*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

- W13** The authority holder must notify the administering authority as soon as practicable, (nominally within twenty-four (24) hours after of cessation of a release) of the cessation of a release notified under Condition W12 and within 28 days provide the following information in writing:
  - a) release cessation date/time;
  - b) natural flow volume in receiving water;
  - c) volume of water released;
  - d) details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
  - e) all in-situ water quality monitoring results; and
  - f) any other matters pertinent to the water release event.

**Notification of Release Event Exceedance**

- W14** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.
- W15** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:
  - a) the reason for the release;
  - b) the location of the release;
  - c) all water quality monitoring results;

- d) any general observations;
- e) all calculations; and
- f) any other matters pertinent to the water release event.

**Monitoring of Water Storage Quality**

**W16** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

**W17** In the event that waters storages defined in Table 5 exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures, where practicable, to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>

**Department of Environment and Resource Management**  
Conserving and managing Queensland's environment and natural resources

Zinc (mg/L)	Maximum	20 <sup>1</sup>
-------------	---------	-----------------

Note:

<sup>1</sup> Contaminant limit based on ANZECC & ARMCANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARMCANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4-9".

Note: Total measurements (unfiltered) must be taken and analysed

**Receiving Environment Monitoring and Contaminant Trigger Levels**

**W18** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency	Comments
pH	6.5 – 8.0	Daily during the release	See Table 2 comments
Electrical Conductivity (µS/cm)	1000		
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.		
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	250 (Protection of drinking water Environmental Value) OR 1000 (Protection of irrigation environmental value)		

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

**EXPLANATORY NOTES – Selection of monitoring sites:**

The intent here is that that each discharge point has both an upstream and downstream monitoring point associated with it. These monitoring points should be located as close as practicable to the release point and the distances should be defined in the footnotes in Table 8. The location of flow monitoring points should also be considered in selecting upstream monitoring points. Other considerations include accessibility, particularly during wet weather conditions.

Monitoring Points	Receiving Waters Location Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)
<b>Upstream Background Monitoring Points</b>			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
<b>Downstream Monitoring Points</b>			

**Department of Environment and Resource Management**  
 Conserving and managing Queensland's environment and natural resources

Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

**Notes:**

- a) The upstream monitoring point should be within Xkm the release point.
- b) the downstream point should not be greater than Xm from the release point.
- c) The data from background monitoring points must not be used where they are affected by releases from other mines.

**W19** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:

1. where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or
2. where the down stream results exceed the upstream results complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
  - (i) details of the investigations carried out; and
  - (ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W19 2(ii) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

**Receiving Environment Monitoring Program (REMP)**

**EXPLANATORY NOTES – Designing a REMP:**

The intent here is that the REMP will be designed for specific requirements of the mine's releases and the receiving environment. The monitoring within the REMP should not be the primary basis for compliance but will be essential for providing supporting information when incidents may occur or for deriving future license limits. The focus should also be on reporting against water quality objectives for relevant waterways affected by the discharge and be on a longer term basis compared to compliance reporting. The intent is that the REMP is to provide condition assessment of near-field areas, ie. local areas likely to be significantly affected by the mine's releases. To do this, it is necessary that monitoring data is collected during times of natural flow outside of times of release in addition to time of release. The REMP is likely to include monitoring sites and indicators in addition to what is presented in the tables of these conditions. The intent is that far-field areas and cumulative impacts will be monitored as part of regional monitoring described in Condition W43 and assist in providing regional condition assessment and regionally specific reference information.

**W20** A REMP must be developed and implemented by XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE) to monitor and record the effects of the release of contaminants on the receiving environment periodically and whilst contaminants are being discharged from the site, with the aims of identifying and describing the extent of any adverse impacts to local environmental values, and monitoring any changes in the receiving water. A copy of the REMP must be provided to the administering authority prior to its implementation and due consideration given to any comments made on the REMP by the administering authority.

For the purposes of the REMP, the receiving environment is the waters of the XX and connected waterways within XX (e.g. Xkm) downstream of the release.

**W21** The REMP must address (but not necessarily be limited to) the following:

- a) Description of potentially affected receiving waters including key communities and background water quality characteristics based on accurate and reliable monitoring data that takes into consideration any temporal variation (e.g. seasonality); and
- b) Description of applicable environmental values and water quality objectives to be achieved (i.e. as scheduled pursuant to the Environmental Protection (Water) Policy 1997); and
- c) Any relevant reports prepared by other governmental or professional research organisations that relate to the receiving environment within which the REMP is proposed; and

- d) Water quality targets within the receiving environment to be achieved, and clarification of contaminant concentrations or levels indicating adverse environmental impacts during the REMP.
- e) Monitoring for any potential adverse environmental impacts caused by the release;
- f) Monitoring of stream flow and hydrology;
- g) Monitoring of toxicants should consider the indicators specified in Table 3 to assess the extent of the compliance of concentrations with water quality objectives and/or the ANZECC & ARMCANZ 2000 guidelines for slightly to moderately disturbed ecosystems;
- h) Monitoring of physical chemical parameters as a minimum those specified in Table 2 (in addition to dissolved oxygen saturation and temperature);
- i) Monitoring biological indicators (for macroinvertebrates in accordance with the AusRivas methodology) and metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*) for permanent, semi-permanent water holes and water storages;
- j) The locations of monitoring points (including the locations specified in Table 8 which are background and downstream impacted sites for each release point);
- k) The frequency or scheduling of sampling and analysis sufficient to determine water quality objectives and to derive site specific reference values within 2 years (depending on wet season flows) in accordance with the *Queensland Water Quality Guidelines 2006*. For ephemeral streams, this should include periods of flow irrespective of mine or other discharges;
- l) Specify sampling and analysis methods and quality assurance and control;
- m) Any historical datasets to be relied upon;
- n) Description of the statistical basis on which conclusions are drawn, and
- o) Any spatial and temporal controls to exclude potential confounding factors.

**W22** A report outlining the findings of the REMP, including all monitoring results and interpretations in accordance with conditions W20 must be prepared and submitted in writing to the administering authority by 1 October 2011. This should include an assessment of background water quality, any assimilative capacity for those contaminants monitored and the suitability of current discharge limits to protect downstream environment values.

**Water Reuse**

**W23** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying stock water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with the quality release limits specified in Table 9.

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**W24** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying irrigation water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with quality release limits in Table 10.

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with

- W25** Water contaminated by mining activity may be piped or trucked off the mining lease for the purpose of supplying water to a third party for purpose of construction and/or road maintenance in accordance with the conditions of this environmental authority.
- W26** Water contaminated by mining activity may be piped or trucked for the purpose of supplying water to <name adjoining mine> in accordance with the conditions of this environmental authority. The volume, pH and electrical conductivity of water transferred to {name adjoining mine} must be monitored and recorded.
- W27** If the responsibility of water contaminated by mining activities (the water) is given or transferred to another person in accordance with conditions **W23, W24, W25 or W26**:
- the responsibility of the water must only be given or transferred in accordance with a written agreement (the third party agreement); and
  - include in the third party agreement a commitment from the person utilising the water to use water in such a way as to prevent environmental harm or public health incidences and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters.

#### Water General

- W28** All determinations of water quality must be:
- performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - made in accordance with methods prescribed in the latest edition of the Environment Protection Agency Water Quality Sampling Manual;
- Note: Condition W28 requires the Water Quality Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
- collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible; and
  - carried out on representative samples.
  - laboratory testing must be undertaken using a laboratory accredited (e.g. NATA) for the method of analysis being used.
- W29** The release of contaminants directly or indirectly to waters:
- must not produce any visible discolouration of receiving waters; and
  - must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

#### Annual Water Monitoring Reporting

- W30** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:
- the date on which the sample was taken;
  - the time at which the sample was taken;
  - the monitoring point at which the sample was taken;
  - the measured or estimated daily quantity of the contaminants released from all release points;
  - the release flow rate at the time of sampling for each release point;
  - the results of all monitoring and details of any exceedences with the conditions of this environmental authority; and
  - water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

#### Temporary Interference with waterways

- W31 Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Natural Resources and Water *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

#### Water Management Plan

- W32 A Water Management Plan must be developed and implemented by **XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE)** that provides for the proper and effective management of the actual and potential environmental impacts resulting from the mining activity and to ensure compliance with the conditions of this environmental authority.
- W33 The Water Management Plan must be developed in accordance with DERM Guideline for Preparing a Water Management Plan 2009 (to be developed by 1 October) or any updates that become available from time to time and must include at least the following components:
- Contaminant Source Study;
  - Site Water Balance and Model;
  - Water Management System;
  - Saline Drainage Prevention and Management Measures;
  - Acid Rock Drainage Prevention and Management Measures (if applicable);
  - Emergency and Contingency Planning;
  - Monitoring and Review.
- W34 Each year the holder of the environmental authority must undertake a review of the Water Management Plan prior to the wet season (i.e. by 1 November) and a further review following the wet season (i.e. by 1 May the following year) to ensure that proper and effective measures, practices or procedures are in place so that the mine is operated in accordance with the conditions of this environmental authority and that environmental harm is prevented or minimised.
- W35 A copy of the Water Management Plan and/or a review of the Water Management Plan must be provided to the administering authority on request.

#### Saline Drainage

- W36 The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

#### Acid Rock Drainage

- W37 The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

#### Stormwater and Water sediment controls

- W38 An Erosion and Sediment Control Plan must be developed by an appropriately qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to receiving waters and contamination of storm water.
- W39 The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any receiving waters.
- W40 Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or receiving waters.

#### All Dams

---

#### EXPLANATORY NOTES – Dam conditions:

Note: Conditions W41 and W42 to be removed if already conditioned in the authority.

---

- W41 The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.
- W42 Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

**Fitzroy River Basin Study**

- W43 The administering authority and the holder of this environmental authority both acknowledge that the conditions for release of contaminants to the XX River in this environmental authority have been calculated without the benefit of the findings of projects proposed to be undertaken as per recommendations 2 and 3 of the *Study of cumulative impacts on water quality of mining activities in the Fitzroy River Basin* (April 2009). The administering authority may, based on the information provided in the study report when it becomes available, all relevant information available at the time and the regulatory framework applicable at that time, consult with the holder of this environmental authority about the conditions in the environmental authority concerning the treatment and disposal of waste water.

The aim of the consultation shall be the meaningful review of the contaminant release limits imposed in this authority having regard to:

- a) the study results;
- b) near field monitoring results;
- c) QLD Water Quality Guidelines; and
- d) best practice environmental management.

If this review leads to a change in the requirements on this environmental authority holder, this shall be advanced by way of an authority amendment or a Transitional Environmental Program and as is necessary or desirable.

**Definitions:**

**"20th percentile flow"** means the 20th percentile of all daily flow measurements (or estimations) of daily flow over a 10 year period for a particular site. The 20th percentile calculation should only include days where flow has been measured (or estimated), i.e. not dry weather days.

**"acid rock drainage"** means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

**"administering authority"** means the Department of Environment and Resource Management or its successor.

**"appropriately qualified person"** means a person who has professional qualifications, training, skills or experience relevant to the nominated subject matter and can give authoritative assessment, advice and analysis on performance relative to the subject matter using the relevant protocols, standards, methods or literature.

**"dam"** means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However; a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

**"environmental authority"** means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

**"environmental authority holder"** means the holder of this environmental authority.

**"flowable substance"** means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

**"hazard"** in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

**"hazard category"** means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in the Manual for Assessing Hazard Categories and Hydraulic Performance of Dams (Version 2.0, 2009) published by the Environmental Protection Agency on its website.

**"natural flow"** means the flow of water through waters caused by nature.

**"receiving environment"** means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

**"receiving waters"** means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

**"representative"** means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

**"saline drainage"** The movement of waters, contaminated with salt(s), as a result of the mining activity.

**"waters"** includes river, stream, lake, lagoon, pond, swamp, welland, unconfined surface water, unconfined water natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

Dear <<title>> <<sir\_name>>

**RE: FITZROY BASIN MINING CUMILATIVE IMPACT STUDY  
RECOMMENDATION 1 – IMPLEMENTATION OF ‘MODEL’ CONDITIONS**

Thank you for your participation in the formulation of the ‘model’ water conditions associated with mine discharges in the Fitzroy Basin. The final conditions are enclosed.

The Department has now formulated a process to facilitate the amendment of relevant mining environmental authorities (EA’s) by December 2009. Please find attached a flow chart detailing this process.

Please note that in order to meet the December 2009 timeframe amendment applications are sought from each mine by 1 September 2009. Where amendments are seeking to deviate from the limits or parameters suggested in the agreed model conditions, applications should be accompanied with supporting information including a detailed, reasoned, evidence-based assessment to support alternative compliance limits, trigger levels and flow triggers.

