPTON CITY COUNCIL	PELTOPHORUM ST NORTH ROCKHAMPTON QLD	Waste Disposal Services	4	25258

No Features Found in the following layer(s):

- Highways
- Railway Stations
- Streets
- Major Towns
- Other States

## Appendix C

### How to obtain Wetlands and Biodiversity Ecomaps layers

- Open [Ecomaps](#) (click on link) or select the GIS (green) button from the Permits screen in Ecotrack and it will take you to the exact location in Ecomaps
- Select add/remove layers
- Select **“Biologic & Ecologic”**
- Select **“Aquatic Conservation Assessments”** and tick relevant area (if in doubt tick them all)
- Select **“Biodiversity Planning Assessments”** and tick the relevant area (if in doubt tick them all)
- Select **“Wetland Programme”** then tick:
  - Queensland Wetland Data Wetland Displayed by Wetland System
  - Queensland Wetland Data riverine systems drainage line
  - Queensland Wetland Data palustrine system springs

- Close add/remove layers

## Risk Assessment (ERA and non-ERA) industry / business activities

- Ensure relevant layers are ticked on the left hand side and refresh maps
- Select “legend” tab to identify the areas of State or Regional significance and very high or high in the Aquatic Conservation Assessment
- Zoom into desired area (this step is not required if you have accessed Ecomaps via Ecotrack). Select “locate” button in top menu then select “built environment” if searching by address or select “administrative” if searching by lot plan.
- Click on “information” button in top menu and “identify by” window will open
- Select “point select” then click on desired location (yellow/green dot)
- Query/selection result window will open listing wetlands information

**Environmental nuisance complaint and/or pollution incident allegation**

*This form is to be completed by the complainant, (the person who is making the complaint about a nuisance, or reporting a pollution incident). Please provide as much details as possible. Any ensuing investigation will require your further assistance.*

**Complainant information**

**1 Complainant name and address**

Full name(s)

Street & postal address

Telephone: Home  
Work

Fax  
E mail

**2 Do you give permission for your details to be released to the alleged source if required?**

- Yes     No     Only after consultation with an EPA officer.

**Alleged source information**

**3 Name and address of the alleged source of nuisance/pollution (if known)**

Individual's name and/or company/business name

Street address of the individual and/or company/business

Telephone

Fax

**4 Type of premises where the nuisance or pollution originates from**

- Residential     Commercial/industrial     public land (examples of public land include roads, waterways and parkland)

**5 Have you contacted the person/company/business about the problem?**

- Yes     No

**Environmental nuisance complaint and/or pollution incident allegation**

**6 Allegation type?**

**Nuisance:**

- Noise                       Chemical/paint over spray  
 Light                          Odour/fume/smoke  
 Dust/particulate          Other

**Pollution:**

- Waste dumping             Water pollution  
 Other

**7 Details of allegations and/or description of the problem**

(Including location if different to alleged source address in Question 3)

**8 Details of the days and times that the nuisance/pollution incident has occurred?**

For example, "Monday to Friday 6am to 5pm" or "every Sunday at 8am"

**9 How long does the nuisance/pollution incident usually last for?**

For example, "5 mins", "30 mins" or "24 hours a day"

**10 To the best of your knowledge how long has the pollution/nuisance incident been occurring for?**

History

**Only complete questions 11 & 12 if the problem was identified as a nuisance allegation at question 6. If the problem relates to a pollution allegation go to question 13.**

**11 When is the nuisance most annoying to you and where does the nuisance affect you the most**

Details (For example, the nuisance is affecting you inside your home when you are trying to sleep)

**12 Will you be willing to keep a diary regarding the nuisance, if required?**

- Yes                       No

**13 Have you brought the nuisance/pollution incident to the attention of any of the following authorities?**

- EPA                       Local council             Police                       Another government agency

Please provide details of who you spoke to.

**Environmental nuisance complaint and/or pollution incident allegation**

**14 Additional Notes**

If there is any further information you would like to provide, please enter the information below or attach a separate signed statement

**Declaration**

Please read carefully through the certification before signing.

- I do solemnly and sincerely declare that the information provided is true and correct to the best of my knowledge and I make this solemn declaration conscientiously believing the same to be true and by virtue of the provisions of the *Oaths Act 1867*.
- I understand that all information supplied on or with this application form may be disclosed publicly in accordance with the *Freedom of Information Act 1992* and the *Evidence Act 1977*.
- I understand that environmental nuisance matters from 1/1/09 have been devolved to local councils, and as such that all information supplied can be disclosed to another agency, body or person under Information Privacy Principle 42.

# Suggested PIN Letter Text (EP Act)

## Copy and Paste to Departmental Letter Template as required

*Suggested PIN Letter Text for infringement notices issued under the Environmental Protection Act 1994 excluding littering offences.*

Dear Mr/Ms xxx,

### **Re: Penalty Infringement Notice**

As you are aware, the Department of Environment and Resource Management (DERM) has been investigating an incident in which (*describe incident briefly, including date*).

*(then describe investigation, as below. Delete all italicised and put in your facts:*

*During DERM's attendance at the site on xxx 2010 it was evident that the xxxx waste had been released to the bed and banks of waters. This release is a contravention of condition (C1) of xxxx Development Approval (IPDE/IPCExxx) that states:*

*Contaminants must not be directly or indirectly released from any approved place to any waters or the bed and banks of any waters except:*

- (i) as permitted under any water schedule in this development approval;*
- (ii) as permitted under the stormwater schedule; or*
- (iii) to a sewer as permitted or otherwise agreed from time to time by the relevant Local Government*

*I draw your attention to Section 435 of the Environmental Protection Act 1994 ("the Act") that states that it is an offence for a person to contravene a development condition of a development approval. A copy of this section is enclosed for your information.*

*A person who contravenes a condition of a development approval can be prosecuted by DERM in court in which case the maximum penalty the court can impose is \$166 500 for individuals and \$832 500 for corporations. Alternatively, DERM can exercise its discretion to issue an Infringement Notice for the offence that requires the payment of a set fine. The infringement notice penalty for contravention of a development condition of a development approval s \$2000.00. This figure is not representative of the penalty a court may impose.*

*On this occasion DERM has decided to issue xxxx an Infringement Notice for failing to comply with condition C1 of IPDE/IPCExxx on xxx 2010.*

Should DERM obtain evidence indicating that the alleged offence is more serious than first thought, DERM may withdraw the Infringement Notice within 28 days and may consider taking further action under the Act's provisions. The infringement notice is attached.

If you have any questions regarding the content of this letter please phone xxxx on phone (07) xxxx-xxxx

Yours sincerely

<Insert Name>

<Insert Position>

*Environmental Protection Act 1994*

**435 Offence to contravene development condition**

**(1)** A person must not wilfully contravene a development condition of a development approval.

Maximum penalty—2000 penalty units or 2 years imprisonment.

**(2)** A person must not contravene a development condition of a development approval.

Maximum penalty—1665 penalty units.

**(3)** In a proceeding for an offence against subsection (1), if the court is not satisfied the defendant is guilty of the offence charged but is satisfied the defendant is guilty of an offence against subsection (2), the court may find the defendant guilty of the offence against subsection (2).

## Environmental Protection Act

### Transitional environmental program certificate of approval number

---

*This certificate of approval is issued by the administering authority pursuant to <PICK FROM LIST> of the Environmental Protection Act 1994. A transitional environmental program is a specific program that, when approved, achieves compliance with the Environmental Protection Act 1994 for the matters dealt with by the program by reducing environmental harm, or detailing the transition to an environmental standard.*

Under the provisions of the *Environmental Protection Act 1994*, this <PICK FROM LIST> is hereby granted to:

<INSERT recipient's name>

<INSERT street address>

<INSERT suburb, state and postal code>

approving the draft transitional environmental program; titled <INSERT title> for management of <INSERT details> at <INSERT location>.

The draft transitional environmental program, dated <INSERT date>, was received by this office on <INSERT date>.

The draft transitional environmental program is approved subject to the following conditions:

<INSERT conditions>

The transitional environmental program remains in force until <INSERT date>.

In any case where conditions are imposed upon a certificate of approval, you may apply to the administering authority for a review of the decision. You may also appeal against the decision to the Planning and Environment Court.

Information relating to a review of decisions or appeals under the *Environmental Protection Act 1994* is included with this notice. This information is intended as a guide only. You may have other legal rights and obligations.

Should you have any queries in relation to this Notice, <INSERT contact officer's name> of the Department of Environment and Resource Management on telephone <INSERT phone number> would be happy to assist you.

# Warning Letter—ERA Site

Compliance

## Warning Letter for ERA sites in non-compliance

Enquiries           #####  
Telephone          (07) #####  
Your reference     #####  
Our reference      #####

Date

Name  
Council Name  
Address  
City State Postcode

Dear Sir/Madam

I refer to the inspection of premise name—located at premise address—on date, conducted by officers of the Environmental Protection Agency (EPA) in the company of Mr/Mrs ##### and/or yourself. The primary purpose of the inspection was to assess whether the activities conducted on site are in compliance with Development Approval (DA) conditions of approval Approval Number eg. IPDE##/IPCE##/SR##

The inspection was not a complete audit of your site and does not relieve you of your obligations to ensure compliance with approval Approval Number eg. IPDE##/IPCE##/SR##, and all other requirements of the *Environmental Protection Act 1994* (EP Act). You are reminded of section 319 of the EP Act—general environmental duty—which requires anyone who carries out an activity that causes or is likely to cause environmental harm to take all reasonable and practicable measures to prevent or minimise the harm..

As you may be aware, the inspection is part of the EPA's program, [undertaken in association with] ##### Council, to inspect industrial premises within the Estate name Industrial Estate.

During the inspection EPA officers observed the following environmental issues:

- i. e.g. contaminated stormwater was leaving the site via a drainage channel at the eastern side of the site
- ii. other issue

<<SELECT 1 OR BOTH OF THE FOLLOWING 2 PARAGRAPHS>>

<<For a breach of conditions>>

In light of these observations, it appears that at the time of the inspection, you were in breach of the following approval conditions:

- Condition No. and Condition
- Condition No. and Condition
- Condition No. and Condition

I recommend that you immediately take all reasonable and practicable measures to ensure compliance with the conditions of approval Approval Number eg. IPDE###/IPCE##/SR##. I draw your attention to Section 435 of the EP Act that states that it is an offence for the holder of a development approval to contravene a condition of the development approval.

The EPA has a responsibility to respond to any non-compliance with legislative requirements. In the event of non-compliance with the legislation and environmental performance standards, the EPA has the ability to use a number of enforcement tools including warning notices, statutory orders requiring certain actions to be taken, Penalty Infringement Notices and prosecution.

<<For a breach of other legislation administered by the EPA>>

During the inspection EPA officers observed that you were in breach of the following section(s) of the EP Act/Policy Name:

- Section Section Number and brief description

I recommend that you immediately take all reasonable and practicable measures to rectify the above issues and to ensure compliance with your general environmental duty.

The EPA is focussed on achieving environmental outcomes and looks forward to the prompt resolution of the matters raised above. EPA officers will return to your site on or after Date (2-3 weeks from date of letter) to ensure these matters have been properly addressed. Should the matters not be adequately addressed, other enforcement options may be considered.

If you wish to discuss this matter further please contact Officer Name on (07) #####.

Yours sincerely

Team Leaders Name  
**Team Leader, District  
Region, EPA**

## Withdrawal of Infringement Notice

*This infringement notice is submitted for withdrawal. Copy of this report together and copies of notice to be filed at your office for audit purposes.*

**Office**

**Date**

Withdrawal of Infringement Notice No \_\_\_\_\_ is requested for the following reason:

- Error detected after issue. No further action desired.
- Issue of Infringement Notice not appropriate. Summons action to be commenced.
- Following Review.

# Procedural guide

## Environmental Protection Act 1994 Environmental Protection Orders (EPOs)

*Environmental Protection Orders (EPOs) are dealt with under Chapter 7 Part 5 of the Environmental Protection Act 1994 (EP Act). EPOs are a useful environmental management tool that can be issued to a person to secure compliance with a number of requirements including those contained in the general environmental duty, environmental authorities or development approvals, or an audit notice.*

### What is an EPO?

An EPO is an enforcement tool that can be used to secure compliance with the EP Act. It is a useful tool where a solution is clear and action can be undertaken by a person or an organisation. An EPO may:

- Impose a reasonable requirement upon a person to prevent or minimise environmental harm.
- Require the recipient to stop or not start a particular activity for a stated period or indefinitely.
- Require the recipient to undertake a specified activity only during stated times or subject to stated conditions or
- Require the recipient to take certain action within a specified period.

It is important that these impositions and requirements are made lawfully and fairly. Not only does this mean that the 'right' decision is likely to be made, it helps to increase public confidence in DERM and the government generally.

### The decision to issue an EPO is an administrative decision

The following has been adapted from the Queensland Ombudsman's good decision making guide. Reference should also be made to that document as it is a valuable resource on making a good administrative decision. It can be downloaded from <<http://www.ombudsman.qld.gov.au>

The community expects public agencies to have policies and procedures to support and inform fair and consistent decision making at all levels within government. Good administrative decision making lies at the heart of this process. Administrative decision making can be broken down into three basic components: <sup>1</sup>

- *Facts* - gathering all necessary and relevant information
- *Law* - correctly identifying, interpreting and applying the relevant law to the facts
- *Discretion* - correctly identifying and considering relevant policy and considerations and reasonably exercising discretion

There are principles that apply to making a good administrative decision. It is recommended that you familiarise yourself with the Queensland Ombudsman's good decision making guide for further information. The guide also refers to four stages involved in good decision making. These are:

1. Preparing for the decision
2. Developing the decision
3. Making the decision

---

1

4. Communicating the decision.

It is important that throughout these four stages, **comprehensive and timely record-keeping** is maintained.

### STAGE 1: Preparing for the decision (to issue an EPO)

This stage is critical, being the foundation of the decision making process. If this stage is not handled well, it is unlikely the ultimate decision will be sound.

#### What are the key issues?

The first step in any decision making process or investigation is to correctly identify the key issues. Here you need to first identify whether any of circumstances in which an EPO may be issued apply. These are outlined in section 358 of the EP Act and include:

- If a person does not comply with a requirement to conduct or commission an environmental evaluation (EE)
- If a person does not comply with a requirement to prepare a transitional environmental program (TEP)
- If an EE shows that unlawful environmental harm is being or is likely to be caused by an activity
- To secure compliance with:
  - the general environmental duty
  - an environmental protection policy (EPP)
  - a condition of an environmental authority (EA) or a development authority (DA)
  - a standard environmental condition of a code of environmental compliance for a chapter 4 activity
  - a condition of a site management plan
  - an audit notice
  - a surrender notice
  - a rehabilitation direction
  - a regulation *or*
  - an accredited environmental risk management plan

Identifying the key issues is important to the success of any decision to be made. The key issues in any decision include the relevant matters to be considered. You should only consider the relevant matters in making a decision. Irrelevant matters should be ignored.

Section 359 of the EP Act says that before deciding to issue an EPO, the administering authority (or his or her delegate) **must** consider the **standard criteria**. The definition of standard criteria is set out in the dictionary to the EP Act and means:

- The principles of ecologically sustainable development as set out in the national strategy for ecologically sustainable development 2 *and*

<sup>2</sup> The **Guiding Principles** are:

- decision making processes should effectively integrate both long and short-term economic, environmental, social and equity considerations
- where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation
- the global dimension of environmental impacts of actions and policies should be recognised and considered

- Any applicable environmental protection policy *and*
- Any applicable Commonwealth, State or local government plans, standards, agreements or requirements *and*
- Any applicable environmental impact study, assessment or report *and*
- The character, resilience and values of the receiving environment *and*
- All submissions made by the applicant and submitters *and*
- The best practice environmental management for activities under any relevant instrument, or proposed instrument, as follows:
  - an EA
  - a TEP
  - an EPO
  - a disposal permit
  - a DA *and*
- The financial implications of the requirements under an instrument, or proposed instrument, mentioned in paragraph (g) as they would relate to the type of activity or industry carried out, or proposed to be carried out, under the instrument *and*
- The public interest *and*
- any applicable site management plan *and*
- Any relevant integrated environmental management system or proposed integrated environmental management system *and*
- Any other matter prescribed under a regulation.

Another key point to consider when issuing an EPO includes whether or not it is even appropriate to use an EPO. An EPO is used to require someone either to take or to not take a certain specified action in order to prevent or minimise environmental harm. EPOs are a good tool to use when it is known what action needs to be taken and if the action needs to be undertaken over a relatively short timeframe. EPOs should not be used where extensive work needs to be undertaken over a long period of time. A TEP is more appropriate where lengthy timeframes (i.e. years) are needed to achieve a solution to an environmental problem. If it is necessary to work out what is causing harm or what needs to be done to rectify the harm, an EE is a better tool to use. EPOs may only be used in order to prevent or minimise environmental harm. The [choosing the appropriate statutory tool to respond to regulatory non compliance](#) procedural guide can assist further in determining this

- 
- the need to develop a strong, growing and diversified economy which can enhance the capacity for environmental protection should be recognised
  - the need to maintain and enhance international competitiveness in an environmentally sound manner should be recognised
  - cost effective and flexible policy instruments should be adopted, such as improved valuation, pricing and incentive mechanisms
  - decisions and actions should provide for broad community involvement on issues which affect them
  - decision making processes should effectively integrate both long and short-term economic, environmental, social and equity considerations
  - where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation

These guiding principles and core objectives need to be considered as a package. No objective or principle should predominate over the others. A balanced approach is required that takes into account all these objectives and principles to pursue the goal of ESD.

### Start and maintain a document trail

Public agencies have an obligation to undertake comprehensive record-keeping. This obligation is based on law and policy including:

- Sections 7, 13 and 26 of the *Public Records Act 2002*
- *Right to Information Act 2009*
- *Information Privacy Act 2009*
- *Information standard 40 'record keeping' (ISO40) – overarching record keeping policy for state and local government in Queensland*
- *The best practice public guide to record keeping - provides practical guidance for implementing the policy and principles in ISO40*
- *Information standard 31 'retention and disposal of public records' (ISO31) and the guidelines for the development and implementation of retention and disposal schedules*
- *General retention and disposal schedule for administrative records*

All information relevant to the decision to issue an EPO should be the subject of written records. Every form of contact should be recorded and maintained. These include emails, telephone memorandums, faxes, letters, notes of inspections and minutes of meetings

### Read and understand the legislation

The main sections that are relevant to EPOs are 358 to 363 of the EP Act.

### Check you have the legal authority to make the decision?

Legislation usually sets out who is authorised to make a decision. Section 358 of the EP Act says that the *administering authority* can issue an EPO. Sections 516 and 518 deals with who the *administering authority* (*chief executive*) can delegate his or her power to under the EP Act. The current EP Act delegation (in which the administering authority delegates the power to issue an EPO) is published on the DERM intranet at <http://insite2.dnr.qld.gov.au/derm/delegations/pdf/epa04.pdf>. It provides guidance as to the category of office or position that is able to issue an EPO (i.e. a team leader reporting to a regional manager, regional service delivery).

### Should you be the decision maker?

It is important to consider whether you may have a conflict of interest in the decision to issue an EPO. A conflict of interest is where a decision maker's private interests interfere or appear to interfere with their duty to put the public interest first. Refer to the [code of conduct](#) and the [conflict of interest policy](#) published on the DERM intranet for further discussion.

## STAGE 2: Developing the decision (to issue an EPO)

In developing the decision, you need to follow lawful and fair procedures, gather information relevant to the decisions and give people who may be affected by a proposed adverse decision natural justice.

### Follow procedure

The EP Act imposes statutory requirements on a person responsible for the decision to issue an EPO. Some are mandatory (i.e. where the word *must* is used) and others are discretionary (i.e. where the word *may* is

used). Section 360 of the EP Act sets out the form and content that EPO that *must* follow. Section 360(1) says that the EPO:

- **Must** be in the form of a written notice (an [EPO template](#) is available on Ecosteps) *and*
- **Must** specify the person to whom it is issued (a *person* includes an individual and a corporation. Please note both companies and individuals can have business names. Please refer to the understanding legal entities procedural guide To confirm the existence of a company, a company search should be performed through CITEC. To help identify who runs a business, a business name search can be used. See [www.abr.gov.au](http://www.abr.gov.au). The Australian Securities and Investments Commission can also be a useful site to visit in relation to searching for Australian businesses and companies <http://www.asic.gov.au/asic/asic.nsf> ) *and*
- **Must** state the review or appeal details *and*
- **Must** be served on the recipient. Please refer to the understanding legal entities for further information about service. The procedural guide can be located on Ecosteps at <http://wwwhost.epa.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=330>

### Gather and record all relevant information

Information gathering should be directed to relevant factual matters to be proved and considered. When collecting information for making a decision, it is important to be aware of the status and the quality of the information being collected. You should ensure that you have gathered all reasonably/practicably available relevant evidence as this should be the basis for your findings of fact. Evidence is information that can be used to demonstrate the existence or non existence of a fact.

Types of evidence include oral, documentary, visual, physical and expert. Oral evidence is the verbal recollections of persons gathered by telephone, meeting and or interview. Documentary evidence is documents/records. Refer to sections 11, 12 and 13 of the *Right to Information Act 2009* and s 36 of the *Acts Interpretation Act 1954* for definitions of *document*. Visual evidence is gathered by site inspections. Physical evidence is any evidence gathered in the form of a physical object, thing or sample, intended to prove a fact in issue, based on its demonstrable physical characteristics. Expert evidence is opinion evidence given by an expert in a field of specialised field of knowledge.

### Observe natural justice

Natural justice or procedural fairness means that a person who might be adversely affected by an administrative decision (the affected person) must be given a 'fair hearing' before the decision is made. However, there are generally considered to be three aspects of natural justice:

1. **The notice requirement** - the notice to the affected person must identify the critical issues and contain sufficient information for the person to be able to participate meaningfully in the decision-making process.
2. **The fair hearing rule** - means that the affected person is given a reasonable opportunity to 'speak or respond' and also that the decision-maker genuinely considers the affected person's submission in making the decision.
3. **The lack of bias rule** - means the person making the decision must act impartially in considering the matter. Bias is a lack of impartiality for any reason and may be in favour of or against the affected person. It may arise from the decision maker having some financial or other personal interest in the outcome of the decision (conflict of interest), or giving the impression that they have prejudged the issue to be decided (prejudgment).

Comment [a1]: Think this discussion needs to be improved on

Bias can be actual or apprehended. Apprehended (or the appearance of) bias is judged by whether a fair-minded observer properly informed as to the nature of the proceedings or process might reasonably apprehend that the decision-maker might not bring an impartial or unprejudiced mind to the resolution of the issue.

### STEP 3: Make the decision

#### Find and record the facts

After evidence is gathered, you should evaluate the evidence, asking yourself three main questions.

1. **Is the evidence relevant?**

Relevant evidence is information that is logically or reasonably related to the issue in question. All relevant evidence must be considered, not just the evidence which supports the finding you may want to make.

2. **Is the evidence reliable?**

The reliability of evidence concerns the credibility or weighting. Some criteria to check in terms of ensuring the reliability of the information include:

- a) Is it hearsay? That is, is it simply second or third hand information, based on what someone else has been told is correct?
- b) Is there contradictory evidence? If there are two pieces of evidence that contradict each other, you will have to make a determination as to which is the most correct.

3. **Is the evidence sufficient to prove a fact?**

The question of whether evidence is sufficient to prove a fact must be assessed in accordance with a legal standard. The *civil standard of proof* (on the *balance of probabilities*) applies to administrative decisions. As mentioned above, EPOs can be issued in a number of circumstances.

If you are issuing an EPO to secure compliance with conditions of a DA for example, you must ensure that you have gathered and recorded specific evidence that demonstrates that on the *balance of probabilities*, the condition of the DA has been breached. This will be met if you can successfully establish that the claim you are making is *more probable than not*.

Ensure you record all findings of fact and the explanation and the explanation and reasoning for them. Clearly identify and explain the findings of fact that 'turn the decision' by recording the evidence you considered, the evidence you accepted or preferred and your reasoning. Where there are contradictions, you will need to indicate which findings have certain weight.

#### Apply the law to the facts

Comment [a2]: Is this needed?

It is helpful in applying the law to the facts, by gaining an understanding of the purposes or objects of the legislation you are working with. The object of the EP Act (defined in section 3) is environmental protection within the context of ecologically sustainable development. To achieve this object the Act provides a wide range of tools including EPOs.

#### Reasonably exercise discretion

Generally, if legislation states that a power *may* be exercised, after proper consideration of all the relevant issues and the particular circumstances of the case, it is up to the decision maker whether or not to exercise the discretion for the decision to be made. However, the decision to exercise or not to exercise the discretion must be lawful and reasonable in the circumstances. As discussed above, the EP Act imposes mandatory statutory

requirements on a person responsible for the decision to issue an EPO. However, section 360(1)(c), says that the EPO:

- **May** impose a reasonable requirement to prevent or minimise environmental harm.

Section 360(2) also says that without limiting subsection (1)(c), an environmental protection order **may**

- Require the recipient to not start, or stop, a stated activity indefinitely, for a stated period or until further notice from the administering authority *or*
- Require the recipient to carry out a stated activity only during stated times or subject to stated conditions *or*
- Require the recipient to take stated action within a stated period.

Section 360(1)(c) and section 360(2)(a)-(c) give the decision maker the ability to impose requirements on the recipient of the EPO. To ensure that the requirements you impose on an EPO are lawful and reasonable, please refer to the *writing effective and enforceable conditions* procedural guide located on Ecosteps at <http://wwwhost.env.qld.gov.au/steps/references/pg-ip-writing-effective-enforceable-conditions.pdf>. The requirements of an EPO must be unambiguous and fixed at the date the EPO is issued for them to be enforceable. The procedural guide also helps to ensure that the requirements and conditions are enforceable by asking the person drafting them to consider whether they are SMART (Specific, Measurable, Achievable, Relevant and Time Specific).

Requiring compliance with an Australian Standard for example, is likely to be too general to be enforceable. However, requiring the remediation of land in accordance with the Queensland Government *'Instructions for the Treatment and Management of Acid Sulfate Soils, 2001'* is appropriate. In considering what a 'reasonable requirement' is, allow sufficient time for compliance with the EPO, notwithstanding that there may have been extensive discussions leading up to the issue of the EPO. An extension can also be granted at a later date to allow more time for compliance with the EPO.

When requesting action to be/not to be taken at a *premise/place*, provide a description or definition of the *premises*. For example use wording such as 'this Environmental Protection Order is issued in respect of activities of XXXX Pty Ltd at premises/place on land described as comprising Lot X situated at X Street, Queensland (the 'said premises').

It is important that EPO requirements have a time period by which they have to be completed and that this is stipulated clearly and that the action required is clear. For example use the words '*by x date, ensure that...*' rather than '*take action to ensure*'. If the source of the contamination is unknown then avoid using the word 'investigate' instead say 'identify the source of the contamination' and provide the administering authority with a report on the investigation and subsequently require 'the contamination to be contained' (if applicable).

The EPO requirements must also be able to stand alone. For example if there are a number of requirements, a due date should be set for each and should not be contingent upon the other requirements (even if they can only be implemented in succession). If there is a list of requirements then they should all be due at the same time.

#### STAGE 4: Communicate the decision

It's important that people affected by government decisions understand the reasons for a decision. They must also be advised of any available right of internal or external review and appeal. If a correct decision is badly communicated, then it is likely compliance will be generated. Effective communication of decisions and reasons can assist in preventing or reducing complaints.

### Give meaningful and accurate reasons

The purpose of giving reasons for a decision is to enable the person affected by the decision:

- To understand why the decision was made
- To decide whether to seek a review of or to appeal against, the decision and to identify the grounds for the review or appeal

Even though it is not a requirement of the EP Act (and if you haven't already) include an accompanying cover letter containing facts and circumstances by which the grounds for issuing the EPO can be established. This helps to promote fairness, transparency and accountability in decision-making. The recipient should also be made aware of the penalties for not complying with the EPO. As such the following information should be included when communicating the decision you have made in issuing an EPO.

### What is the penalty for non-compliance with an EPO?

As with all statutory tools, it is important that once an EPO is issued, you follow up to make sure that the person to whom it is issued is complying with its requirements. If they are not complying, you should take appropriate follow up action (which could range from an informal warning, to issuing a penalty infringement notice or recommending that a matter be referred to the Investigations Team for investigation with a view to possible court action).

It is an offence under the EP Act, specifically section 361(1), to contravene an EPO. The section is split into three provisions, an indictable offence provision i.e. wilful contravention of an EPO, a summary offence provision i.e. contravention of an EPO and finally an overarching provision which provides the court with the discretion to reduce the offence from indictable to summary should they choose to do so.<sup>3</sup>

The maximum penalty a court may impose on an individual who wilfully contravenes an EPO is 2,000 penalty units (\$200,000) or 2 years imprisonment.<sup>4</sup> The maximum penalty a court may impose on an individual who contravenes an EPO is 1,665 penalty units or \$166,500.<sup>5</sup>

The maximum penalty a court may impose on a corporation who wilfully contravenes an EPO is 11,660 penalty units or \$1,166,000.<sup>6</sup>

The maximum penalty a court may impose on a corporation who contravenes an EPO is 8,325 penalty units or \$832,500.<sup>7</sup>

<sup>3</sup> Section 361(1)(2)(3) of the *Environmental Protection Act 1994 (Qld)*

<sup>4</sup> Section 361(2) of the *Environmental Protection Act 1994 (Qld)*

<sup>5</sup> Section 361(3) of the *Environmental Protection Act 1994 (Qld)*

<sup>6</sup> Section 361(2) of the *Environmental Protection Act 1994 (Qld)*, section 181B(3) of the *Penalties and Sentencing Act 1992 (Qld)* and under section 57A of the *Corporations Act 2001 (Cth)* defines a Corporation to include a company, body corporate and or an unincorporated body that under the law of its place of origin, may sue or be sued, or may hold property in the name of its secretary or of an office holder of the body duly appointed for that purpose.

<sup>7</sup> Section 361(3) of the *Environmental Protection Act 1994 (Qld)* and section 181B(3) of the *Penalties and Sentencing Act 1992 (Qld)* and under section 57A of the *Corporations Act 2001 (Cth)* defines a Corporation to include a company, body corporate and or an unincorporated

### **What is the penalty for non-compliance with disclosure requirement?**

In circumstances where a recipient of an EPO enters into an agreement with a third party to dispose of the place or business, the recipient must give written notice to the buyer of the existence of the EPO before any such agreement is reached.<sup>8</sup> The recipient who disposes of the place or business must within 10 business days give written notice of the disposal to the administering authority.<sup>9</sup> The maximum penalty a court may impose on an individual for failing to disclose such information is 50 penalty units (\$5,000) or 250 penalty units (\$25,000) for a corporation.<sup>10</sup>

### **What is the penalty for failing to cease an activity?**

Where the administering authority has stipulated within an EPO that a recipient must discontinue a specific activity, the recipient must give written notice to the administering authority within ten (10) days of this discontinuance.<sup>11</sup> The maximum penalty a court may impose on an individual for failing to provide written notice is 50 penalty units (\$5,000) or 250 penalty units (\$25,000) for a corporation.<sup>12</sup>

<sup>11</sup> Section 363 of the *Environmental Protection Act 1994* (Qld)

<sup>12</sup> Section 363 of the *Environmental Protection Act 1994* (Qld) and section 181B(3) of the *Penalties and Sentencing Act 1992* (Qld) and under section 57A of the *Corporations Act 2001* (Cth) defines a Corporation to include a company, body corporate and or an unincorporated body body that under the law of its place of origin, may sue or be sued, or may hold property in the name of its secretary or of an office holder of the body duly appointed for that purpose.

# Environmental Protection Order

Environmental Services

## Environmental Protection Order

*This Environmental Protection Order is issued by the administering authority pursuant to section 358 of the Environmental Protection Act 1994.*

<INSERT recipient's name>  
<INSERT street address>  
<INSERT suburb, State and postal code>

Your reference: <INSERT>  
Our reference: <INSERT>

**TAKE NOTICE** that under the provisions of the *Environmental Protection Act 1994*, an Environmental Protection Order is issued to you by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Resource Management (referred to below as the Department of Environment and Resource Management).

The Environmental Protection Order is issued in respect to the activities of <INSERT RECIPIENTS NAME> at <INSERT PREMISES/PLACE> on land described as Lot <INSERT> on SP <INSERT> situated at <INSERT ADDRESS> (the "said premises").

### A. Grounds

The Environmental Protection Order is issued on the following grounds:

- <INSERT THE APPLICABLE GROUNDS FOUND UNDER SECTION 358 OF THE EP ACT>>
- <UNDER EACH GROUND INSERT THE FACTS AND CIRCUMSTANCES WHICH FORM THE FACTUAL BASIS FOR THE GROUND (BE SURE TO INCLUDE WHERE RELEVANT THE STANDARD CRITERIA)>

### B. Requirements

In accordance with this Environmental Protection Order, you are required to do the following:

- <INSERT THE REQUIREMENTS YOU BELIEVE ARE NECESSARY FOR THE PERSON TO BE COMPLIANT, MAKE SURE THE REQUIREMENTS ARE REASONABLE, UNAMBIGUOUS, HAVE A FIXED TIMEFRAME AND ARE DIRECTLY RELATED TO THE GROUNDS MENTIONED ABOVE>

### C. Penalty

The maximum penalty for failure to comply with an Environmental Protection Order is \$200,000 or 2 years imprisonment for an individual or \$1,000,000 for a company.

And also **TAKE NOTICE** that:

1. The requirements of this Order take effect immediately upon service of the Order.
2. Failure to comply with this Environmental Protection Order is an offence under the *Environmental Protection Act 1994 (Qld)*.
3. This Order remains in force until further notice from the administering authority.
4. You may apply for a review of or appeal against the decision to issue the Environmental Protection Order within ten business days of the service of the order. Information regarding the reviews and appeals are attached to this order.

**Obligations**

Should you propose to dispose of the place or business to which this Environmental Protection Order relates, you must advise the buyer of the existence of this Environmental Protection Order (Section 362).

Within 10 business days after ceasing to carry out the activity to which this EPO relates, you must give written notice of the ceasing to carry out the activity to the Department of Environment and Resource Management (Section 363) at <Insert delegate's name and address>.

Facsimile: < INSERT fax number>

**PROCEDURE FOR REVIEWS AND APPEALS**

**Section 521 Procedure for review**

- (1) A dissatisfied person may apply for a review of an original decision.
- (2) The application must-
  - (a) be made in the approved form to the administering authority within-
    - (i) 10 business days after the day on which the person receives notice of the original decision or the administering authority is taken to have made the decision (the "review date"); or
    - (ii) the longer period the authority in special circumstances allows; and
  - (b) be supported by enough information to enable the authority to decide the application.
- (3) On or before making the application, the applicant must send the following documents to the other persons who were given notice of the original decision-
  - (a) notice of the application (the "review notice"); and
  - (b) a copy of the application and supporting documents.
- (4) The review notice must inform the recipient that submission on the application may be made to the administering authority within 5 business days after the application is made to the authority.
- (5) If the administering authority is satisfied the applicant has complied with subsection (2) and (3), the authority must within 10 business days after receiving the application -
  - (a) review the original decision; and
  - (b) consider any submissions properly made by a recipient of the review notice; and
  - (c) make a decision (the "review decision") to-
    - (i) confirm or revoke the original decision; or
    - (ii) vary the original decision in a way the administering authority considers appropriate.
- (6) The application does not stay the original decision.
- (7) The application must not be dealt with by-
  - (a) the person who made the original decision; or
  - (b) a person in a less senior office than the person who made the original decision.
- (8) Within 10 business days after making the review decision, the administering authority must give written notice of the decision to the applicant and persons who were given notice of the original decision.
- (9) The notice must-
  - (a) include the reasons for the review decision; and
  - (b) inform the person of their right of appeal against the decision.
- (10) If the administering authority does not comply with subsection (5) or (8) the authority is taken to have made a decision confirming the original decision.
- (11) Subsection (7) applies despite the Acts Interpretation Act 1954, section 272.
- (12) This section does not apply to an original decision made by-
  - (a) for a matter, the administration and enforcement of which has been devolved to a local government - the local government itself or the chief executive officer of the local government personally; or
  - (b) for another matter-the chief executive personally.

**Section 522 Stay of operation of original decisions**

- (1) If an application is made for review of an original decision, the applicant may immediately apply for a stay of the decision to-
  - (a) for an original decision mentioned in schedule 2, part 1 – the Land Court; or
  - (b) for an original decision mentioned in schedule 2, part 2 – the Court.

- (2) The Land Court or the Court may stay the decision to secure the effectiveness of the review and any later appeal to the Land Court or the Court.
- (3) A stay may be given on conditions the tribunal or the Court considers appropriate and has effect for the period stated by the Land Court or the Court.
- (4) The period of a stay must not extend past the time when the administering authority reviews the decision and any later period the Land Court or the Court allows the applicant to enable the applicant to appeal against the review decision.

**Section 531 Who may appeal**

- (1) A dissatisfied person who is dissatisfied with a review decision, other than a review decision to which subdivision 1 applies, may appeal against the decision to the Court.
- (2) The chief executive may appeal against another administering authority's decision (whether an original or review decision) to the Court.
- (3) A dissatisfied person who is dissatisfied with an original decision to which section 521 does not apply may appeal against the decision to the Court.

## Environmental Evaluations

### Environmental Evaluations (Audits and Investigations)

---

*Environmental evaluations (audits and investigations) are dealt with under Chapter 7 Part 2 (ss321-329) of the Environmental Protection Act 1994 (EP Act). This procedural guide outlines when and how environmental audits and investigations should be undertaken.*

#### Table of Contents

<b>Table of Contents</b> .....	<b>1</b>

## What are environmental evaluations?

An environmental evaluation is an evaluation of an activity or event to decide the source, cause or extent of environmental harm being caused or likely to be caused by the activity or event, and the need for a transitional environmental program for the activity or event.

The administering authority can conduct or commission environmental evaluations (audits and investigations)

## When can environmental evaluations be used?

- Establish whether the environmental evaluation should be an audit (s322 of the EP Act) or an investigation (s323 of the EP Act).
- An environmental evaluation must be required by written notice in a certain format (see template below and s324 of the EP Act). The notice **must** state the **facts and circumstances** forming the basis of the grounds for requiring the environmental evaluation.
- A decision must be made whether or not to accept the environmental report within 20 business days of receipt of it (s 326 of the EP Act).
- The report submitted will form the basis for consideration of the appropriate regulation or control of the activity or event and the action taken by the authority (s 326 of the EP Act).
- The administering authority can extend the time to decide whether or not to accept the report. A failure to make a decision within the required time constitutes a refusal to accept the report.

An environmental evaluation could be just one step in the compliance strategy and there may end up being a prosecution. Review and appeal rights apply against a decision to require an environmental evaluation.