It is expected that deviations from the agreed ‘model’ conditions will be limited to the above scenarios and noted that sites choosing to vary limits and submit supporting rationale should allow for further time for the assessment of their application.

To expedite this process, please find attached a partially filled application form and information request to assist you in preparing the information that will assist DERM in processing the applications efficiently. The fee for this application is \$250 and is required by the *Environmental Protection Act 1994* to make a valid application. An electronic copy of this form is available on request by contacting [REDACTED] ([REDACTED]@[derm.qld.gov.au](mailto:derm.qld.gov.au)).

The opportunity for a pre-lodgement meeting is extended and may be useful where you require assistance in the development of the EC compliance limit (if appropriate) and assessment of the potential contaminants of Table 3 and flow triggers.

The assessment of the applications will be prioritised according to the discharge risk levels in the *Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin*.

An internal training package will be undertaken in early August with DERM officers to ensure pre-lodgement meetings, advice and assessment of the amendment applications is efficient and in context with the history of this project.

If you have any questions in relation to this process or would like to arrange a pre-lodgement meeting please contact your sites DERM Project Manager.

If you have any questions in relation to this letter don't hesitate to contact me on ( [REDACTED] ) ([REDACTED]@[derm.qld.gov.au](mailto:derm.qld.gov.au)) or [REDACTED] on (07) [REDACTED] ([REDACTED]@[derm.qld.gov.au](mailto:derm.qld.gov.au)).

Yours sincerely

[REDACTED]

## Minister for Climate Change and Sustainability The Honourable Kate Jones

**Wednesday, August 12, 2009**

### Inaugural meeting for Fitzroy Water Quality Advisory Group

A new State Government website has been launched to give central Queenslanders publicly available information on water quality in the Fitzroy River Basin, Climate Change and Sustainability Minister Kate Jones said today.

Ms Jones said the website coincided with the first meeting yesterday of the new Fitzroy Water Quality Advisory Group to tackle the region's water quality issues and proactively plan future management of water quality of the waterway.

She said the group would provide advice to the State Government and ensure information on water quality projects was available to the public.

"The group brings together representatives from a range of organisations, Traditional Owners and State Government departments to ensure co-ordinated management of water quality issues in the Fitzroy River catchment area," Ms Jones said.

"One of the Advisory Group's first tasks is to review and comment on processes already in place to address water quality issues in the Fitzroy River Basin.

"Advice will also be provided on implementation of recommendations of Professor Barry Hart's report on 'Review of the Fitzroy Water Quality Issues' and the Department of Environment and Resource Management's (DERM) report on 'Cumulative Impacts on Water Quality Mining Activities in the Fitzroy Basin'.

"Anyone interested in following up on the issues and outcomes discussed by the group and at future meetings can access the minutes at [www.fitzroyriver.qld.gov.au](http://www.fitzroyriver.qld.gov.au)."

Member for Rockhampton Robert Schwarten said the new website would provide up-to-date information to the public on water quality projects being undertaken and progress by the Advisory Group.

"It will also include updates on the Queensland Government's response to the recommendations outlined in Professor Hart's and DERM's reports," Mr Schwarten said.

"Nearly all the recommendations made are being fully supported with many already undertaken or in the process of being implemented."

Ms Jones said DERM was working with the Fitzroy Basin Association to develop environmental values and water quality objectives for the Fitzroy catchment.

"This is a comprehensive project that will include extensive community and stakeholder consultation and input," she said.

"DERM is also working closely with the Queensland Resources Council and mines in the region to review current discharge arrangements in the Fitzroy catchment."

Ms Jones said the amalgamation of the former Environmental Protection Agency and Department of Natural Resources and Water into the newly created DERM meant there was now one lead agency responsible for providing advice and overseeing management of water quality in the Fitzroy Region as well as elsewhere in Queensland.

"This is one of the many recommendations made by Professor Hart which have now been addressed," she said.

"The combined expertise brought together under the one department, allows DERM to undertake additional water quality monitoring across the catchment and share this information with the community."

Ms Jones said DERM would continue to work in conjunction with local communities and the Advisory Group to deliver programs and initiatives that meet the community's expectations related to water quality in the Fitzroy Basin.

**12 August, 2009**

**MEDIA CONTACT:** [REDACTED] or [REDACTED]

# **Fitzroy Water Quality Advisory Group**

## **Terms of Reference**

### **Aims**

- To provide a consultative forum to collect views and information as an input into effective Government decision making on water quality issues in the Fitzroy River Basin.
- To share information with the public, on water quality projects and issues, relating to the Fitzroy River Basin.

### **Role**

FWQAG's role is to:

- provide a forum to enable government to effectively consult with member organisations on the implementation of actions to address community concerns with water quality arising from:
  - the report on the Cumulative Impacts on Water Quality of Mining Activities in the Fitzroy River Basin (DERM)
  - the Review of the Fitzroy River Water Quality Issues (Barry Hart report)
- provide advice to State Government agencies relating to management of water quality in the Fitzroy River Basin.
- inform effective decision making by FWQAG members relating to water quality management in the Fitzroy River Basin.
- act as a coordinating group to provide for the sharing of information on water quality and the progress of water quality projects between stakeholders.
- disseminate information to member organisations and the broader community on approaches to water quality management in the Fitzroy River Basin.

### **Membership**

- Agforce
- Banana Regional Council
- Capricorn Conservation Council
- Central Highlands Regional Council
- Central Queensland University
- Department of Employment, Economic Development and Innovation
- Department of Environment and Resources Management – Chair
- Fitzroy Basin Association
- Fitzroy Basin Elders Committee
- Fitzroy Food and Fibre
- Fitzroy River Fish Stocking Association
- Isaac Regional Council
- Queensland Conservation Council
- Queensland Health
- Queensland Resources Council
- Rockhampton Regional Council / Fitzroy River Water
- Stanwell Corporation Limited
- SunWater

The FWQAG may invite representatives from other groups and organisations to participate as required.

DERM will chair the group and provide secretariat and administrative support.

### **Communication**

The meetings will be organised through email to the nominated contacts for each agency/organisation. An agenda for each meeting will be drafted and distributed by the Chair, 5 to 7 working days before meetings.

The Chair will prepare notes from each meeting, including actions to be undertaken, and distribute the notes to the FWQAG within 5 working days of the meeting.

The FWQAG will meet approximately every six weeks unless otherwise agreed, with alternate meetings held via teleconference.

For phone meetings, a teleconference number will be established.

At the end of each meeting, participants will agree on a set of key messages to be uploaded to relevant websites approximately 3 working days after the meeting.

The Chair will be responsible for briefing the media as required.

Individual members of the FWQAG will be responsible for communicating any recommendations and key messages within their relevant organisation.

### **Life of FWQAG**

FWQAG will operate until a review in June 2010

# **Conditions for Coal Mines in the Fitzroy Basin**

## ***Approach to Discharge Licensing***

**Department of Environment and Resource Management**

### **1. Introduction**

This document describes the proposed approach for deriving consistent and appropriate limits and conditions for Coal mine discharges and supports the draft Conditions for Coal Mines in the Fitzroy Basin. The proposed approach aims to minimise the risk of discharges on downstream environmental values of receiving waters and be consistent with current legislation, departmental policy and State/National water quality guidelines. This includes the department's Policy for wastewater discharges to Queensland waters (<http://www.epa.qld.gov.au/publications?id=2272>), the Queensland Water Quality Guidelines (2006) and the ANZECC/ARMCANZ Fresh and Marine Water Guidelines 2000.

### **2. Managing and Characterising Discharges**

The first step in assessing a licence proposing a wastewater discharges is to demonstrate the unavoidable need for that discharge. Water is a resource and most mines require substantial amounts of water even if for coal washing and/or dust suppression. A well planned and effective water management system is essential for having sufficient water for the mine during dry times but also having sufficient available storage/free-board to ensure discharges are infrequent and only associated with major storm events. Effective water management requires separate storage of water with varying water quality (such as storage of process water/groundwater, surface water runoff), appropriate infrastructure to accommodate sufficient water storage and appropriate flood design and control.

Where the need for a discharge is demonstrated, the next step is to characterise the wastewater and identify the potential contaminants or associated hazards that may exist. This may require an understanding of historical wastewater quality and/or information on local groundwater quality, geology types, the process/treatment systems involved and the broader water management strategies to be adopted. Currently, salinity (measured as electrical conductivity) and suspended sediment (and pH to a lesser extent) are known to be major water quality issues that require regulation. However, for other characteristics such as metals/metalloids, a legitimate need for regulation it is likely to vary from case to case. However, in the majority of cases there is currently a lack of data. Further information needs to be collected on both wastewater and natural waters. An interim approach is required for setting discharge conditions where water quality data insufficient or not currently available.

### **3. Environmental Values and Ephemeral Streams**

After characterising the discharge, the next step requires environmental values and water quality objectives for waterways potentially affected by the discharge to be assessed. Depending on the risks from the discharge (based on its volume, contaminant concentrations, duration and location), this step will need to be done to a lesser or greater spatial extent. With

greater risk, environmental values and potential impacts will need to be considered further a field. Environmental values and water quality objectives specified in the Environmental Protection (Water) Policy 1997 must be considered for assessment of all waterways including ephemeral streams. Environmental values for drinking water, stock watering, irrigation, recreation, industrial use and aquaculture may exist downstream of the discharge depending on the discharge location. The guidelines for these environmental values will form the basis of default water quality objectives and will typically not differ between permanent and temporary flowing streams. Various published guideline values are shown in Tables 1 to 6.

Many coal mines are situated in areas of ephemeral/intermittent streams. Current reference-based water quality guidelines for aquatic ecosystem protection (for example, in the Queensland Water Quality Guidelines, 2006) are available only for permanent flowing streams. Nonetheless, it is proposed that these guidelines be used for impact assessment and licensing discharges to ephemeral streams until local reference information becomes available. In addition, in mining areas it is common that background concentrations may be elevated as a result of historical anthropogenic activities and/or natural causes (certainly the case for some metals). Deriving local guidelines and background data is ideally needed but requires sufficient reliable data from monitoring of appropriate sites. Monitoring of ephemeral streams can be challenging given the infrequent and unpredictable nature of flow and the logistical issues involved with accessing and taking event related sampling. There is currently insufficient information for some contaminants as to how levels change with rainfall and flow. For electrical conductivity (EC) it is unlikely that high EC is associated with high flows in contrast to suspended sediment solids or turbidity which is typically elevated during rainfall-associated events.

For many sites there will be an absence of suitable monitoring data. In this case, reference-based guidelines from permanent flowing streams can be used for deriving end-of-pipe limits or trigger values in a precautionary sense, although consideration needs to be given to the above points. Where good local referenced data has been collected, this could be used to derive local reference-based guidelines (typically 75<sup>th</sup> percentiles for median EC, 80<sup>th</sup> percentiles for other reference-based water quality indicators such as pH, turbidity and suspended sediment). Typically at least 18 data points would be required and collected over at least 3 rain events. This may require 2 years of data but is dependant on rainfall frequency. Data from multiple reference sites could be amalgamated in most situations. The Queensland Water Quality Guidelines propose that this approach also be used for metals/metalloids where background conditions may be elevated. However, for regulation purposes at or close to discharge points, 95<sup>th</sup> percentiles and maximum values of reference/background should also be considered to trigger early warning of elevated levels.

#### **4. Potential Water Quality Impacts**

##### ***Effects of Salinity on Aquatic Organisms***

Salinity has the potential to cause both acute and chronic toxicological effects in aquatic organisms. There is currently no nationally published toxicity trigger for salinity effects in freshwater environments although there is published information on the effects of salinity on fish, macroinvertebrates and other biota. Thus the recommended approach is to consider the ambient reference-based guidelines as discussed in Section 7. Generally, setting EC limits based on reference-based conditions will address potential concerns with toxicity given that discharge levels will typically be below toxicity thresholds. However, for situations where the

stream has assimilative capacity for salinity, it may be possible to have discharge levels at or above toxicity thresholds and through dilution, still meet reference-based guidelines in-stream within a short distance downstream. The general policy position in this case is that the discharge should not result in any toxicity within the initial mixing zone.

Based on the comments by Hart (2008) in a recent review of water quality in the Fitzroy Basin, EC values of less than 1500  $\mu\text{S}/\text{cm}$  are unlikely to affect adult fish although salinity around 1000-1500  $\mu\text{S}/\text{cm}$  may effect early life stages of fish. Macroinvertebrates are unlikely to be affected at below around 1000 $\mu\text{S}/\text{cm}$ . However, for those species adapted to quite low salinity (200-300 $\mu\text{S}/\text{cm}$ ) such as in the south of the Fitzroy Basin, permitting ambient EC concentrations to reach 1000-1500  $\mu\text{S}/\text{cm}$  would adversely affect the community structure, especially at a species level. A conservative trigger used in the ANZECC guidelines (1992) was Total Dissolved Solids (TDS) of 1000 mg/L (this converts to an EC of approximately 1500 $\mu\text{S}/\text{cm}$ ) which receiving waters should not exceed.