An environmental audit is to be used if the administering authority is satisfied on reasonable grounds that:

- the holder of, or a person (individual or corporation) acting under, an environmental authority (EA) is or has been contravening a condition of the EA;
- a person is, or has been, contravening a condition of a development approval (DA); or
- a person is, or has been, contravening an environmental protection policy or a transitional environmental program (TEP).

An environmental investigation is to be used if the administering authority is satisfied on reasonable grounds that:

- An event has happened causing environmental harm while an activity is being carried out; or
- An activity or proposed activity is causing, or is likely to cause, environmental harm.

Consider:

- Whether the Department of Environment and Resource Management has evidence of a problem but it is difficult to identify the source, cause or extent of the problem.
- The person carrying out the activity or event bears the time and cost of undertaking the evaluation.
- Ensure the grounds for requiring an environmental evaluation are well documented.

## Notice to require an environmental evaluation, another environmental evaluation and additional relevant information

- The Notice must state (section 324)
  - grounds upon which requirement is made;
  - facts and circumstances of those grounds;

## Environmental Evaluations (Audits and Investigations)

---

- relevant matters for the environmental evaluation or the information required;
- a reasonable period after which the information/report is required; and
- the review or appeal information.
- When drafting the requirements of the environmental evaluation, consider the level and type of detail you need i.e. information to decide the appropriate regulation or control of the activity or event.
- Be comprehensive enough to ensure you cover all the relevant matters, but do not require information that is not relevant to the event or activity in question.
- The amount of information required and the time given to produce the information.
- Review and appeal rights apply against a decision to require an environmental evaluation.
- See templates of Notice to Conduct/Commission an Environmental Investigation and Another Evaluation attached and the attached example below.

### Assessing environmental reports

The administering authority may

- Require the commission of another environmental evaluation if satisfied the report does not adequately address the relevant matter for the environmental evaluation to which the report relates.
- Require the recipient to give it information if satisfied that more information is required

Consider

- The relevant matters for the environmental evaluation – see the Notice to Conduct the Environmental Evaluation.
- Whether there been a statutory declaration completed by the recipient and the person who carried out the environmental evaluation?
- Does the report adequately address the relevant matters for the environmental evaluation?
- Does the report address the issues in such a way to enable a decision regarding the appropriate method to regulate or control future activities or events of a similar nature?
- Is there a need to require a further environmental evaluation?
- Is there a need to require additional relevant information?

Options after accepting the environmental report:

After accepting the environmental report the administering authority may (section 326 EP Act):

- Where relevant, amend conditions of the EA.
- Require preparation and submission of a TEP.
- Where relevant, change or cancel a condition of the DA.
- Issue an environmental protection order (EPO).
- Any other action that is considered appropriate.

### Links to useful forms and templates

### Extracts from the *Environmental Protection Act 1994*

#### Declarations to accompany report

##### 325.

- (1) An environmental report submitted to the administering authority must be accompanied by a statutory declaration by the recipient and the person who carried out the environmental evaluation.
- (2) The recipient's declaration must be made—
  - (a) if the recipient is an individual—by the recipient; or
  - (b) if the recipient is a corporation—by an executive officer of the corporation.
- (3) The recipient's declaration must state that the recipient—
  - (a) has not knowingly given any false or misleading information to the person who carried out the environmental evaluation; and
  - (b) has given all relevant information to the person who carried out the environmental evaluation.
- (4) A declaration by the person who carried out the environmental evaluation must—
  - (a) state his or her qualifications and experience relevant to the evaluation; and
  - (b) state that he or she has not knowingly included any false, misleading or incomplete information in the report; and
  - (c) state that he or she has not knowingly failed to reveal any relevant information or document to the administering authority; and
  - (d) certify that—
    - (i) the report addresses the relevant matters for the evaluation and is factually correct; and
    - (ii) the opinions expressed in it are honestly and reasonably held.

#### Procedure for review

##### 521.

- (1) A dissatisfied person may apply for a review of an original decision.
- (2) The application must-
  - (a) be made in the approved form to the administering authority within-
    - (i) 10 business days after the day on which the person receives notice of the original decision or the administering authority is taken to have made the decision (the "review date"); or
    - (ii) the longer period the authority in special circumstances allows; and
  - (b) be supported by enough information to enable the authority to decide the application.
- (3) On or before making the application, the applicant must send the following documents to the other persons who were given notice of the original decision-
  - (a) notice of the application (the "review notice");
  - (b) a copy of the application and supporting documents.
- (4) The review notice must inform the recipient that submissions on the application may be made to the administering authority within 5 business days after the application is made to the authority.
- (5) If the administering authority is satisfied the applicant has complied with subsection (2) and (3), the authority must, within 10 business days after receiving the application-
  - (a) review the original decision; and
  - (b) consider any submissions properly made by a recipient of the review notice; and
  - (c) make a decision (the "review decision") to-
    - (i) confirm or revoke the original decision; or
    - (ii) vary the original decision in a way the administering authority considers appropriate.
- (6) The application does not stay the original decision.
- (7) The application must not be dealt with by-
  - (a) the person who made the original decision; or
  - (b) a person in a less senior office than the person who made the original decision.
- (8) Within 10 business days after making the review decision, the administering authority must give written notice of the decision to the applicant and persons who were given notice of the original decision.
- (9) The notice must-
  - (a) include the reasons for the review decision; and

(b) inform the person of their right of appeal against the decision.

**(10)** If the administering authority does not comply with subsections (5) or (8), the authority is taken to have made a decision confirming the original decision.

**(11)** Subsection (7) applies despite the *Acts Interpretation Act 1954*, section 27A.

**(12)** This section does not apply to an original decision made by-

- (a) for a matter, the administration and enforcement of which has been devolved to a local government - the local government itself or the chief executive officer of the local government personally; or
- (b) for another matter-the chief executive personally.

### **Stay of operation of original decisions**

#### **522.**

**(1)** If an application is made for review of an original decision, the applicant may immediately apply for a stay of the decision to-

- (a) for an original decision mentioned in schedule 1, part 1 - the tribunal; or
- (b) for an original decision mentioned in schedule 1, part 2 - the Court.

**(2)** The tribunal or the Court may stay the decision to secure the effectiveness of the review and any later appeal to the tribunal or the Court.

**(3)** A stay may be given on conditions the tribunal or the Court considers appropriate and has effect for the period stated by the tribunal or the Court.

**(4)** The period of a stay must not extend past the time when the administering authority reviews the decision and any later period the tribunal or the Court allows the applicant to enable the applicant to appeal against the review decision.

### **Who may appeal?**

#### **531.**

**(1)** A dissatisfied person who is dissatisfied with a review decision, other than a review decision to which subdivision 1 applies, may appeal against the decision to the Court.

**(2)** The chief executive may appeal against another administering authority's decision (whether an original or review decision) to the Court.

**(3)** A dissatisfied person who is dissatisfied with an original decision to which section 521 does not apply may appeal against the decision to the Court.

# Procedural Guide

## Compliance & Investigations

### Direction Notices

---

*Direction notices are dealt with under Chapter 7, Part 5A of the Environmental Protection Act 1994 (“EP Act”). A direction notice is a useful enforcement tool which can be issued to a person to secure compliance in circumstances which relate to environmental nuisance, noise and water contamination.*

#### **What is a direction notice:**

A direction notice is a statutory enforcement tool made available to only those persons authorised under the EP Act. The purpose of a direction notice is to provide the person receiving it with an opportunity to remedy the situation before any further action is taken. Direction notices can be applied to offences relating to prescribed provisions which include environmental nuisance, noise standards and prescribed water contaminants (section 363A of the EP Act).

#### **Who may issue a direction notice:**

An authorised person under the EP Act may issue a direction notice. Before doing so, check whether your office has any business rules governing the issuing of direction notices. Local government has devolved responsibility to deal with environmental nuisance complaints and breaches of noise standards or the water contaminant provisions. DERM officers will only be required to respond where a government entity is involved or the local government has failed to respond.

#### **Who is it appropriate to issue a direction notice to:**

A direction notice should be issued to the person who is identified as being immediately responsible for the contravention of the specific prescribed provision. A “person” may be an individual, a number of individuals or a corporation.

The authorised person is required to serve the direction notice on a person via registered post or in person as this will provide DERM with confirmation that the notice has been received.

#### **When should a direction notice be issued:**

An authorised person may issue a direction notice where there has been a contravention of a prescribed provision; or a contravention that makes it likely that the contravention will continue or be repeated if

- the matter relating to the contravention can be remedied; and
- it is appropriate to give a person the opportunity to remedy the matter.

An authorised person must be able to establish with the use of credible evidence, the legal elements required before issuing a direction notice. Officers need to substantiate who is responsible for the site and its operations and whether there has been a contravention of a prescribed provision.

**Contravention of a prescribed provision**

There are three prescribed provisions environmental nuisance (section 440 EP Act), noise standards (section 440Q EP Act) and prescribed water contaminants (section 440ZG EP Act).

Where a contravention of these prescribed provisions has resulted in serious or material environmental harm, a direction notice is not available and other enforcement tools contained in the EP should be considered.

**Environmental nuisance**

Environmental nuisance is defined as an unreasonable interference or likely interference with an environmental value such as ecological health, public safety or public amenity (section 15 of the EP Act) caused by aerosols, fumes, light, noise, odour, particles or smoke (section 440 of the EP Act).

Schedule 1 of the EP Act lists the exclusions to offences pertaining to environmental nuisance. These exclusions include environmental nuisance:

1. caused by safety and transport noise;
2. caused by government activities and public infrastructure;
3. covered under;
  - a. a local law;
  - b. Police Powers and Responsibilities Act 2000, Chapter 19, Part 3;
  - c. Workplace Health and Safety Act 1995, section 9;
  - d. the Public Health Act 2005, section 11;
  - e. approval under the Integrated Planning Act 1997 that authorises EN;
  - f. fireworks display under the Explosives Act 1999;
  - g. Tobacco and Other Smoking Products Act 1998; or
  - h. Major Sports Facility Act 2001, section 30A.
4. caused by animal noise from a non-domestic animal; and
5. caused by a domestic cooking odour

In deciding whether to issue a direction notice for environmental nuisance an authorised person should do the following:

1. identify the source and level of nuisance;
2. identify the general emissions criteria contained in section 363C(3) of the EP Act; and
3. where the contravention of environmental nuisance has resulted from aerosols, fumes, light, odour and or particles of smoke, compare the source and level of the nuisance with the general emissions criteria (section 363C(3) of the EP Act); or
4. where the contravention of environmental nuisance has resulted from noise, compare the source and level with the noise emissions criteria (section 363C(4) of the EP Act);
5. if the level of nuisance is unreasonable, determine whether or not the source and level of nuisance can be remedied; and
6. whether it is appropriate to give the person an opportunity to remedy the situation.

**Environmental noise standards**

Noise is characterised to include vibrations of any frequency, whether emitted through air or another medium. It is the local government's responsibility to enact local law's which prohibit the making of certain noises or prescribing noise standards for their particular area (section 440O of the EP Act). In areas which do not contain prescribed noise standards there are default noise standards.

These are listed in sections 440R to 440ZC of the EP Act and have been specified for:

1. building work;
2. regulated devices;
3. pumps;
4. air conditioning equipment;
5. refrigeration equipment;
6. indoor venues;
7. open air vents;
8. amplifier devices;
9. power boats, sports and power boat engines;
10. blasting; and
11. shooting ranges.

If a local government prescribed standard exists then the local government of the area is responsible for enforcing that standard.

In deciding whether to issue a direction notice for a breach of noise standards an authorised person should do the following:

1. identify the source and level of noise;
2. identify the relevant prescribed standards and/or the standards for noise listed in section 440R to 440ZC of the EP Act;
3. compare the levels of noise found on or outside the site with the relevant levels prescribed under the EP Act;
4. if the levels exceed the prescribed level, determine whether or not the source and level can be remedied; and
5. decide whether it is appropriate to give the person an opportunity to remedy the situation.

**Prescribed water contaminants**

A prescribed water contaminant includes earth, defined as sand, soil, silt or mud (section 440ZD of the Act) or a contaminant listed under schedule 9 of the Environmental Protection Regulation 2008.

A person must not deposit a prescribed water contaminant into water, or into a roadside gutter or stormwater drain, or into a place where the contaminant could reasonably be expected to enter water, a roadside gutter or storm water drain (section 440ZG of the EP Act). In addition a person must not unlawfully release stormwater run-off into water, a roadside gutter or stormwater drainage if that release will result in the build up of earth in water, a roadside gutter or stormwater drain.

The term deposit includes drop, place, throw, release and expose (section 440ZE of the EP Act). A depositor of a contaminant includes the occupier of the premises or the person who is in control of the contaminant, who is aware the contaminant has been deposited.

In deciding whether to issue a direction notice to a depositor of a prescribed water contaminant an authorised person should do the following:

1. determine whether the contaminant found in the water is a prescribed contaminant;
2. identify the depositor of the contaminant;
3. determine whether or not the source and pollution can be remedied; and
4. decide whether it is appropriate to give the person an opportunity to remedy the situation.

### **Form and content of a direction notice:**

A direction notice must state the following (section 363D of the EP Act):

1. the authorised person believes the person:
  - a. is contravening a prescribed provision;
  - b. has contravened a prescribed provision in circumstances that make it likely the contravention will continue or be repeated;
2. the particular prescribed provision the authorised person believes is being, or has been, contravened;
3. how it is believed the prescribed provision is being or has been contravened;
4. the time by which the person must remedy the contravention, the time allowed must be reasonable with regard to:
  - a. the action required to remedy the contravention;
  - b. the risk to human health or the natural environment, or risk of loss or damage to property, posed by the contravention; and
  - c. how long the person has been aware of the contravention, for example, because an authorised person has previously made an oral requirement that the contravention be remedied.
5. that it is an offence to fail to comply with the direction notice unless the person has a reasonable excuse;
6. the maximum penalty for failing to comply with the direction notice; and
7. review of appeal details.

The direction notice may also state the reasonable steps the authorised person considers necessary to remedy the contravention, or avoid further contravention, of the prescribed provision.

Please click [here](#) to access a direction notice for you to complete.

The notice should be sent by registered post to the registered office of the business or for an individual to the last known address of that individual. If a company's registered office is different to its business premises, it might also be appropriate to send a copy to the business premises.

If it is not practicable to issue a written notice then a requirement to remedy the contravention may be made orally however; it should be confirmed by a direction notice as soon as possible.

**Offence and Penalties**

It is an offence under section 363E of the EP Act not to comply with a direction notice without a reasonable excuse. The maximum penalty for non-compliance is 300 penalty units for an individual or five times the maximum for a corporation.

**Defences:**

A person must comply with the notice unless there is a reasonable excuse for not complying with it.

**Example of when to issue a direction notice:****Scenario:****Facts:**

DERM receives a noise complaint from a property owner adjacent to a site owned by a government entity. Noise testing is conducted on the site and on properties adjacent to the site to determine the cause and level of noise. The cause is a generator and the level of noise has been calculated.

**DERM Response:**

- DERM has jurisdiction to investigate the government owned entity.
- DERM should identify any relevant prescribed noise standards or default noise standards.
- If the level of noise is above the relevant standards, the site is in breach of a prescribed provision.
- DERM must then determine whether to issue a direction notice taking into consideration the following:
  - whether or not the breach can be remedied; and
  - whether it is appropriate to provide the person with an opportunity to remedy the situation.

## Environmental Services

### Direction Notice

*This statutory notice is issued by an authorised person pursuant to section 363D of the Environmental Protection Act 1994, to advise you of a decision that requires you to remedy a contravention of a prescribed provision.*

<INSERT recipient's name>  
<INSERT street address>  
<INSERT suburb, State and postal code>

Your reference: <INSERT>

Our reference: <INSERT>

**TAKE NOTICE** that under the provisions of the *Environmental Protection Act 1994* a Direction Notice is issued to you by <INSERT authorised person's name>, an authorised person under the *Environmental Protection Act 1994*.

The Direction Notice is issued to <<Name of person/entity>> in respect of the activities at <<State premises/place>> on land described as <<select ONE ONLY>> Lot ## on RP ##### situated at address OR description of locality e.g. causeway of Xyz Highway over Abc Creek to remedy a contravention of a prescribed provision.

#### A. Grounds

The Direction Notice is issued on the following grounds:

<<SELECT ONE OF THE FOLLOWING TWO GROUNDS AND DELETE THE OTHER>>

- <<State name of person/entity>> is contravening a prescribed provision being <<select ONE ONLY>> section 440 / 440Q / 440ZG of the *Environmental Protection Act 1994*; or
- <<State name of person/entity>> has contravened a prescribed provision being <<select ONE ONLY>> section 440 / 440Q / 440ZG of the *Environmental Protection Act 1994* in circumstances that make it likely that the contravention will continue or be repeated.
- The facts and circumstances forming the basis of these grounds are:

*Briefly describe how the prescribed provision is being, or has been, contravened.*

*If contravention of section 440 (environmental nuisance), including consideration of the general emission criteria (as stated in section 363C(3)) and having regard to those criteria consider whether it would be appropriate to issue a Direction Notice or first try and resolve the matter in another way. If the contravention of section 440Q (contravening a noise standard) state which Default Noise Standard applies.*

*If the nuisance relates to noise, and there are no Default Noise Standards for that noise, the offence is contravention of section 440; or if there is a Default Noise Standard for that noise and the person is complying with the Default Noise Standard, but the administering authority believes that environmental nuisance is still being caused, consider the general emission criteria (as stated in section 363C(3)), the noise emission criteria (as stated in section 363C(4)) and having regard to those criteria whether it would be appropriate to issue the Direction Notice first or resolve the matter in another way.>>*

**B. Requirements**

Pursuant to this Direction Notice you are required to perform the following actions by the time indicated for each action:

- (1) <<State action and time>>;
- (2)

**C. Penalty**

The maximum penalty for failure to comply with a Direction Notice is \$30,000 for an individual or \$150,000 for a company.

AND also **TAKE NOTICE** that:

- 1. The requirements of this Notice take effect immediately upon service of the Notice.
- 2. Failure to comply with this Direction Notice, without reasonable excuse, is an offence under the *Environmental Protection Act 1994*.
- 3. You may apply for a review of or appeal against the decision to issue the Direction Notice within ten (10) business days of the service of the Notice. Information regarding the reviews and appeal are attached to this Notice.

**EXTRACTS FROM THE ACT REGARDING REVIEWS AND APPEALS**

- 521**
- (1) A dissatisfied person may apply for a review of an original decision.
  - (2) The application must-
    - (a) be made in the approved form to the administering authority within-
      - (i) 10 business days after the day on which the person receives notice of the original decision or the administering authority is taken to have made the decision (the "**review date**"); or
      - (ii) the longer period the authority in special circumstances allows; and
    - (b) be supported by enough information to enable the authority to decide the application.
  - (3) On or before making the application, the applicant must send the following documents to the other persons who were given notice of the original decision-
    - (a) notice of the application (the "**review notice**"); and
    - (b) a copy of the application and supporting documents.
  - (4) The review notice must inform the recipient that submission on the application may be made to the administering authority within 5 business days after the application is made to the authority.
  - (5) If the administering authority is satisfied the applicant has complied with subsection (2) and (3), the authority must within 10 business days after receiving the application -
    - (a) review the original decision; and
    - (b) consider any submissions properly made by a recipient of the review notice; and
    - (c) make a decision (the "**review decision**") to-
      - (i) confirm or revoke the original decision; or
      - (ii) vary the original decision in a way the administering authority considers appropriate.
  - (6) The application does not stay the original decision.
  - (7) The application must not be dealt with by-
    - (a) the person who made the original decision; or
    - (b) a person in a less senior office than the person who made the original decision.
  - (8) Within 10 business days after making the review decision, the administering authority must give written notice of the decision to the applicant and persons who were given notice of the original decision.
  - (9) The notice must-
    - (a) include the reasons for the review decision; and
    - (b) inform the person of their right of appeal against the decision.
  - (10) If the administering authority does not comply with subsection (5) or (8) the authority is taken to have made a decision confirming the original decision.
  - (11) Subsection (7) applies despite the *Acts Interpretation Act 1954, section 27A*.
  - (12) This section does not apply to an original decision made by-
    - (a) for a matter, the administration and enforcement of which has been devolved to a local government - the local government itself or the chief executive officer of the local government personally; or
    - (b) for another matter-the chief executive personally.
  - (13) **Also, this section does not apply to an original decision to issue a clean-up notice.**

**Who may appeal**

- 531**
- (1) A dissatisfied person who is dissatisfied with a review decision, other than a review decision to which subdivision 1 applies, may appeal against the decision to the Court.
  - (2) The chief executive may appeal against another administering authority's decision (whether an original or review decision) to the Court.

- (3) A dissatisfied person who is dissatisfied with an original decision to which section 521 does not apply may appeal against the decision to the Court.

### Clean-up Notice

*The purpose of this procedural guide is to provide officers with an overview of the clean-up notice provisions found under chapter 7, part 5B of the Environmental Protection Act.*

#### **What is a clean-up notice:**

A clean-up notice is an enforcement tool contained under chapter 7, part 5B of the *Environmental Protection Act 1994* ("EP Act"). It is issued by the administering authority in response to a contamination incident which has resulted in material or serious environmental harm. A clean-up notice may require a person to take any of the following stated action:

- Prevent or minimise the contamination.
- Rehabilitate or restore the environment because of the incident, including by taking steps to mitigate or remedy the effects of the incident.
- Assess the nature and extent of the environmental harm, or the risk of further environmental harm, from the incident, including by inspecting, sampling, recording, measuring, calculating, testing or analysing.
- Keep the administering authority informed about the incident or the actions taken under the notice, including by giving to the administering authority stated reports, plans, drawings or other documents.

#### **Who can issue a clean-up notice:**

A delegate of the administering authority can issue a clean-up notice. Ensure that the person issuing the notice has the delegation to do so by checking the delegations on the DERM's Intranet.

#### **Who can be issued with a clean-up notice:**

The administering authority may issue a clean-up notice to a prescribed person for a contamination incident. A prescribed person is defined in section 363G of the EP Act to include any of the following:

1. a person, causing or permitting, or who caused or permitted the incident to occur;
2. a person who at the time of the incident, is or was,
  - a. the occupier of a place at or from which the incident is happening or happened; or
  - b. the owner, or person in control, of a contaminant involved in the incident;
3. if a clean-up notice is issued to a corporation (the first corporation) in relation to the incident and if it fails to comply with the notice,
  - a. a parent corporation of the first corporation; and
  - b. an executive officer of the first corporation.

An “occupier of the place” is defined in schedule 4 of the EP Act to mean the person apparently in charge of the place. “Place” is defined to include premises, another place on land or a vehicle.

A “parent corporation of another corporation” is defined as a corporation of which the other corporation is a subsidiary under the Corporations Act.

### **When a clean-up notice can be issued:**

The administering authority may issue a written clean-up notice to a person whom the administering authority believes to be a prescribed person for a contamination incident. A contamination incident is *an incident involving contamination of the environment, that the administering authority is satisfied has caused or is likely to cause serious or material environmental harm* (section 363F of the EP Act).

In order for a clean up notice to be issued there needs to be contamination of the environment causing:

- serious environmental harm or;
- material environmental harm.

### **What is contamination of the environment:**

A contamination of the environment is defined as *the release (whether by act or omission) of a contaminant into the environment* (section 10 of the EP Act). A contaminant is defined broadly to include a *gas, liquid, solid, odour, organism (whether alive or dead) including a virus, energy, including noise, heat, radioactivity, electromagnetic radiation or a combination of contaminants* (section 11 of the EP Act).

### **What is material environmental harm:**

Material environmental harm is defined in section 16 of the EP Act as *environmental harm, other than environmental nuisance that is:*

1. *not trivial or negligible in nature, extent or context; or*
2. *that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$5000), but less than the maximum amount (\$50,000); or*
3. *that results in costs of more than the threshold amount but less (\$5000) that the maximum (\$50,000) amount being incurred in taking appropriate action to*
  - a. *prevent or minimise harm; and*
  - b. *rehabilitate or restore environment to its condition before the harm.*

To determine whether a contamination incident is trivial or negligible in nature, officers are required to consider the context of the contamination incident and its associated long term effects on the environment. For example if a dam containing hazardous waste was to overflow into its surrounding area, the characterisation of the harm would depend upon the nature of the surrounding area, the amount of waste that overflowed and the prevention/rehabilitation measures available. If the prevention/rehabilitation costs amount to a figure between \$5,000 and \$50,000 then the incident can be classed as causing material environmental harm.

### **What is serious environmental harm:**

Serious environmental harm is defined in section 17 of the EP Act as *environmental harm, other than environmental nuisance,*

1. *that is irreversible, of a high impact or widespread; or*

2. *caused to an area of high conservation value or special significance; or*
3. *that causes actual or potential loss or damage to property of an amount of, or amounts totalling, more than the threshold amount (\$50,000); or*
4. *that results in costs of more than the threshold amount (\$50,000) being incurred in taking appropriate action to,*
  - a. *prevent or minimise harm, and*
  - b. *rehabilitate or restore the environment to its condition before harm.*

To determine whether a contamination incident should be classed as irreversible, of a high impact or widespread, officers should consider the context of the contamination incident and its associated long term effect on the environment. For example if a transportation vehicle releases a toxic contaminant, such as hazardous wastewater and the contaminant then flows into a watercourse the characterisation of such harm would depend upon the amount of hazardous wastewater released, the nature of the watercourse and the prevention/rehabilitation measures available. If the cost of prevention/rehabilitation amounts to more than \$50,000 then the incident can be classified as causing serious environmental harm.

**Form and content of a clean-up notice:**

The clean-up notice must state the following:

1. the name of the recipient, (if there is more than one recipient, each recipient must receive a notice);
2. a description of the contamination incident;
3. the place at or from which the administering authority is satisfied the incident is happening or has happened;
4. the actions the recipient must take;
5. for each action, the time by which it must be taken, (the time in which the recipient is required to complete an action must be reasonable given the circumstances, the specific action required to be taken and the risk of harm or further harm from the incident);
6. that it is an offence for the recipient not to comply with the notice unless the recipient has a reasonable excuse;
7. the maximum penalty for the offence;
8. that, if the recipient does not comply with the notice, an authorised person may take any of the action stated in the notice and the administering authority may recover from the recipient the costs incurred in taking the actions;
9. the name, address and contact details of the administering authority; and
10. the review or appeal details.

The notice may also include any other information the administering authority considers appropriate.

Please click [here](#) to access a clean-up notice for you to complete.

The notice should be sent by registered post to the registered office of the business or for an individual to the last known address of that individual. If a company's registered office is different to its business premises, it might also be appropriate to send a copy to the business premises.

**Offence and penalty:**

It is an offence under section 363I EP Act not to comply with a clean-up notice without a reasonable excuse. The maximum penalty for non compliance is 2000 penalty units or 10,000 penalty units for a corporation.

**Defences:**

The recipient of a clean-up notice must comply with the notice, unless the recipient has a reasonable excuse. It is a reasonable excuse not to comply with a notice if it requires information that might incriminate the person to whom it was issued (section 363I EP Act).

It is also a defence if the recipient can show that:

1. the recipient is not the prescribed person for the contamination incident;
2. the relevant contamination incident was caused by a natural disaster;
3. the relevant contamination incident was caused by a terrorist act or some other type of sabotage by a person other than the recipient;
4. the recipient had taken all measures it would be reasonable for the recipient to have taken to prevent the incident, having regard to all the circumstances including the inherent nature of the risk and the nature of the recipient's connection with the incident;
5. if the recipient is the parent corporation, that it took all reasonable steps to ensure the first corporation complied with the notice served on the first corporation; or
6. if the recipient is an executive officer of the first corporation,
  - a. that the person took all reasonable steps to ensure the first corporation complied with the notice served on the first corporation; or
  - b. the person was not in a position to influence the conduct of the first corporation in relation to its compliance with the notice on the first corporation.

**Examples of when to issue a clean-up notice:****Scenario:**

A transport company by the name of T Transport is carrying a variety of hydrocarbons manufactured by a petrol company named P Industries. T Transport's vehicle is involved in an accident. The hydrocarbons stored in the vehicle then leak out into a stormwater drain and surrounding land. The Department receives a phone call informing it of the incident. Officers investigate and find that the hydrocarbons are contained in crude oil which was being transported by T Transport. In addition local government plans indicate that the stormwater drain is a main drain which is responsible for distributing water into an ecologically sensitive river.

In the next few hours, the Department obtains quotes with respect to preventative and rehabilitation measures which can be taken. The quotes are around \$35,000.00.

**Compliance response:**

- Officers should investigate the matter and gather relevant evidence
- In deciding whether to issue a clean-up notice DERM should confirm that crude oil containing hydrocarbons fits within the definition of a contaminant under section 11 EP Act and characterise the harm.

- In this case the harm would constitute material environmental harm as the cost of preventative and rehabilitation measures is above the threshold amount but less than the maximum amount under section 16 EP Act.
- DERM should identify the prescribed person, in this case P Industries or T Transport, and issue them with a clean-up notice. It may be better to issue P Industries with the notice as they may have the requisite level of experience and funding to undertake the clean-up.

**Disclaimer**

While this document has been prepared with care it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Department of Environment and Resource Management should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

# Compliance Program Scheduled Notice

Compliance and Support

## **Suggested Text – Compliance Program Scheduled Inspection Notice**

*The purpose of this procedural guide is to provide officers with a suggested body of text with respect to a Compliance Program Scheduled Inspection Notice. Officers are required to copy and paste the below text and insert the text into the current Departmental provided letter template. In addition, officers are required to insert relevant details into the suggested body of text, where necessary. If officers using this template require further assistance, please contact the Compliance and Investigations Branch.*

RE: Compliance Inspection to be conducted for <INSERT activity> at <INSERT premises>

Officers of the Department of Environment and Resource Management are conducting compliance inspections as part of the compliance inspection program. The compliance inspection program is a pro-active system for measuring environmental compliance during the operational stage of an environmentally relevant activity.

DERM officers will be visiting your site on <insert date – suggested 14 days notice for large or remote sites> to conduct a compliance inspection in regards to your <insert either License/Development Approval> issued under the <insert either *Environmental Protection Act 1994/Integrated Planning Act 1997*>.

Please arrange to have the appropriate company personnel on site for this inspection, and have all environmental records and documents available for inspection. DERM officers will enter the premises at a reasonable time and complete the inspection as promptly as possible. Because of the scale of the activity the environmental inspection will take <insert timeframe>.

Should you require any further information regarding this matter, or if you foresee any difficulties meeting the requirements of this notice, please contact DERM officer <insert name of officer> on <insert phone number>.

# Assessment Report

Environmental Protection Act 1994

## Assessment of a transitional environmental program (TEP)

*This document will assist users in critically evaluating the content of a draft TEP and make a decision to either to approve (with or without conditions) or refuse the draft TEP.*

<b>Identifying details</b>	
<b>Compliance activity number</b>	
<b>Ecotrack number</b>	
<b>Permit number</b>	
<b>File number</b>	
<b>Applicant name</b>	
<b>Registered office or place of business</b>	
<b>Date draft TEP received.</b>	<i>Note: The department has 20 business days in which to make a decision in relation to the draft TEP.</i>

**Note:**

1. Assessment reports recommending a decision be made are to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading.
3. The report is to be endorsed by the investigating officer, supervisory review and the delegated decision maker.

### 1. Brief history of the matter.

Please briefly outline any historical information relevant to this decision.

<Provide historical information relating to the matter.>

### 2. Criteria and considerations in assessing the content of a draft TEP.

Will the draft TEP, if approved, achieve compliance with the *Environmental Protection Act 1994* (the Act) by reducing environmental harm or detailing the transition to an environmental standard?

Yes.

No.

<If the answer is yes, provide a brief summary><If the answer is no, then provide details of concerns/issues.>

Does the draft TEP clearly set out the objectives that will be achieved and maintained under the program?

- Yes.  
 No.

<If the answer is yes, provide a brief summary><If the answer is no, then provide details of concerns/issues.>

Does the draft TEP clearly set out the proposed actions to achieve the stated objectives, including the date by which each action will be completed?

- Yes.  
 No.

<Consider whether there is sufficient information provided in relation to each proposed action to allow the department to be able to clearly determine whether or not it has been carried out. Is each action specific about what will be done and is performance of the action able to be measured? Does each action have a due date for completion?>

Does the draft TEP take into account best practice environmental management for the activity?

- Yes.  
 No.

Note: Refer to s21 of the Act for more information about best practice environmental management.

<If the answer is yes, provide a brief synopsis of how the draft program address this><If the answer is no, then list how the draft TEP does not address this.>

Have all of the risks of environmental harm associated with the activity been appropriately identified and addressed by the proposed actions?

- Yes.  
 No.

Note: The draft TEP should contain sufficient detail on how each risk will be prevented or minimised including what specific interim measures are to be implemented and how these will be measured.

<If the answer is yes, provide details in relation to each risk identified><If the answer is no, provide details of how these matters have not been addressed in relation to each risk>

If the draft TEP has been prepared to transition an activity to comply with a condition of a development approval or environmental authority, is each condition that has been breached addressed by the proposed actions?

- Yes.  
 No.  
 Not applicable.

Note: There should be sufficient information provided in the draft TEP to show how the activity does not comply at present and detail how compliance with the condition will be achieved by the end of the program.

<If the answer is yes, provide summary on how this will be achieved for each condition> <If the answer is no, list which conditions have not been addressed>

If the draft TEP has been prepared to transition an activity to meet an environmental standard, has each standard been appropriately identified and addressed by the proposed actions?

- Yes.  
 No.  
 Not applicable.

<If the answer is yes, provide summary on how this will be achieved> <If the answer is no, list which standards have not been addressed>

If the draft TEP is prepared because of a requirement of a condition of a development approval or environmental authority, has the program been checked for inconsistencies with other conditions of the approval or authority?

- Yes.  
 No.  
 Not applicable.

<If the answer is yes, provide summary on how this will be achieved> <If the answer is no, list which standards have not been addressed>

Is end date of the TEP clearly stated?

- Yes.  
 No.

Note: The date on which the TEP will expire should be clearly stated. Consideration should also be given to the viability of the timeframe proposed to achieve the objectives of the program.

<If the TEP was submitted in response to a written notice from the department, does the term in the TEP meet the requirements as set out in the notice?>

Have appropriate performance indicators at intervals of not more than 6 months been included in the draft TEP?

- Yes.  
 No.

Note: The performance indicators must be clearly defined and measurable and set out the date on which each indicator will be assessed.

Does the draft TEP provide for sufficient monitoring and reporting on compliance with the program?

- Yes.  
 No.

Note: Specific details on the frequency and level of the monitoring and reporting must be provided e.g. what information should be given to the department and when.

Is the proposed monitoring sufficient to allow the company and DERM to assess progress with the TEP, and to assess compliance with the requirements of the TEP?

- Yes.  
 No.

Is the draft TEP acceptable in terms of any relevant regulatory requirements?

Yes.

No.

Note: Regulatory requirements are set out in ss46-64 of the Environmental Protection Regulation 2008 and may also be contained in environmental protection policies.

If the answer is yes, provide brief details on which regulatory requirements were considered and why the draft TEP is acceptable how this will be achieved.

If the answer is no, provide brief details of which regulatory requirements were considered and why the draft TEP is not acceptable.

<Answer>

Is the draft TEP acceptable in terms of the standard criteria?

Yes.

No.

For each of the standard criteria, provide brief details of your assessment of the draft TEP. If a criterion is not applicable, write 'N/A'.

<b>Standard criteria</b>	<b>Detailed comments</b>
<b>Ecologically sustainable development</b>	
<b>Environmental protection polices (EPPs)</b>	
<b>Plans, standards or agreements</b>

<b>Financial implications</b>	
<b>Public interest</b>	
<b>Site management plan</b>	
<b>Environmental management systems (IEMS)</b>	

Has all additional information given in relation to the draft TEP been considered?

Yes.

No.

Not applicable.

If the answer is yes, provide brief notes on the information contained within the additional documents e.g. do they recommend further investigations or propose specific works that have been incorporated into the draft TEP.

If the answer is no, list reasons why.

<Answer>.

If applicable, have any views expressed at a conference held in relation to the draft program been considered?

Yes.

No.

Not applicable.

< If the answer is yes, provide brief notes on the information provided.>

**Are you satisfied that the draft TEP meets all of the requirements of the Act and should be approved?**

If the answer to all of the above questions was “Yes” or “Not applicable”, the draft TEP may be approved. If the answer to any question about was “No”, the draft TEP may not be approved.

Yes - Proceed to section 3.

No - Proceed to section 4.

**3. If you are satisfied with the draft TEP.**

Prior to making a recommendation to issue a certificate of approval it is important to bear in mind that the Act stipulates that the draft TEP be a program that achieves compliance with the Act for the matters dealt within it.

If the draft TEP does **NOT** meet the requirements of the Act it must be refused. Whilst the Act does make provision for the approval to be subject to conditions, the conditions should address relatively minor issues only. Conditions on a certificate of approval must not be used to rectify significant issues with a draft TEP.

A certificate of approval must be issued within 8 business days of making the decision to approve the TEP. If the approval is subject to conditions, an information notice about the decision to impose conditions must also be provided.

**Certificate of approval checklist.**

Does the certificate of approval identify the documents forming the approved TEP, including any amendments under s339(1)(a)?

Does the certificate of approval specify any conditions imposed?

Does the certificate of approval state the date the approval ends?

If conditions have been added, has an information notice been drafted?

**4. If administrating authority is not satisfied with the draft TEP.**

If a decision is made to refuse the draft TEP, an information notice must be given to the person or public authority that submitted the program. The information notice should include:

the reasons for the decision.

any available rights of internal and external review.

## 5. Provide for natural justice.

If you are making a decision that is not the decision requested by the person or company submitting the TEP (for example, to refuse to approve the draft TEP), summarise below any submissions put forward by the person or company in favour of the draft TEP and your response to those submissions.

<List any submissions made.>

<State the reasons why you accept or reject the submissions.>

Are the decision maker and recommending officer free from bias or the perception of bias?

Yes.

No.

<If the answer is no, the person should not be involved in recommending or making a decision about the draft TEP.>

## 6. Recommendation.

The recommending officer is required to make a recommendation in relation to the draft TEP.

Recommendation:.

<For example, "I recommend that the draft TEP be approved OR I recommend that the draft TEP be approved with the amendments agreed in the letter to the company dated dd/mm/yyyy OR I recommend that the draft TEP be refused".>

**7. Endorsement**

# Procedural Guide

## Environmental Protection Act 1994

### Program notices

---

*The purpose of this guide is to provide officers with guidance on what to do if a program notice under s350 of the Environmental Protection Act 1994 is received by the Department of Environment and Resource Management.*

#### What is a program notice?

A program notice is a notice given by a person (or company) to the Department of Environment and Resource Management (the department) about:

- an act or omission
- that has caused or threatened environmental harm
- in the course of carrying out an activity by the person
- that is lawful apart from the *Environmental Protection Act 1994* (the Act).

This means that for a person to be able to submit a program notice, they must have done something or failed to do something that has caused or threatened environmental harm. If there is no environmental harm or threat of environmental harm, a person cannot submit a program notice. The activity must also be lawful (apart from anything that the Act makes unlawful). This means that a program notice cannot be submitted for an activity that needs to be authorised by other legislation but is not actually authorised.

#### What must a program notice contain?

A program notice must be in the approved form and contain all of the following:

- full details of the act or omission that has caused or threatened environmental harm
- a declaration that the person intends to prepare and submit a transitional environmental program (TEP).

#### What is the effect of a program notice?

If a person submits a program notice, it has the following effects:

- The program notice itself and any documents submitted with the program notice, are not admissible in evidence against the person submitting the program notice in a prosecution for any offence revealed by the program notice. **However, the program notice does not stop other evidence from being gathered and then used against the person.**
- The person cannot be prosecuted for any offence revealed by the program notice until one of the following events happen:

- The person receives an approval from the department for a TEP that addresses the matters set out in the program notice (if the person receives an approval, they are then authorised to do or not do the actions set out in the TEP even if those actions would otherwise breach the Act).
- The person receives from the department a notice of refusal to approve a TEP that addresses the matters set out in the program notice.
- The person fails to submit to the department a draft TEP by the date specified by the department.

In summary, the program notice gives a person protection while they are developing a TEP. If the department approves the TEP, then the person has the normal protection given by a TEP. If, however, the person does not submit a draft TEP or submits a draft TEP that is refused by the department, the department may still prosecute the person for the original incident. It is also important to note that the department may take other compliance or enforcement action against the person (such as issuing an environmental protection order (EPO) or a penalty infringement notice (PIN)) even if a program notice is submitted. The information in the program notice can be used to support an EPO, PIN, or other statutory tool.

The department is able to apply to the Planning and Environment Court for an order setting aside the person's immunity from prosecution. The court may set aside the immunity in certain circumstances – if the offence revealed by the program notice was wilful and done with the intention of relying on the immunity from the program notice; or the nature and extent of the environmental harm caused or threatened by a continuation of the offence is so great that the immunity should be withdrawn. The department must make its application to the court within 20 business days of receiving the program notice.

## **What actions should be taken when a program notice is received?**

### **Inform manager**

Inform your manager that the program notice has been received and provided with a copy of the notice and any accompanying documents. Do this immediately after receiving the program notice, to allow the department as much time as possible to consider whether to make an application to the court to set aside the immunity from prosecution.

If the manager believes that the program notice should be set aside for either of the two reasons set out in the previous section, the manager should contact the regional manager as soon as possible so that the Litigation Branch can be briefed.

It is the regional manager's responsibility to decide whether to forward the program notice to the Litigation Branch for advice on commencing an application to set aside the immunity. The regional manager should also inform the Director of Compliance and Investigations of the matter.

### **Ecotrack**

Details of the program notice must be entered into Ecotrack.

### **Does it meet the legal requirements?**

Check whether the program notice meets the requirements of the Act. Does the program notice state an act or omission done by the person? An event that happens to a person or site is not by itself enough for a program notice.

For example, heavy rain that caused a pond to overtop is not an act or omission by the person. However, failing to adequately manage stormwater leading to overtopping of a pond is an omission by the person and would meet the legal requirements for a program notice. If the program notice doesn't state an act or omission, write to the person informing them that the program notice does not meet the requirements of the Act and is not effective. Contact the Compliance and Investigations Unit (Compliance Support) or Litigation Branch if assistance is required.

The program notice must also be about the environmental harm that has been caused or threatened. If the program notice does not reveal that environmental harm has been caused or is threatened by the act or omission, write to the person informing them that the program notice does not meet the requirements of the Act and is not effective.

For example, treating sewage from more equivalent persons than allowed by a development approval, if the sewage treatment plant has the capacity to treat the excess sewage, is not an act that is causing or threatening environmental harm and is not able to be the subject of a program notice. However, a breach of discharge limits that leads to an increase in contaminants in a watercourse is an act that causes or threatens environmental harm and does meet the requirements for a program notice. Again, contact Compliance and Investigations Unit (Compliance Support) or Litigation Branch if you need assistance.

### **Acknowledge the notice and request a TEP**

Once a TEP is received, the department has 10 business days to give a written notice to the person submitting it. The notice from the department must do two things:

- acknowledge receipt of the program notice
- state the day by which a draft TEP dealing with the matters contained in the program notice must be submitted to the department. That day must be no more than three months after the department receives the program notice. In other words, the person submitting the program notice has a maximum of three months within which to submit the draft TEP.

When choosing the day by which the draft TEP must be submitted, consider how complex the matter raised in the program notice is, how urgent it is for a draft TEP to be submitted and what is a reasonable time for the person to prepare the draft TEP.

A [template acknowledgement notice](#) is available on Ecosteps.

### **What happens when the draft TEP is submitted?**

When the person submits the draft TEP refer to the procedural guide, [Assessment of transitional environmental programs](#) and the assessment report, [Assessment of a transitional environmental program](#) available on Ecosteps for guidance on assessing the draft TEP.

# Procedural guide

Environmental Protection Act 1994

## Assessment of transitional environmental programs (TEPs)

*This document is designed to assist users to critically evaluate the content of a draft transitional environmental program and assess whether or not the proposed objectives and actions meet the legislative requirements. It should be used in conjunction with the document Assessment report for assessing a transitional environmental program.*

### What must be included in the content of a draft transitional environmental program (TEP)? (s331)

A draft TEP must:

- state the objectives to be achieved and maintained under the program for an activity
- state how the objectives are to be achieved, and a timetable to achieve the objectives, taking into account:
  - the best practice environmental management for the activity
  - the risks of environmental harm being caused by the activity
- state the appropriate performance indicators at intervals of not more than 6 months
- make provision for monitoring and reporting compliance with the program.

### Fees

The draft TEP must be accompanied by the required fee. The fee is set by the operational policy titled, *Transitional environmental program (TEP) fees*, available on Ecosteps.

### Application date (s552)

Many actions about draft TEPs must be made within a certain number of days from the application date. The application date is either:

- 10 business days after the day the application for approval of the TEP draft is received by the Department of Environment and Resource Management (the department), or
- if the department requests additional information about the draft TEP within 8 business days of receiving the application for approval, the day that the department says to the applicant in a written notice is the new application date. That new application date must be no earlier than 2 business days after the applicant receives the written notice.

### What is the timeframe for consideration of a draft TEP? (s337)

The department must decide whether to approve the draft TEP within 20 business days after the application date. There is one exception to this. If public notice is required under s335 of the *Environmental Protection Act 1994* (the Act) the department must decide whether to approve the draft TEP within 20 business days of the day stated in the public notice as the day by which submissions may be made to the department. More information about public notice is set out below.

If the department fails to decide whether to approve or refuse a draft TEP within the time required, the failure is taken to be a decision by the department to refuse to approve the draft TEP (s343).

### What criteria must be taken into consideration? (s338)

When deciding whether or not to approve the draft TEP or deciding to impose conditions (if any) on the approval, the department must comply with any relevant regulatory requirement.

Subject to the above, the department must also consider:

- the standard criteria
- additional information given in relation to the draft program
- the views expressed at a conference held in relation to the draft program.

If the draft program is prepared because of a requirement of a development condition of a development approval, the department may approve the draft program only if it is not inconsistent with other conditions of the approval.

More information about these matters is set out below.

### Is public notice required? (s335)

Public notice is required where the person or public authority submits for approval (in either compulsory or voluntary circumstances) a draft TEP that will be carried out for longer than 3 years. Within 2 business days after the application date, the person or public authority must give public notice of the submission by:

- advertisement published in a newspaper circulating generally in the area in which the activity to which the draft program relates is, or is proposed to be, carried out
- if the program relates to premises, a notice must also be placed on the premises and served on the occupiers of all adjoining premises.

The notice must be in the approved form, invite submissions (see s335(3)(b)) on the draft TEP and state the day (at least 10 business days after the advertisement and service of notice) nominated by the department as the day by which submissions may be made to it.

### When may the department call a conference? (s336)

The department may invite the person or public authority that has submitted a draft TEP and another person who has made a submission under s335 about the program, to a conference to help it in deciding whether or not to approve the program. See s336 for details of notice and other requirements regarding conferences.

## Other consultation and considerations

Depending on the content of the draft TEP, officers may need to consult with other business units or departments in order to ensure that the risks from and effects of, the draft TEP have been fully understood. For example, if the draft TEP involves releases to water, Queensland Health and/or Office of the Water Supply Regulator should be consulted. Releases to air may also require consultation with Queensland Health.

Officers should consider whether a formal risk assessment should be undertaken to ensure that any risks from approving the draft TEP are identified and adequately managed. If there is likely to be significant community interest in the draft TEP, officers should also consider whether the views of the community and other stakeholders should be taken into account.

## How do I successfully assess a draft TEP?

Officers must complete an assessment report to document the decision and depending on the outcome issue a certificate of approval and/or written information notice detailing conditions or an information notice detailing refusal of the draft TEP.

### Step 1 - Complete the assessment report

Officers are required to complete an assessment report which sets out relevant information about the draft TEP and documents the decision making process used in determining to either approve or refuse the draft TEP (with or without conditions).

The assessment report is not intended to replicate the departmental file. Rather it is designed to capture all critical aspects that have led to the department's decision. Accordingly, officers are encouraged to limit the information included to relevant points only. A template assessment report is available on Ecosteps <http://wwwhost.epa.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=467>.

The following sections relate to the corresponding sections of the assessment report.

#### 1. Brief history of the matter

Please briefly outline any historical information relevant to the decision. This information should be presented in succinct chronological dot points and should include why a draft TEP is now being considered i.e. as a result of a program notice, voluntary submission or in response to a notice requesting the submission of a TEP.

#### 2. Criteria and considerations in assessing the content of a draft TEP (s338)

A significant amount of care should go into checking and considering the full potential effects of the draft TEP because by approving the draft TEP the officer is authorising everything permitted by the TEP.

Therefore the assessment criteria plays an instrumental part of the decision making process. Firstly, to establish the critical objectives the TEP must achieve and if the content of the draft TEP actually addresses how these achievements will be completed.

Secondly, from the point of view of compliance and enforceability, to establish whether the draft TEP passes the SMART test (i.e. it must be specific, measureable, achievable, relevant and time specific to the objective stated). This is an imperative consideration given that the department may have to establish beyond a reasonable doubt that the TEP has not been complied with, in order to take action against the holder for failure

to comply with the TEP. For this reason, the contents of the draft TEP must be clearly drafted, unambiguous and easily auditable.

### **Achieving compliance with the Act by reducing environmental harm or detailing the transition to an environmental standard**

The draft TEP must either bring the applicant into compliance with the Act or detail how the applicant will transition to an environmental standard. If it is not clear from the information provided by the applicant that at the end of the period of the TEP the applicant will be in compliance with the Act or will have successfully transitioned to an environmental standard, the draft TEP must not be approved.

This section must demonstrate how the activity is currently in non-compliance with the Act (e.g. non-compliance with permit conditions resulting in the need to upgrade plant or equipment to achieve permit requirements) or how the activity is currently not achieving a particular environmental standard and why it is desirable to achieve this standard (e.g. a sewage treatment plant currently treats to class 'C' quality and is required to achieve class 'A').

An 'environmental standard' includes, but is not limited to new requirements under the *Environmental Protection Regulation 2008* or environmental protection policies following amendments.

### **Objectives to be achieved and maintained under the TEP**

The draft TEP must clearly set out the objectives of the TEP (i.e. what is it aiming to achieve?). Examples of objectives might be - to bring the operator into compliance with conditions G12 and H5 of development approval 1234; or, to prevent or minimise environmental harm caused by the migration of landfill gas. The objectives should be as specific and clear as possible so that, if approved, the department can assess whether the objectives have been met.

### **Clearly set out the proposed actions**

The draft TEP must set out the actions that the applicant will carry out in order to achieve the objectives of the TEP. It is important that the actions are as definite, specific and clear as possible. If they are vague or uncertain, it will be difficult for the department to assess whether the applicant is doing what they have said that they will do and may prevent the department from taking enforcement actions. Each action must have a due date in day-month-year or dd/mm/yyyy format, by which it will be completed and must comply with the SMART principle (specific, measurable, achievable, relevant and time specific). For more information on SMART, refer to the guide *Writing effective and enforceable conditions* on Ecosteps. Included in the actions should be progress reporting dates and final reporting dates in day-month-year or dd/mm/yyyy format.

### **Best practice environmental management**

In stating how the draft TEP will achieve its objectives, it must take into account best practice environmental management (BPEM). BPEM is defined in s21 of the Act and officers should refer to the Act for more detail on what BPEM is.

### **Risks of environmental harm**

The draft TEP must take into account the risks of environmental harm being caused by the activity being carried out by the applicant. The draft TEP and any supporting documents must show that the risks have been considered and what treatment or mitigation of the risks is proposed.

### **Transition to comply with condition**

If the objective of the draft TEP is to bring the applicant into compliance with one or more conditions of a development approval or environmental authority, the draft TEP must set out actions to address each condition that is stated in the objective.

### **Transition to environmental standard**

If the objective of the draft TEP is to transition to meet an environmental standard, the draft TEP must identify each standard and the actions that are proposed to ensure that those standards are met.

### **TEP required because of a condition of a development approval or environmental authority**

If the draft TEP has been prepared because of a requirement of a condition of a development approval or environmental authority, it must be consistent with the conditions of the approval or authority.

### **End date**

The draft TEP must state the date on which it will come to an end. By that date, the applicant must be in compliance with the Act for the matters covered by the TEP. Note that if the TEP is proposed to last for more than 3 years, public consultation is required (see above).

### **Performance indicators**

The draft TEP must set out appropriate performance indicators at intervals of not more than 6 months. The performance indicators must show how the applicant is progressing in achieving the objectives of the TEP. The indicators must also be capable of being measured and be specific enough for the department to be able to assess with certainty whether they have been met or not. The indicators must set out the date by which each one will be met.

### **Monitoring and reporting**

The draft TEP must provide for sufficient monitoring and reporting. It must provide for the applicant to monitor progress with carrying out the actions in the TEP and with achieving its objectives and for any necessary environmental monitoring. It must also provide for reporting by the applicant to the department on progress with the TEP, including any failure to carry out actions by their due dates. Reporting by the applicant must also include provision to the department and interpretation of any environmental monitoring requirements and a final report demonstrating compliance with the Act or successful transition to the nominated environmental standard and outline the achievement of all actions and objectives in the TEP.

## Regulatory requirements

Sections 46-64 of the *Environmental Protection Regulation 2008* set out matters that must be considered in certain specified circumstances. Officers must consider any matters that are relevant to the draft TEP (e.g. there are certain matters specified where release of water to land is contemplated). If consideration of the matters leads to the conclusion that the actions proposed in the TEP are not appropriate, then the TEP should be refused or the applicant should be asked to amend the draft TEP.

## Standard criteria

Officers must consider the standard criteria set out in the Act when considering the draft TEP. If consideration of the criteria leads to the conclusion that the actions proposed in the TEP are not appropriate, then the TEP should be refused or the applicant should be asked to amend the draft TEP. Some guidance on the standard criteria is set out below:

- **The principles of ecologically sustainable development (as set out in the *National strategy for ecologically sustainable development*)**

Consider the following questions:

- Has the decision effectively integrated long and short term economic, environmental, social, and equity considerations?
  - Has due regard been given to the precautionary principle? (i.e. where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation)
  - Does the decision have due regard to the global dimensions of environmental impacts and policies?
  - Does the decision assist in the development of a strong growing and diversified economy, which can enhance the capacity for environmental protection?
  - Has the need to maintain and enhance international competitiveness in an environmentally sound manner been considered when making the decision?
  - Have cost effectiveness and flexibility been considered?
  - Does the decision/action allow for broad community involvement on issues that affect them?
- **Any applicable environmental protection policies (EPPs)**
    - Is the draft TEP consistent with the EPPs on water, air, noise and waste (where relevant)?
  - **Any applicable Commonwealth, State or local government plans, standards or agreements**
    - Consider documents such as State and regional coastal plan, National Health and Medical Research Council (NHMRC) and Australian and New Zealand Environment and Conservation Council (ANZECC).
  - **Any applicable environmental impact study, assessment or report**
    - Consider any findings or recommendations that are relevant to the draft TEP.
  - **The character, resilience and values of the receiving environment**
    - Does the draft TEP have regard to the environmental values of the receiving environment?
    - What is the impact on the values of the actions contained in the draft TEP?

- **All submissions made by the applicant and submitters**
  - Consider any submissions made by the applicant and anyone who makes a properly made submission about the draft TEP.
- **Best practice environmental management**
  - See above.
- **The financial implications of the requirements**
  - Explore the financial implications for the client in complying with conditions of the TEP. Are they reasonable in the particular circumstances?
- **The public interest**
  - Is it in the interests of the community that the draft TEP be approved?
- **The site management plan**
  - If there is a site management plan for contaminated land (approved under chapter 7, part 8 of the Act), is the draft TEP consistent with the site management plan? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled? Consult with the Contaminated Land Unit as early as possible when there are any contaminated land issues.
- **Any relevant integrated environmental management systems (IEMS) or proposed IEMS**
  - Is the draft TEP consistent with the IEMS? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled?

#### **Other additional information**

Has any supporting information provided by the applicant been considered? Considering the draft TEP and any supporting information, is it clear that the draft TEP achieve compliance with the Act?

#### **Views expressed at a conference**

If a conference has been held as part of a public notice process, the views expressed at that conference must be considered and the reasons for having regard to or not having regard to, those views must be recorded.

#### **Satisfaction that the draft TEP meets the requirements of the Act**

Having considered all of the above matters, officers completing the assessment report must decide whether they are satisfied with the draft TEP. If any of the issues in the assessment report were answered 'no', officers should proceed to section 4. Otherwise they should proceed to section 3.

### **3. If you are satisfied with the draft TEP**

If the answer to all of the questions on the assessment report was 'yes' (or 'not applicable'), you may recommend that the draft TEP be approved. If the delegate approves the draft TEP the department must, within 8 days after making a decision to approve the draft TEP, give to the person or public authority that submitted the program a certificate of approval about the decision.

### What should the certificate of approval contain?

The certificate should:

- identify the documents forming the approved TEP, including any amendments under s339(1)(a)
- state any conditions imposed
- state the day the approval ends.

### Key considerations regarding conditions

The Act does make provision for the approval to be subject to conditions the administering authority considers appropriate and remains in force for the period specified in the certificate (s339(3)). However, the enforceability of conditions placed on TEPs is unclear. As a result conditions should not be imposed except for minor matters. Conditions must not be used to alter the terms of the TEP itself. Instead, if the TEP is not satisfactory, it must be refused or amendments sought from the applicant. Conditions in the certificate of approval should not be used as a quasi-development approval, or to alter or amend the TEP to meet the requirements of the Act.

If the draft TEP is approved with conditions an information notice must be given to the person or public authority that submitted the program.

## 4. If you are not satisfied with the draft TEP

If you have answered 'no' to one or more of the questions in the assessment report, you should either recommend a refusal of the draft TEP, or seek more information or amendments to the draft TEP from the applicant. If you seek more information within 8 business days of the department receiving the draft TEP, you may specify a new application date which will give you more time to assess the draft TEP (see above for more information).

If you receive more information and/or amendments to the TEP, you should repeat the assessment report process taking into account the new information or amendments. This may lead to the draft TEP being acceptable.

### What action is required? (s340)

If the draft TEP is refused an information notice must be given to the person or public authority that submitted the program. As a matter of good practice the notice should include:

- the reasons for the decision
- any available rights of internal and external review or appeal.

## 5. Provide for natural justice:

The department must ensure that decisions are made in a fair and consistent manner. This includes ensuring that the affected individual is provided with 'natural justice' (that they are given an opportunity to make their case for why the decision should go in their favour) and that people involved in making the decision are free from bias or the perception of bias.

Any submissions made by the applicant that have not already been considered earlier in the assessment report process must be documented in section 5 of the assessment report.

## 6. Recommendation

The recommending officer is required to make a recommendation as to whether or not the draft TEP should be approved, with or without conditions, or refused.

## 7. Endorsement

An officer with the appropriate delegation must consider the contents of the assessment report and the recommendation and make a decision about whether to approve (with or without conditions) or refuse the draft TEP. The department's list of delegations can be found on the department's intranet at <http://insite2.dnr.qld.gov.au/derm/delegations/>.

## What is the effect of compliance with the approved TEP? (s346)

An approved TEP protects the holder or a person acting under the approval, from enforcement action for non-compliance with the relevant:

- regulation
- condition of an environmental authority (EA)
- condition of an development approval (DA)
- condition of an environmental protection policy (EPP)
- standard environmental condition of a code of environmental compliance for a chapter 4 activity
- accredited environmental risk management plan (ERMP) under the Great barrier Reef protection measures.

## What follow up is required?

It is an offence for the holder of an approved TEP to contravene the program. Officers should diarise all performance indicator requirements listed in the program or conditions and monitored for compliance.

Officers are encouraged to use tools such as reminders in Microsoft Outlook to ensure the matter is followed up in a timely manner.

## What penalties exist for non-compliance with a TEP? (s432)

The holder of an approval of a TEP, or a person acting under a TEP, must not wilfully contravene the program. 'Contravening the program' includes failing to comply with milestones and failing to undertake actions required by the TEP.

Maximum penalty is 1665 penalty units or 2 years imprisonment.

The holder of an approval of a TEP, or a person acting under a TEP, must not contravene the program.

Maximum penalty is 835 penalty units.

## Check list for successfully assessing a draft TEP

Officers are encouraged to ensure the following criteria have been considered:

- The appropriate and delegated decision maker has been identified. The department's list of delegations can be found at <http://insite2.dnr.qld.gov.au/derm/delegations/>.
- The appropriate person or commercial entity to be issued the certificate of approval, information notice of refusal or conditions is known. Assistance can be sought at: <http://wwwhost.epa.qld.gov.au/steps/reflaunch.cfm?nw=true&ref=330>
- The decision makers are free from a potential conflict of interest or bias in considering this matter.
- Copies of all the information sourced during the investigation have been documented, labelled and stored.
- Any reasons why information has been deemed to be irrelevant and has been excluded from the decision making process has been recorded.
- The principles of natural justice have been observed and the affected person has been provided with the opportunity to respond to the information that the department has sourced.
- Any major arguments raised by the affected person have been documented and addressed.
- Hard and soft copies of any information gathered to date have been labelled and stored.
- Any time frames set for the decision making process have been identified and complied with in accordance with legislation or best practice guidelines.
- A diary or other tool has been used to ensure appropriate follow up of this matter.

# Procedural Guide

## Compliance and Investigations

### Covert Recording

---

*This document sets out the circumstances in which authorised persons conducting investigative activities can covertly record conversations. This document is separate to the EPA's Human Resource Management policy No. 18 Covert Recording of Conversations.*

#### Purpose

The purpose of this document is to:

- Set out the circumstances in which authorised persons may covertly record a conversation; and
- Where covert recording is permissible, to provide an approval process.

#### Definitions

'*Covert recording*' is when one or more parties to a conversation are unaware a recording is taking place.

'*Overt recording*' is when **all parties to a conversation are fully aware** a recording is taking place

'*Recording device*' means any instrument, apparatus, equipment or device capable of being used to overhear record, monitor or listen to a private conversation when it is taking place. Examples include tape recorders, mobile phones, digital cameras, video recorders and telephone adaptations that enable recording of conversations.

#### Background

- Authorised persons regularly investigate breaches of EPA administered legislation. Investigations may lead to criminal and/or civil litigation.
- Audio and video recording provide an effective means to avoid allegations of harassment and to negate any concerns involving threat, promise or inducement.
- Covert recording is an essential and legitimate investigative tool.

#### Legal position

The *Invasion of Privacy Act 1971* allows the covert recording of conversations by persons who are a party to the conversation. However the Act contains restrictions regarding the use of such a recording.

Permission is not required from the parties involved if the conversation is intended for use as evidence in court or if the conversation is deemed to be in the public interest by the courts. There are severe criminal penalties for persons who breach this exception.

## Use of Overt Recording

Authorised persons may overtly record a conversation to which they are a party. It is the responsibility of the authorised person to ensure all parties to the conversation are fully aware the conversation is being recorded, and such awareness should be evident from the recording itself.

Please ensure you receive verbal confirmation on the recording to indicate as evidence the parties to the conversation are fully aware.

## Use of Covert Recording

**At no time can an authorised person record a conversation to which they are not a party.**

Authorised persons **may**, with the necessary approval, covertly record a conversation to which they are a party in the following circumstances:

1. Where the authorised person is investigating whether parties are complying with EPA administered legislation; or
2. The recording of the conversation will assist, or is likely to, assist in the gathering of evidence regarding an alleged contravention of the legislation administered by the EPA; or
3. Where it is important that there is an accurate record of conversations for evidentiary reasons; or
4. Where the authorised person reasonably believes the disclosure of a recording activity may adversely affect the authorised person in the execution of their duties.

If an authorised person covertly records a conversation, the fact of the covert recording must be noted in the authorised person's official notebook as soon as practicable.

## Covert Recording approval process

EPA Division	Authorised person to grant approval	Method
<b>QPW</b> Authorised officers under the legislation administered by QPW, such as "conservation officers" under the <i>Nature Conservation Act 1992</i>	Executive Director, QPW	Regional staff must seek <sup>1</sup> support through their Regional Manager.  Regional Manager to seek support from Director (Terrestrial) or Director (Marine).  Director to seek approval by Executive Director via email.  Executive Director may approve via email.
<b>Environmental Services</b> Authorised officers under the legislation administered by Environmental Services such as the <i>Environmental Protection Act 1994</i>	Executive Director, Environmental Services	Regional staff must seek support through their Regional Manager.  Regional Manager to seek support from Director Regional Services.  Director Regional Services to seek approval by Executive Director via email.  Executive Director may approve via email.

<sup>1</sup> This may be verbal, email or by phone confirmation (if urgent)

State-Wide Investigations Team	Director (Compliance and Investigations) or Executive Director, Environmental Services	<p>Investigator to seek support from Manager (Investigations).</p> <p>Manager (Investigations) to seek approval by Director (C&amp;I) or Executive Director either at time of approval of investigation plan or via email.</p> <p>Director (C&amp;I) and Executive Director may approve via email.</p> <p>Where Director (C&amp;I) is the approving officer, a copy of the approval must be provided to the Executive Director.</p>

**Communication of information obtained covertly**

If a recording is sought to be communicated or otherwise used then advice must be sought from the Legal Services Unit, except if the recording is to be used as evidence in litigation.

**Approved By**

Signed

## Compliance and Investigations

### Proposed Compliance Action Report

---

*This form is to be completed in order to request proposed action for regulatory non-compliance. Approval will refer the matter to the investigations team for action. Guidance for inserting the required information is provided in italics; please delete these prior to producing a final documents for signature. Please contact the Investigations Team for further advice.*

**Date Report Prepared:**

**Name and contact details of officer preparing this report:**

**Relevant sections of the legislation:**

**1) Name and full details of the person/entity that is the subject of this report:**

- Provide the person/entity's full name, address, DOB and any other details known. It is to include any know DERM licences that are held and the nature/location of any activity undertaken by the person/entity.*
- Provide any history of previous non-compliance*

**2) Details of the incident or information received; including how the matter came to notice:**

- Dot point incident/information in chronological order, including full name and details of any alleged offender/s. Briefly outline what offences have allegedly occurred and evidence there is to support the allegations. Do not attach copious documents or photographs as these can be obtained at a later date.*
- Dot point the relevant sections of the Act and how this PCAR relates to each one.*

**3) The case for the proposed compliance action:**

- Dot point what action you propose and why this action is necessary.*

**4) Comments on alternative approaches to the proposed compliance action:**

- Dot point whether there are any other alternate approaches to the action proposed and clearly indicate why the alternate/s are not applicable in this case.*

**5) Anticipated resource implications:**

- Dot point what resources you believe may be necessary to carry out the proposed action.*

**Proposed Compliance Action Report**

# Procedural guide

## *Environmental Protection Act 1994* Transitional environmental program (TEP)

### Part 1 – Notice requiring a draft TEP

---

*This document is designed to assist Environmental Services officers to issue a notice requiring a draft TEP under the provisions of Chapter 7, Part 3 of the Environmental Protection Act 1994.*

#### What is a TEP?

Section 330 of the *Environmental Protection Act 1994* (the Act) provides that a transitional environmental program (TEP) is a specific program which, when complied with, facilitates compliance with the Act for the activity to which the TEP relates by doing one or more of the following—

- reducing environmental harm caused by the activity
- detailing the transition of the activity to an environmental standard
- detailing the transition of the activity to comply with:
  - a condition (including a standard environmental condition) of an environmental authority or code of environmental compliance or
  - a development condition.

The legislative provisions in respect to TEPs can be found in Chapter 7, Parts 3 and 4 (ss330-357) of the Act.

#### Who can enter into a TEP?

A person or public authority may enter into a TEP voluntarily or may be required to submit a draft TEP by the Department.

#### When can a TEP be used?

TEPs are intended to be used where a significant change or changes are needed to be made by a person to achieve compliance. One of the reasons for this is that a person has some protection from prosecution for actions conducted under the TEP for the duration of the TEP.

##### (a) Requirement to submit a draft TEP

There are certain circumstances when the Department may require a person or public authority to prepare and submit for approval a draft TEP. These circumstances are set out in Section 332 of the Act.

##### (b) Voluntary TEP

Section 333 of the Act provides that a person or public authority may also, at any time, submit a draft TEP to the Department for an activity the person or public authority is carrying out or proposes to carry out.

### (c) Program notices

A person intending to prepare and submit a voluntary TEP may give the Department a program notice under s350 of the Act. For further information in regard to program notices, see: [Procedural Guide - Program notices TEP](#)

### (d) Fee for consideration of draft TEP

A person or public authority that submits a draft TEP to the Department for consideration and approval must pay the Department the fee prescribed by regulation. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

An invoice for the fees incurred should be issued to the person or public authority that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued.

## How do I successfully issue a notice requiring a draft TEP?

Officers must complete an assessment report to document the decision to issue a notice requiring a draft TEP, as well as completing the notice.

### Step 1 - Complete the Assessment Report

Before completing the notice requiring a draft TEP, officers must complete an assessment report. The assessment report sets out the facts and circumstances relating to the matter and documents the decision-making process of the Department in determining whether or not to issue the notice.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference.

The assessment report is not intended to replicate the Departmental file. Rather it should capture all critical aspects considered by the Department in making a decision. Accordingly, officers should include relevant points only. A template assessment report may be found on the Compliance Support Materials page on the Departmental intranet.

#### 1. Brief history of the matter

Briefly outline any historical information relevant to the decision. This information should be presented in succinct chronological dot points and include how the Department became aware of the issues that led the Department to consider issuing a notice requiring a draft TEP.

For example:

- *Previous compliance inspections have identified risks with stormwater controls and management on the site (CA123 – Ecotrack – May 2008) (CA456 – Ecotrack – May 2009).*
- *The operator made significant investments in stormwater management infrastructure in 2002, however the business has grown substantially since this period with no changes to stormwater management.*
- *Discussions with the operator during a compliance inspection on 10 May 2010 indicated an acceptance of the need to investigate and pursue further stormwater management improvements and included a discussion of the potential submission of a draft TEP.*

- *The Department wrote to the operator on 1 June 2010 to advise of the outcomes of the May compliance inspection.*
- *The Department received an Annual Return Form from the operator attaching stormwater release monitoring results demonstrating non-compliance with development approval conditions C11 and C12.*
- *The Department issued a notice requiring a draft TEP to another timber preservation/treatment operator in the region for non-compliance with development approval conditions associated with stormwater management issues.*

## 2. Grounds for issuing a notice requiring a draft TEP

The legislation provides in Section 332 that the Department may require the submission of a draft TEP—

- as a condition of an environmental authority or
- as a development condition of a development approval.

The Department may also require the preparation and submission of a draft TEP if satisfied that—

- an activity carried out, or proposed to be carried out by the person or authority is causing, or may cause unlawful environmental harm or
- it is not practicable for the person or public authority to comply with an environmental protection policy or regulation on its commencement or
- a condition of an environmental authority held by the person or public authority is, or has been, contravened or
- a standard environmental condition of a code of environmental compliance for a chapter 4 activity is, or has been, contravened by the person or public authority or
- a development condition of a development approval is, or has been, contravened and the person or public authority is:
  - an owner of the land for which the approval is granted or
  - another person in whom the benefit of the approval vests.

In this section, an officer must identify the relevant grounds upon which the decision to issue the notice requiring a draft TEP is based. For example:

*A timber preservation/treatment operator is required under development approval conditions to ensure that stormwater released from the site meets specific limits. A compliance inspection was undertaken on the site that identified some issues with stormwater controls and management. Following the inspection, a letter was sent by the Department to the operator advising of the outcomes of the inspection and reminding the operator of its responsibilities. The operator submitted monitoring results indicating that on occasion, stormwater was released from the site in breach of the release limits.*

*A notice requiring a draft TEP was issued to the operator based on the following grounds:*

1. *that an activity carried out, or proposed to be carried out, by the person is causing, or may cause, environmental harm and/or*
2. *that a development condition of a development approval is, or has been, contravened and the person is an owner of the land for which the approval is granted.*

### 3. Expand upon the grounds

The purpose of this section is to clearly identify the elements, or what the Department must 'prove' before deciding to use a notice requiring a draft TEP, and should be used to expand upon the grounds which have previously been identified. This can include identifying the specific offence or breach under investigation or any statutory requirements listed in the legislation which must be met by the Department prior to issuing the notice.

In instances where one action has resulted in multiple breaches, each breach should be listed independently. For example, a site inspection could potentially detect a number of breached conditions associated with a single development approval. In this situation each breach would need to be proven on its own merits and should be listed separately.

Each ground (including breaches or requirements) should be allocated a separate number.

### 4. Detail the matters considered

The purpose of the table in the assessment report is to link the elements of the breach to the evidence gathered and the conclusions formed. This is achieved by identifying:

- the elements of any specific breach or allegation
- the evidence which has been considered for each element and
- the conclusion that has been reached by the officer after considering the information sourced.

When documenting the evidence, officers should limit the information to relevant points only. This can include (but is not limited to):

- notes recorded in an officer's official notebook
- samples collected for analysis and any subsequent lab reports
- photographs and copies of documents and
- any observed actions and direct testimony received from individuals.

The last column in the table requires officers to detail the relevant facts and circumstances. Officers are encouraged to consider the accuracy and relevance of available evidence, historical details, professional expertise and the weight attributed to any direct testimony provided.

After considering the details, evidence, facts and circumstances, officers are required to set out how the TEP would deal with the issues.

### 5. Provide for Natural Justice

Prior to the Department making a decision which may adversely impact on an individual or group it must:

- **Notify** - Notify the individual that the Department is considering issuing a notice requiring a draft TEP
- **Respond** - Provide the individual with an opportunity to respond to the allegation and
- **Consider** - Consider any representations made by the affected person before finalising the decision.

The seriousness of the matter will dictate the process by which natural justice is provided and is likely to vary from case to case. Accordingly, officers should use their discretion in determining how to best ensure natural justice is afforded and the amount of time provided to the affected person to respond. In some circumstances it may be appropriate for an officer to discuss the above information with the affected person during a site

inspection or a telephone interview and to take contemporaneous notes. In more serious circumstances a written notification which includes a specific closing date for submissions should be used.

Regardless of the manner in which natural justice is afforded, any information provided by the affected person is to be documented. The summary of information should include how natural justice was provided as well as any responses given by the affected person. For example:

*Following each of the compliance inspections, the Department wrote to the site operator advising of the outcomes of the inspections and the risks identified with stormwater management on the site:*

- CA123 – May 2008
- CA456 – May 2009
- CA780 – May 2010

*On-site discussions with the operator during the May 2010 compliance inspection indicated an acceptance of the need to investigate and pursue further stormwater management improvements and included commitments to consider drafting a voluntary TEP.*

*Since the May 2010 compliance inspection the Department has had further discussions with the operator, raising the implications of the exceedances of the release limits observed in the stormwater quality monitoring results for the last 12 months. The operator was also informed that the Department's intention was to issue a notice requiring a draft TEP and given a period of five business days to submit any further information for consideration by the Department. The operator did not submit any formal submissions to the Department but has advised by telephone of an intention to engage a suitably qualified consultant to assist with drafting a plan of action for site upgrades.*

## 6. Proposed requirements of the TEP

Officers are required to include the following things (amongst other things as set out in s332(4)) in the notice requiring a draft TEP—

- the matters to be addressed by the program and
- the period over which the program is to be carried out and
- the day (at least a reasonable period after the notice is given) by which the program must be prepared and submitted to the Department.

In instances where it is recommended that requirements are imposed upon the affected person, officers are required to develop proposed requirements for consideration by the delegate. As affected persons are able to seek a review of the Department's decision to impose one or more conditions/requirements, it is necessary for officers to provide justification for their inclusion.