## **5. Monitoring of Metals/Metalloids**

Metals/metalloids have the potential to cause both acute and chronic toxic effects in the short-term and bioaccumulate to have similar effects in the long-term. The comments on measuring EC in receiving waters are also relevant to applying limits to metals/metalloids in receiving waters. There are few examples of where metals/metalloid limits have been applied end-of-pipe at this stage for coal mines and in most cases, further review of data is required for this to be done. Ascertaining end-of-pipe total and dissolved metal concentrations is recommended. Trigger values for receiving environment monitoring can be applied. Trigger values should be based on relevant environmental values. Conservative trigger values are shown in Tables 5 and 6. For aquatic ecosystem protection (Table 5), the default trigger values are for slightly-to-moderately disturbed (SMD) systems protecting 95% of species. For highly disturbed systems (HDS), ANZECC/ARMCANZ (2000) guidelines recommend adopting SMD levels in the first instance but if there are known high levels naturally occurring, lower lesser level of species protection (such as 90% or even 80%) can be adopted. In some situations such as may occur in highly mineralised mining catchments, natural or historical effects have resulted in even higher background levels for some specific metals/metalloids. Guideline adjustment for metals such as aluminium, copper, iron and zinc is sometimes required. If this is the case, background data should be assessed to develop locally-relevant guidelines. Guideline values for long-term medians can be developed from 80<sup>th</sup> percentiles of background/reference data. It is proposed that local receiving environment triggers for metals/metalloids be developed based on 95<sup>th</sup> percentiles (or maximums) of historical background/reference data. This would also form the basis for future revision of end-of-pipe triggers and indicators.

For aquatic ecosystems, the metals/metalloid limits could be applied to total (i.e. unfiltered) concentrations. If this is the case and the total concentration exceeds the trigger value, a hardness correction can be applied for some metals (cadmium, chromium III, copper, lead and nickel) up to a salinity of 2500 mg/L. See Table 3.4.3 of ANZECC/ARMCANZ (2000) Guidelines as to how to modify the trigger values for hardness for these metals. However, if exceedances still occur or are likely to occur then dissolved (i.e. filtered) metals/metalloid concentrations should also be measured and compared to the limits. Also note that speciation of some metals/metalloids is usually required for aquatic ecosystem protection (e.g. arsenic and chromium). For event-based sampling, measurement of dissolved metals/metalloids will be more problematic and logistically difficult. Samples need to be filtered, refrigerated and analysed within short time frames and this may not always be possible. However, at this stage

it is proposed that for protection of aquatic ecosystem, metals are measured for dissolved metals/metalloids given the likelihood for exceedance of the guidelines. On the other hand, given the potential addition costs of speciated metals, it is proposed that all samples be analysed for dissolved total species (i.e. all species of the metal/metalloid, or 'total' species) for licensing. Where risks are identified, further assessment of speciated components may be required. For other environmental values, assessment of total metals/metalloids is needed to compare to guidelines but only for those that are specified in the guidelines. Where there is an absence of other information on potential sources or levels of metals/metalloids, a standard set of metals/metalloids is recommended until such information is made available. This might include characterising of the wastewater in dams or potential sources of wastewater (such as groundwater, waste characterisation or geological analysis).

## **6. Monitoring Receiving Waters**

### ***Water Quality Monitoring***

Where data is available, background receiving water quality typically does not meet reference-based guidelines for all indicators. This may be due to both differences in natural conditions and from anthropogenic pressures. For this reason, application of guidelines to receiving waters as regulatory limits is likely to result in frequent non-compliance, regardless of whether the mine is discharging or not.

Therefore, receiving water assessments should only be used for triggering reporting (or investigation purposes) and not as a primary mechanism for regulation. This could include reporting of long-term medians of data (reference-based guidelines) or reporting against 95<sup>th</sup> percentiles (biological effect data/maximums of background). Maximum trigger values for certain indicators may be adopted for some near-field monitoring sites.

Reporting against guidelines for environmental values other than aquatic ecosystem protection should also be done where present. Monitoring should be done when the stream is flowing (this flow trigger would preferably be below the discharge flow trigger) and should ideally be done both when the discharge is and is not occurring. Reporting of the receiving environment monitoring program (REMP) could be done.

Water quality measurements of permanent water holes or other specific downstream environmental values are also appropriate where risks of potential impact are identified. For ephemeral streams, the current science suggests that the permanent and semi-permanent water holes need to be protected as a high priority. The concentrations of some water quality characteristics can increase significantly in water holes with time due to evaporation and no flow conditions whilst others decrease in concentration due to changes in water chemistry. Recent mine discharges have resulted in significant changes to salinity profiles within some downstream drinking water reservoirs and therefore impoundments, storages, weirs, dams, etc. should also be monitored given the potential for impacts.

### ***Biological Monitoring***

Biological monitoring (e.g. macroinvertebrate sampling) will generally only be required when the discharge quality and circumstances are such that they are considered to pose a significant risk to the affected receiving waters and associated habitat(s). For instance, this situation might arise when end-of-pipe EC levels are above 1000  $\mu\text{S}/\text{cm}$  and there is a potential for discharge

during times of low flow when limited dilution will be occurring. Having said that, biological monitoring should generally be limited to permanent and semi-permanent water bodies that could be potentially impacted by the discharge (for example, within 50km of the discharge), although this will depend on the quantity and duration of discharge. Note that specific ecosystem-type considerations must be taken into account, for example, in some areas of the catchment even short-term wetting of stream beds can play an extremely important role in the ecological cycle of the system and therefore may warrant biological monitoring.

Monitoring of macroinvertebrates must be carefully designed and interpreted in accordance with (i) the Queensland Australian River Assessment System (AusRivAS) Sampling and Processing Manual (August, 2001) and (ii) Chessman (2003), SIGNAL 2 – A Scoring System for Macro-invertebrate ('Water Bugs') in Australian Rivers, Monitoring River Health Initiative Technical Report no. 31, Commonwealth of Australia, Canberra. Monitoring should be undertaken at both impact and control sites. (For further advice on this issue, contact Neil Tripodi on 3896 9241)

### ***Sediment Sampling***

Sediment sampling for toxicants such as metals and metalloids will generally only be required when the discharge quality and circumstances are such that they pose a significant risk to the receiving waters. This may be the case where end-of-pipe metals/metalloid concentrations are significantly above both background/guideline concentrations, discharge has occurred for extended periods of low flow and ANZECC/ARMCANZ (2000) water quality guideline values and background water quality concentrations are exceeded.

Sediment monitoring should be limited to permanent water bodies (such as weirs, water holes etc) that could be potentially impacted by the discharge and that possess the environment where muds (sediment) can accumulate. Sediment monitoring locations may be of similar nature to macroinvertebrate sampling sites (where required).

### **8. Setting End-of-pipe Limits and Links to Natural Flow**

Discharging linked to natural flow in ephemeral streams is an essential mechanism for ensuring any discharge has reduced risk of impact on downstream environmental values. The specification of upstream monitoring sites and start/stop discharge triggers based in the environmental flow is also needed to ensure that this occurs. Large dilutions factors (e.g. 1 to 10 or 1 to 20) would generally result in reduced risk of both water quality and flow impacts, assuming the monitoring of the stream and discharge flow are closely linked and controlled.

The proponent should provide adequate data and modelling of the flow in their part of the catchment to determine the most suitable environmental flow trigger under which a discharge of certain maximum volume and flow rate should occur. The frequency or percentage of wet weather days that this will be possible should be assessed under a range of rainfall scenarios.

As part of the approval, the following will be required:

- A minimum natural receiving environment flow ( $m^3/s$ ) should be defined at which wastewater discharge can take place – both commencement and cessation. It should be based on historical measurements of upstream natural flow and be designed to avoid times of poor mixing and permit significant post-discharge flushing (such as <20<sup>th</sup> percentile flow). Ongoing access to data from a suitably situated gauging station will be required.

- The maximum discharge rate should be set so that it does not exceed 20% of the minimum natural receiving environment flow rate (i.e. 1:4 – 1 part discharge wastewater : 4 parts natural flow).
- Daily discharge in cumecs ( $\text{m}^3/\text{s}$ ) should be reliably measured and recorded.

An interim approach is required when no background receiving environment monitoring data is available. In this case, the dilution factors are not considered in setting limits as background water quality may exceed guidelines (i.e. there would be no assimilative capacity for any contaminant), although a 20 percent dilution with receiving waters will still be required.

Where discharge cannot be linked to sufficient natural flow, more detailed risk assessment should be undertaken for the waterways potentially affected by the discharge as the likelihood of impact is significantly increased. Any permanent water bodies (e.g. weirs or water holes) or locations of other environmental values potentially affected by the discharge should be identified. For such situations, more stringent water quality limits would typically be required such that it meets ambient or background water quality levels. Long-term continuous discharges in ephemeral streams should be generally discouraged. In the case of some mines in upper catchment areas, an interim approach may be adopted where discharge is permitted with flow measurements downstream. This will ensure that potential impacts are limited to near-field. Such an approach may be suitable for a transitional environmental program (TEP) or where the potential effects are considered low risk.

Monitoring of relevant physical chemical and toxicant indicators in Tables 1 to 6 should be undertaken end-of-pipe when a discharge is occurring, ideally coinciding with receiving environment monitoring. The limits/triggers are derived from ambient water quality data of permanent flowing streams in the Fitzroy and from drinking water guidelines. It is proposed that the EC discharge limit should vary depending on geographical location and whether a drinking water reservoir is located downstream of the discharge. Other issues that should be considered in setting end-of-pipe indicators and limits/triggers include laboratory detection limits and the relevance of the indicators to the activity and the risks involved.

End-of-pipe limits are required for EC and pH. The information is not currently available to set maximum values based on acute toxicity. A conservative approach would be to ensure discharge limits for EC end-of-pipe do not exceed  $1500 \mu\text{S}/\text{cm}$ . Under certain circumstances, a higher end-of-pipe limit may be applicable where large mixing ratios are achieved and discharge is only for smaller durations/volumes. In these cases, the end-of-pipe limit may be increased up to  $2250 \mu\text{S}/\text{cm}$ . The need for this would need to be demonstrated. The pH limits would ideally be between 6.5 and 8.5 when linked to 1:4 dilutions. Higher pH limits (say  $\leq 9.0$ ) end-of-pipe may be negotiated where appropriate dilution will be achieved. Limits for suspended solids concentrations can be negotiated with mines for sediment based on expected sediment removal from settling. Turbidity levels should be measured with the view of setting a relevant limit when sufficient background data is obtained.

In terms of metals/metalloid measurements end-of-pipe, it is recommended that no compliance limit be applied to this end-of-pipe monitoring unless adequate receiving environment data is collected and reviewed. However, trigger limits can be proposed for those metals/metalloids that currently have ANZECC/ARMCANZ (2000) trigger values for freshwater. Such trigger limits, if triggered, would firstly require a comparison of end-of-pipe to background and downstream receiving water quality. If values are within background levels, no further action would be required.

There is a range of other indicators that may be monitored and regulated end-of-pipe (and in receiving waters). These include nutrients (ammonia, nitrate, total nitrogen, total phosphorus, filterable reactive phosphorus, phosphate, chlorophyll-a), sulphate, total hydrocarbons, fluoride and pathogens to mention only a few. Nutrients should be monitored where these are likely to be high in the discharge as a result of the activity, for example, where a sewage treatment plant is adopted or where there is a source of nutrients in the process. Ammonia and nitrate are potential toxicants (with toxicant trigger values) while total nitrogen, total phosphorus, ammonia, organic nitrogen, oxidised nitrogen, and filterable reactive phosphorus are indicators relating to potential eutrophication effects (and have related ambient water quality guidelines). Sulphate is currently regulated as a result of potential effects on drinking water (human and stock). Sulphate has no aquatic ecosystem trigger value although can change the interactions of other water quality contaminants. There are also no aquatic ecosystem guidelines for total petroleum hydrocarbons (TPHs) or polycyclic aromatic hydrocarbons (PAHs) other than naphthalene but this may be required to be monitored where mechanical workshops or petroleum-based chemicals/fuels are used on site.

## **9. Receiving Environment (RE) Monitoring and Triggers**

Monitoring of all indicators listed for relevant environmental values in Tables 1 to 6 should be undertaken in the receiving waters at upstream and receiving environment monitoring points. Metals/metalloids as shown in Table 5 (and Table 6 if relevant) should also be monitored at upstream and downstream receiving environment monitoring points, at least until time where sufficient data is available to revise suitable monitoring indicators. Ideally, both total and dissolved metals should be monitored in the receiving environment relevant to the environmental value that the indicator relates to, e.g. total arsenic is required for assessment against drinking water guidelines.