Requirements must be specific, measureable, achievable, relevant to the activity and time-specific. For further information, refer to the [Procedural Guide - Writing effective and enforceable conditions](#). For example:

Proposed requirement	Justification
<i>The draft TEP must include a stormwater management plan in order to cease all unlawful releases of stormwater from the site on or before 30 November 2011 and be submitted to DERM by 1 July 2011.</i>	<i>The development of a stormwater management plan is considered to be best practice and is a requirement which is currently being met at other ABC Pty Ltd development sites in Queensland.  Compliance inspections conducted in May 2008, 2009</i>

*The stormwater management plan must include the following—*

1. *An assessment of the existing site infrastructure, including but not limited to:
 
  - (a) *a determination of the effectiveness of existing stormwater infrastructure in controlling stormwater runoff and capturing contaminants to prevent or minimise the release of contaminants to waters and*
  - (b) *a determination of the effectiveness of existing containment facilities associated with the storage, transport and production of materials in minimising the release of contaminants to the stormwater system and*
  - (c) *a determination of the effectiveness of current management practices and procedures regarding the minimisation of stormwater contamination.**
2. *An identification of measures to improve stormwater management on site, which must:
 
  - (a) *assess the adequacy of existing pollution control measures and*
  - (b) *identify opportunities to reduce areas of surface contamination and minimise contact of stormwater with contaminants and*
  - (c) *identify opportunities to separate the clean and contaminated stormwater catchments and*
  - (d) *identify opportunities for harvesting clean stormwater for beneficial reuse and*
  - (e) *identify the infrastructure (including its appropriate structural design) required to effectively manage stormwater in each of the stormwater catchments.**
3. *A program of activities to construct measures to improve stormwater management on the site, including but not limited to:
 
  - (a) *a program of activities informed by 1 and 2 above and*
  - (b) *stormwater quality monitoring to inform the effectiveness of (a) above.**
4. *The operator is required to propose a reasonable timetable for consideration of approval by the*

*and 2010 have identified a number of exceedances of release limits of stormwater, with an increase in the last 12 months.*

*The Department has consulted with the operator on a number of occasions and discussed the implications of the exceedances. However, such consultation has not resulted in any action by the operator in relation to reducing unlawful stormwater releases.*

*The Department estimates that it will take at least 12 months for the operator to upgrade the site to a standard that results in compliance with stormwater release limits.*

*After considering all of the issues and the estimated time-frame for the operator to achieve compliance, the Department considers that requiring the operator to provide a draft TEP is the most appropriate and effective course of action.*

*As ABC Pty Ltd is currently operating in a regional area, the Department has allowed ABC Pty Ltd 9 weeks (5 weeks more than for an urban area) to develop the plan.*

<i>administering authority for the above actions to be completed.</i>	
---	--

## 7. Recommendation

The responsible officer is required to make a recommendation in relation to the alleged breach. For example:

<i>It is the opinion of the Department that ABC Pty Ltd failed to comply with development conditions D11 and D12 of development approval IPDE123456 by allowing stormwater to leave 24 Jones Road and enter Murphy Creek. After considering all factors the Department has determined that requiring a draft TEP would be the most effective way of achieving the operator's compliance with the development conditions. It is recommended that a notice requiring a draft TEP be issued.</i>
---

Administrative decisions are made based upon the balance of probabilities. This means that the decision-maker must be able to determine whether, based upon the information available, it was more likely than not that the event occurred.

Officers are encouraged to consider alternative actions/tools, the Department's enforcement guidelines, details of any consultations including site visit details and discussions with the ERA contact officer (if applicable) prior to making a recommendation. The reasonableness of proposed timeframes for the completion and submission of the draft TEP for consideration and approval, and the period over which the TEP is to be carried out, should be taken into account. For example, if the location is geographically isolated, or there is an impending wet season, the Department may consider allowing additional time for the recipient of the notice to prepare the draft TEP.

## 6. Approval

The assessment report is to be approved by an appropriately delegated officer. The Department's list of delegations can be found at: <http://insite2.dnr.qld.gov.au/derm/delegations/>

### Step 2 - Complete the notice requiring a TEP

The notice requiring a draft TEP must meet a number of legislative requirements in order to be legally binding. A requirement to prepare and submit a draft TEP must be made by written notice which must state—

- the grounds on which the requirement is made and
- the matters to be addressed by the TEP and
- the period over which the TEP is to be carried out and
- the day (at least a reasonable period after the notice is given) by which the TEP must be prepared and submitted to the Department and
- the review or appeal details.

A template notice requiring a draft TEP is included in the TEP material.

The notice and the assessment report must be signed by the decision-maker.

## Service of a notice requiring a draft TEP

Service means delivery to the party who will be responsible for actioning the notice. Officers are encouraged to use their discretion as to the most appropriate form of service, having regard to the recipient in question.

Methods of service are provided for in ss39 and 39A of the *Acts Interpretation Act 1954* (AI Act).

A notice requiring a draft TEP may be served:

- on a person:
  - by delivering it to the person personally or
  - by leaving it at, or by sending it by post, facsimile or similar facility (e.g. email) to the person's last known place of residence or business or
- on a body corporate - by leaving it at, or sending it by post, facsimile or similar facility (e.g. email) to the head office, a registered office or a principal office of the body corporate.

The date, time and method of service should be documented by contemporaneous notes, a file note, any receipts arising from the postage or any facsimile confirmations and email 'read' receipts.

## What follow-up is required?

It is important that the matter is appropriately followed up to make sure that the person to whom the notice requiring a draft TEP is issued complies within the required time-frame. Follow-up is to be scheduled by the relevant officer and confirmed with the business area manager. The business area manager is responsible for ensuring follow-up is undertaken within the agreed time frame.

Once a notice has been issued, dates for the submission of the draft TEP and the review and appeal periods should be diarised and monitored. If the draft TEP is not submitted by the due date, follow-up should be carried out by way of a site visit or telephone call. The recipient should be reminded that the time-frame has expired and that non-compliance with the notice could lead to prosecution.

The recipient of the notice requiring a draft TEP may contact the Department during the period of the notice and establish legitimate reasons for non-compliance with the relevant time frame. In this instance the Department may consider granting an extension of time. However, it must be remembered that the affected person should communicate any issues with time-frames prior to their expiration. For further information regarding amendments to an issued notice requiring a draft TEP, please see the paragraph below headed 'Amendments to an issued notice requiring a draft TEP'.

## What are my record-keeping responsibilities?

Officers are required to record all allegations of non-compliance in the EcoTrack system. This includes creating a complaint report, uploading copies of any relevant documents, updating the description field with commentary on actions and recording any decisions made on the enforcement measures screen (this includes a decision to take no further action). Hard copies of any relevant documents should be placed on the paper file. The Department is required to make and record an informed decision about all allegations of non-compliance.

## Amendments to an issued notice requiring a draft TEP

If minor changes to the notice requiring a draft TEP or an extension of time to respond are required, the recipient of the notice should be notified in writing.

If significant changes are required, officers should, in order to avoid confusion, repeal (revoke) the original notice, and issue a fresh one on the same grounds with the necessary changes.

The repeal and issue of a fresh notice requiring a draft TEP should be carried out in the same way, and subject to the same conditions as the issuing of the original notice. Accordingly, a new assessment report should be completed and endorsed by the appropriate delegate.

It is preferable if the decision to issue a fresh notice is made by the original decision-maker. If this is not possible the decision should be made by a person with the appropriate delegation who holds a position equal to or higher than that of the original decision-maker.

Officers should also update and record the changes or the decision to repeal and re-issue the notice in EcoTrack or CIRaM and place hard copies of any documents on the paper file.

## Review of decisions and appeals

The provisions regarding review of decisions and appeals may be found in Chapter 11, Part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision made by the Department in respect to a notice requiring a draft TEP may apply for a review of an original decision by submitting an application on the approved form to the Department—

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or
- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the Planning and Environment Court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court by filing written notice of appeal with the registrar of the Court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the Court extends the period for filing the notice of appeal.

The court may grant a stay of a decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

## Non-Compliance with a notice requiring a draft TEP

Officers must respond and may take further action in relation to non-compliance with a notice requiring a draft TEP. The following issues should be considered—

- **Providing extra time** – If extra time to comply has been granted, officers should document the details of the extra time allowed and the reasons for giving the extension of time. Confirmation of these details should be provided in writing to the recipient of the notice.
- **Other tools** – It may be that using another compliance tool would be more likely to achieve compliance. For example, issuing an Environmental Protection Order (EPO) in relation to the non-compliance may be a more appropriate way to achieve compliance due to the far higher penalty for breaching the EPO.
- **Prosecution** – If no other action is likely to be effective, officers should consider prosecuting a non-compliant recipient of a notice requiring a TEP for both failure to comply with the notice as well as for the environmental harm being caused.

### **What penalties exist for non-compliance with a notice requiring a draft TEP?**

A person must comply with a notice requiring a draft TEP, unless the person has a reasonable excuse (s332(5)).

Maximum penalty for non-compliance with a notice requiring a TEP—

For an individual – 100 penalty units or \$10,000.00.

For a corporation – 500 penalty units or \$50,000.00.

# Procedural guide

## *Environmental Protection Act 1994* Transitional environmental program (TEP)

### Part 2 - Considering and making a decision about a draft TEP

---

*This document is designed to assist users to critically evaluate the content of a draft TEP and assess whether or not the proposed objectives and actions meet the legislative requirements.*

#### Consideration of a draft TEP submitted by a person or public authority

If a person submits a draft TEP to the Department of Environment and Resource Management (the Department), the Department is required to consider the draft TEP and make a decision whether to approve or refuse the draft TEP, or to approve it with conditions.

Section 337 of the *Environmental Protection Act 1994* (the Act) provides that the Department must make its decision within 20 business days after—

- if a public notice is required under s335—the day stated in the notice as the day by which public submissions may be made to the Department or
- otherwise—the application date.

The terms *application date* and *person* are defined below.

#### Application date (s552)

The *application date* is important because many actions in relation to a draft TEP must be made within a certain number of days from the application date. Subsection 552(2) of the Act states that the application date relating to a draft TEP is 10 business days after the day it has been submitted to the Department.

However, if the Department requires additional information about the draft TEP within 8 business days after the day it has been submitted, the application date is the day the Department states in a written notice to the applicant as being the application date (s552(3)). This day must not be earlier than two business days after the person has received the written notice (s552(6)).

If, within 8 business days after a person submits a draft TEP, the Department advises the person who made the submission that the TEP (or proposed amended TEP) does not contain or provide for a matter mentioned in s331 (content of a program), and the person is required by the Department to amend the submission so that the TEP (or proposed amended TEP) is compliant with s331 and to resubmit the submission to the Department, the application date is the day that is 10 business days after the day the amended TEP is submitted to the Department.

Or, if the Department requires additional information about the amended TEP within 8 business days after the day the amended TEP is submitted to the Department, the application date is the day the Department states in a written notice to the applicant as being the application date (s552(5)). This day must not be earlier than 2 business days after the person has received the written notice (s552(6)).

#### Person

The term *person* includes an individual, public authority or corporation.

### Fee for consideration of a draft TEP (s334)

A person that submits a draft TEP to the Department for consideration and approval must pay to the Department the fee prescribed by regulation. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

An invoice for the fees incurred should be issued to the person that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued.

### What must be included in the content of a draft TEP? (s331)

Section 331 of the Act requires that a draft TEP must, for the activity to which it relates—

- (a) state the objectives to be achieved and maintained under the TEP for the activity and
- (b) state the particular actions required to achieve the objectives, and the day by which each action must be carried out, taking into account:
  - (i) the best practice environmental management for the activity and
  - (ii) the risks of environmental harm being caused by the activity and
- (c) state how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented and
- (d) if the activity is to transition to an environmental standard, state:
  - (i) details of the standard and
  - (ii) how the activity is to transition to the standard before the TEP ends and
- (e) if the activity is to transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition, state:
  - (i) details of the condition and how the activity does not comply with it and
  - (ii) how compliance with the condition will be achieved before the TEP ends and
- (f) state the period over which the TEP is to be carried out and
- (g) state appropriate performance indicators at intervals of not more than six months and
- (h) provide for monitoring and reporting on compliance with the program.

### Is public notice required? (s335)

Public notice is required where the person submits a draft TEP for approval that states the TEP is to be carried out over a period of longer than three years. Within 2 business days after the application date, the person must give public notice of the submission by:

- an advertisement published in a newspaper circulating generally in the area in which the activity to which the draft program relates is, or is proposed to be, carried out and
- if the program relates to premises, a notice must also be placed on the premises and served on the occupiers of all adjoining premises

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- invite submissions on the draft TEP (s335(3)(b)) and state the day (at least 10 business days after the advertisement and service of notice) nominated by the Department as the day by which submissions may be made to the Department.

The notice must meet the requirements of the Act,

### **In what circumstances may the Department call a Conference? (s336)**

The Department may invite the person that has submitted a draft TEP, and another person that has made a submission under section 335 about the TEP, to a conference to help it decide whether or not to approve the draft TEP. See section 336 of the Act for details of notice and other requirements regarding conferences.

### **Other consultation and considerations**

Depending on the content of the draft TEP, officers may need to consult with other business units or Departments in order to ensure that the risks from, and effects of, the draft TEP have been fully understood. For example, if the draft TEP involves releases of water, Queensland Health and/or the Office of the Water Supply Regulator should be consulted. Releases to air may also require consultation with Queensland Health.

Officers should consider whether a formal risk assessment should be undertaken to ensure that any risks from approving the draft TEP are identified and adequately managed.

### **Consideration of draft TEPs (s337)**

The Department must decide whether to approve a draft TEP submitted to it within 20 business days after the application date. Or, if a public notice is required under s335, the Department must make a decision 20 business days after the day stated in the notice as the day by which submissions may be made to the Department. If public notice of the submission of the draft TEP is required to be given, the Department must be satisfied that public notice has been properly given before making a decision (s337(2)).

If the Department fails to decide whether to approve or refuse a TEP within the time it is required to make a decision, the failure is taken to be a decision by the Department to refuse to approve the program at the end of the time (s343).

### **What must be taken into consideration? (s338)**

When deciding whether or not to approve the draft TEP or the conditions (if any) of the approval, the Department—

- must comply with any relevant regulatory requirement and
- subject to the above, must also consider the following:
  - the standard criteria
  - additional information given in relation to the draft TEP and
  - the views expressed at a conference held in relation to the draft TEP.

If the draft TEP is prepared because of a requirement of a development condition of a development approval, the Department may approve the draft TEP only if it is not inconsistent with other conditions of the approval.

## Decision about draft TEP (s339)

Section 339 of the Act provides that the Department may—

- approve a draft TEP as submitted or
- approve a draft TEP as amended at the request, or with the agreement, of the Department or
- refuse to approve a draft TEP.

If the Department approves the draft TEP it may impose—

- any conditions the Department must impose under a regulatory requirement and
- any other conditions considered appropriate by the Department.

If the draft TEP is approved, the approval remains in force for the period stated in the notice of the approval given pursuant to s340 of the Act.

## How does an officer successfully consider and make a decision about a draft TEP?

Officers must complete an assessment report to document the decision whether to accept the draft TEP (with or without conditions), to require amendments to the draft TEP or to reject the draft TEP. If the draft TEP is accepted (with or without conditions) or rejected, a notice of decision must be issued under s340 of the Act.

### Step 1 - Complete the assessment report

Before issuing a notice of decision under s340 of the Act, officers are required to complete an assessment report which sets out the facts and circumstances relating to the matter and documents the decision-making process used in determining whether to approve or refuse the draft TEP (with or without conditions).

The assessment report lists all the matters that must be considered by officers during the decision-making process. This includes the criteria by which the TEP must be assessed, the matters that must be addressed by the draft TEP and the matters that officers must consider when making a decision about the draft TEP. Each matter has checkboxes beside it, as well as text fields for officers to provide further information if necessary. The text fields contain explanatory notes indicating the types of information that is to be provided. Officers should check the relevant checkboxes to indicate that the particular matter has either been adequately addressed or is not applicable to that particular draft TEP. If a matter is applicable, but has not been adequately addressed, the checkbox should not be checked, and details as to how the particular matter has not been adequately addressed should be inserted in the text field provided.

The following sections of the procedural guide are a guide to completing the assessment report. The numbering and headings of the sections in the procedural guide correlate with those in the assessment report for ease of reference. Officers should refer to the procedural guide for information while completing the assessment report.

The assessment report is not intended to replicate the Departmental file. Rather, it is designed to capture all critical aspects that have led to the Department's decision. Accordingly, officers should limit the information included to relevant points only.

A template assessment report may be accessed at the Compliance Support Materials site on the DERM intranet.

## 1. Brief history of the matter

Briefly outline any historical information relevant to this decision. This information should be presented in succinct, chronological dot points and should include the reasons why a draft TEP is now being considered, for example, as a result of a program notice, voluntary submission or in response to a notice requesting the submission of a TEP.

## 2. Matters that must be considered when making a decision about the draft TEP (s338)

A significant amount of care should go into checking and considering the potential effects of the draft TEP, because by approving the draft TEP, the officer is authorising everything it permits.

Accordingly, the assessment criteria are an instrumental part of the decision-making process. Firstly, they establish the critical objectives that the draft TEP must achieve and how the content of the draft TEP will deliver on these objectives. Secondly, from the view of compliance and enforceability, and to establish that the draft TEP passes the *SMART* test, the requirements must be specific, measurable, achievable, relevant and time-specific. These are vital considerations given that in future, the Department may have to establish beyond a reasonable doubt that the TEP has not been complied with in order to take action against the person for failure to comply with the TEP. For this reason, the contents of the draft TEP must be clearly drafted, unambiguous and easily auditable.

More information about drafting SMART requirements and conditions may be found in the [Procedural guide - Writing effective and enforceable conditions](#)

### ***Achieving compliance with the Act (s330)***

A TEP should, for the activity to which it is concerned, achieve compliance with the Act by doing one or more of the following things—

- reducing environmental harm caused by the activity
- detailing the transition of the activity to an environmental standard
- detailing the transition of the activity to comply with:
  - a condition, including a standard environmental condition, of an environmental authority or code of environmental compliance or
  - a development condition.

The term *environmental standard* is defined as being:

- an environmental standard (however called) set out, or otherwise provided for, in a regulation under the Act or
- an outcome or objective that is directed at protecting or enhancing environmental values set out in an environmental protection policy.

A *standard environmental condition* for an environmental authority or code of environmental compliance means a standard environmental condition approved by the Minister pursuant to s549 of the Act.

A *development condition* of a development approval means a condition of the approval imposed by, or because of a requirement of, the Department if it is the assessment manager or concurrence agency for the application for the approval.

The draft TEP must set out how the activity is currently in non-compliance with the Act and how the person proposes to make the activity compliant. If it is not clear from the information provided in the draft TEP that by

## TEP Part 2 – Considering and making a decision about a draft TEP

doing one or more of these things compliance with the Act will be achieved by the end of the operative period of the TEP, the draft TEP must not be approved.

### **Content of the TEP (s331)**

A TEP, for the activity to which it relates, must include the following—

#### **(a) Objectives to be achieved and maintained under the TEP**

A draft TEP must clearly set out what it is trying to achieve. For example:

##### *EXAMPLE 1*

*To bring the operator into compliance with conditions G12 and H5 of development approval 123456*

##### *EXAMPLE 2*

*To prevent or minimise environmental harm caused by the migration of landfill gas.*

The objectives should be as specific and clear as possible so that, if the draft TEP is approved, the Department can assess whether the objectives have been met.

#### **(b) State the particular actions**

The draft TEP must set out the actions that the person will carry out in order to achieve the objectives. It is important that the actions are as definite, specific and as clear as possible. If they are vague or uncertain, it will be difficult for the Department to assess whether the person is doing what they have said they will do, which may prevent the Department from taking enforcement action in future. Each action must have a due date by which it will be completed, and must comply with the SMART principles.

Progress reporting dates and final reporting dates should be included in the actions.

In stating the particular actions required to achieve the objectives, the draft TEP must take into account best practice environmental management. Officers should refer to s21 of the Act for a definition of *best practice environmental management*.

#### **(c) Prevention and minimisation of environmental harm**

The risks of environmental harm being caused by the activity should also be taken into account. The draft TEP must state how any environmental harm that may be caused by the activity will be prevented or minimised, including any interim measures that are to be implemented.

#### **(d) Transition to an environmental standard**

If the objective of the draft TEP is to transition to meet an environmental standard, the draft TEP must provide details of the standard and set out how the activity is to transition to the standard before the operative period of the TEP comes to an end. Please see 'Achieving compliance with the Act' above for a definition of *environmental standard*.

#### **(e) Transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition**

If the objective of the draft TEP is for an activity to transition to comply with a condition of an environmental authority or code of environmental compliance, or a development condition, the draft TEP must set out each condition and detail how the activity does not comply with the condition. The draft TEP must also state how compliance with the condition will be achieved before the end of the operative period of the TEP.

## TEP Part 2 – Considering and making a decision about a draft TEP

### (f) Period over which the TEP is to be carried out

To be approved, the draft TEP must state the period over which the TEP is to be carried out. If the person has submitted for approval a draft TEP that states it will be carried out over a period longer than three years, the person must give public notice of the submission within 2 business days after the application date in accordance with s335 of the Act.

### (g) Performance indicators

The draft TEP must state appropriate performance indicators at intervals of not more than 6 months. The performance indicators must show how the applicant is progressing in achieving the objectives of the TEP. The indicators must also be capable of being measured and be specific enough to enable the Department to assess with certainty whether or not they have been met. The date on which each performance indicator will be met must be set out in the TEP.

### (h) Monitoring and reporting

The draft TEP must provide for sufficient monitoring and reporting on compliance with the program. It should provide for the person to monitor and report on—

- the carrying out of the actions
- whether or not the objectives are being achieved
- whether or not the required time-frames are being met and
- any environmental and scientific testing.

The draft TEP should also allow for the person to provide—

- reports on progress with the TEP, including any failure to carry out prescribed actions by the stipulated dates
- reports on any environmental monitoring requirements (including interpretation) and
- a final report to the Department demonstrating that compliance with the Act has been achieved.

### **Regulatory requirements (s338(1)(a))**

Sections 46-64 of the *Environmental Protection Regulation 2008* specify the matters that must be considered when the Department is making environmental management decisions. An *environmental management decision* is a decision under the Act for which the Department is required to comply with regulatory requirements. All matters relevant to the draft TEP must be considered when making a decision about it, for example, if there are certain matters specified where release of water to land is contemplated.

### **Standard criteria (s338(1)(b)(i))**

As stated above, the Department **must** consider the standard criteria, set out below, before deciding whether or not to approve the draft TEP—

- **The principles of ecologically sustainable development as set out in the ‘National Strategy for Ecologically Sustainable Development (ESD)’**

Consider the following guiding principles:

- Has the decision effectively integrated long- and short-term economic, environmental, social, and equity considerations?

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- Has due regard been given to the precautionary principle? In other words, where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- Does the decision have due regard to the global dimensions of environmental impacts and policies?
- Does the decision assist in the development of a strong, growing and diversified economy, which can enhance the capacity for environmental protection?
- Has the need to maintain and enhance international competitiveness in an environmentally sound manner been considered when making the decision?
- Have cost effectiveness and flexible policy instruments (for example, improved valuation, pricing and incentive mechanisms) been adopted?
- Does the decision/action allow for broad community involvement on issues that affect them?
- **Any applicable Environmental Protection Policies (EPPs)**
  - Is the draft TEP consistent with the EPPs on water, air, noise and waste (where relevant)?
- **Any applicable Commonwealth, State or local government plans, standards, agreements or requirements**
  - Consider guidelines such as the State and Regional Coastal Plan, National Health and Medical Research Council (NHMRC) and the Australian and New Zealand Environment and Conservation Council (ANZECC) Guidelines.
- **Any applicable environmental impact study, assessment or report**
  - Consider any findings or recommendations that are relevant to the draft TEP.
- **The character, resilience and values of the receiving environment**
  - Does the draft TEP have regard to the environmental values of the receiving environment?
  - What is the impact on the values of the actions contained in the draft TEP?
- **All submissions made by the applicant and submitters**
  - Consider any submissions made by the applicant and anyone who properly makes a submission about the draft TEP.
- **Best practice environmental management for the activity to which the draft TEP relates**
  - Analyse how approving the draft TEP with or without conditions will ensure that best practice environmental management is achieved.
- **The financial implications of the requirements**
  - Explore the financial implications for the client in complying with conditions of the TEP. Are they reasonable in the particular circumstances?
- **The public interest**
  - Is it in the interest of the community that the draft TEP be approved?
- **Any applicable site management plan**
  - If there is a site management plan for contaminated land (approved under Chapter 7, Part 8 of the Act), and is the draft TEP consistent with the site management plan? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled?

## TEP Part 2 – Considering and making a decision about a draft TEP

Consult with the Contaminated Land Unit as early as possible when there are any contaminated land issues.

- **Any relevant integrated environmental management system or proposed integrated environmental management system (IEMS)**
  - Is the draft TEP consistent with the IEMS? If not, is the inconsistency necessary for addressing the matters in the draft TEP? How will any inconsistency be reconciled?
- **Any other matter prescribed by a regulation**
  - See 'regulatory requirements' above.

### ***Additional information (s338(1)(b)(ii))***

The Department must consider any additional information given in relation to the draft TEP. Has all supporting information provided by the applicant been considered? Having considered the draft TEP and any supporting information, is it clear that the draft TEP achieves compliance with the Act?

### ***Views expressed at a conference (s338(1)(b)(iii))***

If a conference has been held as part of a public notice process, the views expressed at that conference in relation to the draft TEP must be considered and the reasons for having regard to, or not having regard to, those views must be recorded.

### ***Consistency with development conditions of a development approval (s338(2))***

If the draft TEP is prepared because of a development condition of a development approval, the Department must not approve the draft TEP unless it is consistent with other conditions of the development approval.

### ***Public notice of submission of draft TEP (s337(2)) and substantial compliance with the Act (s342)***

If public notice is required, before approving the draft TEP, ensure that the person or public authority submitting the draft TEP has properly given public notice and complied with the requirements of s335 of the Act.

The Department must be satisfied that the public notice has been properly given before making a decision (s337 of the Act). If the Department is not satisfied that public notice has been properly given, it may consider and decide whether to approve the draft program if it is satisfied there has been substantial compliance with the public notice requirements of the Act (s342).

See 'Is public notice required?' above for further information regarding public notice.

### ***Satisfaction that the draft TEP meets the requirements of the Act***

Having considered all of the above matters, officers completing the assessment report must decide whether they are satisfied the draft TEP adequately addresses all of the relevant matters. If any of the issues in the assessment report were answered 'no', officers should proceed to section 4. Otherwise, proceed to section 3.

## **3. Request for further information and/or amendments to the draft TEP**

In some cases the draft TEP may substantially address the required matters, but cannot be approved because some matters have not been adequately addressed. In this situation, the Department may request that further information be provided or that particular amendments be made to the draft TEP. It is important to recognise that if there are major problems with the draft TEP, or a large number of matters that have not been addressed by the draft TEP, officers should recommend to the Delegate that it not be approved and a notice of decision should be sent to the person or public authority that submitted the draft TEP advising of this decision.

## TEP Part 2 – Considering and making a decision about a draft TEP

---

However, if it is likely that the draft TEP would be approved if further information is provided or some changes are made, it is preferable for the Department to write to the person submitting the draft TEP and request the further information and/or amendments, rather than approve the TEP subject to conditions, owing to the fact that conditions may be difficult to enforce. See ‘Key considerations regarding conditions’ below for further information.

Officers should consult with their supervisor when considering whether to request further information or amendments to the draft TEP, and in formulating the amendments required to be made (if any). A request for amendments to a draft TEP should be made in writing. If, after the draft TEP is amended, it is approved, the amended TEP will form part of the approved TEP.

It is highly recommended that a request for amendments be made within 8 business days after the draft TEP is submitted to the Department, as this means that the application date will then be 10 business days after the date that the amended TEP is submitted to the Department. Consequently, the Department will have additional time to consider the amended TEP and make a decision whether or not to approve it.

### **Time-frames**

For information regarding a change in time-frames if further information is sought or the Department requests amendments to the draft TEP, see the section ‘Application date’ above.

### **Minor amendments and/or further information**

If only very minor amendments are necessary, officers should consider suspending the decision-making process, so as to provide the opportunity to the person submitting the draft TEP to make the requested amendments. If the requested amendments are made, the assessment report can then be completed to reflect the amendments. Then, if all relevant matters have been adequately addressed, officers may recommend that the Delegate approve the draft TEP.

### **More significant amendments**

If the amendments required are more significant or complicated, officers should list the requested amendments in the assessment report and recommend that the Delegate approve a request for the required amendments. Then, if the amendments are provided by the person submitting the draft TEP, officers must complete a fresh assessment report and provide a new recommendation to the Delegate.

## **4. Approval of the draft TEP**

The assessment report lists all the matters that must be considered by officers during the decision-making process, with checkboxes beside each matter. At least one checkbox must be checked beside each matter before a decision can be made to approve the draft TEP.

### **Key considerations regarding conditions**

The Act does make provision for an approval of a draft TEP to be subject to conditions the Department considers appropriate. However, the enforceability of conditions placed on a TEP is unclear. Accordingly, conditions should not be imposed except for minor matters. Conditions must not be used to alter the terms of the TEP itself. If the TEP is not satisfactory, it must be refused or amendments sought from the applicant. Conditions in the notice of decision should not be used as a quasi-development approval, or to alter or amend the TEP to meet the requirements of the Act.

### Financial assurance conditions (ss364-367)

Under s364 of the Act, the Department may, by condition of an approval of a TEP, require the holder of the approval to give the Department financial assurance as security for—

- compliance with any conditions of the TEP and
- costs or expenses, or likely costs or expenses, that the Department incurs, or might reasonably incur, in taking action to:
  - prevent or minimise environmental harm or rehabilitate or restore the environment, in relation to the carrying out of an activity under a TEP approval or
  - secure compliance with the TEP, or any conditions of the TEP, for which financial assurance has been given.

However, under s364(2) the Department may impose a condition requiring a financial assurance to be given only if it is satisfied that the condition is justified, having regard to—

- the degree of risk of environmental harm being caused, or that might reasonably be expected to be caused, by the activity carried out, or to be carried out, under the program and
- the likelihood of action being required to rehabilitate or restore and protect the environment because of environmental harm being caused by the activity and
- the environmental record of the holder.

Section 365 of the Act provides that before approving a draft TEP subject to the condition that financial assurance be given, the Department must give the person who submitted the draft TEP a written notice that must –

- state the grounds for the condition and
- state the form and extent of the financial assurance and
- invite the person to make representations to the Department to show why the approval of the draft TEP should not be subject to the condition and
- state the period (at least 22 business days after the notice is given to the person) within which the representations may be made and
- the representations must be made in writing (s365(3)).

Within 20 business days after the end of the period stated in the notice (s365(4)), the Department must—

- consider the representations properly made by the person and
- if the Department gives the approval subject to the condition that the holder of the approval give financial assurance—the Department must give written notice to the person giving reasons for imposing the condition.

## 5. Refusal to approve a draft TEP

The draft TEP cannot be approved unless a checkbox has been checked next to each matter listed on the assessment report, either to confirm the matter has been adequately addressed, or to indicate that the matter is not applicable to the draft TEP. If a checkbox has not been checked next to a matter, officers are to provide details in the text field provided.

## TEP Part 2 – Considering and making a decision about a draft TEP

---

If any of the required matters are not addressed in the draft TEP, officers should either recommend a refusal of the draft TEP, or seek further information or amendments to the draft TEP from the person that submitted it. (See 'Request for further information and/or amendments to the draft TEP' above). If the deficiencies in the draft TEP are too serious to be addressed by further information and amendments, the Department should refuse to approve the draft TEP.

### 6. Provide for natural justice

The Department must ensure that decisions are made in a fair and consistent manner. This includes ensuring that the affected individual is provided with 'natural justice' (that they are given an opportunity to make their case for why the decision should go in their favour) and that people involved in making the decision are free from bias or the perception of bias.

Any submissions made by the applicant that have not already been considered earlier in the assessment report process must be documented in section 5 of the assessment report.

### 7. Recommendation

Officers are required to make a recommendation as to whether or not the draft TEP should be approved (with or without conditions) or refused.

### 8. Approval

An officer with the appropriate delegation must consider the contents of the assessment report and the recommendation and make a decision about whether to approve (with or without conditions) or refuse the draft TEP. The Department's list of delegations can be found on the Department's intranet at <http://insite2.dnr.qld.gov.au/derm/delegations/>.

## Step 2 – Complete the notice of decision

Section 240 of the Act provides that within 8 business days of making a decision under s339, the Department must give the person or public authority that submitted the draft TEP a written notice of the decision (the notice of decision).

If the delegate approves the draft TEP, the notice of decision must—

- identify the documents forming the approved TEP, including any amendments under s339(1)(a)(ii) and
- state any conditions imposed on the approval by the Department and
- state the day the approval ends.

If the draft TEP is approved, the approval remains in force for the period stated in the notice of decision (s339(3)).

### ***Content of approved program (s341)***

An approved TEP consists of the following—

- the draft program submitted under section 332 or 333, as amended at the request, or with the agreement of the Department

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- any conditions imposed on the program by the Department.

### **Information notice**

If the Department refuses to approve the draft TEP, or approves it with conditions, the notice of decision given to the person or public authority that submitted the program must be an information notice (s340(3)).

An *information notice* means a written notice stating—

- the decision and
- the reasons for the decision and
- the review and appeal details.

Officers must issue an invoice for the fees for consideration of the draft TEP to the person or public authority that has submitted the draft TEP for approval at the time when the notice stating the Department's decision is issued. See: [Operational policy - Transitional Environmental Program \(TEP\) fees](#)

### **What is the effect of compliance with the approved TEP? (s346)**

An approved TEP protects the holder, or a person acting under the approval, from enforcement action for non-compliance with the relevant—

- regulation or
- environment protection policy (EPP) or
- environmental authority (EA) held by the holder or
- development condition of a development approval (DA) or
- standard environmental condition of a code of environmental compliance for a chapter 4 activity or
- accredited environmental risk management plan (ERMP) under the Great Barrier Reef protection measures.

### **What follow-up is required?**

It is an offence for the holder of an approved TEP to contravene the program. Officers should diarise all performance indicator requirements listed in the program or conditions and ensure they are monitored for compliance.

Officers are encouraged to use tools such as reminders in Microsoft outlook to ensure the matter is followed up in a timely manner.

### **Review of decisions and appeals**

The provisions regarding review of decisions and appeals may be found in Chapter 11, Part 3 of the Act.

The Act specifies that a person who is dissatisfied by a decision made by the Department about a draft TEP, may apply for a review of an original decision by submitting an application on the approved form to the Department—

- within 10 business days after the day on which the person received notice of the original decision or the Department is taken to have made the decision, or

## TEP Part 2 – Considering and making a decision about a draft TEP

---

- if there are special circumstances, whatever longer period the Department allows.

An approved form for the review of an original decision may be found at [Application form - Review of Original Decision](#)

A person who has made an application for review of an original decision may immediately apply to the Planning and Environment Court for a stay of the decision.

If the person is dissatisfied with the review decision, the person may appeal against that decision to the Planning and Environment Court by filing written notice of appeal with the registrar of the Court within 22 business days after the day the person receives notice of the decision or the decision is taken to have been made, unless the Court extends the period for filing the notice of appeal.

The court may grant a stay of a decision appealed against until such time the appeal is decided. An appeal against a decision does not affect the operation or the carrying-out of a decision unless the decision is stayed.

Further information about review of decisions and appeals may be found in the [Information sheet - Internal review \(DERM\) and appeal to the Planning and Environment Court](#)

### **What penalties exist for a contravention of a requirement of a TEP (s432)?**

The holder of an approval of a TEP, or a person acting under a TEP, must not wilfully contravene a requirement of the program.

Maximum penalty—1665 penalty units (\$166,500.00) or 2 years imprisonment.

The holder of an approval of a TEP, or a person acting under a TEP, must not contravene the program.

Maximum penalty—835 penalty units (\$83,500.00).

The maximum penalty for a corporation is five times the penalty for an individual.

### **What penalties exist for contravention of a condition of approval (s432A)?**

A person must not, without reasonable excuse, contravene a condition of an approval of a transitional environmental program.

Maximum penalty—835 penalty units (\$83,500.00)

The maximum penalty for a corporation is five times the penalty for an individual.

# Chapter 1

## Introduction

---

This Fitzroy Basin Resource Operations Plan January 2004 implements the Water Resource (Fitzroy Basin) Plan 1999.

A water resource plan (WRP) is a plan prepared under the provisions of the *Water Act 2000* (Water Act), approved by the Minister and is subordinate legislation. A WRP sets the strategic framework for the allocation and sustainable management of water.

A resource operations plan (ROP) is a plan prepared under the provisions of the Water Act by the chief executive to implement a WRP for certain water in all or part of the plan area. A ROP defines the rules that guide the allocation and management of water to achieve the objectives set in the WRP.

The scope of the Fitzroy Basin Resource Operations Plan is detailed in Chapter 2.

# Chapter 2

## Scope of Resource Operations Plan

### Overview

The Water Act specifies the elements that a resource operations plan (ROP) must contain or address – for instance its name, the area and the water to which it applies, the water resource plan (WRP) it is being prepared for, and the infrastructure involved. This chapter outlines some of these requirements.

#### 2.1 WRP under which the ROP is made

The ROP is made to implement the Water Resource (Fitzroy Basin) Plan 1999.

#### 2.2 Name of the ROP

The name of this ROP is the Fitzroy Basin Resource Operations Plan January 2004.

#### 2.3 Commencement of the ROP

The Fitzroy Basin ROP was approved by the Governor in Council on 18 December 2003 and came into effect on 9 January 2004. The ROP commenced on the first business day after the ROP took effect.

Amendments to the ROP take effect on the day approval by the Governor in Council is notified in the Government Gazette. Amendments to the ROP commence on the first business day after the amendment to the ROP takes effect.

#### 2.4 ROP area

The area to which the ROP applies is the entire Fitzroy River Basin covered by the WRP. The area covered is shown in Map A.

#### 2.5 Water to which the ROP applies

The ROP applies to water in each watercourse, lake or spring, and water conserved by a weir, dam or barrage constructed in, on or over a watercourse, lake, or spring.

#### 2.6 Water infrastructure to which the ROP applies

The ROP applies to the infrastructure outlined in the attachments for the following water supply schemes:

- Dawson Valley Water Supply Scheme Attachment 4.1D;
- Nogoia Mackenzie Water Supply Scheme Attachment 4.2D;
- Lower Fitzroy Water Supply Scheme Attachment 4.3D; and
- Fitzroy Barrage Water Supply Scheme Attachment 4.4D.

## **2.7 Sustainable management and allocation of water**

The WRP states:

‘Water in the plan area must be managed in an integrated and sustainable way that seeks to achieve a balance in providing

- security for water users in the plan area;
- security for holders of resource operations licences in the plan area;
- for further water-related development in the plan area; and
- for environmental water requirements for aquatic ecosystems in the plan area.’

These outcomes are to be achieved through the environmental flow objectives, water allocation security objectives and strategies specified in the WRP.

## **2.8 Zones**

For the purpose of defining the location of a water allocation within a particular reach of river, geographic zones have been defined in parts of the ROP area.

The attachments to this chapter define these zones, according to the river systems in the ROP area. The river systems and relevant attachments are:

- The Dawson River Attachment 2.1;
- The Nogoia and Mackenzie rivers Attachment 2.2; and
- The Fitzroy River Attachment 2.3.

The zones are shown in maps in each of these attachments.

# Chapter 3

## Assessment

### Overview

#### Assessment framework

The assessment program is intended to assist in determining how effective the Water Resource Plan (WRP) strategies are in achieving the WRP's specified outcomes.

The outcomes relate to:

- Security for water users and holders of resource operations licences; and
- Providing environmental water for aquatic ecosystems.

The strategies specified in the WRP are designed to meet environmental flow objectives and water allocation security objectives that will in turn achieve these outcomes. The Resource Operations Plan (ROP) has been developed to ensure that these objectives are satisfied. The management arrangements in the ROP for supplemented water supply schemes and associated infrastructure, and those for unsupplemented water are dealt with in Chapter 4 and Chapter 5 respectively.

The assessment program will check for compliance with the management arrangements in the ROP and, over the long term, will assist in determining how effectively the strategies in the WRP are achieving the WRP outcomes.

The assessment framework is outlined in Figure 1.

The assessment program seeks to establish whether:

- The management rules are being complied with;
- The water resource plan is contributing to the ecological outcome; and
- The water resource plan is contributing to the security outcomes.

The information obtained by the monitoring activities of the assessment program will also contribute to an improved information base for future water planning within the Fitzroy Basin.

The responsibilities for monitoring and reporting activities required by the assessment program rest with the State Government and the holders of Resource Operations Licences (ROL holders).

**Figure 1: Assessment Framework**

### **Aquatic ecosystem assessment in the Fitzroy Basin**

The framework to assess the ecological performance of the strategies in the WRP is designed to confirm the detail of the implicit assumptions of the plan. The relevant assumptions fall into two categories:

- Specific flows create the aquatic conditions necessary to provide opportunity for an ecological response (for example, the first post-winter flow will create the conditions that enable yellowbelly fish to spawn and their eggs to hatch).
- Specific aquatic conditions provide opportunities for ecological responses (for example, if water velocity is sufficient to keep yellowbelly fish eggs suspended in the water column for approximately 2 to 3 weeks after spawning, the eggs and larvae have an increased chance of surviving)

The framework requires detailed understanding of the biology of organisms in order to find critical ecological responses (for example, death of individuals, breeding behaviour, successful recruitment) that depend on specific aquatic conditions (for example, water depth, water velocity, water temperature, length of time of inundation and seasonal timing).

Ecological responses might not necessarily be elicited given the provision of suitable aquatic conditions because other influences may prevent the response (for example, a chemical spill could kill all of the fish that would have otherwise spawned). Flow management can provide the opportunity for an ecological response but not guarantee the response.

The basis of the framework is as follows:

- Organisms respond to real-time specific aquatic conditions such as hydraulic characteristics of water depth and velocity;
- Water availability is currently managed by controlling hydrologic characteristics;
- Management of hydrologic characteristics controls the availability of specific aquatic conditions that give opportunities for ecological response; and
- Therefore, availability of specific aquatic conditions is the mediator for ecological responses to water management.

In the framework, the assessment of the effectiveness of delivery of ecological outcomes requires confirmation of:

- The provision of specific aquatic conditions that give opportunities for ecological response;
- The specifics of the aquatic conditions necessary for the ecological response; and
- The hydraulic model linking flow to specific aquatic conditions.

### **Related monitoring activities**

Other monitoring programs being carried out in the Fitzroy Basin are addressing different questions and hence collect different information. This includes the water quantity and quality monitoring programs carried out by the department. Other programs are conducted by agencies such as the Environmental Protection Agency, the Department of Primary Industries, universities and Cooperative Research Centres (CRCs). These other programs include short-term, localised projects of only 2 or 3 years that are targeted at significant issues. However, although at this point they are not integral to the ROP, they may provide data and findings suitable for integration at some later stage. The studies will also contribute to the knowledge

base used to develop future water resource plans.

### **Metering water entitlements**

Measuring water diversion and use is fundamental to responsible management of the State's water resources. Meters and/or other flow measurement devices are required to provide data for water management activities, including:

- Demonstrating compliance with management rules;
- Equitable sharing of available water;
- Property scale water management; and
- Water resource planning.

All water allocations will be metered. In addition, water licences identified by criteria set out in Section 5.5 of Chapter 5 will be amended to provide for metering.

### **3.1 Performance assessment**

The assessment of the overall performance of the water resource plan will incorporate analysis of the data collected from monitoring programs.

#### **3.1.1 Aquatic ecosystem monitoring program**

The aquatic ecosystem monitoring and reporting requirements are specified in Attachment 3.1.

#### **3.1.2 Other monitoring programs**

Information collected as part of other monitoring and assessment programs in the catchment may be used in the assessment of the ecological outcomes detailed in the water resource plan. These may include (but are not limited to) ROL holder monitoring, the state monitoring program ([www.nrw.qld.gov.au/water/monitoring/pdf/numeric.pdf](http://www.nrw.qld.gov.au/water/monitoring/pdf/numeric.pdf)), community monitoring programs, the National Action Plan for Salinity and Water Quality and specific research projects.

### **3.2 ROL holder monitoring and reporting requirements**

The monitoring and reporting requirements for the ROL holder for the Dawson Valley Water Supply Scheme are given in Attachment 4.1G.

The monitoring and reporting requirements for the ROL holder for the Nogo Mackenzie Water Supply Scheme are given in attachment 4.2G.

The monitoring and reporting requirements for the ROL holder for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3G.

The monitoring and reporting requirements for the ROL holder for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4G.

### **3.3 Departmental water monitoring data collection standard**

Where this plan requires monitoring by a ROL holder, including measurement, collection, analysis and storage of data, the ROL holder must ensure the monitoring is consistent with the

Water Monitoring Data Collection Standard.

The Water Monitoring Data Collection Standard may be reviewed and updated by the chief executive at any time.

The chief executive must notify the ROL holder at least 20 business days before any substantive changes are made to the Water Monitoring Data Collection Standard.

#### **3.4 Departmental water monitoring data reporting standard**

Where this plan requires transfer of data or reporting by a ROL holder, the ROL holder must ensure the transfer or reporting is consistent with the Water Monitoring Data Reporting Standard.

The Water Monitoring Data Reporting Standard may be reviewed and updated by the chief executive at any time.

The chief executive must notify the ROL holder at least 20 business days before any substantive changes are made to the Water Monitoring Data Reporting Standard.

#### **3.5 Monitoring data must be made available**

The ROL holder must transfer monitoring data to the chief executive upon request, and within the time requested.

# Chapter 4

## Supplemented water supply schemes

### Overview

Supplemented water is water that is supplied from a water supply scheme managed under a Resource Operations Licence (ROL).

Unsupplemented water management (for example, waterharvesting), which is covered in Chapter 5, is the responsibility of the department.

### Water supply schemes and their operation

Supplemented water management arrangements detailed in this Resource Operations Plan (ROP) cover the following water supply schemes:

- The Nogoia Mackenzie Water Supply Scheme;
- The Dawson Valley Water Supply Scheme;
- The Lower Fitzroy Water Supply Scheme; and
- The Fitzroy Barrage Water Supply Scheme.

The approximate extent of these water supply schemes is shown in Map B.

### Callide Valley Water Supply Scheme

This ROP does not deal with the Callide Valley Water Supply Scheme, which will be subject to an amendment to the ROP at a later stage.

In the interim, the scheme will continue to be operated and managed in accordance with SunWater's existing Interim Resource Operations Licence, issued in November 2000, unless otherwise amended.

### Monitoring and reporting

If, as a result of the monitoring required under this ROP, the ROL holder becomes aware of an incident or storage operation practice that may cause, or threaten to cause, material or serious environmental harm as defined by the Environmental Protection Act 1994 (EP Act), the ROL holder has an obligation under Section 320 of the EP Act to report the incident to the Environmental Protection Agency. This may include water released from storages not meeting the relevant water quality guidelines as determined by the Environmental Protection Policy 1997.

## 4.1 Dawson Valley Water Supply Scheme

### Overview

This section specifies the water management arrangements for the Dawson Valley Water Supply Scheme, which extends some 338 km along the Dawson River from the Glebe Weir pond to the downstream end of the Boolburra waterhole, which is near Duinga, or approximately 18 km upstream of the Fitzroy River junction.

### Priority group for authorisations supplied through Dawson channel system

Existing authorisations supplied through the Theodore and Gibber Gonyah channel systems have been converted as medium A priority water allocations, except where part or all of an authorisation has been converted as high priority water allocation under the conversion rules.

### Sub-schemes

The Dawson Valley Water Supply Scheme is divided into two sub-schemes. The upper Dawson sub-scheme includes Glebe, Gylanda, Orange Creek, Theodore, and Moura weirs and the Moura Offstream Storage, while the lower Dawson sub-scheme includes Neville Hewitt Weir.

Releases may not be made from the upper sub-scheme to supply water orders or maintain storage levels in the lower sub-scheme. The lower sub-scheme independently achieves higher reliabilities than the upper sub-scheme without the need for releases from the upper sub-scheme.

### Environmental management rules

The operating rules include strategies for meeting environmental flow requirements. Provisions are made for passing first post-winter flows and seasonal base flows.

For the upper Dawson sub-scheme, the first post-winter flow management strategy will be activated by specified flow criteria for flows downstream of Glebe Weir. For the lower Dawson sub-scheme, the strategy will be activated by specified flow criteria for flows either immediately downstream of Neville Hewitt Weir or downstream of the Don River junction. Management strategies apply for 21 days following activation, during which the ROL holder will be required, subject to specified exceptions, to pass inflows. There are no specific restrictions on taking supplemented water during this period.

The ROP also includes seasonal base flow management strategies for Theodore, Moura and Neville Hewitt weirs. The strategies require the ROL holder to pass base flows through these weirs whenever specified flow and storage level criteria occur.

### Water sharing rules

The water sharing rules specify the way the available water will be shared between the water allocation priority groups, namely medium, medium A and high.

The water sharing rules include announced allocation rules for medium, medium A and high priority water allocations, rules for sharing water to deal with occurrences of low water

availability (critical water supply water sharing rules), provision for the transfer of water from one water year to another, and provision for seasonal water assignment.

Seasonal assignment of water allocations for distribution losses associated with the Theodore or Gibber Gunyah channels is currently not permitted.

The ROP maintains the 20% announced allocation differential for medium A priority water allocations.

The critical water supply water sharing rules define how the available supplies are to be shared when available supplies are low, including securing supplies for essential water needs. The arrangements for July to September are activated only when the announced allocations cannot be met from available supplies.

#### **4.1.1 Extent of the water supply scheme**

The extent of the Dawson Valley Water Supply Scheme is:

- The Dawson River from the upstream limit of Glebe Weir (AMTD 356.5 km) to the downstream limit of the Boolburra waterhole (AMTD 18.37 km); and,
- Sections of tributaries of the Dawson River that contain water from natural waterholes and infrastructure within the above section of the Dawson River.

The Dawson Valley Water Supply Scheme is divided into:

- The upper Dawson sub-scheme; and
- The lower Dawson sub-scheme.

The extent of the upper Dawson sub-scheme is from the upstream limit of Glebe Weir (AMTD 356.5 km) to the effective upstream limit of Neville Hewitt Weir (AMTD 113 km), which is the upstream extent of the Harcourt waterhole.

The lower Dawson sub-scheme extends from the effective upstream limit of Neville Hewitt Weir (AMTD 113 km) to the downstream limit of Boolburra waterhole (AMTD 18.37 km), which is near Duaringa.

#### **4.1.2 Water allocations associated with the water supply scheme**

Authorisations supplied through the Dawson Valley Water Supply Scheme have been converted to water allocations under the rules given in Attachment 4.1B.

Details of water allocations converted from authorisations supplied through the Dawson Valley Water Supply Scheme are given in Attachment 4.1A.

The total volume of supplemented water allocations in the Dawson Valley Water Supply Scheme, for each zone and priority group, at commencement of the ROP, is given in Attachment 4.1C.

Water supplied under a water allocation may only be used for the purpose stated on that water allocation.

#### **4.1.3 Continuing interim water allocations associated with the water supply scheme**

An interim water allocation for 105 ML held by SunWater for the Back Creek Water Area will not be converted to a water allocation until the future arrangements for administration of the area and the volume and ownership details for the water allocation are resolved to the satisfaction of the chief executive. These matters will be resolved following a review of the Back Creek Water Area referred to in Section 6.2.5 of Chapter 6.

#### **4.1.4 Infrastructure associated with the water supply scheme**

The infrastructure associated with the Dawson Valley Water Supply Scheme is defined in Attachment 4.1D.

Infrastructure details defined in Attachment 4.1D may not be changed unless the change is provided for in Chapter 8.

#### **4.1.5 Infrastructure operating rules**

The rules for infrastructure operation and environmental management for the Dawson Valley Water Supply Scheme are given in Attachment 4.1E.

#### **4.1.6 Water sharing rules**

The water sharing rules for the Dawson Valley Water Supply Scheme are given in Attachment 4.1F.

#### **4.1.7 Monitoring and reporting requirements for Resource Operations Licence holder**

The monitoring and reporting requirements for the ROL holder for the Dawson Valley Water Supply Scheme are given in Attachment 4.1G.

#### **4.1.8 Water allocation change rules**

The water allocation change rules for the Dawson Valley Water Supply Scheme are given in Attachment 4.1H.

#### **4.1.9 Amending critical water supply management arrangements**

The rules for amending critical water supply management arrangements for the Dawson Valley Water Supply Scheme are given in Attachment 4.1I.

## 4.2 Nogo Mackenzie Water Supply Scheme

### Overview

This section specifies the water management arrangements for the Nogo Mackenzie Water Supply Scheme, which extends for some 398 km along the Nogo and Mackenzie rivers from the Fairbairn Dam pond to the Springton Creek junction. The Springton Creek junction is located approximately 29 km upstream from the Dawson River junction.

### Environmental management rules

The operating rules include strategies for meeting environmental flow requirements. Provisions are made for passing first post-winter flows and seasonal base flows.

For Fairbairn Dam, the first post-winter flow management strategy will be activated by specified flow criteria for flow in the Mackenzie River immediately downstream of the Comet River junction. For Bedford Weir, the first post-winter flow management strategy will be activated by specified flow criteria for flow in the Mackenzie River immediately downstream of Bingegang Weir. The management strategy applies for Fairbairn Dam for 19 days following activation, and 21 days for Bedford Weir, during which the ROL holder will be required, subject to specified exceptions, to pass inflows to Fairbairn Dam and Bedford Weir through these storages. There are no requirements under the management strategy applying to Selma, Bingegang or Tartrus weirs. There are no specific restrictions on taking supplemented water during this period.

The discharge capacity of the outlet of Fairbairn Dam will be increased from its current (approximately) 600 ML/day limit to up to about 1,500 ML/day to achieve the first post-winter flow objectives at Bedford and Bingegang Weirs. The implementation schedule provided in Attachment 9 gives a timeframe for the ROL holder to comply with this higher release rate requirement.

The ROP also includes seasonal base flow management strategies for Bedford, Bingegang and Tartrus weirs. The strategies require the ROL holder to pass base flows through these weirs whenever specified time of year, flow and storage level criteria occur.

### Water sharing rules

The water sharing rules specify the way the available water will be shared between the water allocation priority groups, namely medium and high.

The water sharing rules include announced allocation rules for medium and high priority water allocations, rules for sharing water to deal with occurrences of low water availability (critical water supply water sharing rules), provision for the transfer of water from one water year to another, and provision for seasonal water assignment.

Seasonal assignment of water allocations for distribution losses associated with the Selma or Weemah channels and Blackwater pipeline is currently not permitted.

The critical water supply water sharing rules define how the available supplies are to be shared when available supplies are low, including securing supplies for essential purposes.

#### **4.2.1 Extent of the water supply scheme**

The extent of the Nogo Mackenzie Water Supply Scheme is:

- The Nogo River from the upstream limit of Fairbairn Dam (AMTD 737.5 km) to the Comet River junction (AMTD 611.5 km);
- The Mackenzie River from the Comet River junction (AMTD 611.5 km) to the Springton Creek junction (AMTD 339.3 km); and
- Sections of tributaries of these rivers that contain water from natural waterholes and infrastructure within the above sections of the Nogo and Mackenzie rivers.

#### **4.2.2 Water allocations associated with the water supply scheme**

Authorisations supplied through the Nogo Mackenzie Water Supply Scheme have been converted to water allocations under the rules given in Attachment 4.2B.

Details of water allocations converted from authorisations supplied through the Nogo Mackenzie Water Supply Scheme are given in Attachment 4.2A.

The total volume of supplemented water allocations in the Nogo Mackenzie Water Supply Scheme, for each zone and priority grouping, at commencement of the ROP, is given in Attachment 4.2C.

Water supplied under a water allocation may only be used for the purpose stated on that water allocation.

#### **4.2.3 Infrastructure associated with the water supply scheme**

The infrastructure associated with the Nogo Mackenzie Water Supply Scheme is defined in Attachment 4.2D.

The infrastructure details defined in Attachment 4.2D may not be changed unless the change is provided for in Chapter 8.

#### **4.2.4 Infrastructure operating rules**

The rules for infrastructure operation and environmental management for the Nogo Mackenzie Water Supply Scheme are given in Attachment 4.2E.

#### **4.2.5 Water sharing rules**

The water sharing rules for the Nogo Mackenzie Water Supply Scheme are given in Attachment 4.2F.

#### **4.2.6 Monitoring and reporting requirements for Resource Operations Licence holder**

The monitoring and reporting requirements for the ROL holder for the Nogo Mackenzie Water Supply Scheme are given in Attachment 4.2G.

#### **4.2.7 Water allocation change rules**

The water allocation change rules for the Nogo Mackenzie Water Supply Scheme are given in Attachment 4.2H.

**4.2.8 Amending critical water supply management arrangements**

The rules for amending critical water supply management arrangements for the Nogoia Mackenzie Water Supply Scheme are given in Attachment 4.2I.

### 4.3 Lower Fitzroy Water Supply Scheme

#### Overview

This section specifies the water management arrangements for the Lower Fitzroy Water Supply Scheme, which extends for some 68 km along the Fitzroy River from the Eden Bann Weir pond to the upstream limit of the Fitzroy Barrage.

#### Conversion of area-based water licences on and downstream of Eden Bann Weir pond

The area-based water licences from the Eden Bann Weir pond to the upstream limit of the Fitzroy Barrage pond have been converted to medium priority water allocations, and will be supplied by the ROL holder for the Lower Fitzroy Water Supply Scheme.

#### Conjunctive operation of Eden Bann Weir and Fitzroy Barrage

The Lower Fitzroy Water Supply Scheme, based on Eden Bann Weir, and the Fitzroy Barrage Water Supply Scheme, based on the Fitzroy Barrage, will be operated in conjunction.

Releases will be made from Eden Bann Weir to maintain the level of water stored in the Barrage at about 0.4 metres below full supply level. This will enable the Barrage fishway to continue to function, will minimise pumping costs for Barrage water users, and support continued recreational use.

Releases from Eden Bann Weir to the Barrage will cease when the weir level falls to EL 9.55 m AHD (overflow level for original waterhole at Eden Bann). Provision is made for releases to the Barrage to resume when the level in the Barrage is very low and water is available from the weir.

While releases from Eden Bann Weir to the Barrage will cease at EL 9.55 m AHD, releases will continue to be made to supply water allocation holders upstream of the Barrage pond. This practice will cease when weir releases are no longer practicable, or restrictions are imposed through the critical water supply water sharing rules.

#### Environmental management rules

Seasonal base flows will be passed through Eden Bann Weir as a consequence of the seasonal base flow management rules for the Fitzroy Barrage Water Supply Scheme and the requirement for releases from Eden Bann Weir to maintain the level in the Barrage.

#### Water sharing rules

The water sharing rules specify the way the available water will be shared between the water allocation priority groups, namely medium and high.

The water sharing rules include announced allocation rules for medium and high priority water allocations, rules for sharing water to deal with occurrences of low water availability (critical water supply water sharing rules), provision for the transfer of water from one water year to another, and provision for seasonal water assignment.

The critical water supply water sharing rules prevent medium priority water extractions whenever the Barrage is approximately 3 metres below full supply level. This is necessary to protect high priority water allocations such as those held by Stanwell Power Station and

Rockhampton City Council. The rules also restrict the amount of high priority water allocation that may be taken during these periods.

Seasonal assignment of water allocations for distribution losses associated with the Stanwell pipeline is currently not permitted.

#### **4.3.1 Extent of the water supply scheme**

The extent of the Lower Fitzroy Water Supply Scheme is:

- The Fitzroy River from the upstream limit of Eden Bann Weir (AMTD 183.4 km) to the upstream limit of the Fitzroy Barrage (AMTD 115.0 km); and
- Sections of tributaries of the Fitzroy River that contain water from natural waterholes and infrastructure within the above section of the Fitzroy River.

#### **4.3.2 Water allocations associated with the water supply scheme**

Authorisations supplied through the Lower Fitzroy Water Supply Scheme have been converted to water allocations under the rules given in Attachment 4.3B.

Details of water allocations converted from authorisations supplied through the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3A.

The total volume of supplemented water allocations in the Lower Fitzroy Water Supply Scheme, for each zone and priority grouping, at commencement of the ROP, is given in Attachment 4.3C.

Water supplied under a water allocation may only be used for the purpose stated on that water allocation.

#### **4.3.3 Infrastructure associated with the water supply scheme**

The infrastructure associated with the Lower Fitzroy Water Supply Scheme is defined in Attachment 4.3D.

Infrastructure details defined in Attachment 4.3D may not be changed unless the change is provided for in Chapter 8.

#### **4.3.4 Infrastructure operating rules**

The rules for infrastructure operation and environmental management for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3E.

#### **4.3.5 Water sharing rules**

The water sharing rules for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3F.

#### **4.3.6 Monitoring and reporting requirements for Resource Operations Licence holder**

The monitoring and reporting requirements for the ROL holder for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3G.

**4.3.7 Water allocation change rules**

The water allocation change rules for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3H.

**4.3.8 Amending critical water supply management arrangements**

The rules for amending critical water supply management arrangements for the Lower Fitzroy Water Supply Scheme are given in Attachment 4.3I.

## 4.4 Fitzroy Barrage Water Supply Scheme

### Overview

This section specifies the water management arrangements for the Fitzroy Barrage Water Supply Scheme, which extends for some 55 km along the Fitzroy River.

### Conversion of existing authorisations to water allocations

Water entitlements for Fitzroy Barrage irrigators have been converted to medium priority water allocations, which will be supplied by the ROL holder for the Fitzroy Barrage Water Supply Scheme.

### Conjunctive operation of Eden Bann Weir and Fitzroy Barrage

The Lower Fitzroy Water Supply Scheme, based on Eden Bann Weir, and the Fitzroy Barrage Water Supply Scheme, based on the Fitzroy Barrage, will be operated in conjunction.

Releases will be made from Eden Bann Weir to maintain the level of water stored in the Barrage at about 0.4 metres below full supply level. This will enable the Barrage fishway to continue to function, will minimise pumping costs for Barrage water users, and support continued recreational use.

Releases from Eden Bann Weir to the Barrage will cease when the weir level falls to EL 9.55 m AHD (overflow level for original waterhole at Eden Bann). Provision is made for releases to resume when the level within the Barrage is very low and water is available from the weir.

### Environmental management rules

The ROP includes a seasonal base flow management strategy for the Barrage. The strategy requires the ROL holder to pass base flows through the Barrage whenever specified flow and storage level criteria occur. The flow criteria relate to inflows to Eden Bann Weir.

### Water sharing rules

The water sharing rules specify the way the available water will be shared between the water allocation priority groups, namely medium and high.

The water sharing rules include announced allocation rules for medium and high priority water allocations, rules for sharing water to deal with occurrences of low water availability (critical water supply water sharing rules), provision for the transfer of water from one water year to another, and provision for seasonal water assignment.

The critical water supply water sharing rules prevent medium priority water extractions whenever the Barrage is approximately 3 metres below full supply level. This is necessary to protect high priority water allocations such as those held by Stanwell Power Station and Rockhampton City Council. The rules also restrict the amount of high priority water allocation that may be taken during these periods.

#### **4.4.1 Extent of the water supply scheme**

The extent of the Fitzroy Barrage Water Supply Scheme is:

- The Fitzroy River from the upstream limit of the Fitzroy Barrage (AMTD 115.0 km) to the Fitzroy Barrage (AMTD 59.6 km); and
- Sections of tributaries of the Fitzroy River that contain water from the Fitzroy Barrage.

#### **4.4.2 Water allocations associated with the water supply scheme**

Authorisations supplied through the Fitzroy Barrage Water Supply Scheme have been converted to water allocations under the rules given in Attachment 4.4B.

Details of water allocations converted from authorisations supplied through the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4A.

The total volume of supplemented water allocations in the Fitzroy Barrage Water Supply Scheme, for each zone and priority grouping, at the commencement of the ROP, is given in Attachment 4.4C.

Water supplied under a water allocation may only be used for the purpose stated on that water allocation.

#### **4.4.3 Infrastructure associated with the water supply scheme**

The infrastructure associated with the Fitzroy Barrage Water Supply Scheme is defined in Attachment 4.4D.

Infrastructure details defined in Attachment 4.4D may not be changed unless the change is provided for in Chapter 8.

#### **4.4.4 Infrastructure operating rules**

The rules for infrastructure operation and environmental management for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4E.

#### **4.4.5 Water sharing rules**

The water sharing rules for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4F.

#### **4.4.6 Monitoring and reporting requirements for Resource Operations Licence holder**

The monitoring and reporting requirements for the ROL holder for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4G.

#### **4.4.7 Water allocation change rules**

The water allocation change rules for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4H.

**4.4.8 Amending critical water supply management arrangements**

The rules for amending critical water supply management arrangements for the Fitzroy Barrage Water Supply Scheme are given in Attachment 4.4I.

# Chapter 5

## Unsupplemented water management

### Overview

Unsupplemented water is water that is not supplied from a water supply scheme managed under a resource operations licence.

Unsupplemented water management is the responsibility of the department.

Supplemented water management within a water supply scheme, which is covered in Chapter 4, is the responsibility of a Resource Operations Licence (ROL) holder.

### Unsupplemented water management areas

Unsupplemented water management arrangements detailed in this Resource Operations Plan (ROP) cover the following water management areas:

- The Dawson Valley Water Management Area in Section 5.1 covering the Dawson River from the Glebe Weir pond to the Fitzroy River junction;
- The Nogoia Mackenzie Water Management Area in Section 5.2 covering the Nogoia and Mackenzie rivers from the Fairbairn Dam pond to the Dawson River junction; and
- The Fitzroy Water Management Area in Section 5.3 covering the Fitzroy River from the Dawson River junction to the Fitzroy Barrage.

The approximate extent of these water management areas is shown in Map C.

Over time, future additions to the ROP will progressively extend the unsupplemented water management arrangements to other parts of the Fitzroy basin.

### Seasonal assignment of water licences outside water management areas

Section 5.4 specifies those areas outside of those water management areas established under this ROP where seasonal water assignments can be made, and the associated rules.

Additional areas and rules for seasonal water assignment may be established under the amendment provisions given in Chapter 8.

### Amendment of water licences and metering outside water management areas

Section 5.5 sets out the criteria under which metering of water licences will be required and provides for the amendment of those affected licences in areas outside the water management areas established under this ROP.

Apart from these changes, existing authorisations outside the specified water management areas will continue to be subject to their current terms and conditions unless they are amended either by a change to the ROP, for consistency with the Water Resource Plan (WRP), or as a consequence of other routine actions under the Water Act.

## 5.1 Dawson Valley Water Management Area

### Overview

This section specifies the unsupplemented water management arrangements for the Dawson River within the Dawson Valley Water Management Area, which extends some 356 km from the Glebe Weir pond to the Fitzroy River junction.

The water management area overlaps the Dawson Valley Water Supply Scheme, which ends at the Boolburra waterhole near Duaringa about 18 km upstream of the Fitzroy River junction.

These unsupplemented water management arrangements thus refer to taking water under high stream flow conditions (waterharvesting) within the bounds of the Dawson Valley Water Supply Scheme and to taking any water downstream of the Boolburra waterhole.

### Zones

The location from which water may be taken under a water allocation is specified as a zone. Zones for the Dawson River are specified in Attachment 2.1.

### Amending waterharvesting authorisations

The WRP specifies that a ROP must address any economic impacts associated with a decline in the performance of existing waterharvesting authorisations downstream of the proposed Nathan Dam. At this point the operational details for the Nathan Dam development are not available, therefore options to address any impacts can not be assessed nor can existing waterharvesting licences be converted to water allocations under this ROP.

The WRP indicated that the way in which such impacts might be addressed include amending the terms and conditions of existing waterharvesting authorisations, conversion of existing waterharvesting authorisations to water allocations from the proposed Nathan Dam or by other agreed actions.

The operating rules for waterharvesting given in this ROP apply before the Nathan Dam development proceeds. After the ROP has commenced, existing waterharvesting licences will be amended for consistency with these operating rules. Other amendments include the addition of a zone for the specification of the location for each licence. Volumetric limits and maximum rates for taking water will not be applied to waterharvesting licences at this stage.

Metering will continue to be a requirement for taking unsupplemented water under waterharvesting conditions.

Permanent trading and seasonal assignment of unsupplemented (waterharvesting) water in the Dawson can not occur until water allocations have been established under a future amendment to the ROP.

### Operating and environmental management rules for waterharvesting licences

The operating rules for waterharvesting include arrangements under which water may be taken and the strategies for meeting environmental flow requirements. Provision for passing part of the first post-winter flow event is an example of these strategies.

During the first post-winter flow management strategy, announced waterharvesting periods for taking water for all waterharvesting will be determined on a 30 cumec passing flow for a period that depends on a number of specified factors.

#### **Licences (not for waterharvesting) downstream of the Boolburra waterhole**

Area-based licences in the water management area situated downstream of the Boolburra waterhole continue as water licences under this ROP. These licences have not been converted to water allocations and there are no operating rules specified in the ROP for these licences.

#### **Back Creek Water Board**

The ROP allows for the possible future grant of a water licence to the Back Creek Water Board under arrangements given in Section 6.2.5 of Chapter 6.

#### **5.1.1 Extent of the Dawson Valley Water Management Area**

The extent of the Dawson Valley Water Management Area is:

- The Dawson River from the upstream limit of Glebe Weir (AMTD 356.5 km) to the Fitzroy River junction; and
- Sections of tributaries of the Dawson River where flows in the above section of the Dawson River are accessible.

#### **5.1.2 Amending waterharvesting authorisations**

Waterharvesting licences on the Dawson River between the upstream limit of Glebe Weir and the Fitzroy River junction will be amended under the rules given in Attachment 5.1A.

Processing of these amendments, under Section 217 of the Water Act, will commence as soon as possible after commencement of this ROP.

#### **5.1.3 Operating rules for water licences for waterharvesting**

The operating rules for water waterharvesting licences with 15 and 30 cumec flow conditions are given in Attachment 5.1B.

## 5.2 Nogoia Mackenzie Water Management Area

### Overview

This section specifies the unsupplemented water management arrangements for the Nogoia and Mackenzie rivers within the Nogoia Mackenzie Water Management Area, which extends for some 427 km from the Fairbairn Dam pond to the Dawson River junction.

The water management area overlaps the Nogoia Mackenzie Water Supply Scheme, which ends at the Springton Creek junction about 29 km upstream from the Dawson River junction.

These unsupplemented water management arrangements thus refer to taking water under high stream flow conditions (waterharvesting) within the bounds of the Nogoia Mackenzie Water Supply Scheme and to taking any water downstream of the Springton Creek junction.

### Zones

The location from which water may be taken under a water allocation is specified as a zone. Zones for the Nogoia and Mackenzie rivers are specified in Attachment 2.2.

### Conversion of waterharvesting authorisations to water allocations

Waterharvesting authorisations on the Nogoia and Mackenzie rivers downstream from the Theresa Creek junction have been converted to water allocations.

For these water allocations, the total volumetric limit is approximately 60,000 ML and the total maximum rate for taking water is about 36 cumec.

### Conversion of area irrigated authorisations downstream of Springton Creek junction to water allocations

Area irrigated authorisations on the Mackenzie River downstream of the Springton Creek junction have been converted to water allocations.

For these water allocations, the total volumetric limit is 720 ML.

### Amendment of existing waterharvesting authorisations upstream of Theresa Creek junction

Waterharvesting authorisations on the Nogoia River from the Fairbairn Dam pond downstream to the Theresa Creek junction remain as water licences under this ROP. These licences are not being converted to water allocations because the performance of waterharvesting in this reach does not have a specified water allocation security objective in the WRP.

Waterharvesting in this reach is permitted only when Fairbairn Dam overflows at greater than 30 cumec, which occurs in fewer than 30 per cent of years.

These waterharvesting licences will be amended for consistency with the operating rules and to specify a volumetric limit and a maximum rate for taking water.

### Unsupplemented water allocations

An unsupplemented water allocation is described in terms of volume, location, the purpose for which water may be taken, the maximum rate for taking water and the flow conditions under which it may be taken.

The volume specification for unsupplemented water allocations comprises two elements – a volumetric limit and a nominal volume.

The volumetric limit is the maximum amount of water that may be taken under a water allocation in a water year. The amount of water actually taken is dependent on the flow conditions and rate for taking water stated for the water allocation, the operating rules in the ROP and availability of water in the locality at the time, subject to the total amount taken not exceeding the volumetric limit for the allocation.

The nominal volume, as defined in the Water Act, is a number used to calculate the allocation's share of the water available to be taken by holders of water allocations in all water allocation groups in a water resource plan area. The nominal volume represents the long-term average amount of water entitled to be taken under the allocation, which establishes a uniform measure for all unsupplemented water entitlements throughout the basin. The nominal volume is also relevant in relation to a basis on which a reconfiguration of a water allocation is permitted.

The nominal volume does not affect how much water can actually be taken within a particular water year or flow event.

#### **Operating and environmental management rules**

The operating rules for waterharvesting include arrangements under which water may be taken and the strategies for meeting environmental flow requirements. Specification of volumetric limits and provisions for passing part of the first post-winter flow event are examples of these strategies.

Under the first post-winter flow management strategy, announced waterharvesting periods for all waterharvesting will be determined on a 4,320 ML/day (50 cumec) passing flow for a period that depends on a number of specified factors.

The operating rules for low stream flow condition (up to 9 ML/day passing flow) water allocations apply only to those water allocations converted from area-based licences downstream of Springton Creek. These rules include specific monitoring requirements for drawdown of waterholes and the circumstances when limitations may be applied.

Rules for seasonal water assignment are specified in the operating rules. A holder of a water allocation may apply to seasonally assign to another person, for the current water year, the benefit of all or part of the water associated with the allocation. Seasonal water assignment is not permitted for waterharvesting licences on the Nogoia River upstream of the Theresa Creek junction.

#### **Water allocation change rules**

The water allocation change rules specify those changes that are permitted, and changes that are prohibited. Applications for any changes that are not expressly permitted (and not prohibited) would be considered through the public processes given in the Water Act.

For instance, permitted changes include the relocation, subdivision and amalgamation of allocations subject to the specified arrangements.

Prohibited changes include the relocation of a water allocation to an area outside of where water allocations have been established in the Fitzroy Basin.

### **5.2.1 Extent of Nogoia Mackenzie Water Management Area**

The extent of the Nogoia Mackenzie Water Management Area is:

- The Nogoia River from the upstream limit of Fairbairn Dam (AMTD 737.5 km) to the Comet River junction (AMTD 611.5 km); and
- The Mackenzie River from the Comet River junction (AMTD 611.5 km) to the Dawson River junction (AMTD 310.3 km); and
- Sections of tributaries of the Nogoia and Mackenzie rivers where flows in the above river sections are accessible.

### **5.2.2 Conversion of authorisations to water allocations**

Waterharvesting authorisations on the Nogoia and Mackenzie rivers from the Theresa Creek junction downstream to the Dawson River junction have been converted to water allocations under the rules given in Attachment 5.2B.

Area irrigated authorisations on the Mackenzie River from the Springton Creek junction downstream to the Dawson River junction have been converted to water allocations under the rules given in Attachment 5.2C.

Details of water allocations converted from authorisations in the Nogoia Mackenzie Water Management Area are given in Attachment 5.2A.

The total volume for unsupplemented water allocations for each zone at commencement of the ROP are given in Attachment 5.2E.

### **5.2.3 Amending waterharvesting authorisations**

Waterharvesting licences on the Nogoia River from the upstream limit of Fairbairn Dam to the Theresa Creek junction will be amended under the rules given in Attachment 5.2D.

Processing of these amendments, under Section 217 of the Water Act, will commence as soon as possible after commencement of this ROP.

### **5.2.4 Operating rules**

The operating rules for:

- Water allocations and water licences with 2,592 and 4,320 ML/day passing flow conditions are given in Attachment 5.2F; and
- Water allocations with up to 9 ML/day passing flow conditions are given in Attachment 5.2G.

### **5.2.5 Water allocation change rules**

The water allocation change rules are given in Attachment 5.2H.

### **5.2.6 Zones**

Zones for the Nogoia and Mackenzie Rivers are given in Attachment 2.2.

### 5.2.7 Water allocation groups

Water allocation groups for the Nogoia Mackenzie Water Management Area are given in Table 1.

**Table 1: Water allocation groups**

Location for water allocation	Zone	Water allocation group	Flow conditions for water allocations
Mackenzie River from the Isaac Mackenzie waterharvesting upstream limit to the Dawson River junction	Mackenzie A Mackenzie B Mackenzie C Mackenzie D Mackenzie E	Class 1A	2,592 ML/day passing flow
		Class 1B	4,320 ML/day passing flow
Nogoia and Mackenzie rivers from the Comet Mackenzie waterharvesting upstream limit to the Isaac Mackenzie waterharvesting upstream limit	Mackenzie F Mackenzie G Mackenzie H Mackenzie I Mackenzie J Mackenzie K	Class 2A	2,592 ML/day passing flow
		Class 2B	4,320 ML/day passing flow
Nogoia river from the Theresa Creek junction to the Comet Mackenzie waterharvesting upstream limit	Mackenzie L	Class 3A	2,592 ML/day passing flow
Mackenzie River from the Springton Creek junction to the Dawson River junction	Mackenzie A	Class 4C	No flow condition, and 9 ML/day passing flow

### 5.3 Fitzroy Water Management Area

#### Overview

This section specifies the unsupplemented water management arrangements for the Fitzroy River within the Fitzroy Water Management Area, which extends for some 250 km from the Dawson River junction to the Fitzroy Barrage.

The water management area overlaps both the Lower Fitzroy Water Supply Scheme and the Fitzroy Barrage Water Supply Scheme.

These unsupplemented water management arrangements thus refer to taking water under high stream flow conditions (waterharvesting) within the bounds of both water supply schemes and to taking any water upstream of the Eden Bann Weir pond.

#### Zones

The location from which water may be taken under a water allocation is specified as a zone. Zones for the Fitzroy River are defined in Attachment 2.3.

#### Conversion of waterharvesting authorisations to water allocations

Waterharvesting authorisations on the Fitzroy River have been converted to water allocations.

For these water allocations, the total volumetric limit is approximately 46,000 ML and the total maximum rate for taking water is about 7.5 cumec.

#### Conversion of authorisations (other than for waterharvesting) upstream of Eden Bann Weir pond to water allocations

Authorisations (other than for waterharvesting) upstream of the Eden Bann Weir pond have been converted to water allocations.

For these water allocations, the total volumetric limit is about 12,300 ML.

#### Unsupplemented water allocations

An unsupplemented water allocation is described in terms of volume, location, the purpose for which water is used, the maximum rate for taking water and the flow conditions under which it may be taken.