Ideally, any associated local receiving environment monitoring program should include at least one far-field monitoring point situated much further downstream to represent post-mixing water quality. Note that the far-field monitoring point may be off the mining lease but should remain located within the nearest major flowing stream – this monitoring point should not be assessed for compliance purposes (or maximum triggers). A reference site un-impacted by mining activities (e.g. no mines within 20km upstream) should be identified and monitored for the sub-catchment. In situations where this is not possible, the least affected site, or unaffected site from another nearby sub-catchment should be identified for the purpose of collecting reference or “background” data. Collaborative monitoring programs involving more than one mining company may be applicable for monitoring such sites for local creek catchments.

Upstream and downstream receiving environment monitoring should occur during all flow events, not just during periods when discharges are taking place. This requirement is necessary for a number of reasons:

- To allow for condition assessment of these waterways
- To allow for potential assessing of impacts before and after discharge
- To allow assessment of background to assist with limit setting

Where end of pipe compliance limits apply for physical chemical indicators and are considered low risk, receiving environment monitoring and reporting should be based on long term assessment of consecutive measurements over a twelve month period and compared to

ambient water quality objectives in the Queensland Water Quality Guidelines (2006) and background water quality.

Where end-of-pipe limits are considered to pose some potential risk to receiving waters, trigger values can be applied to sites immediately downstream from the discharge. The trigger values would generally be more stringent than end-of-pipe conditions but be achievable. For example, based on this information available a receiving environment maximum trigger of 1000  $\mu\text{S}/\text{cm}$  EC is proposed for near-field monitoring sites until local background/reference data becomes available. Trigger values for metals/metalloids would typically be ANZECC/ARMCANZ (2000) toxicant trigger values for slightly moderately disturbed systems unless local background/reference data is available.

Exceedance of these trigger values during discharge should require a comparison between discharge, background and downstream water quality. Where downstream water quality is within background measurements, no further action should be required.

## **10. Modifying Limits and Triggers**

Changes to compliance limits and trigger values may be appropriate where adequate and relevant reference monitoring data is made available and assessed as per the allowance in ANZECC/ARMCANZ (2000) and additional information. A reference site can be defined as a site without mine impacts (e.g. no mines within 20km upstream) for the sub-catchment with other requirements as per Appendix C in the QWQG (2006). In some cases it may be the least impacted site, or an unaffected site from another adjacent sub-catchment. An adequate number of valid data points are required to provide a reasonable confidence limit around the percentile based trigger values/guidelines. For example to develop an 80<sup>th</sup> percentile guideline, a minimum of 18 samples is required to provide a 95% confidence level. A greater number of samples would be required to derive 90<sup>th</sup> or 95<sup>th</sup> percentile guidelines. Ideally, samples should be taken from multiple (minimum 3) flow events over at least a one to two year period.

The objective of water sampling for meta/metalloid concentrations discussed above is to help form an acceptable data set to allow site specific license limits or trigger values to be set for end-of-pipe and receiving waters. Elevated background levels of some metals such as aluminium, zinc, iron and chromium have been observed in the Fitzroy Basin.

Where assimilative capacity has been identified as part of monitoring, additional allowance may be incorporated into discharge limits.

### **Definitions**

**Background** – In terms of water quality, background would typically be obtained by sampling upstream of the mining activity in times of natural flow. Background should not include times of discharges from other mines upstream or times of no flow.

**Reference** - A reference site is a site whose condition is considered to be a suitable baseline or benchmark for assessment and management of sites in similar waterbodies. The condition of the site is reference condition and values of individual indicators at that site are the reference values. Most commonly, reference condition refers to sites that are subject to minimal/limited

disturbance. The key criteria quoted in the Queensland Water Quality that is applicable for most mining areas in the Fitzroy is that there is no major extractive industry (current or historical) within 20km upstream. Monitoring must occur when the stream is flowing.

**Adequate Data** – The Queensland Guidelines recommend a minimum of 18 samples collected over at least 12 months for estimates of 20th or 80th percentiles at a site. For 50th percentiles a smaller minimum number of samples (~ 10–12) would generally be adequate. For ephemeral streams, more than one sample should be taken for each flow event and all flow events in the period should be sampled.

**Table 1. Reference-based EC guidelines for the protection of aquatic ecosystems in the Fitzroy Catchment (Qld Guidelines 2007). Units in  $\mu\text{S}/\text{cm}$ .**

Sub catchment	95 <sup>th</sup> Percentile Guideline	90 <sup>th</sup> Percentile Guideline	75 <sup>th</sup> Percentile Guideline*
Fitzroy North	1400	1250	720
Fitzroy South	650	510	340

\* guideline should be compared to median of long term data set.

# Checklist

## Environmental authorities for mining activities

### EIS trigger criteria

*Environmental Protection Act 1994*

<b>EA NO:</b>	
---------------	--

For all non-code compliant applications, the administering authority must decide whether an environmental impact statement (EIS) is required for the project (s162).

An EIS will be required if any of the following trigger criteria are met. If no criteria are triggered, this does not provide an exemption from having to prepare an EIS if the administering authority or EPA Minister considers that there may be a significant environmental impact, or there is a high level of uncertainty about the possible impacts, or there is a high level of public interest in the proposal.

For exploration permits or mineral development licences, the current policy is not to require an EIS.

For each question, indicate whether the answer is "yes" (column A), or "no" (column B).

Criterion	A Yes	B No
1. Will the project have a significant impact on <u>Category A</u> or <u>Category B</u> environmentally sensitive areas? (refer to Schedule 1A of the <i>Environmental Protection Regulation 1998</i> )	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Will the project involve mining in a marine area?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
3. Will the project involve mining less than 500 m landward from mean high water?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. Will the project require the construction of more than 150 new dwelling units?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. Will the project include an activity that would otherwise be a <u>Level 1 environmentally relevant activity</u> with an annual fee of greater than \$4000?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. Will the project involve the mining of more than 2 million tonnes of mineral or run of mine ore per year?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
7. Will the project involve the abstraction of more than 2 million m <sup>3</sup> of water per year from natural surface or groundwater sources?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
8. Will the project result in more than 25 ha remaining post mining in a non-beneficial land capability where an acceptable alternative is considered feasible?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
9. Will the project involve any non-code compliant mining activity less than 2 km from town?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
10. Will the project contain a high hazard dam?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
11. Will the project include mining for uranium or asbestos?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
12. Will the project trigger a Commonwealth interest in matters of national environmental significance to the extent that an EIS would be required under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> ?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Recommendation**

**After completing the list above, mark which of the following applies:**

- (a) If there is a marked box in column A, an EIS is required (unless the application is for an extension to an existing project, and does not constitute a significant increase in environmental harm). Proceed through the non-code compliant assessment process with an EIS.....
- (b) If all boxes in Column B are marked, an EIS is not required. Proceed through the non-code compliant application process without an EIS.....

**Assessing Officer Name:**

**Date:**

## Notice of Decision – Amendment Application

*This notice is issued by the Environmental Protection Agency to advise of a statutory decision made under section 257 of the Environmental Protection Act 1994.*

## Coordinated Assessment Committee Report

*This report is prepared by an assessment officer for consideration by the Coordinated Assessment Committee (CAC). Upon determining the next appropriate course of action, the Chair of the Committee completes the 'CAC Recommendation' section of the report and returns it to the assessment officer for action.*

**Date prepared:**

### Project details

Permit No.: <Insert>  
Project No: <Insert>  
EPA Administering District: <Insert><Insert>  
EPA Region: <Insert>  
Project Name: <Insert>  
Project type (may be more than one): Coal Mine  
Applicant(s): <Insert>  
Project location: <Insert>  
Project Description: <Insert>  
Permit Application type(s): Level 1 non-code compliant  
Application date: <Insert>  
Decision required: Assessment level decision (ALD)  
Decision Due: <Insert>  
**Recommended Decision:** Other: significant environmental harm unlikely, no EIS  
**Recommended Project Director:** Other: Melissa Wells  
**Assessing Officer:** <Insert>

### Additional processes required: (attach details where necessary)

- None
- Other applications received by EPA for project
- Referral Coordination under Integrated Planning Act 1997
- An EIS process under any Queensland Act
- A process under the State Development and Public Works Organisation Act 1971;
- Major works under the Marine Parks Act 1982;
- Commonwealth processes under the Environmental Protection and Biodiversity Conservation Act 1999.
- Other <details>

**Special circumstances: (attach details where necessary)**

- None
- Affects a sensitive area
- Involves a large number of individual decisions;
- Is likely to generate significant community concern;
- Needs policy change for approval;
- Applicant suitability;
- Involves a make or break issue;
- Involves significant issues with another State/Commonwealth Agency; and
- Another special circumstance which significantly elevates environmental, social or economic risks beyond those usual for this type of project.
- Other: The application to amend Schedule C conditions are in accordance with DERM's document "*Conditions for Coal Mines in the Fitzroy Basin - Approach to Discharge Licensing*" and the model conditions. These documents have been prepared in implementing recommendation 1 of the *Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin* on 11 May 2009. The study made the following recommendations:
  1. develop appropriate conditions in environmental authorities for mine water discharges.
  2. develop local water quality guidelines; and
  3. develop a model for assessing cumulative impacts across the region.

**Indicate the level of impact or significance for each of the following EPA/QPWS interests: [if impact is indicated, notes must be included to describe how]**

**Biodiversity**

- N/A Rare and threatened species and ecosystems
- N/A Vegetation clearing
- N/A Marine systems
- N/A Sustainable use of wildlife
- N/A Riparian buffer zones

**Notes:**

The amendment application is not changing existing authorised areas of disturbance.

**Resource allocation**

- N/A Mining
- N/A Dredging
- N/A Occupancy of marine lands (marinas etc)
- N/A Commercial opportunities on national parks and marine parks
- N/A Allocation of public resources (e.g. physical and natural resources environmental capacity),
- N/A National competition policy

**Notes:**

**National and international**

- N/A World heritage
- N/A RAMSAR listed wetlands
- N/A Migratory species
- N/A National estate
- N/A Commonwealth marine areas
- N/A Radioactive materials

**Notes:**

**Tenure Issues**

- N/A Protected areas
- N/A Native title interests
- N/A Offshore jurisdiction
- N/A Commonwealth jurisdiction
- N/A Inter-State jurisdiction

**Notes:**

## Coordinated Assessment Committee Report

### Water Issues

- N/A Quality
- N/A Discharges
- N/A Stream flows (effects in ecology)
- N/A Waterways management
- N/A Hydrology
- N/A Impacts on freshwater and marine systems
- N/A Ground water

*Notes:*

The applicant has applied to replace the Schedule C conditions in accordance with DERM's letter of 31 July 2009.

### Noise Issues

- N/A Community noise
- N/A Transportation noise
- N/A Industrial noise
- N/A Ground vibration
- N/A Airblast overpressure

*Notes:*

### Land Issues

- N/A Contaminated land
- N/A Acid sulphate soils
- N/A Erosion/stability
- N/A Landscapes
- N/A Effects on hydrology
- N/A Sustainable use
- N/A Clearing
- N/A Land use history
- N/A Compliance with planning schemes
- N/A Rehabilitation and subsequent use

*Notes:*

### Impacts on surrounds Issues

- N/A Transportation
- N/A visual impacts
- N/A compatibility with surrounding uses and activities
- N/A neighbours opinions

*Notes:*

### Air Issues

- N/A Air shed management
- N/A Pollution
- N/A Health
- N/A Nuisance
- N/A Ecological impacts

*Notes:*

### Waste Issues

- N/A Solid waste
- N/A Liquid waste
- N/A Gaseous waste
- N/A Dredge spoil disposal
- N/A Energy
- N/A Best practice environmental management

*Notes:*

### Heritage Issues

- N/A Aboriginal and Torres Strait Islander cultural sites
- N/A Historic buildings and locations
- N/A Designated landscape Area

*Notes:*

### Coastal Issues

- N/A Erosion
- N/A Structures
- N/A Reclamation
- N/A Strategic planning

*Notes:*

### Social issues

- N/A Amenity
- N/A displacement of use
- N/A community views
- N/A public safety
- N/A politics/policy

*Notes:*

### Pre-lodgement Advice: [indicate who gave advice and when]

Lindsay Delzoppo is the Project Director and Melissa Wells the Project Manager for Recommendation 1 of the Cumulative Study. The site project manager is <insert> and has provided pre-lodgement advice on <insert>.

### Other issues

**General comments and additional information:**

**CAC Recommendation**

<b>CAC Recommendation:</b> Significant environmental harm unlikely, No EIS	
<b>Project Director:</b> <Insert>	
<b>Assessment Office:</b> <Insert>	
<b>Project Risk Level:</b> <Insert>	
<b>Signature of Chair:</b>	<b>Date:</b>

- Please attach a contextual map showing the location of the proposed activity.
- If EIS decision to be made, attach EIS trigger checklists.
- If other decisions to be made by Agency attach CEDP decision risk table.

## EA/DA Assessment Report:

### APPLICATION NOTES:

1. Each assessment report prepared to support recommendations made for decision is to be structured in the format shown below.
2. Explanatory notes for completing the report are given under each heading in brackets.
3. The report is to be completed, where indicated, to confirm conclusion of supervisory review/endorsement, and decision stages of the process.

**PROJECT NUMBER:** <insert>

**FILE NO:** <insert>

**EPA EA/DA NO:** <insert>

**DEVELOPMENT APPROVAL NO:** N/A

**TYPE OF APPLICATION:** Application to Amendment Level 1 Non-Code Compliant Environmental Authority (Mining Activity)

**APPLICANT:** <insert>

**TRADING AS:** <insert>

**ENVIRONMENTALLY RELEVANT ACTIVITY/IES:** Schedule 6, Item 5, Mining black coal (EP Reg)

### 1. Issues

The proponent has applied to replace the Schedule C conditions with the agreed model water conditions. These conditions were agreed to through a consultative working group of DERM, mining company representatives and QRC to implement Recommendation 1 of the *Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin* on 11 May 2009. The study made the following recommendations:

1. develop appropriate conditions in environmental authorities for mine water discharges.
2. develop local water quality guidelines; and
3. develop a model for assessing cumulative impacts across the region.

The DERM has amended the EA to apply the model water conditions with agreed compliance limits, flow triggers and site specific changes to the potential contaminants in table 3.

Assessment Level Decision – No EIS, significant increase in harm is unlikely.

### 2. Description of Operation

<insert>

#### Current Project Environmental Authorities:

The environmental authority is held by <insert>

#### Amendment:

The amendment application was in accordance the DERM letter of 31 July 2009. This letter requested applications to amend the Schedule C conditions by replacing them with the model conditions that have been agreed to by DERM, mining company representatives and the QRC.

The applicant has provided information for compliance limits, flow triggers and site specific information for potential contaminant trigger levels (table 3).

## Emissions, Discharges and Environmental Compliance

### General Management:

No changes have been made to the environmental authority.

**Air:**

No changes have been made to the environmental authority.

**Water Management:**

Schedule C conditions have been replaced by the agreed model conditions (copy attached).

The applicant has provided site specific information for the following:

1. Compliance Limits:

<insert>

2. Flow triggers:

<insert>

3. Potential contaminants:

<insert>

The information provided is consistent with DERM's document "*Conditions for Coal Mines in the Fitzroy Basin - Approach to Discharge Licensing*" and the explanatory notes in the model conditions.

**Land Management**

No changes have been made to the environmental authority.

**Regulated Dams**

No changes have been made to the environmental authority.

**Noise and Vibrations**

No changes have been made to the environmental authority.

**Waste**

No changes have been made to the environmental authority.

**Community**

No changes have been made to the environmental authority.

**3. Assessment Considerations**

Initial overall considerations are presented in the checklist EADA (attached). Support and substantiation for the identified relevant considerations are given below under the appropriate headings:

i) **Standard criteria (as applicable)**

**NOTE: when considering the standard criteria, comments related only to those considered relevant are required. For criteria considered not relevant to the matter, no notation is made. Information provided should reflect the complexity of issues for the application. Example text is provided for guidance.**

Ecological Sustainable Development

The principals of ESD are applied in this proposal as the activity the water quality of mine discharges have been improved and the dilution of the discharges have been conditioned. It is expected that the improved discharge requirements will reduce impacts to the natural waterways.

Environmental Protection Policies (EPP's)

The EPPs have been considered in the setting of water quality requirements. The Queensland water Quality Guidelines 2006 with the input of Freshwater and Marine Services for the setting of the water quality limits.

Plans, standards and agreements

Not applicable to this amendment.

Environmental Impact Statement (EIS)

The amendment does not require an EIS.

Receiving Environment

The amendments will result in improved releases into waterways compared to the previous environmental authority.

Best Practice Environmental Management

The improved water discharges will result in the applicant applying better water management measures. The conditions will represent the new minimum standard for managing water on coal mine sites in the Fitzroy Basin and will be consistently applied across the basin for coal mines.

Financial implications

The site may incur financial implications from the restriction of mining activities if the site becomes water bound. Further, significant infrastructure may be required as a result of complying with the agreed model water conditions.

Public Interest

There is significant public interest in the implementation of the Recommendations mentioned above. The Fitzroy Water Quality Advisory Group will manage the public interest. Further a website will be released shortly containing information on all issues with water quality of the Fitzroy Basin.

Site management plan

N/A

ii) **Native Title (if applicable)**

N/A

iii) **Notifiable Activity (if applicable)**

N/A

**4. Consultations**

The model conditions were developed and agreed to by DERM, mining company representatives and QRC through a consultative process. All mining companies were involved in the process.

Consultation with applicant was undertaken at all stages of the amendment process with regard to the amendment, and particularly compliance limits, flow triggers and potential contaminants for table 3.

**5. Project Killers**

N/A

**6. Streamlined Conditions**

The following conditions are used:

Full Streamlined Conditions

Some Streamlined Conditions (the agreed model conditions were based initially on the streamline and model mining conditions)

No Streamlined Conditions

## 7. Recommendations

That the draft amendment of Environmental Authority be decided in accordance with section 257 of the EP Act.

## Environmental Authorities for Mining Activities

### Assessment Level Decision for Amending a Non Standard EA

Environmental Protection Act 1994

<b>EA NO:</b>	
---------------	--

An assessment level decision must be made within 10 business days from receipt of the application (section 246). The first stage of this decision is to determine whether the amendment would significantly increase the level of environmental harm caused by the mining activity.

In making this determination, you should follow the procedures given in the EPP Water, EPP Air, EPP Waste and EPP Noise, and consider the standard criteria.

Answer the following question:

1. Would the amendment result in a significant increase of environmental harm in respect of:

Consideration	no	n/a	yes > brief description
water	<input checked="" type="checkbox"/>	<input type="checkbox"/>	The amendment is consistent with recommendation 1 of the <i>Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin</i> on 11 May 2009. The model conditions have been agreed to by DERM, mining company representatives and the QRC.  The amendment would not constitute a significant increase in the level of environmental harm. The model conditions provide a consistent approach to the regulation of discharge of water from mine sites.
air	<input checked="" type="checkbox"/>	<input type="checkbox"/>	N/A – no change to conditions.
noise	<input checked="" type="checkbox"/>	<input type="checkbox"/>	N/A – no change to conditions.
waste	<input checked="" type="checkbox"/>	<input type="checkbox"/>	N/A – no change to conditions.
any other issue	<input checked="" type="checkbox"/>	<input type="checkbox"/>	N/A – no change to conditions.

<b>Assessing Officer Name:</b>	<b>Date:</b>
--------------------------------	--------------

If you have identified any issues which are likely to significantly increase the level of environmental harm, you should proceed to determine whether an EIS is required for the proposed amendment.

## **Assessment Level Decision for Amending a Non Standard EA**

---

If there are no concerns of the proposed amendment significantly increasing the level of environmental harm, proceed to decide whether to grant or refuse the application.

## PROCESS TO AMEND ENVIRONMENTAL AUTHORITIES FOR RECOMMEDATION 1 OF THE FITZROY PROJECT

Letter sent to mining companies requesting an amendment application in accordance with section 240 of the *Environmental Protection Act 1994* (EP Act) and submitted to DERM by 1 September 2009.

Pre-lodgement meetings can be arranged by contacting the DERM Project Manager and should involve Ian Ramsay, Melissa Wells, or another from the Fitzroy Basin project team.

Fill out the documents:  
Fitzroy ALD\_Amend\_EA.doc  
Fitzroy CAC report.doc  
Fitzroy EIS\_trigger\_criteria.doc

The recommendation generally would be: "significant environmental harm increase unlikely"

Where the applicant provides information to the contrary (e.g. works required to meet the conditions), provide a succinct brief to Melissa Wells (Project Manager, Recommendation 1).

The ECSU will issue the AMD within the 10 business days in accordance with section 246 based on the recommendation provided.

Asses the amendment application in accordance with section 256 – 258A of the EP Act:

Complete the documents:  
Fitzroy decision notice.doc  
Fitzroy Assessment\_Report\_Amendment.doc  
Final Model Water Conditions for Coal Mines in the Fitzroy Basin July 2009.doc

Advice should be sort from Ian Ramsay in relation to:  
Compliance limits  
Flow triggers  
Potential contaminants (table 3)

If the administering authority decides to grant the application the environmental authority (EA) must be amended and a copy of the EA given to the applicant in accordance with s258 EP Act (10BD).

All coal mine EA's must be amended by 31 December 2009. Where mines do not apply or are not consistent with the approach and model conditions, the DERM will amend the legislation to allow for the change with out agreement. Where this is likely provide a brief to Melissa Wells through your current reporting hierarchy.

The amended EA may generate inconsistencies with the current approved Plan of Operations (i.e. action program). In accordance with s236 the EA holder must within 28 days after becoming aware of the inconsistency, cause the plan to be amended in a way that the plan is no longer inconsistent with the EA.

# Final Model Water Conditions for Coal Mines in the Fitzroy Basin

**Note:**

Explanatory notes are in green. **DELETE** prior to issue of EA.

Insertions required by applicants and or the administering authority are in blue. **DELETE** prior to issue.

**Contaminant Release**

- W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters except as permitted under the conditions of this environmental authority.
- W2** The release of contaminants to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 <this would be a plan or plans locating all monitoring (water quality and flow) and release points> attached to this environmental authority.

**Table 1 (Contaminant Release Points, Sources and Receiving Waters)**

Release Point (RP)	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Contaminant Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	e.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	e.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

- W3** The release of contaminants to waters must not exceed the release limits stated in Table 2 when measured at the monitoring points specified in Table 1 for each quality characteristic.

**Table 2 (Contaminant Release Limits)**

**EXPLANATORY NOTES – Setting interim release limits for EC:**

Option (c) – To negotiate a higher value for end-of-pipe EC limits, it will be necessary to have sufficient background water quality data from historical flow events, ideally above each discharge point. This data should be used to demonstrate that there is sufficient “assimilative capacity” in receiving waters to receive mine discharges of the proposed higher EC levels and maximum flows specified in condition W9. In other words, the limits should be such that the predicted in-stream water quality downstream will always remain below 1000 µS/cm EC (for example, using all historical data and assumptions of complete dilution). Consideration should also be given to the potential impact on any drinking water reservoirs immediately downstream of the discharge and the need to keep in-stream water quality below 750 µS/cm.

Option (d) – To negotiate a stepped approach to achieve Option (b) or (c) it will be necessary to predict the likely downstream receiving water EC as a result of the proposed limits for each step proposed. It will be necessary to have sufficient background water quality data from historical flow events, ideally for each discharge point. The data should be used to demonstrate that there is sufficient assimilative capacity to receive mine discharges of the proposed higher EC levels and maximum flows specified in condition W9. The limits should be such that predicted the in-stream water quality downstream is not likely to result in environmental harm from high salinity impacts. Ideally, in-stream EC s should remain below 1000 µS/cm EC (for example, using all historical data and assumptions of complete dilution). Where in-stream EC is likely to be above 1000 µS/cm then a case should be put forward as to why this is require d and comments about the likelihood and potential extent of impacts. Consideration should also be given to the potential impact on any drinking water reservoirs immediately downstream of the discharge and the need to keep in-stream water quality below 750 µS/cm.