The volume specification for unsupplemented water allocations comprises two elements – a volumetric limit and a nominal volume.

The volumetric limit is the maximum amount of water that may be taken under a water allocation in a water year. The amount of water taken is dependent on the flow conditions and rate for taking water stated for the water allocation, the operating rules in the ROP and availability of water in the locality at the time, subject to the total amount taken not exceeding the volumetric limit for the allocation.

The nominal volume, as defined in the Water Act, is a number used to calculate the allocation's share of the water available to be taken by holders of water allocations in all water allocation groups in a water resource plan area. The nominal volume represents the

long-term average amount of water entitled to be taken under the allocation, which establishes a uniform measure for all unsupplemented water entitlements throughout the basin. The nominal volume is also relevant in relation to a basis on which a reconfiguration of a water allocation is permitted.

The nominal volume does not affect how much water can actually be taken within a particular water year or flow event.

### **Operating rules**

The operating rules for waterharvesting include arrangements under which water may be taken and the strategies for meeting environmental flow requirements. Specification of volumetric limits and provisions for passing part of the first post-winter flow event are examples of these strategies.

Under the first post-winter flow management strategy, announced waterharvesting periods for all waterharvesting will be determined on a 6,000 ML/day (approximately 70 cumec) passing flow for a period that depends on a number of specified factors.

The operating rules for low stream flow condition (up to 260 ML/day passing flow) water allocations apply to those water allocations that have been converted from authorisations (other than for waterharvesting) upstream of the Eden Bann Weir pond. These rules include specific monitoring requirements for drawdown of waterholes and the circumstances when limitations may be applied.

Rules for seasonal water assignment are specified in the operating rules. A holder of a water allocation may apply to seasonally assign to another person, for the current water year, the benefit of all or part of the water associated with the allocation.

### **Water allocation change rules**

The water allocation change rules specify those changes that are permitted, and changes that are prohibited. Applications for any changes that are not expressly permitted (and not prohibited) would be considered through the public processes given in the Water Act.

For instance, permitted changes include the relocation, subdivision and amalgamation of allocations subject to the specified arrangements.

Prohibited changes include the relocation of a water allocation to an area outside of where water allocations have been established in the Fitzroy Basin.

#### **5.3.1 Extent of the Fitzroy Water Management Area**

The extent of the Fitzroy Water Management Area is:

- The Fitzroy River from the Dawson River junction (AMTD 310.3 km) to the Fitzroy Barrage (AMTD 59.6 km); and
- Sections of tributaries of the Fitzroy River where flows in the above section of the Fitzroy River are accessible.

#### **5.3.2 Conversion of authorisations to water allocations**

Waterharvesting authorisations on the Fitzroy River from the Dawson River junction to the

Fitzroy Barrage have been converted to water allocations under the rules given in Attachment 5.3B.

All other authorisations on the Fitzroy River from the Dawson River junction to the upstream limit of Eden Bann Weir (AMTD 183.4 km) have been converted to water allocations under the rules given in Attachment 5.3C.

Details of water allocations converted from authorisations in the Fitzroy Water Management Area are given in Attachment 5.3A.

Total volumes for unsupplemented water allocations for each zone as at commencement of the ROP are given in Attachment 5.3D.

### 5.3.3 Operating rules

The operating rules for:

- Water allocations with 2,592 ML/day and 4,320 ML/day passing flow conditions are given in Attachment 5.3E; and
- Water allocations with up to 260 ML/day passing flow conditions are given in Attachment 5.3F.

### 5.3.4 Water allocation change rules

Water allocation change rules are given in Attachment 5.3G.

### 5.3.5 Zones

Zones for the Fitzroy River are given in Attachment 2.3.

### 5.3.6 Water allocation groups

Water allocation groups for the Fitzroy Water Management Area are given in Table 2.

**Table 2: Water allocation groups**

Location for water allocation	Zone	Water allocation group	Flow conditions for water allocations
Fitzroy River from the Dawson River junction to the Fitzroy Barrage	Fitzroy A Fitzroy B Fitzroy C Fitzroy D Fitzroy E	Class 5A	2,592 ML/day passing flow
		Class 5B	4,320 ML/day passing flow
Fitzroy River from the Dawson River junction to the upstream limit of Eden Bann Weir	Fitzroy D Fitzroy E	Class 6C	No flow condition, and 9 ML/day passing flow
Fitzroy River from the Dawson River junction to the upstream limit of Eden Bann Weir	Fitzroy D Fitzroy E	Class 7D	260 ML/day passing flow

## **5.4 Seasonal water assignment of water licences outside water management areas**

### **Overview**

This section provides for the seasonal water assignment of water licences, under Section 230 of the Water Act, in areas outside of water management areas established under the ROP.

The seasonal water assignment arrangements set out in this section will not apply to an area that is subsequently included within the bounds of a water management area established under a future amendment of the ROP.

### **5.4.1 Seasonal water assignment rules**

This section does not apply to seasonal water assignments in areas within the bounds of a water management area established under the ROP.

Areas where seasonal water assignment of water licences is permitted outside of water management areas established under the ROP, and the rules for those seasonal water assignments, are given in Attachment 5.4.

## **5.5 Metering water licences**

### **Overview**

This section provides for the chief executive to amend a water licence to make the fitting and operation of a water meter or other approved flow measurement device a condition of the licence, subject to the criteria specified in Section 5.5.1.

Where meters or other approved flow measurement devices are to be installed as a requirement of the ROP, affected water licensees will be invited to participate in the planning and management of the project.

A project team will be established for each implementation area. This team, to be made up of departmental staff and licensees, will manage the process to ensure that local conditions and issues are addressed. The project may include:

- Consultation with affected water licensees;
- Establishment of project management guidelines;
- Evaluation of existing works for meter installation requirements for user and regulatory needs;
- Preliminary design and costing of meter installations;
- Consideration of financial arrangements for metering; and
- Contractual arrangements for the supply and installation of metering devices.

### **5.5.1 Requirement for metering**

Installation of a meter or other approved flow measuring device is required where a water licence:

- Requires that water taken be metered; or
- States a volumetric limit or maximum annual diversion; or
- Is in an area where there are:
  - Significant risks of environmental or resource damage; or
  - Disputes over sharing available water.

### **5.5.2 Amendment of licences**

Any water licence for which flow measurement is required will be amended to provide for a meter or other approved flow measuring device to be installed in accordance with arrangements prescribed by a Water Regulation made under the Water Act.

# Chapter 6

## Granting of new water entitlements

### Overview

This chapter provides for the granting of new water entitlements for the taking of water. In particular, it provides for:

- Water licences that may be granted to particular groups of water users (Section 6.1);
- Water licences and water allocations to be granted to specified entities (Section 6.2);
- The process and options for the release of unallocated water (Sections 6.4, 6.5 and 6.6); and
- The process and requirements for provision of water to projects of significant economic or social importance to the State (Section 6.7).

### Grant of particular water licences for taking of water

If an application for taking water, lodged under Chapter 2 Part 6 Division 2 of the Water Act, falls within one of the categories of application covered by Sections 6.1.1 to 6.1.6, the chief executive will deal with the application. The categories of application are discussed below.

Landholders may apply for a water licence to take water for stock and domestic purposes. Section 6.1.1 sets out how applications made by landholders without an alternative water supply for stock and domestic purposes will be decided.

Applications for or about a water licence to take water from watercourses, lakes and springs that flow into the Fitzroy River below the Fitzroy Barrage will be decided in accordance with Section 6.1.2. Section 6.1.2 sets out how these applications will be decided. The Fitzroy Barrage is the lowest reporting point on the Fitzroy River, and it is at this point, or above, that stream flow is measured, and environmental flow objective and water allocation security objective performance evaluated. The diversion of water from watercourses that do not enter the Fitzroy River upstream of the Fitzroy Barrage will not affect those measures of performance. However, the Water Resource Plan (WRP) still requires that specified impact assessment criteria must be considered in making a decision concerning any application to take water.

Holders of mining tenure (for example, a mineral development licence or mining lease) may make an application for or about a water licence to take water. Section 6.1.3 sets out how these applications will be decided. Any water licence issued would be limited to enabling removal of mine site seepage or runoff that is unavoidably being or proposed to be discharged to a watercourse. The arrangements would need to form part of an approved overall mine site environmental management strategy. These circumstances are more likely to arise on older mine sites where historical mining practices may have led to poor quality water entering watercourses which can not be avoided. In that instance the issue of a licence could allow that water to be taken from the watercourse and suitably stored and or treated.

Local governments and the State may make an application for or about a water licence to take water. Section 6.1.4 sets out how these applications will be decided. Any licence issued will be limited to taking of water for the construction and maintenance of public assets, such as

roads and bridges. Currently, temporary permits are issued for individual projects and localities for comparatively small volumes. The proposed approach will provide a more streamlined and effective means of addressing these needs.

If a licence has expired and there was no application lodged within the specified time in the Water Act for the licence to be reinstated or replaced, the licensee may apply for a new licence to take water. Section 6.1.5 sets out how these applications will be decided. Any licence issued will be limited to circumstances where it can be shown that at the time the licence expired, the works associated with the licence were installed and there had been continuing use of the entitlement in the intervening period.

Under Section 6.1.6 applications may be made that do not increase the amount of water taken. For example this section covers amending existing authorisations where there is no increase in the amount of water taken.

### **Grant of water licences and water allocations to specified entities**

Section 6.2 specifies the water licences and water allocations to be granted to specified entities. Most of these water licences and allocations are to be granted to replace a range of existing authorisations. The exception is the water licence for a water supply to the town of Rolleston. The issue of this water licence is urgently required and considered to be in the broader public interest.

These water licences and allocations will be granted following approval of the ROP without application or other process.

### **Process for dealing with applications for water licences**

Section 6.3 requires the chief executive to refuse any application to take water made prior to commencement of the Resource Operations Plan (ROP), unless the application is in one of the categories that may be dealt with under Section 6.1 discussed above.

Applications made after commencement of the ROP will be refused unless the applications are in one of the categories that may be dealt with under Section 6.1, or in connection with processes outlined under sections 6.5, 6.6 or 6.7 discussed below.

### **Release of unallocated water by grant of water allocation**

Section 6.4 details the process that will apply for release of unallocated water in the Mackenzie and Fitzroy rivers through sale of unsupplemented water allocations.

If water taken under an allocation granted under Section 6.4 is proposed to be used for irrigation, then the use of the water will require an approved Land and Water Management Plan under Section 73 of the Water Act.

### **Release of unallocated water by grant of water licence**

Section 6.5 details the process that will apply for release of unallocated water through sale of water licences. The release will only be available in the Isaac/Connors, lower Mackenzie and Fitzroy River catchments, excluding the Dawson River catchment, Fitzroy River and Lower Mackenzie River.

A water licence granted via this process is subject to the provisions of the Water Act that

apply to water licences, and it should be noted that:

- The licence is not tradable separate from land to which it is attached;
- The licence does not have any specified reliability of supply; and
- At times of water shortage, the chief executive may limit the taking of water under a water licence or permit as provided in Section 25 of the Water Act.

If water taken under a licence granted under Section 6.5 is proposed to be used for irrigation, then the use of the water will require an approved Land and Water Management Plan under Section 73 of the Water Act.

### **Triggers for additional unallocated water release**

The volumes of release identified under Sections 6.4 and 6.5 may not meet current viable, sustainable demand, and/or additional demand may be identified in the period after the ROP commencement but before completion of the next phase of the planning process through the Central Queensland Regional Water Supply Study (CQRWSS). Under those circumstances, provision of a mechanism that permits release of additional water within defined constraints and without compromise to other future planning processes, is appropriate where unallocated water reserves allow. Section 6.6 details the triggers for, and volumetric constraints on such additional release.

Such additional release is possible in the Isaac/Connors and lower Mackenzie and Fitzroy catchments because of the volume of unallocated water that is still available in these systems.

### **Significant projects**

The ROP provides for the setting aside of reserves of water for projects determined by the Queensland Government to be of significant economic or social importance to the State. These reserves are designed to be a small, one-off source of last resort that is available to support significant regional development projects where there is no opportunity for trading or access to 'unallocated' water, and when there is no other cost-effective water supply available.

Applicants for this water will need to provide assessments of alternative piped and groundwater supply opportunities for benchmarking against comparable local industries, and show that best water use efficiency, demand management and wastewater recycling/reuse practices are to be utilised.

## **6.1 Water licence applications under Chapter 2 Part 6 Division 2 of the Water Act**

Under this section the chief executive may grant an application for or about a water licence to take water made under Chapter 2 Part 6 Division 2 of the Water Act.

### **6.1.1 Stock and domestic use**

Landholders anywhere in the Fitzroy Basin may make an application for a water licence to take water for stock and domestic purposes.

The chief executive must deal with an application in accordance with this section and the provisions of the Water Act.

However, the chief executive must refuse the application if:

- an alternative water supply is available to the applicant, such as a supply from a farm dam or a bore;
- the application is to take water from a watercourse in which water is managed under a ROL or IROL; or
- the application is to take water from sections of a watercourse where water allocations have been granted.

When granting a water licence under this section of the ROP, the chief executive must limit the volume that can be taken in any year.

The maximum annual volume calculated for domestic purposes is:

- 1 ML; or
- An alternative volume determined by the chief executive based on consideration of the circumstances.

The maximum annual volume calculated for stock watering is:

- A volume equivalent to 1 ML per 250 ha of land without an alternative water supply; or
- An alternative volume determined by the chief executive based on a consideration of the circumstances. (Note: The volume equivalent to 1 ML per 250 ha is the minimum value for the purpose of this section, which would be increased if actual stocking rates and the particular situation indicate larger water requirements. Annual consumptive requirements would be assessed on industry standards, for example, an average annual consumption of 16,000 litres per head per annum would be assumed for beef cattle)

The total maximum annual volume (volumetric limit) on the licence will be the sum of the volume allowed for stock purposes and that allowed for domestic purposes.

### **6.1.2 Downstream locations**

For the purposes of this section, a ‘downstream location’ means a location within the plan area on any watercourse, lake or spring that does not provide tributary inflow to the Fitzroy River upstream of the Fitzroy Barrage.

Application may be made for a water licence to take water from a downstream location.

The chief executive must deal with the application in accordance with this section and the provisions of the Water Act.

In deciding whether to grant or refuse an application, the chief executive will take into consideration the criteria in Section 14 of the WRP.

The purchase price for a water licence will be at a fixed price per megalitre of maximum annual volume of take of water. The chief executive will determine the fixed price per megalitre of maximum annual volume of take having regard to matters including:

- market value of water entitlements in the Fitzroy plan area and relativity of product;
- market value of water entitlements in adjacent plan areas and relativity of product;
- capacity to pay; and
- any other matters.

### 6.1.3 Mining tenure

For the purposes of this section, ‘mining tenure’ means a mineral development licence or mining lease granted under the *Mineral Resources Act 1989*.

The holder of a mining tenure may make application for a water licence to take water.

The chief executive must deal with the application in accordance with this section and the provisions of the Water Act.

Any water licence issued, in accordance with this section, must be limited to enabling removal of mine site seepage or runoff that is unavoidably being discharged or proposed to be discharged to a watercourse. The arrangements would need to form part of an approved overall mine site environmental management strategy.

A condition of a water licence under this section must be that the water may only be taken if there would be inconsequential effect on the flow naturally occurring in the watercourse downstream of the mining tenure.

### 6.1.4 Local governments and the State

A local government or the State may make application for a water licence to take water.

The chief executive must deal with the application in accordance with this section and the provisions of the Water Act.

Any water licence issued, in accordance with Section 6.1.4, will be limited to the taking of water required for the construction and maintenance of public assets such as roads and bridges.

The chief executive must refuse any application to take water from a watercourse in which water is managed under a ROL or IROL.

The chief executive must refuse any application to take water from sections of a watercourse where water allocations have been established.

In deciding whether to grant or refuse an application, the chief executive will take into consideration the criteria in Section 14 of the WRP.

### 6.1.5 Previous licences

If a licence has expired and there was no application lodged within the specified time in the Water Act for the licence to be reinstated or replaced, the landholder may make application for a new licence to take water.

The chief executive must deal with the application in accordance with this Section and the provisions of the Water Act.

The chief executive must refuse the application if:

- The works associated with the licence that has expired were not installed at the time the licence expired;
- There has not been continuing use of water associated with the licence that expired; and

- Other licences of the same type and in the same area have been converted to water allocations.

If the chief executive approves the application, the volume entitled to be taken under the new licence will not exceed that of the previous licence.

#### **6.1.6 Other applications for or about a water licence**

The chief executive may grant water licences that do not increase the amount of water that is authorised to be taken.

The chief executive must deal with the application in accordance with this section and the provisions of the Water Act.

## 6.2 Process for grant of water licences and water allocations to specified entities

Following approval of this ROP, the chief executive may grant the following water licences and water allocations under Section 122 and 212 of the Water Act, subject to any additional conditions determined by the chief executive:

### 6.2.1 Woorabinda Aboriginal Council

#### Licence details

Licensee: Woorabinda Aboriginal Council

Period: 10 years

Water: Mimosa Creek

Location: Lot 6 on Plan No WNA141

Volumetric limit: 150 ML per water year

Rate: 7 L/s

Purpose: Any

#### Reason for grant

Part of the water supply for Woorabinda township is drawn from galleries in the sands of Mimosa Creek. These galleries were constructed prior to 1950. This type of activity now requires an authorisation under the Water Act.

### 6.2.2 Environmental Protection Agency

#### Licence details

Licensee: Environmental Protection Agency

Period: 10 years

Water: Carnarvon Creek

Location: Lot 236 on Plan No NPW490

Volumetric limit: 15 ML per water year

Rate: 7 L/s

Purpose: Any

#### Reasons for grant

A permit to take water from Carnarvon Creek to provide water for camping facilities at Carnarvon National Park was previously granted under the *Water Act 1926/1983*. This form of authority is no longer available under the current legislation. It is appropriate that this activity be authorised by a water licence under the Water Act. The water licence replaces the permit.

### 6.2.3 Mount Morgan Shire Council

**Licence details:**

Licensee:	Mount Morgan Shire Council
Period:	10 years
Water:	Dee River
Location:	Lot 201 on Plan No RN836502
Volumetric limit:	584 ML per water year
Rate:	37 L/s
Purpose:	Any

**Reason for grant:**

Mount Morgan Shire Council's (MMSC) existing No 7 Dam was raised in 1999 to a capacity of 2,930 ML to increase the reliability of the Mount Morgan town water supply. The grant of a water licence to the MMSC has been put on hold pending preparation of this ROP. The hydrologic model (IQQM) for the Fitzroy Basin includes the raised dam. The water licence authorises the taking of water from this dam.

### 6.2.4 Bauhinia Shire Council

**Licence details:**

Licensee:	Bauhinia Shire Council
Period:	10 years
Water:	Comet River
Location:	Lot 71 on Plan No CP856877
Volumetric limit:	400 ML per water year
Rate:	1,000 L/s
Purpose:	Any

Conditions to include: Water may only be taken when the passing flow exceeds 12 cumec.

**Reason for grant:**

Bauhinia Shire Council urgently requires a water licence to provide for a new water supply for the town of Rolleston. A reliable supply of 60 ML per annum is needed. The proposed scheme comprises two 500 L/s pumps delivering water to a 290 ML capacity offstream storage. The hydrologic model (IQQM) for the Fitzroy Basin includes the proposed scheme. The proposed scheme has wide community support, including industry sectors in the Central Highlands.

### 6.2.5 Back Creek Water Supply Area

A water licence for taking of unsupplemented (waterharvesting) water from the Dawson River may be granted for the Back Creek Water Supply Area once the future arrangements for administration of the area and the volume of the required waterharvesting entitlement are resolved to the satisfaction of the chief executive.

#### Reason for grant:

The Back Creek Water Area and Board was originally established by Order in Council in 1960 for the purpose of supplying the stock and domestic water requirements on 7 properties along Back Creek from the Dawson River. By Order in Council in 1987 the Board was dissolved and an administrator was appointed to manage the affairs of the Board. The arrangements for supply of water to the area from the Dawson River at Moura Weir have not been effective for a number of years. A review will be undertaken to establish the future arrangements for administration of the area and to determine whether a waterharvesting entitlement is needed for the supply of the stock and domestic water requirements of the area and the appropriate details of any entitlement. The grant of a water licence for waterharvesting, if required, would replace historic arrangements for supply of water to the area.

An interim water allocation for 105 ML was granted to SunWater in December 2000, for supply to the Back Creek Water Area from Moura Weir, pending a review of the Back Creek Water Area. The volume and ownership details for this allocation would also be integral to the abovementioned review.

### 6.2.6 Rockhampton City Council

#### Medium priority water allocation specifications

Water allocation holder:	Rockhampton City Council
Resource Operations Licence:	Fitzroy Barrage Water Supply Scheme
Location:	Zone Fitzroy A
Nominal Volume:	575 ML per water year
Purpose:	Agriculture
Priority Group:	Medium

#### Reason for grant

The WRP identified an amount of 575 ML of unallocated medium priority water supply from the Fitzroy Barrage. This amount is the difference between the total allocatable agricultural supply from the Fitzroy Barrage of 12,335 ML and the total amount of water allocation for existing water users of 11,760 ML. This allocation is granted to the Rockhampton City Council as the owner of the Fitzroy Barrage.

### 6.2.7 SunWater

#### Medium priority water allocation specifications

Water allocation holder:	SunWater
Resource Operations Licence:	Nogoa Mackenzie Water Supply Scheme
Location:	Zone Mackenzie N
Nominal Volume:	155 ML per water year
Purpose:	Any
Priority Group:	Medium

#### High priority water allocation specifications

Water allocation holder:	SunWater
Water supply scheme:	Nogoa Mackenzie Water Supply Scheme
Location:	Zone Mackenzie N
Nominal Volume:	45 ML per water year
Purpose:	Any
Priority Group:	High

#### Reason for grants

Water has historically been taken from Fairbairn Dam to supply public amenities, including the recreation area and the Fairbairn Dam township. This water was previously taken by the State, as the operator of the dam, and accordingly no formal authorisation was required at that time. The grant of these allocations will formalise the continued take of water for this public purpose. The grant is made to SunWater who has responsibility for supplying this water.

### 6.2.8 JN, VC, & DC Kavanagh

#### Licence details:

Licensee:	JN, VC, DC Kavanagh
Period:	10 Years
Water:	Sandy Creek (stream classification 130.01.41.01)
Location:	Lot 5 RP619639
Attached lands:	Lot 5 RP619639
Maximum area to be irrigated:	100 hectares

Rate: 200l/s

Purpose: Agriculture

Conditions to include: Water that is taken under the authority of this water licence must only be water that is impounded under the authority of water licence 57852F.

**Reason for grant:**

On 25 August 1998 JN, AJ, DC, & GM Kavanagh were granted an authority to construct a water storage on Sandy Creek for the purpose of irrigation. Upon the granting of the authority to construct the dam it was intended to also approve an authority to take water stored in the dam for irrigation/agricultural requirements. Due to the administrative arrangements in place at the time, the authority to take water was not issued. The issue of this authority will enable the licensee to use the water stored in the dam for the purpose it was intended.

### **6.3 Process for dealing with applications for water licences**

This section only applies to applications for taking water made under Chapter 2 Part 6 Division 2 of the Water Act.

#### **6.3.1 Process for dealing with applications for water licences made prior to commencement of this ROP**

Following approval of this ROP, the chief executive must refuse all applications for water licences to take water made prior to commencement of this ROP, other than those applications dealt with under Section 6.1.

#### **6.3.2 Process for dealing with applications for water licences made after commencement of this ROP**

The chief executive must refuse all applications for water licences to take water made after commencement of this ROP, other than those dealt with under sections 6.1, 6.5, 6.6 or 6.7.

## **6.4 Release of unallocated water by grant of water allocation**

### **6.4.1 Volume and location of initial release**

This section provides for two separate releases of unsupplemented water allocations as follows:

- Group one release: Up to 8,000 ML nominal volume for water allocations to be located in the lower Mackenzie River in zones Mackenzie A, Mackenzie B, Mackenzie C, Mackenzie D and/or Mackenzie E (Mackenzie River from the Dawson River junction to the Isaac Mackenzie waterharvesting upstream limit); and
- Group two release: Up to 7,000 ML nominal volume for water allocations to be located in the Fitzroy River in zones Fitzroy A, Fitzroy B, Fitzroy C, Fitzroy D and/or Fitzroy E (Fitzroy River from the Fitzroy Barrage to the Dawson River junction).

The group one release will proceed as soon as practicable after the approval of the ROP. The group two release will proceed when the specified conditions in Section 6.6.2 are met.

Additional water may also be granted through Section 6.6 if the specified triggers are met.

### **6.4.2 Water allocation specifications**

Water allocations granted under the process detailed in Section 6.4.3 will be for the taking of unsupplemented water under conditions commonly referred to as waterharvesting. The management rules set out in Chapter 5 will apply to each water allocation.

A water allocation granted under Section 6.4.3 will specify:

- A nominal volume, which will be the volume purchased through the process set out in Section 6.4.3;
- A volumetric limit, which will be determined from the nominal volume as follows:
  - For a water allocation with a Mackenzie location, the volumetric limit (in megalitres) will be equal to the nominal volume (in megalitres) multiplied by 1.20; and
  - For a water allocation with a Fitzroy location, the volumetric limit (in megalitres) will be equal to the nominal volume (in megalitres) multiplied by 1.35;
- A maximum rate that the water may be taken at, which will be determined from the volumetric limit as follows:
  - For a water allocation with a Mackenzie location, the maximum rate (in litres per second) will be equal to the volumetric limit (in megalitres) multiplied by 0.503; and
  - For a water allocation with a Fitzroy location, the maximum rate (in litres per second) will be equal to the volumetric limit (in megalitres) multiplied by 0.276;
- A location which identifies the zone from which water can be taken;
- A purpose for the use of the water taken under the allocation; and
- A passing flow condition of 4,320 megalitres per day.

In the context of this specification:

- ‘Nominal volume’ represents the estimated long-term average amount of water entitled to be taken under the allocation;
- ‘Volumetric limit’ means the maximum amount of water that may be taken in a water year under the allocation;
- ‘Maximum rate’ means the maximum rate that water may be taken averaged over a

- specified time period;
- ‘Passing flow condition’ means the stream flow nominally required to pass downstream while water is being taken under the water allocation; and
- ‘Purpose’ means the purpose for which the water can be taken which will be specified as either ‘any’ or ‘agriculture’ where:
  - ‘Agriculture’ means that the water allocation will be used primarily for agricultural purposes; and
  - ‘Any’ means that the water allocation can be used for any purpose.

#### **6.4.3 Process for tendering for a water allocation**

The chief executive will grant water allocations by inviting tenders to purchase an allocation for a nominal volume of water. The process outlined below will apply.

##### **a) Preliminary**

Prior to the public invitation to tender, the chief executive will determine the minimum price criterion per megalitre for the water being released to tender.

The chief executive may alter the minimum price criteria at any time.

##### **b) Invitation to tender**

The chief executive will publicly call for tenders and make relevant information about the tender available, including the conditions of tender. Particular conditions on tender process include the following:

- Participation in the tender will be open to all prospective tenderers;
- The minimum price criteria will not be publicly advertised;
- The tender will be open for a time period specified by the chief executive;
- The tender must be made in the form approved by the chief executive; and
- A tender will become a binding offer for the bid volume at the bid price.

##### **c) Dealing with tenders**

The chief executive will deal with tenders as follows:

- Tenders will be publicly opened;
- All tenders will be assessed against the minimum price criterion;
- Tenders with a bid price below the minimum price criterion will be unsuccessful;
- Tenders with a bid price equal to or above the minimum price criteria will be ranked in order of bid prices, from highest to lowest;
- Ranked tenders will be accepted in order of bid price, until all of the total release volume has been sold;
- Where two or more tenders have the same bid price, and the combined volumes being sought cannot be met from the remaining release volume, then each of those tenderers will be offered a proportionate share of the remaining water;
- If the release is under-subscribed, the chief executive will either:
  - Offer the balance of the total release volume to unsuccessful tenderers at the lowest accepted bid price; or
  - Add the balance of the total release volume to the release volume available under Section 6.6; and

- Where an offer is made to unsuccessful tenderers, the offer will be for the bid volume included in their tender. The offer will be made to tenderers in order of bid price and will continue until all of the release has been sold, or all tenderers have been approached. Any remaining balance of the total release volume will be added to the release volume available under Section 6.6.

**d) Grant and registration**

- On the completion of the sale of a water allocation through the above process, the chief executive will grant the water allocation to the buyer and the registrar will record the water allocation on the water allocation register, in accordance with Section 122 of the Water Act. The water allocation has effect from the day it is recorded on the water allocation register.

**e) Definition of terms**

In the context of the tender process outlined above:

- ‘Total release volume’ is the total nominal volume to be released;
- ‘Bid price’ is the price per megalitre of nominal volume that the tenderer offers for the proposed water allocation;
- ‘Bid volume’ is the amount of nominal volume tendered for at the bid price;
- ‘Ranked tenders’ are tenders with a bid price equal to or above the minimum price criteria which have been ranked in order of bid prices, from highest to lowest;
- ‘Under-subscribed’ means that the total amount of nominal volume sought at bid prices that are equal to or above the minimum price criteria is less than the total release volume; and
- ‘Lowest accepted bid price’ is the lowest bid price which exceeds the minimum price criteria.

## **6.5 Release of unallocated water by grant of water licence**

The processes for dealing with unallocated water by grant of water licences are covered in Section 6.5.

### **6.5.1 Volume and location of release**

The chief executive will initially release unallocated water by grant of water licences of up to 12,000 ML of total maximum annual volume in the Isaac/Connors, lower Mackenzie and Fitzroy River catchments, excluding the Dawson River catchment, Fitzroy River and lower Mackenzie River. This initial release will commence as soon as practicable after the approval of the ROP under the process specified in Section 6.5.3.

Any part of the unallocated water volume not granted in the initial release will be added to the release volume available under Section 6.6.

Following the initial process for granting water licences under Section 6.5.3, the chief executive may decide under Section 6.6 to make additional releases of unallocated water. At the discretion of the chief executive, additional releases of unallocated water to be granted as water licences may be made either by:

- The process specified in Section 6.5.3;
- The process specified in Section 6.5.4; or
- The process specified in Section 6.5.5.

### **6.5.2 Water licence specifications**

A water licence granted under the processes detailed in Sections 6.5.3, 6.5.4 or 6.5.5 may specify:

- A maximum annual volume specified as a volumetric limit;
- A location;
- The land to which the licence attaches;
- A purpose for the use of the water taken under the licence;
- A passing flow condition;
- A first post-winter flow condition;
- A maximum rate that the water may be taken at;
- A seasonal base flow condition; and
- Any other details and conditions decided by the chief executive.

In the context of water licence specification:

- 'Location' for a water licence to take from a watercourse means the AMTD on the river or creek at the point where the water must be taken;
- 'Purpose' means the purpose for which the water can be taken which will be specified as either 'any' or 'agriculture' where:
  - 'Agriculture' means that the water licence will be used primarily for agricultural purposes; and
  - 'Any' means that the water licence can be used for any purpose;
- 'Passing flow condition' means the stream flow nominally required to pass downstream while water is being taken under the water licence;

- ‘Maximum rate’ means the maximum rate that water may be taken; and
- The basis for determination of the passing flow condition, first post-winter flow condition, seasonal base flow condition and maximum rate of take will be established through a set of guidelines to be published prior to the public notification of a water release under Sections 6.5.3 b), 6.5.4 b) or 6.5.5 b).

### **6.5.3 Granting water licences under Section 212 of the Water Act by inviting offers to purchase water**

The chief executive will grant water under a water licence by inviting offers to purchase a water licence for a maximum annual volume of water.

The process outlined in this section provides for the granting of water licences under Section 212 of the Water Act following an amendment of the ROP in accordance with Section 106(b) of the Water Act.

The process outlined below will apply.

#### **a) Preliminary**

Prior to public notification of a water release under Section 6.5.3 b), the chief executive will determine:

- The minimum price per megalitre of maximum annual volume for the water being released; and
- Evaluation criteria for offers.

The chief executive may alter the minimum price at any time.

Evaluation criteria may include, but not be limited to, benchmarking of water use efficiency against comparable regional and/or industry standards and consideration of risk management strategies for water use, to establish individual licence limits on maximum annual volume of take. Offerers may also need to demonstrate they can physically access the water bid for.

#### **b) Public notification of water release**

The chief executive will publicly call for offers and make relevant information about the offer available, including details of how the offers will be evaluated. Particular conditions on the offer process will include the following:

- Participation in the offer process will be open to all prospective offerers;
- The minimum price will not be publicly advertised;
- The offer will be open for a time period specified by the chief executive; and
- The offer must be made in the form approved by the chief executive.

The chief executive may require a one-off, non-refundable, offer processing fee to be lodged with the offer or prior to the offer details being publicly advertised in accordance with Section 6.5.3 d).

#### **c) Offers considered**

The chief executive will assess all offers against price and the publicly advertised evaluation criteria.

The chief executive may invite an offerer to make an amendment of a stated type to its offer within a stated timeframe. Without limiting the type of amendment that may be invited, the chief executive may invite an amendment to include a draft flow condition or limit on annual volume of take that would apply to the proposed licence. An offerer amending its offer as invited may also alter its bid price. If the offerer does not take up this invitation within the timeframe, the offer will be regarded as unsuccessful.

#### **d) Public notification of offers**

All offers that meet the conditions on the offer process, evaluation criteria and minimum price will be ranked in order of their bid price. Subsequently, for those ranked offers that sum within, or up to, the total release volume, proposed water licences will be advertised as a proposed amendment to the ROP. For each of the proposed water licences advertised in the proposed amendment, the following will be specified:

- The name of the proposed licensee;
- The land on which the water is to be used;
- The maximum annual volume (specified as a volumetric limit);
- The location where the water is proposed to be taken; and
- Where information on any draft conditions the chief executive proposes to apply to the proposed water licence can be viewed.

The chief executive will invite submissions on matters relating to the proposed amendment to the ROP within a specified timeframe.

#### **e) Review of submissions and settling of offers**

Review of submissions and settling of offers will be undertaken in accordance with the following:

- The chief executive may collate information about the submissions and refer the collated information and submissions to a Referral Panel established under Section 1004 of the Water Act for review and recommendation on how the submissions and offers should be dealt with;
- The chief executive must consider the submissions received, and if a submission has been referred to a Referral Panel, the recommendations of the Panel, and for each offer:
  - Accept the offer;
  - Invite the offerer to make an amendment of a stated type to its offer; or
  - Refuse the offer;
- An offerer amending its offer as invited may also alter its bid price;
- If an offerer amends its offer as invited, the chief executive will accept the offer, provided that the offer still meets the evaluation criteria and any altered bid price still meets the minimum price criteria;
- If the chief executive accepts the offer, the offerer must pay the bid price by the specified date in order for the offer to be regarded as a successful offer; otherwise the offer will be unsuccessful; and
- If the chief executive refuses the offer, the offer is unsuccessful.

#### **f) Amendment of ROP and grant of licences**

The chief executive will amend the ROP to specify the details for water licences for all successful offers. Following amendment of the ROP, the chief executive will, under Section

212 of the Water Act, grant a water licence to the successful offerers in accordance with the details specified in the ROP.

**g) Unsuccessful offerers advised**

On amendment of the ROP, the chief executive will advise any offerers whose offer has been unsuccessful and will provide reasons the offer was unsuccessful.

**h) Definition of terms**

In the context of the offer process outlined above:

- ‘Total release volume’ is the total maximum annual volume to be granted in the release;
- ‘Bid price’ is the price per megalitre of maximum annual volume of take that the offerer offers for the proposed water licence; and
- ‘Draft condition’ means a condition that the chief executive proposes to attach to any licence granted as a result of the offer process.

**6.5.4 Granting water licences under Section 212 of the Water Act by application and purchase at a fixed price**

The chief executive will grant water under a water licence by inviting applications to purchase a water licence for a maximum annual volume of water. The purchase price for a water licence will be at a fixed price per megalitre of maximum annual volume of take of water.

The process outlined in this section provides for the granting of water licences under Section 212 of the Water Act following an amendment of the ROP in accordance with Section 106(b) of the Water Act.

The process outlined below will apply.

**a) Preliminary**

Prior to public notification of a water release under Section 6.5.4 b), the chief executive will determine:

- The fixed price per megalitre of maximum annual volume for the water being released; and
- Evaluation criteria for applications.

Evaluation criteria may include, but not be limited to, benchmarking of water use efficiency against comparable regional and/or industry standards and consideration of risk management strategies for water use, to establish individual licence limits on maximum annual volume of take. Applicants may also need to demonstrate they can physically access the water applied for.

**b) Public notification of water release**

The chief executive will publish a notice to advise interested parties of the water release and make relevant information about the release available, including details of how applications will be evaluated. Particular conditions on the release process may include the following:

- The fixed price per megalitre of maximum annual volume of take of water;
- Conditions for taking water made available under the release;

- Application requirements and details of how the applications will be evaluated; and
- Applications must be made in the form approved by the chief executive.

The chief executive may require a one-off, non-refundable, application processing fee to be lodged with the application or prior to the proposed licence details being publicly advertised in accordance with Section 6.5.4 d).

#### **c) Applications considered**

The chief executive will assess applications against the publicly advertised evaluation criteria.

The chief executive may invite an applicant to make an amendment of a stated type to its application within a stated timeframe. Without limiting the type of amendment that may be invited, the chief executive may invite an amendment to include a draft flow condition or limit on annual volume of take that would apply to the proposed licence. If the applicant does not take up this invitation within the timeframe, the application will not be accepted.

#### **d) Public notification of applications**

For each application that meets the conditions on the release process and the evaluation criteria, proposed water licences will be advertised as a proposed amendment to the ROP. For each proposed water licence advertised in the proposed amendment, the following will be specified:

- The name of the proposed licensee;
- The land on which the water is to be used;
- The maximum annual volume (specified as a volumetric limit);
- The location where the water is to be taken; and
- Where information on any draft conditions the chief executive proposes to apply to the proposed water licence can be viewed.

The chief executive will invite submissions on matters relating to the proposed amendment to the ROP within a specified timeframe.

#### **e) Review of submissions and decisions on applications**

Review of submissions and decisions on an application will be undertaken in accordance with the following:

- The chief executive may collate information about the submissions and refer the collated information and submissions to a Referral Panel established under Section 1004 of the Water Act for review and recommendation on how the submissions and applications should be dealt with;
- The chief executive must consider the submissions received, and if a submission has been referred to a Referral Panel, the recommendations of the Panel, and for each application, either:
  - Decide the details for the water licence that may be granted following an amendment to the ROP; or
  - Refuse the application.
- If the details decided by the chief executive for the water licence are not accepted by the applicant, the chief executive will refuse the application.
- If the chief executive decides that a water licence may be granted following an

amendment of the ROP, the applicant must pay the price for the water licence by the date specified by the chief executive; otherwise the application will be refused.