Quality Characteristic	Interim Release Limits for all mines (limits to apply from the date of issue)	Future Release Limits from XX/XX/XXXX (negotiated date) <b>Note:</b> These future limits will apply from a yet to be negotiated date using alternative numbers that will be derived from the information gathered by any combination of the following: (1) the results of near field monitoring, (2) any studies or investigations carried out in accordance with recommendations 2 & 3 of the Cumulative Impact Study on water quality in the Fitzroy River Basin. (3) any review of the QLD Water Quality Guidelines. (4) other relevant information <b>Note:</b> This information should be available by the end of 2011 if not before and when it becomes available limits will be determined for each mine site based on the environmental values to be protected and in accordance with criteria below	Monitoring frequency	Comment
Electrical conductivity (uS/cm)	<p>Hierarchy for determining limits in priority order starting with (a):</p> <p>(a) for mines that do not release contaminants to waters - no conditions are required for release authorisation, then conditions W2, to W15 inclusive, W18, W19 and W43 can be deleted.</p> <p>(b) Current limit for those mine sites not under a TEP or 1500 EC (Maximum)* which ever is lower or</p> <p>(c) a negotiated higher limit value that does not result in the contaminant release exceeding a maximum 1000 EC in the receiving waters and where the mine site demonstrates to DERM that it is unreasonable and impractical to immediately comply with the 1500 EC limit in (b) above and supported by a business case and commitment to ongoing environmental improvement on the mine site and with nominated timeframes.</p> <p><i>Note: If the current limit is lower than a limit determined as above then the current limit would initially apply.</i></p> <p>(d) for those other mines which cannot immediately achieve (b) or (c) above a stepped approach within the interim period ending 2011 to achieve (b) or (c) will be</p>	<p><b>Aquatic ecosystem protection (no drinking water value):</b></p> <p>An end-of-pipe limit to achieve in the range 0 to 1000 EC in the receiving waters. (Must have natural flow i.e. the 20<sup>th</sup> percentile flow trigger and achieve a 1:4 dilution</p> <p><b>OR</b></p> <p>for mines in the upper catchments must have natural flow i.e. the 20<sup>th</sup> percentile flow trigger.</p> <p><b>OR</b></p> <p><b>Drinking water protection:</b></p> <p>An end-of-pipe limit to achieve 0 to 750 EC in the receiving waters. (Must have natural flow, either 1:4 dilution and only release where a 20<sup>th</sup> percentile flow trigger occurs; OR for mines in the upper catchment must have a natural flow i.e. 20<sup>th</sup> percentile trigger.</p>	Daily during release (the first sample must be taken within 2 hours of commencement of release)	

	<p>required.</p> <p><i>Note: some of these mines may already be under an approved TEP and EC limits and compliance timeframes in the TEP need to be taken into account with the stepped approach.</i></p> <p>To support a stepped approach DERM will require a business case and commitment to ongoing environmental improvement on the mine site to ensure that all reasonable and practicable measures are being/will be taken to prevent and/or minimise environmental harm.</p>			
pH (pH Unit)	<p>6.5 (minimum)</p> <p>9.0 (maximum)</p>	<p>6.5 (minimum)</p> <p>9.0 (maximum)</p>	Daily during release (the first sample must be taken within 2 hours of commencement of release)	
Turbidity (NTU)	NA*	NA*	Daily during release* (first sample within 2 hours of commencement of release)	Turbidity is required to assess ecosystems impacts and can provide instantaneous results.
Suspended Solids (mg/L)	Current Limit	Limit to be determined based on receiving water reference data and achievable best practice sedimentation control and treatment	Daily during release* (first sample within 2 hours of commencement of release)	Suspended solids are required to measure the performance of sediment and erosion control measures.
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	Current limit or 1000 (maximum) which ever is the lower	<p>250 (Maximum) (Protection of drinking water Environmental Value)</p> <p>OR</p> <p>1000 (Maximum) (Protection of irrigation environmental value)</p>	Daily during release* (first sample within 2 hours of commencement of release)	Drinking water environmental values from NHMRC 2006 guidelines OR ANZECC & ARMCANZ 2000 stock water quality guidelines.

Note: NA – not available, \* local trigger values need to be developed

**W4** The release of contaminants to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency specified in Table 2 and Table 3.

**Table 3 (Release Contaminant Trigger Investigation Levels)**

Quality Characteristic	Trigger Levels (µg/L)	Comment on Trigger Level	Monitoring Frequency
Aluminium	100	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>	Commencement of release and thereafter weekly during release
Arsenic	13	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Cadmium	0.2	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Chromium	1	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Copper	2	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>	
Iron	300	<i>For aquatic ecosystem protection, based on low reliability guideline</i>	
Lead	10	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>	
Mercury	0.2	<i>For aquatic ecosystem protection, based on LOR for CV FIMS</i>	
Nickel	11	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Zinc	8	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Include additional contaminants as required	Include additional contaminants as required		

**EXPLANATORY NOTES – Table 3 Potential Contaminants:**

The quality characteristics listed below should be assessed on a site by site basis by each mine prior to finalisation of amendment applications. Based on this assessment, the quality characteristic should be either disregarded if below trigger levels; or included as priority contaminants in Table 3 if above trigger levels. Assessment should involve comparison of representative data from dams that have historically been discharged or likely to be discharged from contaminant release points in Table 1. Data may include historical results or sampling undertaken for this specific purpose. The intent here is that not all dams on site would need to be sampled but those that would make up the majority of water in dams with release points. It could also be demonstrated based on existing water quality information that the water source and relative water quality of some dam are the same, in which case such dams may not need to be sampled individually. For metals and metalloids, trigger levels apply if dissolved results exceed trigger levels. However, total (unfiltered) results for metals and metalloids can be used to disregard a characteristic for inclusion in Table 3. Terms include SMD – slightly moderately disturbed level of protection, guideline - refers ANZECC & ARMCANZ (2000), LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical methods required to achieve LOR.

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

Quality Characteristic	Trigger Levels (µg/L)	Comment on Trigger Level
Boron	370	<i>For aquatic ecosystem protection, based on SMD guideline</i>
Cobalt	90	<i>For aquatic ecosystem protection, based on low reliability guideline</i>
Manganese	1900	<i>For aquatic ecosystem protection, based on SMD guideline</i>
Molybdenum	34	<i>For aquatic ecosystem protection, based on low reliability guideline</i>
Selenium	10	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>
Silver	1	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>
Uranium	1	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>

Vanadium	10	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>
Ammonia	900	<i>For aquatic ecosystem protection, based on SMD guideline</i>
Nitrate	1100	<i>For aquatic ecosystem protection, based on ambient Qld WQ Guidelines (2006) for TN</i>
Petroleum hydrocarbons (C6-C9)	20	
Petroleum hydrocarbons (C10-C36)	100	
Fluoride (total)	2000	<i>Protection of livestock and short term irrigation guideline</i>

Note:

1. All metals and metalloids must be measured as total (unfiltered) and dissolved (filtered). Trigger levels for metal/metalloids apply if dissolved results exceed trigger.
2. The list of quality characteristics required to be monitored as per Table 3 will be reviewed once the results of the monitoring data is gathered for the interim period until 31 December 2011 or an earlier date if the data is, or becomes, available and if it is determined that there is no need to monitor for certain individual quality characteristics these can be removed from Table 3.
3. SMD – slightly moderately disturbed level of protection, guideline refers ANZECC & ARMCANZ (2000).
4. LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical method required to achieve LOR.

**W5** If quality characteristics of the release exceed any of the trigger levels specified in Table 3 during a release event, the environmental authority holder must compare the down stream results in the receiving waters to the trigger values specified in Table 3 and:

1. where the trigger values are not exceeded then no action is to be taken; or
2. where the down stream results exceed the trigger values specified Table 3 for any quality characteristic, compare the results of the down stream site to the data from background monitoring sites and;
  - (a) if the result is less than the background monitoring site data, then no action is to be taken; or
  - (b) if the result is greater than the background monitoring site data, complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
    - (i) details of the investigations carried out; and
    - (ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W5 (ii)(b)(ii) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

**W6** If an exceedance in accordance with condition W5 (b)(ii) is identified, the holder of the authority must notify the administering authority within 14 days of receiving the result.

### Contaminant Release Events

**W7** The holder must install, operate and maintain a stream flow gauging station to determine and record stream flows at the locations upstream of each Release Point as specified in Table 4 for any receiving water into which a release occurs.

**W8** Notwithstanding any other condition of this environmental authority, the release of contaminants to waters must only take place during periods of natural flow events specified as minimum flow in Table 4 for the contaminant release point(s) specified in Table 1.

**Table 4 (Contaminant Release during Flow Events)**

**EXPLANATORY NOTES – Table 4**

**Gauging station description:**

The intent here is that every release point in Table 1 is associated with a gauging station that measures flow upstream of the discharge point. More than one discharge point may be associated with the same gauging station. The gauging station should be at a minimum distance from the discharge point such that water flow under trigger flow events will not significantly diminish by the time it reaches the discharge point. The location of the gauging station should ideally be such that it is not significantly affected by other upstream point source releases or times of discharge are limited to periods of “natural” flow.

Under certain circumstances it may be appropriate to have a downstream gauging station in addition to or in replace of an upstream gauging station. The location should ideally not be affected by the discharge (e.g. be measured off the main waterway). The need for this must be demonstrated on a case by case basis to show why an upstream gauging station is insufficient. This may be the case when mines are located in the upper parts of catchments or near the downstream confluence or a major waterway. Similarly, the gauging station should be at a distance from the discharge point such that water flow during triggered flow events will not significantly diminish between the discharge point and the measuring point (or the confluence with the creek being measured). For downstream flow triggers, some changes to calculation for flow triggers and maximum release flows would typically be required based on the relative sizes of the waterways involved.

**Minimum Flow Trigger:**

The intent for the minimum flow trigger is that the times of discharge are limited to times of natural flow events only (for ephemeral receiving waters). Ideally, the flow trigger should be chosen such that it represents, for example, a 20<sup>th</sup> percentile average daily flow (in m<sup>3</sup>/s) of a minimum ten year period. This or a similar approach should aim to eliminate discharges during “low flow” periods. The maximum discharge volume can then be calculated by dividing the upstream flow trigger by 4. The intent here is that a minimum dilution 1:4 is always maintained (20% of downstream flow). In some situations, this will not allow the mine to release sufficient quantities of water. Therefore, it is possible to propose more than one flow trigger. For example, a 40<sup>th</sup> percentile average daily flow trigger may also be used in addition to the initial 20<sup>th</sup> percentile flow trigger such that above the 40<sup>th</sup> percentile average daily flow trigger a higher release volume will be allowed during periods of higher in-stream flow (while still maintaining a 1:4 dilution ratio).

The expectation is that where flow gauging data is available, it is used to calculate flow triggers. Where gauging data is not available or is insufficient, flow triggers should be based on runoff/stream flow estimates using appropriate hydrological calculations or models and known catchment area, rainfall estimations etc.

Under certain circumstances, such as where a mine is in the upper part of the catchment, achieving a 1:4 dilution with receiving waters as described above may not allow the mine to discharge sufficient volumes. In such a case, a lower flow trigger must still be proposed but the discharge volume will also need to be linked to some downstream flow measure with sufficient dilution (ideally much greater than 1:4). The need for this must be demonstrated on a case by case basis and be supported by various flow calculations to demonstrate feasibility and show minimal environmental impacts.

Other special cases include discharges to creeks below water reservoirs or dams and these should be dealt with on a case by case basis to address the intent described above.

Receiving water description	Release Point	Gauging station description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Minimum Flow in Receiving Water Required for a Release Event	Flow recording Frequency
Wet Creek		Gauging station 1	XXXX	XXXX	Depending on individual catchment this minimum flow trigger will be either the release comprising less than 20% of the natural flow or any natural flow in the receiving environment. The volume of flow can be determined by height of water or flow. The actual flow must be a quantifiable measure. Example: > or = 5 m <sup>3</sup> /sec	Continuous (minimum daily)

- W9** The volume released through the release point(s) must not exceed **XX** m<sup>3</sup>/s (minimum flow specified in Table 4 divided by 4).
- W10** The daily quantity of contaminants released from each release point must be measured and recorded at the monitoring points in Table 1.
- W11** Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

#### **Notification of Release Event**

- W12** The authority holder must notify the administering authority as soon as practicable (no later than 6 hours of having commenced releasing mine affected water to the receiving environment). Notification must include the submission of written verification to the administering authority of the following information:
- release commencement date/time;
  - expected release cessation date/time;
  - release point/s;
  - release volume (estimated);
  - receiving water/s including the natural flow rate; and
  - any details (including available data) regarding likely impacts on the receiving water(s).

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

- W13** The authority holder must notify the administering authority as soon as practicable, (nominally within twenty-four (24) hours after of cessation of a release) of the cessation of a release notified under Condition W12 and within 28 days provide the following information in writing:
- release cessation date/time;
  - natural flow volume in receiving water;
  - volume of water released;
  - details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
  - all in-situ water quality monitoring results; and
  - any other matters pertinent to the water release event.

#### **Notification of Release Event Exceedance**

- W14** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.
- W15** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:
- the reason for the release;
  - the location of the release;
  - all water quality monitoring results;
  - any general observations;
  - all calculations; and
  - any other matters pertinent to the water release event.

#### **Monitoring of Water Storage Quality**

- W16** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

**W17** In the event that waters storages defined in Table 5 exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

Note:

<sup>1</sup> Contaminant limit based on ANZECC & ARM CANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARM CANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".

Note: Total measurements (unfiltered) must be taken and analysed

### Receiving Environment Monitoring and Contaminant Trigger Levels

**W18** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency	Comments
pH	6.5 – 8.0	Daily during the release	<b>See Table 2 comments</b>
Electrical Conductivity ( $\mu\text{S}/\text{cm}$ )	1000		
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.		
Sulphate ( $\text{SO}_4^{2-}$ ) (mg/L)	250 (Protection of drinking water Environmental Value) OR 1000 (Protection of irrigation environmental value)		

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

**EXPLANATORY NOTES – Selection of monitoring sites:**

The intent here is that that each discharge point has both an upstream and downstream monitoring point associated with it. These monitoring points should be located as close as practicable to the release point and the distances should be defined in the footnotes in Table 8. The location of flow monitoring points should also be considered in selecting upstream monitoring points. Other considerations include accessibility, particularly during wet weather conditions.

Monitoring Points	Receiving Waters Location Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)
Upstream Background Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Downstream Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

Notes:

- The upstream monitoring point should be within  $X$ km the release point.
- the downstream point should not be greater than  $X$ m from the release point.
- The data from background monitoring points must not be used where they are affected by releases from other mines.

**W19** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:

- where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or

2. where the down stream results exceed the upstream results complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
  - (i) details of the investigations carried out; and
  - (ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W19 (ii) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

## Receiving Environment Monitoring Program (REMP)

---

### EXPLANATORY NOTES – Designing a REMP:

The intent here is that the REMP will be designed for specific requirements of the mine's releases and the receiving environment. The monitoring within the REMP should not be the primary basis for compliance but will be essential for providing supporting information when incidents may occur or for deriving future license limits. The focus should also be on reporting against water quality objectives for relevant waterways affected by the discharge and be on a longer term basis compared to compliance reporting. The intent is that the REMP is to provide condition assessment of near-field areas, ie. local areas likely to be significantly affected by the mine's releases. To do this, it is necessary that monitoring data is collected during times of natural flow outside of times of release in addition to time of release. The REMP is likely to include monitoring sites and indicators in addition to what is presented in the tables of these conditions. The intent is that far-field areas and cumulative impacts will be monitored as part of regional monitoring described in Condition W43 and assist in providing regional condition assessment and regionally specific reference information.

---

- W20** A REMP must be implemented to monitor and record the effects of the release of contaminants on the receiving environment periodically and whilst contaminants are being discharged from the site, with the aims of identifying and describing the extent of any adverse impacts to local environmental values, and monitoring any changes in the receiving water.
- For the purposes of the REMP, the receiving environment is the waters of the **XX** and connected waterways within **XX** (e.g. **X**km) downstream of the release.
- W21** The REMP must address (but not necessarily be limited to) the following:
- a) Description of potentially affected receiving waters including key communities and background water quality characteristics based on accurate and reliable monitoring data that takes into consideration any temporal variation (e.g. seasonality); and
  - b) Description of applicable environmental values and water quality objectives to be achieved (i.e. as scheduled pursuant to the Environmental Protection (Water) Policy 1997); and
  - c) Any relevant reports prepared by other governmental or professional research organisations that relate to the receiving environment within which the REMP is proposed; and
  - d) Water quality targets within the receiving environment to be achieved, and clarification of contaminant concentrations or levels indicating adverse environmental impacts during the REMP.
  - e) Monitoring for any potential adverse environmental impacts caused by the release;
  - f) Monitoring of stream flow and hydrology;
  - g) Monitoring of toxicants should consider the indicators specified in Table 3 to assess the extent of the compliance of concentrations with water quality objectives and/or the ANZECC & ARMCANZ 2000 guidelines for slightly to moderately disturbed ecosystems;
  - h) Monitoring of physical chemical parameters as a minimum those specified in Table 2 (in addition to dissolved oxygen saturation and temperature);
  - i) Monitoring biological indicators (for macroinvertebrates in accordance with the AusRivas methodology) and metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*) for permanent, semi-permanent water holes and water storages;
  - j) The locations of monitoring points (including the locations specified in Table 8 which are background and downstream impacted sites for each release point);

- k) The frequency or scheduling of sampling and analysis sufficient to determine water quality objectives and to derive site specific reference values within 2 years (depending on wet season flows) in accordance with the *Queensland Water Quality Guidelines 2006*. For ephemeral streams, this should include periods of flow irrespective of mine or other discharges;
- l) Specify sampling and analysis methods and quality assurance and control;
- m) Any historical datasets to be relied upon;
- n) Description of the statistical basis on which conclusions are drawn, and
- o) Any spatial and temporal controls to exclude potential confounding factors.

**W22** The REMP must be prepared and submitted in writing to the administering authority by 1 October 2011.

### Water Reuse

**W23** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying stock water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with the quality release limits specified in Table 9.

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**W24** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying irrigation water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with quality release limits in Table 10.

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with ANZECC & ARM CANZ (2000) Irrigation Guidelines

**W25** Water contaminated by mining activity may be piped or trucked off the mining lease for the purpose of supplying water to a third party for purpose of construction and/or road maintenance in accordance with the conditions of this environmental authority.

**W26** Water contaminated by mining activity may be piped or trucked for the purpose of supplying water to <name adjoining mine> in accordance with the conditions of this environmental authority. The volume, pH and electrical conductivity of water transferred to {name adjoining mine} must be monitored and recorded.

**W27** If the responsibility of water contaminated by mining activities (the water) is given or transferred to another person in accordance with conditions **W23, W24, W25 or W26**:

- a) the responsibility of the water must only be given or transferred in accordance with a written agreement (the third party agreement); and
- b) include in the third party agreement a commitment from the person utilising the water to use water in such a way as to prevent environmental harm or public health incidences and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters.

## Water General

- W28** All determinations of water quality must be:
- performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - made in accordance with methods prescribed in the latest edition of the Environment Protection Agency Water Quality Sampling Manual;
- Note: Condition W27 requires the Water Quality Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
- collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible; and
  - carried out on representative samples.
- W29** The release of contaminants directly or indirectly to waters:
- must not produce any visible discolouration of receiving waters; nor
  - must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

## Annual Water Monitoring Reporting

- W30** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:
- the date on which the sample was taken;
  - the time at which the sample was taken;
  - the monitoring point at which the sample was taken;
  - the measured or estimated daily quantity of the contaminants released from all release points;
  - the release flow rate at the time of sampling for each release point;
  - the results of all monitoring and details of any exceedences with the conditions of this environmental authority; and
  - water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

## Temporary Interference with waterways

- W31** Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Natural Resources and Water *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

## Water Management Plan

- W32** A Water Management Plan must be developed and implemented by [XX/XX/XXXX \(WITHIN 3 MONTHS OF THE DATE OF ISSUE\)](#) that provides for the proper and effective management of the actual and potential environmental impacts resulting from the mining activity and to ensure compliance with the conditions of this environmental authority.
- W33** The Water Management Plan must be developed in accordance with DERM Guideline for Preparing a Water Management Plan 2009 (to be developed by 1 September) or any updates that become available from time to time and must include at least the following components:
- Contaminant Source Study;
  - Site Water Balance and Model;
  - Water Management System;
  - Saline Drainage Prevention and Management Measures;
  - Acid Rock Drainage Prevention and Management Measures (if applicable);
  - Emergency and Contingency Planning;
  - Monitoring and Review.

- W34** Each year the holder of the environmental authority must undertake a review of the Water Management Plan prior to the wet season (i.e. by 1 November) and a further review following the wet season (i.e. by 1 May the following year) to ensure that proper and effective measures, practices or procedures are in place so that the mine is operated in accordance with the conditions of this environmental authority and that environmental harm is prevented or minimised.
- W35** A copy of the Water Management Plan and/or a review of the Water Management Plan must be provided to the administering authority on request.

#### **Saline Drainage**

- W36** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

#### **Acid Rock Drainage**

- W37** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

#### **Stormwater and Water sediment controls**

- W38** An Erosion and Sediment Control Plan must be developed by a suitably qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to waters and contamination of storm water.
- W39** The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any waters.
- W40** Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or waters.

#### **All Dams**

---

#### **EXPLANATORY NOTES – Dam conditions:**

Note: Conditions W41 and W42 to be removed if already conditioned in the authority.

---

- W41** The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.
- W42** Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

#### **Fitzroy River Basin Study**

- W43** The administering authority and the holder of this environmental authority both acknowledge that the conditions for release of contaminants to the XX River in this environmental authority have been calculated without the benefit of the findings of projects proposed to be undertaken as per recommendations 2 and 3 of the *Study of cumulative impacts on water quality of mining activities in the Fitzroy River Basin* (April 2009). The administering authority may, based on the information provided in the study report when it becomes available, all relevant information available at the time and the regulatory framework applicable at that time, consult with the holder of this environmental authority about the conditions in the environmental authority concerning the treatment and disposal of waste water.

The aim of the consultation shall be the meaningful review of the contaminant release limits imposed in this authority having regard to:

- a) the study results;
- b) near field monitoring results;
- c) QLD Water Quality Guidelines; and
- d) best practice environmental management.

If this review leads to a change in the requirements on this environmental authority holder, this shall be advanced by way of an authority amendment or a Transitional Environmental Program and as is necessary or desirable.

**Definitions:**

**"20th percentile flow"** means the 20th percentile of all daily flow measurements (or estimations) of daily flow over a 10 year period for a particular site. The 20th percentile calculation should only include days where flow has been measured (or estimated), i.e. not dry weather days.

**"acid rock drainage"** means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

**"administering authority"** means the Department of Environment and Resource Management or its successor.

**"dam"** means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However; a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

**"environmental authority"** means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

**"environmental authority holder"** means the holder of this environmental authority.

**"flowable substance"** means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

**"hazard"** in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

**"hazard category"** means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in the Manual for Assessing Hazard Categories and Hydraulic Performance of Dams (Version 2.0, 2009) published by the Environmental Protection Agency on its website.

**"natural flow"** means the flow of water through waters caused by nature.

**"receiving environment"** means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

**"receiving waters"** means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

**"representative"** means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

**"saline drainage"** The movement of waters, contaminated with salt(s), as a result of the mining activity.

**"waters"** includes river, stream, lake, lagoon, pond, swamp, wetland, unconfined surface water, unconfined water natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

# Draft Model Water Conditions for Coal Mines in the Fitzroy Basin

## Contaminant Release

- W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters except as permitted under the conditions of this environmental authority.
- W2** The release of contaminants to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 **<this would be a plan locating all monitoring and release points>** attached to this environmental authority.

**Table 1 (Contaminant Release Points, Sources and Receiving Waters)**

Release Point (RP)	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Contaminant Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	e.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	e.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

- W3** The release of contaminants to waters must not exceed the release limits stated in Table 2 when measured at the monitoring points specified in Table 1 for each quality characteristic.

**Table 2 (Contaminant Release Limits)**

Quality Characteristic	Interim Release Limits for all mines (limits to apply from the date of issue)	Future Release Limits from XX/XX/XXXX (negotiated date) Note: These future limits will apply from a yet to be negotiated date using alternative numbers that will be derived from the information gathered by any combination of the following: (1) the results of near field monitoring, (2) any studies or investigations carried out in accordance with recommendations 2 & 3 of the Cumulative Impact Study on water quality in the Fitzroy River Basin. (3) any review of the QLD Water Quality Guidelines. (4) other relevant information Note: This information should be available by the end of 2011 if not before and when it becomes available limits will be determined for each mine site based on the environmental values to be protected and in accordance with criteria	Monitoring frequency	Comment

		<i>below</i>		
Electrical conductivity (uS/cm)	<p>Heirarchy for determining limits in priority order starting with (a):</p> <p>(a) for mines that do not release contaminants to waters - no conditions are required for release authorisation, then conditions W2, to W15 inclusive, W18, W19 and W43 can be deleted.</p> <p>(b) Current limit for those mine sites not under a TEP or 1500 EC (Maximum)* which ever is lower or</p> <p>(c) a negotiated higher limit value that does not result in the contaminant release exceeding a maximum 1000 EC in the receiving waters and where the mine site demonstrates to DERM that it is unreasonable and impractical to immediately comply with the 1500 EC limit in (b) above and supported by a business case and commitment to ongoing environmental improvement on the mine site and with nominated timeframes.</p> <p><i>Note: If the current limit is lower than a limit determined as above then the current limit would initially apply.</i></p> <p>(d) for those other mines which cannot immediately achieve (b) or (c) above a stepped approach within the interim period ending 2011 to achieve (b) or (c) will be required.</p> <p><i>Note: some of these mines may already be under an approved TEP and EC limits and compliance timeframes in the TEP need to be taken into account with the stepped approach.</i></p> <p>To support a stepped approach DERM will require a business case and commitment to ongoing environmental improvement on the mine site to ensure that all reasonable and practicable measures are being/will be taken to prevent and/or minimise environmental harm.</p>	<p><b>Aquatic ecosystem protection (no drinking water value):</b></p> <p>An end-of-pipe limit to achieve in the range 0 to 1000 EC in the receiving waters. NA – not available, \* local trigger values need to be developed

**W4** The release of contaminants to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency specified in Table 2 and Table 3.