**f) Amendment of ROP and grant of licences**

The chief executive will amend the ROP to specify the details of water licences that may be granted. Following amendment of the ROP, the chief executive will, under Section 212 of the Water Act, grant the water licences in accordance with the details specified in the ROP.

**g) Refused applications**

On amendment of the ROP, the chief executive will advise any applicant whose application has been refused and provide reasons for refusing the application.

**6.5.5 Granting of water licences by application under Section 206 of the Water Act and purchase at a fixed price**

The chief executive will grant water under a water licence by inviting applications to purchase a water licence for a maximum annual volume of water. The purchase price for a water licence will be at a fixed price per megalitre of maximum annual volume of take of water.

The process outlined in this section provides for the granting of water licences by application made under Section 206 of the Water Act.

The process outlined below will apply.

**a) Preliminary**

Prior to public notification that applications may be made to purchase water under this section, the chief executive will determine:

- The fixed price per megalitre of maximum annual volume for the water being released; and
- Evaluation criteria for applications.

Evaluation criteria may include, but not be limited to, benchmarking of water use efficiency against comparable regional and/or industry standards and consideration of risk management strategies for water use, to establish individual licence limits on maximum annual volume of take. Applicants may also need to demonstrate they can physically access the water applied for.

**b) Public notification of water release**

The chief executive will publish a notice to advise interested parties of the water release and to make relevant information about the release available. Particular conditions on the release process may include the following:

- The fixed price per megalitre of maximum annual volume of take of water;
- Conditions for taking water made available under the release;
- Application requirements and details of how the applications will be evaluated; and
- Applications must be made under Section 206 of the Water Act.

**c) Processing applications**

The chief executive will decide applications made under Section 206 under the provisions of the Water Act.

## **6.6 Triggers for release of additional unallocated water**

### **6.6.1 Volume, location and process for release**

This section provides for the release of up to 20,000 ML of water in addition to the provisions of Sections 6.4 and 6.5. This additional water will be only released when the requirements of Section 6.6.2 are met.

Water can only be made available in the Isaac/Connors, lower Mackenzie and Fitzroy River catchments, excluding the Dawson River catchment. The proportion of water made available in any system will be determined by the level of justified need identified through Section 6.6.2.

Water in the lower Mackenzie River (zones Mackenzie A to Mackenzie E) and Fitzroy River will be released as tradable water allocations granted through the process identified in Section 6.4.3, and subject to the specification provisions of Section 6.4.2. The volume of release will be assessed as nominal volume.

Water in the Isaac/Connors, lower Mackenzie and Fitzroy River catchments, excluding the Dawson River catchment, lower Mackenzie River and Fitzroy River will be released as water licences granted through the processes specified in Section 6.5. The volume of release will be assessed as maximum annual volume of take.

### **6.6.2 Trigger assessment**

The need for release of additional water under this Section 6.6 will be assessed by the chief executive having regard to the following:

- The broad socio-economic profile of the catchment being evaluated, and the socio-economic justification for additional water supplies;
- Current water use efficiency, demand management and water need profiles for proponents who express an interest or need for the water;
- Trading market characteristics, and access to alternative water supplies through trading, improved demand management and/or wastewater reuse; and
- The likely timeframe in which additional water will be required.

The purpose of this assessment will be to determine valid need for water, assess the opportunity to meet those needs through means other than release of unallocated water and, when appropriate, establish the timing, quantum and location of any additional water release.

## 6.7 Significant projects

### 6.7.1 Limits on application and volume of grant

The Coordinator-General will determine which projects are considered projects of State or regional significance, where:

- “a project of State significance” means a project declared under the *State Development and Public Works Organisation Act 1971* to be a significant project;
- “a project of regional significance” means a project the Coordinator-General, having regard to the matters mentioned in the *State Development and Public Works Organisation Act 1971*, section 27, decides is a project of regional significance for the purposes of this plan.

The process detailed in Section 6.7.3 provides for the granting of water licences for these projects in situations where no other cost-effective source of water is available.

The cumulative volume of licences granted by the chief executive under this Section 6.7 must not exceed:

- 600 ML of maximum annual volume of take in the upper Mackenzie River system (the catchment of the Mackenzie River upstream of the Isaac Mackenzie waterharvesting upstream limit identified in Attachment 2.2); or
- 600 ML of maximum annual volume of take in the Dawson River system; or
- 1,000 ML of maximum annual volume of take in the Fitzroy Basin not including the upper Mackenzie River and Dawson River systems.

### 6.7.2 Water licence specifications

A water licence granted under the process detailed in Section 6.7.3 will specify:

- A maximum annual volume; and
- A location.

A water licence granted under the process detailed in Section 6.7.3 may specify:

- The land to which the licence attaches;
- A purpose for the use of the water taken under the licence, which will be ‘any’;
- A passing flow condition;
- A first post-winter flow condition;
- A maximum rate that the water may be taken at;
- A seasonal base flow condition; and
- Any other details and conditions decided by the chief executive.

In the context of water licence specification:

- ‘Location’ means the AMTD on the river or creek at the point where the water must be taken;
- A purpose of ‘any’ means that the water licence can be used for any purpose;
- ‘Passing flow condition’ means the stream flow nominally required to pass downstream while water is being taken under the water licence;
- ‘Maximum rate’ means the maximum rate that water may be taken averaged over a specified time period; and

- The basis for determination of the passing flow condition, first post-winter flow condition, seasonal base flow condition and maximum rate of take will be established through a set of published guidelines.

### **6.7.3 Granting of water licences to take an annual maximum volume of water**

An entity requiring water for a project deemed by the Coordinator-General to be a project of State significance or a project of regional significance may make an application for a licence to take water under this Section 6.7. The process outlined below will apply to assessment of applications and grant of licences.

#### **a) Consideration of applications**

Each application must be accompanied by an appropriate report providing:

- Detailed description of the project water supply balance including a breakdown of predicted unit water needs by major components of use, timing of supply requirements, and planned wastewater discharge characteristics;
- Details of proposed risk management strategy for water use and disposal;
- Costed evaluation of the identified least-cost pumped/piped water supply option to meet project water needs;
- Costed evaluation of the identified least-cost option for improved water use efficiency and/or wastewater reuse to meet as much as possible of the project water needs;
- If a potential groundwater resource is available, costed evaluation of the least-cost groundwater development to meet project water needs; and
- Evaluation of the local surface water hydrology to establish that sufficient water is available to meet the proposed application, without compromising environmental flow requirements and/or other downstream users.

The chief executive must deal with each application in accordance with this section and the provisions of the Water Act taking into account the following:

- The chief executive must refuse any application to take water in an area where unallocated water is being made available in a suitable timeframe under Section 6.4, 6.5 or 6.6;
- The chief executive must refuse any application to take water from a watercourse in which water is managed under a ROL or IROL;
- The chief executive must refuse any application to take water from sections of a watercourse where water allocations have been granted;
- Where necessary the chief executive may require an applicant to provide more detailed information to justify the planned water balance and/or cost of alternative water supplies;
- The chief executive must refuse an application if an alternative, feasible, cost-effective supply (benchmarked against best practice) is available to the applicant; and
- The justified annual maximum volume of take for a licence granted under this Section 6.7 will be assessed by the chief executive having regard to the following:
  - Current water use efficiency, demand management and water need profiles of the applicant;
  - Access to alternative water supplies through piped supplies, groundwater development, improved demand management and/or wastewater reuse;
  - The likely timeframe in which additional water will be required; and
  - The needs of any other projects in the same catchment that are deemed to be of economic or social importance to the State.

**b) Determination of price to be paid for a licence**

The price to be paid for a licence granted under this section will be determined by the chief executive based on an assessment of the likely market value of the water.

**c) Amendment to application**

The chief executive may invite an applicant to make an amendment of a stated type to its application within a stated timeframe. Without limiting the type of amendment that may be invited, the chief executive may invite an amendment to include a draft flow condition that would apply to the proposed licence. If the applicant does not take up this invitation within the timeframe, the application will be regarded as unsuccessful.

**d) Public notification of applications**

Each application will be advertised as a draft amendment to the ROP. The following information will be specified for each application:

- The proposed licence volume;
- The location where the water is proposed to be taken; and
- Any draft conditions the chief executive proposes to apply to the proposed licence.

The chief executive will invite submissions on matters relating to the draft ROP amendment within a specified timeframe.

**e) Review of submissions and settling of applications**

Review of submissions and settling of applications will be undertaken in accordance with the following:

- The chief executive may collate information about the submissions and refer the collated information and submissions to a Referral Panel established under Section 1004 of the Water Act for review and recommendation on how the submissions and applications should be dealt with;
- The chief executive must consider the submissions received, and if a submission has been referred to a Referral Panel, the recommendations of the Panel, and for each application:
  - Accept the application; or
  - Accept the application subject to conditions; or
  - Invite the applicant to make an amendment of a stated type to its application; or
  - Refuse the application;
- If an applicant amends its application as invited, the chief executive will accept the application, provided that the application still meets the evaluation criteria;
- If the chief executive accepts the application, the applicant must pay the specified price by the specified date in order for the application to be regarded as a successful application; otherwise the application will be unsuccessful; and
- If the chief executive refuses the application, the application is unsuccessful.

**f) Amendment of ROP and grant of licences**

The chief executive will amend the ROP to specify the details of all successful applications. Following amendment of the ROP to include details of the successful applications, the chief executive will, under Section 212 of the Water Act, grant a licence to the successful applicants in accordance with the details specified in the ROP.

**6.7.4 Cancellation of licences**

Any licence granted in accordance with this Section 6.7 of the ROP must be cancelled and the volume of the licence revert to the available reserve, if the relevant project:

- Has not commenced productive operation that relies on the taking or interfering with water authorised under the licence within 3 years of the grant of the licence; or
- Ceases productive operation that relies on the taking of water authorised under the licence.

Where any licence is cancelled, the proponent may reapply in accordance with Section 6.7.3 if the appropriate conditions of application are met.

## 6.8 Lower Fitzroy Reservations

This section specifies the following reserves of unallocated water:

- Nominal volume of 30,000 ML of high reliability water from the Fitzroy River for urban and industrial supplies in the Gladstone area (the *Gladstone reserve*)
- Nominal volume of 4,000 ML of high reliability water from the Fitzroy River for urban supplies in the Capricorn Coast area (the *Capricorn Coast reserve*).

### 6.8.1 Granting from the Gladstone reserve

The chief executive may grant a supplemented water allocation to Gladstone Area Water Board under Section 122 of the *Water Act 2000* for all or part of the unallocated water held as Gladstone reserve if:

- (a) Gladstone Area Water Board makes a submission to the chief executive requesting the release of all or part of the Gladstone reserve, and the submission demonstrates to the satisfaction of the chief executive that there is a formal agreement with the proponent of the additional water infrastructure necessary to supply the water allocation.
- (b) The granting is consistent with:
  - (i) the environmental flow objectives for the *Water Resource (Fitzroy Basin) Plan 1999*; and
  - (ii) the water allocation security objectives for the *Water Resource (Fitzroy Basin) Plan 1999*:
    - (A) generally; and
    - (B) in particular, for the priority group to which the water allocation will belong; and
  - (iii) the resource operations licence for the scheme under which the water allocation would be supplied.

### 6.8.2 Granting from the Capricorn Coast reserve

The chief executive may grant a supplemented water allocation to Rockhampton Regional Council under Section 122 of the *Water Act 2000* for all or part of the unallocated water held as Capricorn Coast reserve if:

- (a) Rockhampton Regional Council makes a submission to the chief executive requesting the release of all or part of the Capricorn Coast reserve, and the submission demonstrates to the satisfaction of the chief executive that there is a formal agreement with the proponent of the additional water infrastructure necessary to supply the water allocation.
- (b) The granting is consistent with:
  - (i) the environmental flow objectives for the *Water Resource (Fitzroy Basin) Plan 1999*; and
  - (ii) the water allocation security objectives for the *Water Resource (Fitzroy Basin) Plan 1999*:
    - (A) generally; and
    - (B) in particular, for the priority group to which the water allocation will belong; and
  - (iii) the resource operations licence for the scheme under which the water allocation would be supplied.

# Chapter 7

## Meeting future water requirements

### Overview

This chapter focuses on potential future releases of water in the Fitzroy Basin in addition to those dealt with in Chapter 6 of this Resource Operations Plan (ROP).

### Unallocated water available for future release

The Water Resource Plan (WRP) provides for additional water allocations in a number of parts of the basin. These include 190,000 ML of medium priority water allocations from the Dawson River for the proposed Nathan Dam Project.

The Plan overview of the WRP also identified estimated quantities of water potentially available at other locations within the basin including:

- Up to 300,000 ML of mean annual diversion from the Isaac/Connors and Lower Fitzroy River systems;
- Up to 40,000 ML of mean annual diversion from the Comet/Nogoa/Mackenzie River system;
- Up to 11,500 ML of mean annual diversion from the upper Dawson River.

The 'unallocated' water reflects a potential to take additional unsupplemented water without impact on the objectives of the WRP. It generally represents a low reliability resource and it is likely that useful access to this water will require significant new storage infrastructure (either in or off stream).

Since development of the initial Water Resource Plan, it has been recognised that extensive overland flow capture in some catchments (for example, the Comet River) already utilises a significant proportion of the available 'unallocated' water. The WRP was amended in 2005 to address overland flow management.

In addition, continued drought conditions experienced in Central Queensland have highlighted the potential impact of severe long-term climate patterns and climatic change on the long-term yield of water supply infrastructure. This, too, has potential implications for future water supply releases.

### Central Queensland Regional Water Supply Strategy

The Central Queensland Regional Water Supply Strategy (CQRWSS) was released in December 2006.

It was developed in response to the severe drought conditions in Central Queensland and the need to develop a strategic water supply plan for the region.

The strategy is an adaptive long-term statement, outlining equitable and timely solutions to the urban, industrial/mining and agricultural water needs of the Central Queensland region. Through a coordinated regional approach the strategy was tailored to achieve optimum social,

environmental and economic outcomes for the region.

Together, the elements of the strategy provide a basis for allocating and managing the regions' water resources, and for planning for infrastructure developments, to 2020 and beyond.

The strategy identifies a range of options for meeting future water demands, including water trading, improved water use efficiency and reuse, and potential additional water infrastructure supply sources.

The additional water infrastructure supply sources proposed to be developed include:

- Raising of Eden Bann Weir and construction of Rookwood Weir, to meet the short- to medium-term needs of Rockhampton, Gladstone and the Capricorn Coast areas, along with construction of a pipeline from Rockhampton to Gladstone, and construction of a pipeline from Rockhampton to the Capricorn Coast;
- Construction of a water pipeline from the Burdekin to Moranbah, which became operational in 2007, to meet the short- to medium-term needs for coal mining in the northern Bowen Basin;
- Construction of the Connors River Dam, to meet the medium- to long-term urban and mining needs of the Isaac Connors area, along with construction of associated distribution pipelines;
- Construction of Nathan Dam, to meet future supply needs in the Dawson region.

The CQRWSS identifies the following reservations of unallocated water to provide high-priority supplies to meet urban, industrial and mining demands in the region:

- Reservation of up to 30,000 ML/a of reliable water from the Lower Fitzroy for urban and industrial purposes for the Gladstone Area Water Board, or other entity that may arise from a review of the institutional arrangements;
- Reservation of 4,000 ML/a of reliable water from the Lower Fitzroy for urban needs on the Capricorn Coast;
- Reservation of the balance of available water from the Lower Fitzroy for urban, industrial and agricultural purposes in the Lower Fitzroy;
- Reservation of water for urban and other purposes in other systems in the Fitzroy Basin where unallocated water is available.

The CQRWSS also identifies that water needs to be reserved in association with the proposed water infrastructure.

Section 6.8 currently includes water reservations for Gladstone and the Capricorn Coast. It is anticipated that future amendments may need to be made to this plan relating to these and other reservations and the future release of this water, in particular once specific water infrastructure project details are more certain. Water release and/or reservation strategies identified under the CQRWSS are an amendment contemplated by this plan.

# Chapter 8

## Amending the Resource Operations Plan

### Overview

Section 106 of the Water Act provides that amendments can be made to a resource operations plan (ROP) through a simplified process, rather than following the formal public notification and submission processes required under the Water Act, if:

- The amendment is one that would correct a minor error or make a change that is not a change of substance; or
- It is stated in the ROP as an amendment that can be made under Section 106(b).

Section 8.1 details the amendments that can be made under Section 106(b) of the Water Act.

### 8.1 Amending the Resource Operations Plan

The following amendments may be made to the ROP under Section 106 (b) of the Water Act:

- a) An amendment necessary to implement an amendment to the Water Resource Plan (WRP) made under Section 57(b) of the Water Act.
- b) An amendment that provides for improved or more efficient monitoring for assessing the WRP outcomes. Examples of such amendments may include:
  - Changing indicators for ecological monitoring; and
  - An increase or addition to monitoring requirements, if further information is required;
  - A reduction or removal of monitoring requirements, if no further information or benefit is gained from the continuation of the monitoring requirements
- c) An amendment to change the infrastructure details in Attachments 4.1D, 4.2D, 4.3D or 4.4D provided the amendment is one of the following and does not adversely impact on the achievement of the WRP objectives:
  - An amendment to correct an error in the details shown in Attachments 4.1D, 4.2D, 4.3D or 4.4D (for example, revision of surface area, storage volume, spillway and/or outlet discharge relationships);
  - The installation of, or modification to, a fish transfer system on any of the infrastructure detailed;
  - The installation of, or modification to, multi-level inlet works on any of the infrastructure detailed; and
  - An increase in the discharge capacity of the Fairbairn Dam river outlet works to up to 1,600 ML/day (when the level of water stored by the dam is EL 199.0 m AHD), and any associated modifications to the outlet works, including if necessary, installation of multi-level inlet works.
- d) An amendment to change the guidelines for the evaluation of flow attributes in making a decision to activate the first post-winter flow management strategies in Attachment 4.1E, 4.2E, 4.3E and 4.4E;
- e) An amendment to add or change the fishway management strategies in Attachments 4.1E, 4.2E, 4.3E and 4.4E;
- f) An amendment to Attachments 4.1E, 4.2E, 4.3E, 4.4E, 4.1F, 4.2F, 4.3F and 4.4F where the amendment is necessary to implement a decision to amend the rules under Attachment 4.1I, 4.2I, 4.3I and 4.4I;

- 
- g) An amendment to change the rules for transfer of water between water years in Section 3.2 of Attachments 4.1F, 4.2F, 4.3F and 4.4F;
  - h) An amendment to change the rules for seasonal assignment in Section 4.2 of Attachments 4.1F, 4.2F, 4.3F and 4.4F;
  - i) An amendment to change:
    - Table 1, Table 2, Table 3 or Table 4 in Attachment 4.1H; or
    - Table 1 or Table 2 in Attachment 4.2H;
  - j) An amendment to change the specified continuous period for the purpose of the maximum rate for taking water in Attachment 5.2F, 5.2G, 5.3E and 5.3F;
  - k) An amendment to add or change an area where seasonal water assignments of water licences are allowed in Attachment 5.4, provided that each water licence to take water in the area specifies the amount of water that may be taken;
  - l) An amendment to add or change the seasonal water assignment rules for an area where seasonal water assignments are allowed in Attachment 5.4, provided that the objectives of the WRP have been considered in the development of or changes to the seasonal water assignment rules;
  - m) An amendment in relation to the release process and triggers for release in Sections 6.4, 6.5, 6.6 and 6.7 of Chapter 6;
  - n) An amendment to provide for the grant of licences in accordance with the process specified in Sections 6.5.3 f) and 6.7.3 f) of Chapter 6;
  - o) An amendment to accommodate the outcomes of the Central Queensland Regional Water Supply Study; and
  - p) An amendment to the implementation schedule in Attachment 9.

# Chapter 9

## Implementation of the Resource Operations Plan

### Overview

Section 98 of the Water Act provides for the Resource Operations Plan (ROP) to include an implementation schedule setting out arrangements for progressive implementation of the requirements of the plan over a period of 5 years.

#### 9.1 Implementation schedule for the ROP

Details of how the ROP will be implemented are specified in the implementation schedule in Attachment 9.1.

#### 9.2 Transitional arrangements for the Fitzroy Barrage Water Supply Scheme

Prior to commencement of this ROP, the department was responsible for supplemented water management in the Fitzroy Barrage Water Supply Scheme. The following transitional arrangements will apply to the shift in responsibility for this scheme from the department to the Resource Operations Licence (ROL) holder for the Fitzroy Barrage Water Supply Scheme.

##### 9.2.1 Seasonal water assignments

Seasonal water assignments approved by the chief executive prior to the issue of a ROL will continue to have effect until the end of the 2003/04 water year. Seasonal water assignments approved by the chief executive will be administered by the ROL holder from the date of issue of the ROL.

#### 9.3 Amendments to the ROP

Details of amendments to the ROP are specified in Attachment 9.2.

## Glossary

**‘AHD’** means Australian height datum, which references a level or height to a standard base level.

**‘AMTD’** means adopted middle thread distance, which is the distance in kilometres (km) that a specific point in a watercourse is from the watercourse’s mouth or junction with the main watercourse and is measured along the middle of a watercourse.

**‘authorisation’** as defined in the Water Resource Plan, means a licence, permit, or other authority to take water given under the Act or the repealed Act, other than a permit for stock or domestic purposes.

**‘channel system’** as defined in the Water Resource Plan, means a system of channels, canals, pumps and pipelines and other works used for the distribution of water to water users in a water supply scheme.

**‘cease to flow’** level for a waterhole, means the level at which water stops flowing from a waterhole over its downstream control.

**‘critical water supply’** management arrangements and water sharing rules mean the management arrangements and rules in the Resource Operations Plan that apply during periods of low water availability.

**‘cumec’** means cubic metre per second.

**‘department’** means the Department of Natural Resources and Mines.

**‘distribution loss’** means water that is lost when delivering water for water allocations in reticulated areas via constructed infrastructure through processes such as (but not limited to) evaporation, seepage, pipeline leakage, accidental loss through temporary pipe failure (breaks), loss through pressure relief systems and scouring.

**‘domestic purposes’** as defined in the *Water Act 2000*, includes irrigating a garden, not exceeding 0.25 hectares, cultivated for domestic use and not for the sale, barter or exchange of goods produced in the garden.

**‘ecological asset’** means a species, group of species, a biological function, particularly ecosystem or place of value for which the conditions created by water are directly critical.

**‘ecological outcome’** as defined in the *Water Act 2000*, means a consequence for an ecosystem in its component parts specified for aquifers, drainage basins, catchments, subcatchments and watercourses.

**‘environmental flow objective’** as defined in the *Water Act 2000*, means a flow objective for the protection of the health of natural ecosystems for the achievement of ecological outcomes. The environmental flow objectives are specified in the Water Resource Plan.

**‘high priority water allocation’** means a water allocation belonging to the high priority group. The water allocation security objectives for the high priority group are specified in the

Water Resource Plan.

**‘interim resource operations licence (IROL)’** as defined in the *Water Act 2000*, means a licence granted under s. 175 of the Act. The purpose of an interim resource operations licence is to make provision for how infrastructure and water is managed before the details have been established through an approved resource operations plan.

**‘interim water allocation (IWA)’** as defined in the *Water Act 2000*, means an authority to take water managed under an interim resource operations licence that represents a volumetric share of water and any conditions attached to that authority.

**‘IQQM computer program’** means the department’s Integrated Quantity and Quality Modelling computer program, and associated statistical analysis and reporting programs, that simulate daily stream flows, flow management, storages, releases, instream infrastructure, water extractions, water demands and other hydrologic events in the Water Resource Plan area.

**‘mean annual diversion (MAD)’** means the long-term average annual volume of water diverted.

**‘medium priority water allocation’** means a water allocation belonging to the medium priority group. The water allocation security objectives for the medium priority group are specified in the Water Resource Plan.

**‘medium A priority water allocation’** means a water allocation belonging to the medium A priority group. The water allocation security objectives for the medium A priority group are specified in the Water Resource Plan.

**‘multi-level outlet’** means an outlet arrangement on a dam or weir that allows stored water to be released downstream from selected levels below the stored water surface.

**‘nominal volume’** for a water allocation, as defined in the *Water Act 2000*, means:

- a) For a water allocation managed under a resource operations licence the number used to calculate the allocation’s share of the water available to be taken by holders of water allocations in the same priority group; and
- b) For a water allocation not managed under a resource operations licence the number used to calculate the allocations share of the water available to be taken by holders of water allocations in all water allocation groups in a water resource plan area.

**‘NR&M’** means the Department of Natural Resources and Mines.

**‘overland flow water’** is defined in the *Water Act 2000*. Overland flow water includes floodwater and water flowing over land other than in a watercourse or lake.

**‘proponent’** has the same definition meaning as in the *State Development and Public Works Organisation Act 1971*.

**‘resource operations licence (ROL)’** means a licence granted under the *Water Act 2000* to make provision for how infrastructure and water are managed under an approved resource operations plan.

**‘resource operations plan (ROP)’** means a plan approved under Section 103 of the *Water*

*Act 2000*. A resource operations plan, prepared by the chief executive implements a water resource plan for any water in the plan area in all or part of the plan area.

**‘seasonal water assignment’** of an interim water allocation, a water allocation or water licence as defined in the *Water Act 2000*, means the assignment by the holder of the allocation or licence of the benefit under the allocation or licence to another person, for a water year, of all or part of the water that may be taken under the allocation or licence.

**‘stock purposes’** in relation to taking water, as defined in the *Water Act 2000*, means watering stock that would normally be depastured on the land on which the water is, or is to be, used.

**‘stratification’** means the formation of layers of water in a dam or weir that do not readily mix with each other.

**‘supplemented water’** as defined in the Water Resource Plan, means water supplied under an interim resource operations licence, resource operations licence or other authority to operate water infrastructure.

**‘tailwater’** means the flow of water immediately downstream of a dam or weir. Tailwater includes all water passing the water storage, for example, controlled releases and uncontrolled overflows.

**‘thermocline’** means the depth in the water column of a dam or weir where a distinct change in temperature occurs due to stratification.

**‘unsupplemented water’** means water that is not supplemented water.

**‘volumetric limit’** for a water allocation, as defined in the *Water Act 2000*, means the maximum volume of water that may be taken under the allocation during the period of time, or in the circumstances, stated in the resource operations plan under which the allocation is managed, unless Section 120B(3) of the Act applies.

**‘Water Act’** means the *Water Act 2000*.

**‘water allocation’** means an authority to take water granted under Section 121 or 122 of the *Water Act 2000*. A water allocation can only be issued under an approved resource operations plan.

For supplemented water, a water allocation may be specified in terms of:

- The nominal volume of water for the allocation;
- The location from which the water may be taken under the allocation;
- The purpose for which water may be taken under the allocation; and
- The priority group to which the allocation belongs.

For unsupplemented water, a water allocation may be specified in terms of:

- The nominal volume of water for the allocation;
- The volumetric limit for the allocation;
- The location from which the water may be taken under the allocation;
- The purpose for which water may be taken under the allocation;

- The maximum rate for taking water;
- The flow conditions under which water may be taken; and
- The water allocation group to which the allocation belongs.

**‘water allocation change rules’** means the rules included in the Resource Operations Plan that define how certain attributes of a water allocation may be changed, for example, a change to the location from which water can be taken or the subdivision or amalgamation of a water allocation.

**‘water allocations register,’** means the register required under Section 148 of the *Water Act 2000*. The register records details of water allocations and other interests and dealings in a water allocation on a similar basis to that for land titles.

**‘water allocation security objective (WASO)’** as defined in the *Water Act 2000*, means an objective that may be expressed as a performance indicator and is stated in a water resource plan for the protection of the probability of being able to obtain water in accordance with a water allocation.

**‘waterharvesting’** means taking of unsupplemented water during specified high flow events, and generally involves storing the water offstream for later use.

**‘water licence’** means a licence granted under the *Water Act 2000*. A water licence is for the taking of and using water or interfering with the flow of water. The authority to construct the works associated with the water licence is given under the *Integrated Planning Act 1997*.

**‘water resource plan’** means a plan approved under the *Water Act 2000*. A water resource plan details the plan area, the water to which the plan applies and what the plan aims to achieve.

**‘water sharing rules’** for a water entitlement, means the water sharing rules included in the Resource Operations Plan. For example, the water sharing rules for water supply schemes in the Resource Operations Plan include rules for announced allocations, critical water supply water sharing arrangements and seasonal water assignments.

**‘zone’** means a geographic location defined by a reach of a watercourse. The location for a water allocation is specified as a zone.

# Map C: Unsupplemented Water Management Areas

## Attachment 2.1

### Scope of Plan

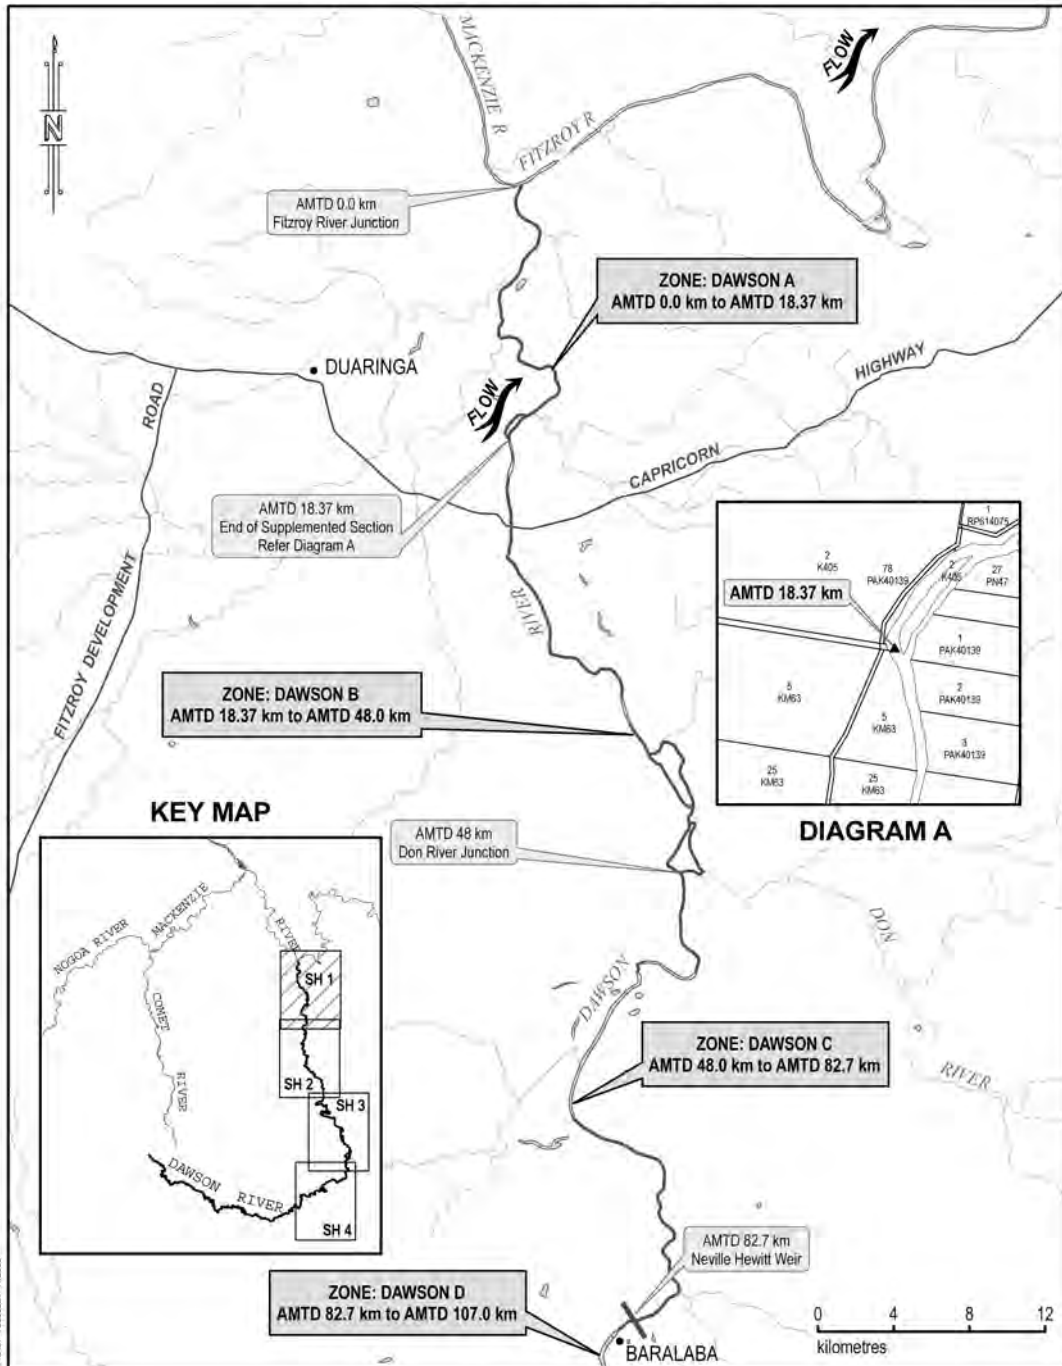

### Zones for Dawson River

#### Zones that apply to the Dawson River

Zone	AMTD (km)	Description
<b>Dawson A</b>	0 - 18.37	Fitzroy River junction to end of supplemented section (downstream end of Boolburra waterhole)
<b>Dawson B</b>	18.37 - 48	End of supplemented section to Don River junction
<b>Dawson C</b>	48 - 82.7	Don River junction to Neville Hewitt Weir
<b>Dawson D</b>	82.7 - 107	Neville Hewitt Weir to effective upstream limit of Neville Hewitt Weir
<b>Dawson E</b>	107 - 133	Effective upstream limit of Neville Hewitt Weir to Mimosa Creek junction
<b>Dawson F</b>	133 - 150.2	Mimosa Creek junction to Moura Weir
<b>Dawson G</b>	150.2 - 167	Moura Weir to effective upstream limit of Moura Weir
<b>Dawson H</b>	167 - 228.5	Effective upstream limit of Moura Weir to Theodore Weir
<b>Dawson I</b>	228.5 - 242	Theodore Weir to effective upstream limit of Theodore Weir
<b>Dawson J</b>	242 - 270.7	Effective upstream limit of Theodore Weir to Orange Creek Weir
<b>Dawson K</b>	270.7 - 311	Orange Creek Weir to effective upstream limit of Gylanda Weir
<b>Dawson L</b>	311 - 326.2	Effective upstream limit of Gylanda Weir to Glebe Weir
<b>Dawson M</b>	326.2 - 356.5	Glebe Weir to upstream limit of Glebe Weir

- a) Zones are also depicted on the following sheet maps.
- b) AMTD - the Adopted Middle Thread Distance (AMTD) is the distance in kilometres along the middle of a stream from its mouth or junction with the main river.
- c) Upstream limit – the upstream limit of an instream storage is the adopted upstream extent of the storage.
- d) Effective upstream limit - the effective upstream limit of an instream storage is the upstream limit of where access to stored water is expected most of the time under typical operating conditions.
- e) Each zone includes those sections of tributaries where there is access to flow or pondage from the Dawson River.

### Scope of Plan

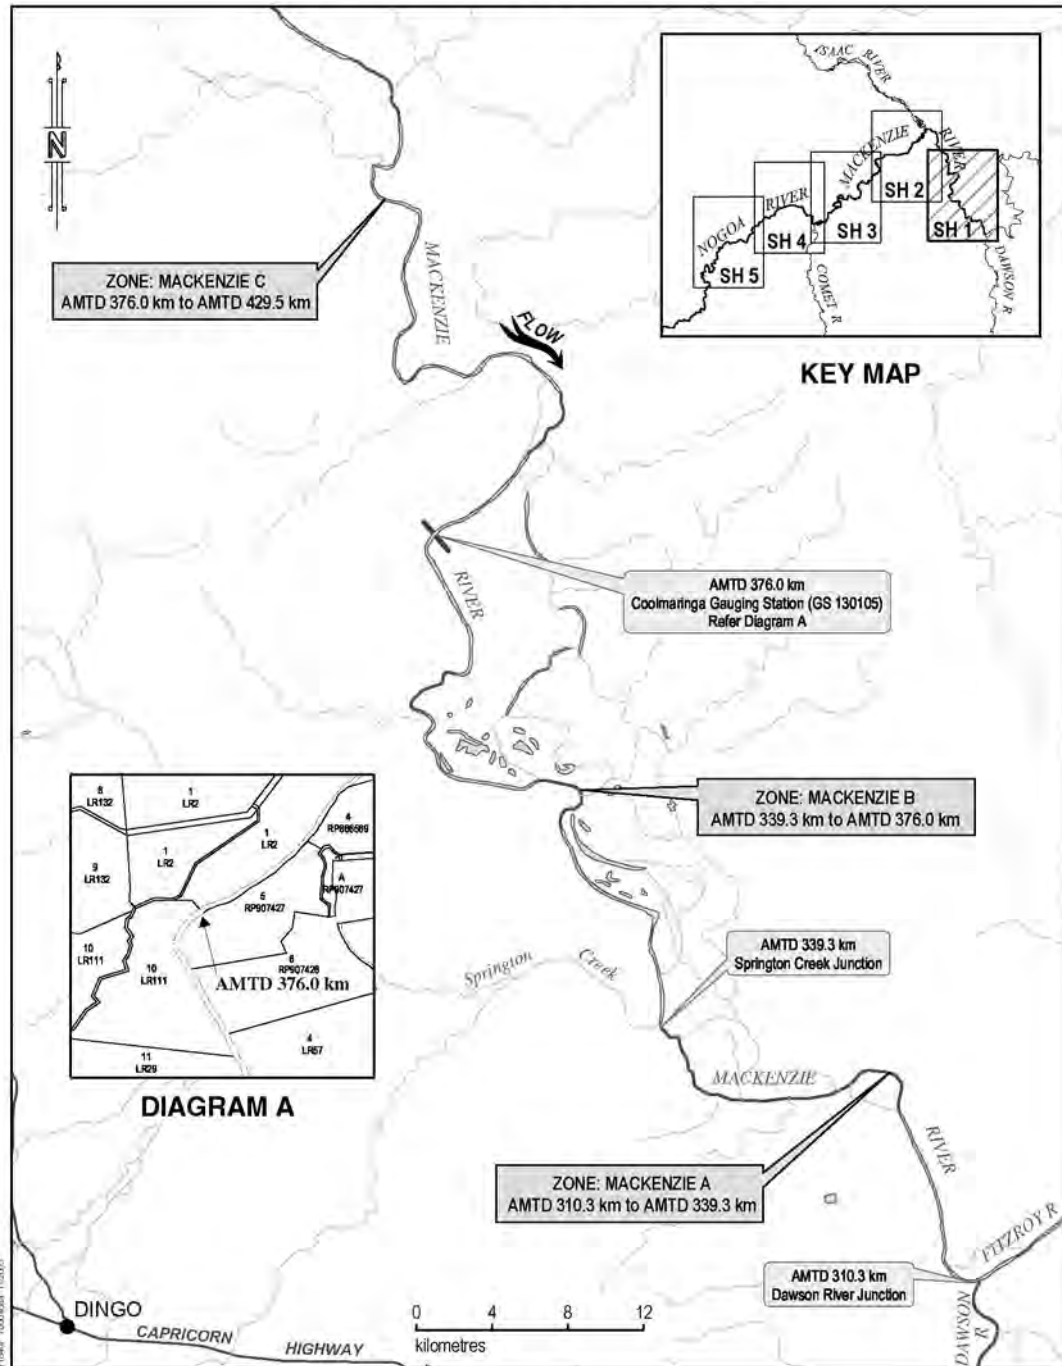

### Zones for Nogoia and Mackenzie rivers

#### Zones that apply to the Nogoia and Mackenzie rivers

Zone	AMTD (km)	Description
<b>Mackenzie A</b>	310.3 - 339.3	Dawson River junction to Springton Creek junction
<b>Mackenzie B</b>	339.3 - 376.0	Springton Creek junction to Coolmaringa Gauging Station (GS130105)
<b>Mackenzie C</b>	376.0 - 429.5	Coolmaringa Gauging Station (GS130105) to Tartus Weir
<b>Mackenzie D</b>	429.5 - 460.5	Tartus Weir to effective upstream limit of Tartus Weir
<b>Mackenzie E</b>	460.5 - 465.5	Effective upstream limit of Tartus Weir to Isaac Mackenzie waterharvesting upstream limit
<b>Mackenzie F</b>	465.5 - 489.2	Isaac Mackenzie waterharvesting upstream limit to Bingegang Weir
<b>Mackenzie G</b>	489.2 - 513.0	Bingegang Weir to effective upstream limit of Bingegang Weir
<b>Mackenzie H</b>	513.0 - 548.8	Effective upstream limit of Bingegang Weir to Bedford Weir
<b>Mackenzie I</b>	548.8 - 585.8	Bedford Weir to effective upstream limit of Bedford Weir
<b>Mackenzie J</b>	585.8 - 611.5	Effective upstream limit of Bedford Weir to Comet River junction
<b>Mackenzie K</b>	611.5 - 615.1	Comet River junction to Comet Mackenzie waterharvesting upstream limit
<b>Mackenzie L</b>	615.1 - 649	Comet Mackenzie waterharvesting upstream limit to Theresa Creek junction
<b>Mackenzie M</b>	649 - 685.6	Theresa Creek junction to Fairbairn Dam
<b>Mackenzie N</b>	685.6 - 737.5	Fairbairn Dam to upstream limit of Fairbairn Dam

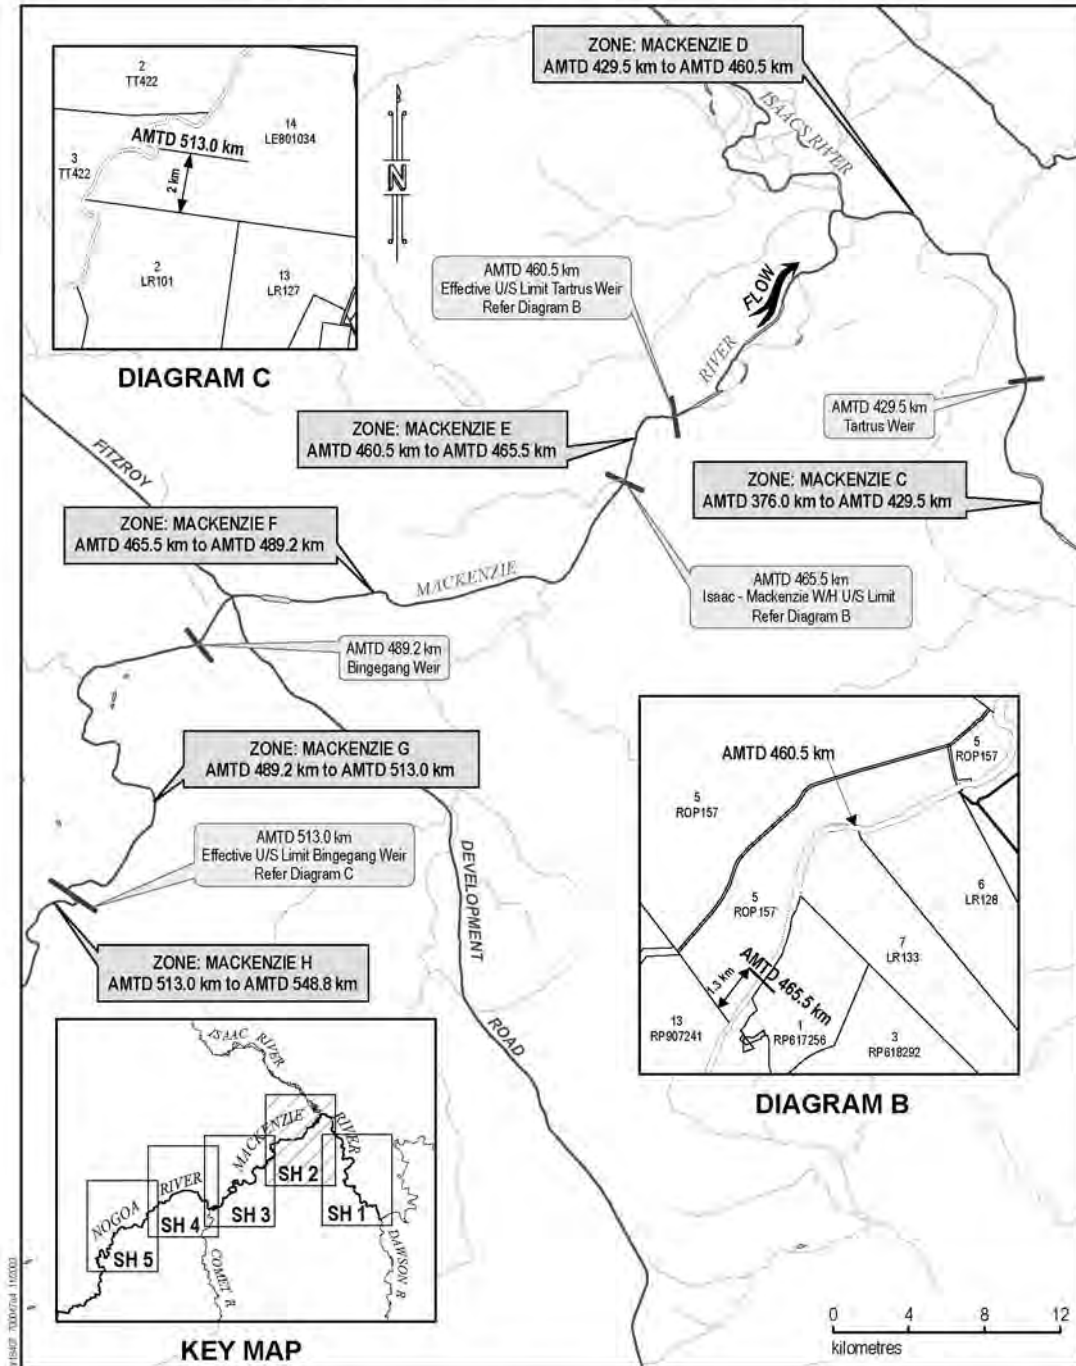

- a) Zones are also depicted on the following sheet maps.
- b) AMTD - the Adopted Middle Thread Distance (AMTD) is the distance in kilometres along the middle of a stream from its mouth or junction with the main river.

## Monitoring and reporting requirements

### State program: aquatic ecosystem

#### 1 Summary of methodology

The chief executive will implement a natural ecosystem monitoring and assessment program in accordance with the Water Resource Plan (WRP). The program will seek to assess the WRP's contribution towards the ecological outcome. Assessment will be made of how the environmental management rules provide flows that create specific aquatic conditions which are essential for particular aspects of riverine ecosystems.

Monitoring will collect information on:

- Whether specific aquatic conditions that are essential for particular aspects of the river's ecosystems are created by flows provided under the environmental management rules; and
- The way that particular biological and physical aspects of riverine ecosystems respond to specific aquatic conditions created by flows provided under the environmental management rules.

Specific aquatic conditions may include:

- Hydraulic characteristics such as water depth and water velocity;
- Water temperature;
- Seasonal timing; and
- Duration of flow.

Biological and physical responses may include:

- The breeding/spawning of particular species of aquatic plants and animals;
- Removal of encroaching sediment and vegetation from particular areas of the river and its banks;
- Movement of particular species of animals;
- Absence of physiological stress to individual plants; and
- Completion of life stages/recruitment of particular species of aquatic plants and animals.

Sites will be established in areas that are influenced by environmental management rules. Timing of data collection will depend on targeted flow events, including those provided under the environmental management rules.

The chief executive will work with stakeholders to determine the indicators (species, particular ecological response and specific aquatic conditions) and sites for the program.

#### 2 Reporting

The information from the monitoring program will be used in compiling the annual report on the WRP.

# Attachment 4.1B

## Dawson Valley Water Supply Scheme

### Rules for conversion to water allocations

#### 1 Locations where existing authorisations are being converted to water allocations

Existing authorisations for supplemented water are being converted to water allocations on:

- The Dawson River from the upstream limit of Glebe Weir to the downstream limit of the Boolburra waterhole; and
- Sections of tributaries of the Dawson River that contain water ponded from natural waterholes or infrastructure within the above section of the Dawson River.

#### 2 Rules for conversion of existing authorisations to water allocations

The following rules apply for the conversion of existing authorisations to water allocations to establish the details required for the registration of supplemented water allocations.

##### 2.1 Location

The location from which water may be supplied under a water allocation is specified as a zone according to the position of the existing authorisation. Descriptions of the zones for the Dawson River are given in Attachment 2.1.

##### 2.2 Purpose

The purpose for which water may be taken under a water allocation is specified as 'agriculture', 'distribution loss' or 'any'. 'Agriculture' is the nominated purpose for those existing authorisations that are primarily used for agricultural purposes. 'Distribution loss' is the nominated purpose for water allocations for distribution losses for the Theodore and Gibber Gonyah channel systems. 'Any' is the nominated purpose for all other uses of water.

##### 2.3 Volume

The nominal volume for a water allocation will be the volume stated on existing authorisations subject to the following arrangements for entitlements associated with watering stock normally depastured on the land and domestic purposes.

Under the Water Act, an owner of land adjoining a watercourse, lake or spring may take water for domestic purposes and watering stock that would be normally depastured on the land without a water entitlement. Therefore any existing authorisation that provides for the taking of water for stock and domestic purposes on land adjoining a watercourse will not be converted to a water allocation.

### 2.3.1 Arrangements for authorisations for irrigation and stock and domestic purposes

- a) For an authorisation for irrigation, stock and domestic purposes, where all the land supplied adjoins a watercourse:
- If the authorisation states an irrigation volume and a stock and domestic volume, the irrigation volume is the volume for the water allocation; or
  - If the authorisation states an irrigation volume but not a stock and domestic volume, the irrigation volume is the volume for the water allocation.
- b) For an authorisation for irrigation, stock and domestic purposes, where all the land supplied does not adjoin a watercourse:
- If the authorisation states an irrigation volume and a stock and domestic volume, the combined irrigation volume and stock and domestic volume is the total volume for the water allocation; or
  - If the authorisation states an irrigation volume but not a stock and domestic volume, the irrigation volume is the volume for the water allocation.
- c) For an authorisation for irrigation, stock and domestic purposes, where part of the land supplied is not contiguous with the land that adjoins a watercourse:
- If the authorisation states an irrigation volume and a stock and domestic volume, the combined irrigation volume and the calculated volume for stock and domestic purposes on the non-adjointing land is the volume for the water allocation; or
  - If the authorisation states an irrigation volume but not a stock and domestic volume, the irrigation volume is the volume for the water allocation.
- d) For an authorisation for stock and domestic purposes only, where all the land supplied does not adjoin a watercourse:
- If the authorisation states a stock and domestic volume, the stock and domestic volume is the volume for the water allocation; or
  - If the authorisation does not state a stock and domestic volume, the annual volume calculated for stock and domestic purposes is the volume for the water allocation.
- e) For Section 2.3.1c) and Section 2.3.1d), the annual volume calculated for domestic purposes is:
- i) 1 ML; or
  - ii) An alternative volume determined by the chief executive based on consideration of a submission received on this matter on the draft Resource Operations Plan (ROP).
- f) For Section 2.3.1c) and Section 2.3.1d), the annual volume calculated for stock watering is:
- i) A volume equivalent to 1 ML per 250 ha of land; or
  - ii) An alternative volume determined by the chief executive based on consideration of a submission received on this matter on the draft ROP.

Where an existing authorisation does not state a stock and domestic volume, the annual volume specified for the water allocation is the combined volume calculated using Section 2.3.1e)i) and Section 2.3.1f)i).

## **2.4 Priority group**

### **2.4.1 Water allocations that take water from the Dawson River**

The priority group for a water allocation converted from an existing authorisation to take supplemented water from the Dawson River is medium priority, except where a product specification or other undertaking associated with the authorisation identifies the authorisation's water supply as being high priority water allocation.

### **2.4.2 Water allocations that take water from the channel system**

The priority group for a water allocation converted from an existing authorisation to take supplemented water from the SunWater channel system is medium A priority, except where a product specification or other undertaking associated with the authorisation identifies the authorisation's water supply as being high priority water allocation.

## **2.5 Conversion of medium or medium A priority to high priority**

For the Dawson Valley Water Supply Scheme, the announced allocations for medium and medium A priority water allocations may be zero in the early part of the water year.

The intent of this section is to cover a period of up to 3 months from the start of the water year for occasions when the announced allocation for both medium and medium A priority water allocations could be zero.

The chief executive will consider submissions lodged during the draft ROP submission period that request a conversion of medium or medium A priority water allocation to high priority water allocation to provide for essential supplies for stock and domestic purposes to land which does not have a riparian entitlement for these purposes (see Section 2.3) or for public safety.

If the chief executive is satisfied, based on a submission, that a high priority water allocation is necessary due to a dependency on supply for essential purposes, the chief executive will reduce the medium or medium A priority water allocation volume determined under Section 2.3 by the volume determined under this section, and establish an additional high priority water allocation for the volume determined under this section.

## Attachment 4.1C

## Dawson Valley Water Supply Scheme Infrastructure details

### Storage: Glebe Weir – Dawson River AMTD 326.2 km

<b>Description of water infrastructure</b>	
Main embankment	Mass concrete and steel sheet piling weir
Full supply level	EL 170.54 m AHD
Fixed crest level	EL 170.54 m AHD
Saddle dam(s)	Nil
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	17,700 ML
Dead storage volume	430 ML
Surface area/elevation and storage volume/elevation relationship	Irrigation and Water Supply Commission Drawing No. S 36445A (28/09/73)
<b>Spillway arrangement</b>	
Description of works	Central ogee crest with cribbed sheet piling to each bank
Spillway level	EL 170.54 m AHD
Spillway width	58.54 metres
Discharge characteristics	Queensland Water Resources Commission Drawing No. A3-55197 (15/03/79)
<b>River inlet/outlet works</b>	
Description of works	An inlet tower equipped with dropboards discharging through a 1200 mm pipe bifurcating to two 675 mm diameter release valves
Multi-level inlet	Dropboards
Cease to flow level	Invert EL 160.44 m AHD
Discharge characteristics	Estimated maximum outlet discharge at FSL is 625 ML/day
<b>Fish transfer system</b>	
Description of works	Nil

**Storage: Gyranda Weir – Dawson River AMTD 284.5 km**

<b>Description of water infrastructure</b>	
Main embankment	Steel sheet piling weir
Full supply level	EL 157.25 m AHD
Fixed crest level	EL 157.25 m AHD
Saddle dam(s)	Anabranch Weir
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	16,500 ML
Dead storage volume	2,120 ML
Surface area/elevation and storage volume/elevation relationship	Queensland Water Resources Commission Drawing No. A3-64635 (16/3/87)
<b>Spillway arrangement</b>	
Description of works	Water flows over full width of weir
Spillway level	EL 157.25 m AHD
Spillway width	148.3 metres
Discharge characteristics	Queensland Water Resources Commission Drawing No. A4-64655 (26/2/92)
<b>River inlet/outlet works</b>	
Description of works	Main embankment: Multi level inlet discharging through 1600 mm by 1600 mm box culvert to a 'vee' notch weir approximately 50 metres downstream of embankment. Anabranch structure: 750 mm diameter pipe
Multi-level inlet	Multi level inlet equipped with: 900 mm by 900 mm sluice gate opening at EL 156.32 m AHD 1060 mm by 1060 mm sluice gate opening at EL 153.14 m AHD 1500 mm by 1500 mm sluice gate opening at EL 150.08 m AHD
Cease to flow level	Invert vee notch EL 149.75 m AHD Invert anabranch pipe approximately EL 153.64 m AHD
Discharge characteristics	Estimated maximum outlet discharge at FSL is 1000 ML/day
<b>Fish transfer system</b>	
Description of works	Nil

**Storage: Orange Creek Weir – Dawson River AMTD 270.7 km**

<b>Description of water infrastructure</b>	
Main embankment	Timber piled weir, with concrete work following maintenance/flood repairs
Full supply level	EL 150.29 m AHD
Fixed crest level	EL 150.29 m AHD
Saddle dam(s)	Anabranch weir
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	6,140 ML
Dead storage volume	2,320 ML
Surface area/elevation and storage volume/elevation relationship	Water Resources Commission (DPI) Drawing No. A3-101017 and 101018 (14/10/92)
<b>Spillway arrangement</b>	
Description of works	No separate spillway. Flows overtop full weir
Spillway level	EL 150.29 m AHD
Spillway width	48.82 metres
Discharge characteristics	Queensland Water Resources Commission Drawing No. A3-55199, submitted to NR&M 12/7/01
<b>River inlet/outlet works</b>	
Description of works	Main embankment: Outlet works consists of a high and low level outlet. Low level outlet is a 600 mm nominal diameter pipe controlled on the upstream end by a gate valve. The high level outlet is a 900 mm nominal diameter, two-barrel dropboard structure for crest releases. Anabranch structure: Outlet works consist of a 300 mm nominal diameter pipe controlled on the upstream end by a gate valve.
Multi-level inlet	High and low level outlets
Cease to flow level	Low level outlet invert EL 145.82 m AHD High level outlet invert EL 148.25 m AHD Anabranch outlet invert EL 147.42 m AHD
Discharge characteristics	Estimated maximum outlet discharge at FSL is 360 ML/day
<b>Fish transfer system</b>	
Description of works	Nil

**Storage: Theodore Weir – Dawson River AMTD 228.5 km**

<b>Description of water infrastructure</b>	
Main embankment	The main weir was originally of timber pile construction, with concrete abutment and apron slabs additions.
Full supply level	EL 133.63 m AHD
Fixed crest level	EL 133.63 m AHD
Saddle dam(s)	Timber piled anabranch weir
Fabridams	Nil
Gates	Nil, but note river inlet/outlet
<b>Storage volume and surface area</b>	
Full supply volume	4,760 ML
Dead storage volume	750 ML
Surface area/elevation and storage volume/elevation relationship	Queensland Water Resources Commission Drawing No. A3-36527B (10/1/84)
<b>Spillway arrangement</b>	
Description of works	Flows overtop full width of weir
Spillway level	EL 133.63 m AHD
Spillway width	60.63 metres
Discharge characteristics	Queensland Water Resources Commission Drawing No. A3-55200 (21/3/79)
<b>River inlet/outlet works</b>	
Description of works	Two 1000 mm by 750 mm gates
Multi-level inlet	Single level outlet with no inlet structure
Cease to flow level	Invert EL 131.75 m AHD
Discharge characteristics	Estimated maximum outlet discharge at FSL is 275 ML/day
<b>Fish transfer system</b>	
Description of works	Nil

**Storage: Moura Offstream Storage – Dawson River Diversion AMTD 156.9 km**

<b>Description of water infrastructure</b>	
Main embankment	Compacted earth
Full supply level	EL 125.29 m AHD
Fixed crest level	EL 125.29 m AHD
Saddle dam(s)	Not applicable
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	2,820 ML
Dead storage volume	140 ML
Surface area/elevation and storage volume/elevation relationship	Natural Resources (State Water Projects) Drawing No. A3-213163 (10/3/00)
<b>Diversion works</b>	
Description of works	Extracts from the Dawson River at AMTD 156.9 km. Reinforced concrete pump station with two by one cumec submersible pumps. Rising main comprising two by 660 mm OD steel pipes joining to a 960 mm OD steel pipe.
<b>River inlet/outlet works</b>	
Description of works	Floating intake arrangement installed in the offstream storage. Concrete base slab EL 118.30 m AHD Steel pipe through embankment invert level EL118.50 m AHD. River releases are made via: <ul style="list-style-type: none"> <li>a) Rising main direct into the river;</li> <li>b) Rising main, then into the 200 mm diameter return line; or</li> <li>c) Combination of both the above.</li> </ul>
Multi-level inlet	Floating intake arrangement
Cease to flow level	EL 118.6 m AHD
Discharge characteristics	Maximum 18 ML/day at FSL through return line Maximum 120 ML/day with pumps removed

**Storage: Moura Weir – Dawson River AMTD 150.2 km**

<b>Description of water infrastructure</b>	
Main embankment	Timber piled weir, which has been renovated to include steel and concrete
Full supply level	EL 104.75 m AHD
Fixed crest level	EL 104.75 m AHD
Saddle dam(s)	Nil
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	7,700 ML
Dead storage volume	600 ML
Surface area/elevation and storage volume/elevation relationship	Natural Resources (State Water Projects) Drawing No. A3-214477 (5/9/00)
<b>Spillway arrangement</b>	
Description of works	Flow overtops full width of weir
Spillway level	High level crest EL 105.05 m AHD Low level crest EL 104.75 m AHD
Spillway width	High level crest 135.67 metres Low level crest 55.70 metres
Discharge characteristics	Not available
<b>River inlet/outlet works</b>	
Description of works	River: 1440 mm diameter outlet pipe with a 1200 mm diameter butterfly valve. Back Creek: 900 mm diameter pipe
Multi-level inlet	Single level outlet only
Cease to flow level	River: invert EL 99.47 m AHD Back Creek: EL 101.25 m AHD
Discharge characteristics	Estimated outlet discharge at FSL is 850 ML/day
<b>Fish transfer system</b>	
Description of works	Vertical slot fishway

**Storage: Neville Hewitt Weir – Dawson River AMTD 82.7 km**

<b>Description of water infrastructure</b>	
Main embankment	Mass concrete weir
Full supply level	EL 80.30 m AHD
Fixed crest level	EL 80.30 m AHD
Saddle dam(s)	Anabranch weir
Fabridams	Nil
Gates	Nil
<b>Storage volume and surface area</b>	
Full supply volume	11,300 ML
Dead storage volume	2,120 ML
Surface area/elevation and storage volume/elevation relationship	Irrigation and Water Supply Commission Drawing No. S 43910 (21/5/75)
<b>Spillway arrangement</b>	
Description of works	Central ogee crest with cribbed sheet piling on both sides
Spillway level	EL 80.30 m AHD
Spillway width	76.20 metres
Discharge characteristics	Tabulated discharge relationship submitted to NR&M on 30/3/01
<b>River inlet/outlet works</b>	
Description of works	Main embankment: inlet structure with dropboards discharging through 750 mm nominal diameter pipe with 750 mm nominal diameter butterfly valve and a 300 mm nominal diameter gate valve. Anabranch structure: inlet structure with dropboards discharging through 600 mm nominal diameter outlet pipe with 375 mm gate valve.
Multi-level inlet	Dropboards
Cease to flow level	Main embankment: outlet pipe invert EL 72.53 m AHD Anabranch structure: outlet sill invert EL 74.80 m AHD Main embankment: inlet pipe invert EL 72.45 m AHD Anabranch structure: inlet sill invert EL 74.74 m AHD
Discharge characteristics	Outlet rating curve submitted to NR&M on 30/3/01 Estimated maximum outlet discharge at FSL is 300 ML/day
<b>Fish transfer system</b>	
Description of works	Fish lock

# Attachment 4.1E

## Dawson Valley Water Supply Scheme Rules for infrastructure operation and environmental management

### 1 Operating levels of storages and waterholes

#### 1.1 Nominal operating levels of storages

The nominal operating level for each storage in the scheme is given in Table 1.

Releases must be made from the relevant upstream storage given in Table 1 to maintain the water level in a storage at its nominal operating level, unless the water level in the upstream storage is below its local supply level.

Storage levels may vary above and below the nominal operating level due to practical limitations of estimating and making releases and for unforeseen circumstances.

**Table 1: Nominal operating levels of storages**

Storage	Upstream storage	Nominal operating level
Glebe Weir	Not applicable	Not applicable
Gyranda Weir	Glebe Weir	EL 152.12 m AHD (4,100 ML)
Orange Creek Weir	Gyranda Weir	No level specified
Theodore Weir	Gyranda Weir	EL 132.73 m AHD (3,930 ML)
Moura Offstream Storage	Not Applicable	Not applicable
Moura Weir	Moura Offstream Storage and Theodore Weir	EL 102.55 m AHD (4,200 ML)
Neville Hewitt Weir	Not applicable	Not applicable

#### 1.2 Local supply levels of storages

The local supply level and local supply area for each storage in the scheme is given in Table 2.

Releases must not be made from a storage that is below its local supply level for the purpose of maintaining nominal operating levels in downstream storages.

Releases may be made from a storage that is below its local supply level in order to supply water in its local supply area. The local supply area for a storage at a particular time extends to the pond of the next downstream storage at that particular time.

#### 1.3 Minimum operating level of storages

The minimum operating level for each storage in the scheme are given in Table 2.

**Table 2: Local supply levels, local supply areas and minimum operating levels of storages**

Storage	Local supply level	Local supply area	Minimum operating levels
Glebe Weir	EL 163.6 m AHD (800 ML)	Glebe Weir pond and downstream to, but excluding, Gylanda Weir pond	EL 160.66 m AHD
Gylanda Weir	EL 151.80 m AHD (3,700 ML)	Gylanda Weir pond and downstream to, but excluding, Theodore Weir pond	EL 150.08 m AHD
Orange Creek Weir	Not applicable	Not applicable	EL 145.82 m AHD
Theodore Weir	EL 131.75 m AHD (3,140 ML)	Theodore Weir pond and downstream to, but excluding, Moura Weir pond	EL 126.95 m AHD
Moura offstream storage	Not applicable	Not applicable	No minimum level specified
Moura Weir	Not applicable	Moura Weir pond and downstream to, but excluding, Neville Hewitt Weir pond	EL 97.0 m AHD
Neville Hewitt Weir	EL 77.0 m AHD (4,000 ML)	Neville Hewitt Weir pond and downstream to downstream limit of Dawson Valley Water Supply Scheme	EL 72.53 m AHD

Water must not be released or supplied from a storage if the water level in that storage is below its minimum operating level, unless otherwise authorised by the chief executive.

Gylanda Weir may be drawn down to its minimum operating level only if Glebe Weir is below its local supply level.

Theodore Weir may be drawn down to its minimum operating level only if Gylanda Weir is below its local supply level.

Moura Weir may be drawn down to its minimum operating level only if Theodore Weir is below its local supply level and Moura Offstream Storage is below its dead storage volume. The dead storage volume for the Moura Offstream Storage is given in Attachment 4.1D.

#### 1.4 Minimum levels in waterholes

For the waterhole known locally as Boolburra waterhole (nominally AMTD 18.37 km on the Dawson River):

- If the water level in Neville Hewitt Weir is above its local supply level, supplemented water should not be taken from the Boolburra waterhole if the water level in that waterhole is more than 0.5 metres below its cease to flow level; and
- If the water level in Neville Hewitt Weir is below its local supply level, supplemented water must not be taken from the Boolburra waterhole if the water level in that waterhole is more than 1.2 metres below its cease to flow level, unless otherwise authorised by the chief executive

For a waterhole within the extent of the Dawson Valley Water Supply Scheme other than the Boolburra waterhole:

- Supplemented water should not be taken from a waterhole that is more than 0.5 metres below its cease to flow level; and
- The chief executive may authorise supplemented water to be supplied from a waterhole when the level is more than 0.5 metres below its cease to flow level.

## **2 Diversions to Moura Offstream Storage**

Water may be diverted to the Moura Offstream Storage at a rate not exceeding 173 ML/day, subject to the following:

- For the duration of the Moura Offstream Storage first post-winter flow management strategy, water may be diverted to the Moura Offstream Storage if the flow passing Moura Weir is more than 30 cumec; and
- At other times water may be diverted to the Moura Offstream Storage if the flow passing Moura Weir is more than 5 cumec.

The Moura Offstream storage first post-winter flow management strategy applies for the same period as the first post-winter flow management strategy for waterharvesting upstream of the Mimosa Creek junction, given in Section 5.1 of Attachment 5.1B.

The chief executive will notify the Resource Operations Licence (ROL) holder if the first post-winter flow management strategy for waterharvesting upstream of the Mimosa Creek junction is activated before 1 October, otherwise the strategy is activated on 1 October.

The chief executive will notify the ROL holder when the first post-winter flow management strategy for waterharvesting upstream of the Mimosa Creek junction ends.

The ROL holder must implement the Moura Offstream Storage first post-winter flow management strategy at the earlier of:

- Within 24 hours of notification of activation of the first post-winter flow management strategy for waterharvesting upstream of the Mimosa Creek junction; or
- 1 October.

## **3 Releases of water from storages**

### **3.1 General rules**

When determining releases from a storage, the ROL holder must have regard to the following:

- The total volume of water ordered, and its distribution;
- The likely contribution of inflows from tributaries that could assist the supply of orders;
- The likely transmission and operating losses;
- The travel time for water delivery;
- The volume of releases required to maintain nominal operating levels in downstream storages, and to maintain levels in waterholes;
- Releases must not be made from storages in the upper Dawson sub-scheme to:
  - Supply orders for water allocations located within the Neville Hewitt Weir pond;
  - Supply orders for water allocations located in zones Dawson B or Dawson C; or
  - Maintain storage levels in the lower Dawson sub-scheme;

- The local supply level in the supplying storage;
- The first post-winter flow management strategy;
- The seasonal base flow management strategy;
- The fishway management strategy; and
- The quality of water released from storages.

The ROL holder may incorporate provisions in supply contracts for circumstances when the release capacity of a storage is insufficient to meet downstream demand.

### 3.2 Release rate rules

Water may be released from a storage at a rate up to the maximum discharge capacity of its outlet works.

The maximum discharge capacity of the outlet works is to be used for meeting downstream demand or passing environmental flows as required.

A change to the rate of a release through the outlet works of a storage must have regard to the limits described in Table 3.

**Table 3: Limits on changes to rate of release through the outlet works of storages**

Storage	Limits on changes to rate of release through outlet works
Glebe, Gylanda, Orange Creek, Theodore, Moura and Neville Hewitt Weirs	<ul style="list-style-type: none"> <li>• Reductions of release rate must occur incrementally, such that the risk of fish stranding and bank slumping is minimised.</li> <li>• Maximum rate of increase in release rate are not specified.</li> </ul>
Moura Offstream Storage	<ul style="list-style-type: none"> <li>• None specified</li> </ul>

## 4 First post-winter flow management strategy

### 4.1 Upper Dawson sub-scheme first post-winter flow management strategy

#### 4.1.1 Notification of activation of strategy

The upper Dawson sub-scheme first post-winter flow management strategy is activated when the chief executive notifies the Dawson Valley Water Supply Scheme ROL holder that the strategy is activated.

The chief executive will activate the first post-winter flow management strategy for the first flow event with the following attributes:

- General stream flow level rises of at least 1.5 metres in the Dawson River between Glebe Weir and the effective upstream limit of Gylanda Weir between 1 October and 10 April, to indicate circumstances that would potentially trigger ecological processes associated with the first post-winter flow; or
- General stream flow level rises of at least 1.5 metres in the Dawson River between Glebe Weir and the effective upstream limit of Gylanda Weir after 14 September, to indicate circumstances that would potentially trigger ecological processes associated with the first post-winter flow, provided that the water temperature is expected to be above the critical level for these processes; and
- Flow characteristics that would typically indicate an event resulting in flows between

Glebe Weir and the effective upstream limit of Gylanda Weir with a duration greater than base flow of at least 15 days, to support ecological processes associated with the intent of the first post-winter flow.

The following guidelines will apply to evaluation of these flow attributes and in making a decision to activate the first post-winter flow management strategy:

- The ecological processes trigger will generally be identified by a rise in stream flow of at least 2,000 ML/day in the Dawson River immediately downstream of Glebe Weir.
- For an event with the ecological processes trigger occurring in September, the water temperature should be at least 23°C; and
- The characteristics of the flow event will be evaluated to decide whether the event would typically result in extended periods of flow immediately downstream of Glebe Weir above the base flow (the Water Resource Plan (WRP) specifies a base flow of 46 ML/day at Glebe Weir). This evaluation will be based on stream flow as well as Bureau of Meteorology weather and rainfall information.

The decision to activate the first post-winter flow management strategy will typically be made within 3 days of the occurrence of the ecological process trigger flow. However, the decision may occur later if subsequent weather, rainfall and runoff conditions indicate that the flow duration attributes could be achieved.

The department will prepare work practices that further guide evaluations associated with the activation of the first post-winter flow management strategies. These guidelines will be regularly reviewed to adapt to technological advances and operational experience.

#### **4.1.2 Strategy details**

Releases to pass flows under the upper Dawson sub-scheme first post-winter flow management strategy are in addition to releases required for water supply or for maintaining operating levels in downstream weirs.

##### **(a) Gylanda Weir**

The ROL holder must implement the upper Dawson sub-scheme first post-winter flow management strategy at Gylanda Weir within 1 day of the activation of the strategy by the chief executive.

For 21 days from the date that implementation of the strategy begins at Gylanda Weir, inflows to Gylanda Weir must be passed as they occur, except:

- Releases must not be made if the water level in Gylanda Weir is below EL 154.9 m AHD (9,000 ML);
- Releases are not required when Gylanda Weir overflow is more than 100 ML/day; and
- Releases are not required when Gylanda Weir inflow is less than 30 ML/day.

For the purpose of implementing the strategy:

- The passing flow may vary above and below that required under this strategy due to practical limitations of estimating and making releases, the maximum discharge capacity of the outlet works, and for unforeseen circumstances;
- The shape of the passing flow hydrograph should follow as far as practicable the shape of the inflow hydrograph; and

- At those times when the maximum discharge capacity of the outlet works limits the ability to pass inflows, the excess inflow volume will be retained in storage.

**(b) Moura Weir**

The ROL holder must implement the upper Dawson sub-scheme first post-winter flow management strategy at Moura Weir within 1 day of the activation of the strategy by the chief executive.

For 21 days from the date that implementation of the strategy begins at Moura Weir, inflows to Moura Weir must be passed as they occur, except:

- Releases must not be made if the water level in Moura Weir is below EL 103.15 m AHD (4,900 ML);
- Releases are not required when Moura Weir overflow is more than 110 ML/day; and
- Releases are not required when Moura Weir inflow is less than 35 ML/day.

For the purpose of implementing the strategy:

- The passing flow may vary above and below that required under this strategy due to practical limitations of estimating and making releases, the maximum discharge capacity of the outlet works, and for unforeseen circumstances;
- The shape of the passing flow hydrograph should follow as far as practicable the shape of the inflow hydrograph; and
- At those times when the maximum discharge capacity of the outlet works limits the ability to pass inflows, the excess inflow volume will be retained in storage.

**4.2 Lower Dawson sub-scheme first post-winter flow management strategy**

**4.2.1 Notification of activation of strategy**

The lower Dawson sub-scheme first post-winter flow management strategy is activated when the chief executive notifies the Dawson Valley Water Supply Scheme ROL holder that the strategy is activated.

The chief executive will activate the first post-winter flow management strategy for the first flow event with the following attributes:

- General stream flow level rises of at least 1.5 metres in the Dawson River downstream of Neville Hewitt Weir between 1 October and 10 April, to indicate circumstances that would potentially trigger ecological processes associated with the first post-winter flow; or
- General stream flow level rises of at least 1.5 metres in the Dawson River downstream of Neville Hewitt Weir after 14 September, to indicate circumstances that would potentially trigger ecological processes associated with the first post-winter flow, provided that the water temperature is expected to be above the critical level for these processes; and
- Flow characteristics that would typically indicate an event resulting in flows downstream of Neville Hewitt Weir with a duration greater than base flow of at least 15 days, to support ecological processes associated with the intent of the first post-winter flow.

The following guidelines will apply to evaluation of these flow attributes and in making a decision to activate the first post-winter flow management strategy:

- The ecological processes trigger will generally be identified by a rise in stream flow of at least 2,000 ML/day in the Dawson River immediately downstream of Neville Hewitt Weir or at the Don River junction;
- For an event with the ecological processes trigger occurring in September, the water temperature should be at least 23°C; and
- The characteristics of the flow event will be evaluated to decide whether the event would typically result in extended periods of flow immediately downstream of Neville Hewitt Weir above the base flow (the WRP specifies a base flow of 78 ML/day at Neville Hewitt Weir). This evaluation will be based on stream flow as well as Bureau of Meteorology weather and rainfall information.

The decision to activate the first post-winter flow management strategy will typically be made within 3 days of the occurrence of the ecological process trigger flow. However the decision may occur later if subsequent weather, rainfall and runoff conditions indicate that the flow duration attributes could be achieved.

The department will prepare work practices that further guide evaluations associated with the activation of the first post-winter flow management strategies. These guidelines will be regularly reviewed to adapt to technological advances and operational experience.

#### **4.2.2 Strategy details**

Releases to pass flows under the lower Dawson sub-scheme first post winter flow management strategy are in addition to any releases required for water supply.

The ROL holder must implement the lower Dawson sub-scheme first post-winter flow management strategy at Neville Hewitt Weir within 1 day of the activation of the strategy by the chief executive.

For 21 days from the date that implementation of the strategy begins at Neville Hewitt Weir, inflows to Neville Hewitt Weir must be passed as they occur, except:

- Releases must not be made if the water level in Neville Hewitt Weir is below EL 77.0 m AHD (4,000 ML);
- Releases are not required when Neville Hewitt Weir overflow is more than 110 ML/day; and
- Releases are not required when Neville Hewitt Weir inflow is less than 35 ML/day.

For the purpose of implementing the strategy:

- The passing flow may vary above and below that required under this strategy due to practical limitations of estimating and making releases, the maximum discharge capacity of the outlet works, and for unforeseen circumstances;
- The shape of the passing flow hydrograph should follow as far as practicable the shape of the inflow hydrograph; and