**Table 3 (Release Contaminant Trigger Investigation Levels)**

**Note: The list of quality characteristics required to be analysed, and their associated trigger levels, is to be reviewed by DERM in consultation with representatives of the mining industry by 31 July 2009.**

Quality Characteristic	Trigger Levels (µg/L)	Monitoring Frequency	Comment
Aluminium #	55	Commencement of release and thereafter weekly during release	Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Ammonia (as N)	900		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Antimony	9		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Arsenic #	13		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Boron #	370		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Beryllium#	0.13		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Cadmium #	0.2		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Chromium #	1		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Cobalt #	1.4		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Copper #	1.4		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Fluoride (# only)	2000		Protection of livestock and short term irrigation trigger (ANZECC & ARMCANZ 2000)
Hardness (HCO <sub>3</sub> )	NA		To provide hardness correction factor to the quality characteristics in accordance with ANZECC & ARMCANZ 2000

Iron #	300		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Lead #	3.4		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Manganese #	1900		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Mercury #	0.1		Detection limit
Molybdenum #	34		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Nickel #	11		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
NO <sub>x</sub> (as N)	NA		Nitrite and nitrate are indicators required for stock watering, NO <sub>x</sub> is the aquatic ecosystem indicator.
Petroleum hydrocarbons (C6-C9)	20		
Petroleum hydrocarbons (C10-C36)	100		
Selenium #	5		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Uranium #	0.5		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Vanadium	6		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Zinc #	8		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)

Note:

1. All metals and metalloids (except for Fluoride) must be measured as dissolved (filtered). Where specified by a (#) total measurements (unfiltered) must also be taken and analysed. Trigger levels for metal/metalloids apply to dissolved results only.

2. The list of quality characteristics required to be monitored as per Table 3 will be reviewed once the results of the monitoring data is gathered for the interim period until 31 December 2011 or an earlier date if the data is, or becomes, available and if it is determined that there is no need to monitor for certain individual quality characteristics these can be removed from Table 3.

**W5** If quality characteristics of the release exceed any of the trigger levels specified in Table 3 during a release event, the environmental authority holder must compare the down stream results in the receiving waters to the trigger values specified in Table 3 and:

- a) where the trigger values are not exceeded then no action is to be taken; or
- b) where the down stream results exceed the trigger values specified Table 3 for any quality characteristic, compare the results of the down stream site to the data from background monitoring sites and;
  - i) if the result is less than the background monitoring site data, then no action is to be taken; or
  - ii) if the result is greater than the background monitoring site data, complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
    - details of the investigations carried out; and
    - actions taken to prevent environmental harm.

Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W5 (ii)(b)(ii) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.

**W6** If an exceedance in accordance with condition W5 (b)(ii) is identified, the holder of the authority must notify the administering authority within 14 days of receiving the result.

**Contaminant Release Events**

**W7** The holder must install, operate and maintain a stream flow gauging station to determine and record stream flows at the locations upstream of each Release Point as specified in Table 4 for any receiving water into which a release occurs.

**W8** Notwithstanding any other condition of this environmental authority, the release of contaminants to waters must only take place during periods of natural flow events specified as minimum flow in Table 4 for the contaminant release point(s) specified in Table 1.

**Table 4 (Contaminant Release during Flow Events)**

Receiving water description	Release Point	Gauging station description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Minimum Flow in Receiving Water Required for a Release Event	Flow recording Frequency
Wet Creek		Gauging station 1	XXXX	XXXX	Depending on individual catchment this minimum flow trigger will be either the release comprising less than 20% of the natural flow or any natural flow in the receiving environment.  The volume of flow can be determined by height of water or flow. The actual flow must be a quantifiable measure.  Example: > or = 5 m <sup>3</sup> /sec	Continuous (minimum daily)

**W9** The volume released through the release point(s) must not exceed XX m<sup>3</sup>/s (minimum flow specified in Table 4 divided by 4).

**W10** The daily quantity of contaminants released from each release point must be measured and recorded at the monitoring points in Table 1.

**W11** Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

**Notification of Release Event**

**W12** The authority holder must notify the administering authority as soon as practicable (no later than 6 hours of having commenced releasing mine affected water to the receiving environment). Notification must include the submission of written verification to the administering authority of the following information:

- a) release commencement date/time;
- b) expected release cessation date/time;
- c) release point/s;
- d) release volume (estimated);
- e) receiving water/s including the natural flow rate; and
- f) any details (including available data) regarding likely impacts on the receiving water(s).

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

- W13** The authority holder must notify the administering authority as soon as practicable, (nominally within twenty-four (24) hours after of cessation of a release) of the cessation of a release notified under Condition W 12 and within 28 days provide the following information in writing:
- release cessation date/time;
  - natural flow volume in receiving water;
  - volume of water released;
  - details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
  - all in-situ water quality monitoring results; and
  - any other matters pertinent to the water release event.

#### Notification of Release Event Exceedance

- W14** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

- W15** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:
- the reason for the release;
  - the location of the release;
  - all water quality monitoring results;
  - any general observations;
  - all calculations; and
  - any other matters pertinent to the water release event.

#### Monitoring of Water Storage Quality

- W16** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

- W17** In the event that waters storages defined in Table 5, exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>

Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

<sup>1</sup> Contaminant limit based on ANZECC & ARMCANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARMCANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".  
 Note: Total measurements (unfiltered) must be taken and analysed

### Receiving Environment Monitoring and Contaminant Trigger Levels

**W18** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency	Comments
pH	6.5 – 8.0	Daily during the release	<b>See Table 2 comments</b>
Electrical Conductivity (µS/cm)	1000		
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.		
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	250 (Protection of drinking water Environmental Value) OR 1000 (Protection of irrigation environmental value)		

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

Monitoring Points	Receiving Waters Location Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)
Upstream Background Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX

Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Downstream Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

Notes:

- a) The upstream monitoring point should be within Xkm the release point.
- b) the downstream point should not be greater than Xm from the release point.
- c) The data from background monitoring points must not be used where they are affected by releases from other mines.

**W19** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:

- a) where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or
- b) where the down stream results exceed the upstream results complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
  - i) details of the investigations carried out; and
  - ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W19 (ii) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

### Receiving Environment Monitoring Program (REMP)

**W20** A REMP must be implemented to monitor and record the effects of the release of contaminants on the receiving environment periodically and whilst contaminants are being discharged from the site, with the aims of identifying and describing the extent of any adverse impacts to local environmental values, and monitoring any changes in the receiving water.

For the purposes of the REMP, the receiving environment is the waters of the XX and connected waterways within XX (e.g. Xkm) downstream of the release.

**W21** The REMP must address (but not necessarily be limited to) the following:

- a) Description of potentially affected receiving waters including key communities and background water quality characteristics based on accurate and reliable monitoring data that takes into consideration any temporal variation (e.g. seasonality); and
- b) Description of applicable environmental values and water quality objectives to be achieved (i.e. as scheduled pursuant to the Environmental Protection (Water) Policy 1997); and
- c) Any relevant reports prepared by other governmental or professional research organisations that relate to the receiving environment within which the REMP is proposed; and
- d) Water quality targets within the receiving environment to be achieved, and clarification of contaminant concentrations or levels indicating adverse environmental impacts during the REMP.
- e) Monitoring for any potential adverse environmental impacts caused by the release;
- f) Monitoring of stream flow and hydrology;
- g) Monitoring of toxicants should consider the indicators specified in Table 3 to assess the extent of the compliance of concentrations with water quality objectives and/or the ANZECC & ARMCANZ 2000 guidelines for slightly to moderately disturbed ecosystems;
- h) Monitoring of physical chemical parameters as a minimum those specified in Table 2 (in addition to dissolved oxygen saturation and temperature);

- i) Monitoring biological indicators (for macroinvertebrates in accordance with the AusRivas methodology) and metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*) for permanent, semi-permanent water holes and water storages;
- j) The locations of monitoring points (including the locations specified in Table 8 which are background and downstream impacted sites for each release point);
- k) The frequency or scheduling of sampling and analysis sufficient to determine water quality objectives and to derive site specific reference values within 2 years (depending on wet season flows) in accordance with the *Queensland Water Quality Guidelines 2006*. For ephemeral streams, this should include periods of flow irrespective of mine or other discharges;
- l) Specify sampling and analysis methods and quality assurance and control;
- m) Any historical datasets to be relied upon;
- n) Description of the statistical basis on which conclusions are drawn, and
- o) Any spatial and temporal controls to exclude potential confounding factors.

**W22** The REMP must be prepared and submitted in writing to the administering authority by 1 October 2011.

### Water Reuse

**W23** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying stock water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with the quality release limits specified in Table 9.

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**W24** Water contaminated by mining activity may be piped or trucked or transferred by some other means that does not contravene the conditions of this authority during periods of dry weather for the purpose of supplying irrigation water to properties directly adjoining properties owned by the environmental authority holder or a third party and subject to compliance with quality release limits in Table 10.

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with ANZECC & ARMCANZ (2000) Irrigation Guidelines

**W25** Water contaminated by mining activity may be piped or trucked off the mining lease for the purpose of supplying water to a third party for purpose of construction and/or road maintenance in accordance with the conditions of this environmental authority.

**W26** Water contaminated by mining activity may be piped or trucked for the purpose of supplying water to {name adjoining mine} in accordance with the conditions of this environmental authority. The volume, pH and electrical conductivity of water transferred to {name adjoining mine} must be monitored and recorded.

- W27** If the responsibility of water contaminated by mining activities (the water) is given or transferred to another person in accordance with conditions **W23, W24, W25 or W26:**
- the responsibility of the water must only be given or transferred in accordance with a written agreement (the third party agreement); and
  - include in the third party agreement a commitment from the person utilising the water to use water in such a way as to prevent environmental harm or public health incidences and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters.

#### **Water General**

- W28** All determinations of water quality must be:
- performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - made in accordance with methods prescribed in the latest edition of the Environment Protection Agency Water Quality Sampling Manual;  
*Note: Condition W 27 requires the Water Quality Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
  - collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible; and
  - carried out on representative samples.
- W29** The release of contaminants directly or indirectly to waters:
- must not produce any visible discolouration of receiving waters; nor
  - must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

#### **Annual Water Monitoring Reporting**

- W30** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:
- the date on which the sample was taken;
  - the time at which the sample was taken;
  - the monitoring point at which the sample was taken;
  - the measured or estimated daily quantity of the contaminants released from all release points;
  - the release flow rate at the time of sampling for each release point;
  - the results of all monitoring and details of any exceedences with the conditions of this environmental authority; and
  - water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

#### **Temporary Interference with waterways**

- W31** Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Natural Resources and Water *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

#### **Water Management Plan**

- W32** A Water Management Plan must be developed and implemented by XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE) that provides for the proper and effective management of the actual and potential environmental impacts resulting from the mining activity and to ensure compliance with the conditions of this environmental authority.

- W33** The Water Management Plan must be developed in accordance with DERM Guideline for Preparing a Water Management Plan 2009 (to be developed by 1 September) or any updates that become available from time to time and must include at least the following components:
- Contaminant Source Study;
  - Site Water Balance and Model;
  - Water Management System;
  - Saline Drainage Prevention and Management Measures;
  - Acid Rock Drainage Prevention and Management Measures (if applicable);
  - Emergency and Contingency Planning;
  - Monitoring and Review.
- W34** Each year the holder of the environmental authority must undertake a review of the Water Management Plan prior to the wet season (i.e. by 1 November) and a further review following the wet season (i.e. by 1 May the following year) to ensure that proper and effective measures, practices or procedures are in place so that the mine is operated in accordance with the conditions of this environmental authority and that environmental harm is prevented or minimised.
- W35** A copy of the Water Management Plan and/or a review of the Water Management Plan must be provided to the administering authority on request.

#### **Saline Drainage**

- W36** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

#### **Acid Rock Drainage**

- W37** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

#### **Stormwater and Water sediment controls**

- W38** An Erosion and Sediment Control Plan must be developed by a suitably qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to waters and contamination of storm water.
- W39** The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any waters.
- W40** Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or waters.

#### **All Dams**

- W41** The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.
- W42** Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

**Note:** *Conditions W41 and W42 to be removed if already conditioned in the authority*

#### **Fitzroy River Basin Study**

- W43** The administering authority and the holder of this environmental authority both acknowledge that the conditions for release of contaminants to the XX River in this environmental authority have been calculated without the benefit of the findings of projects proposed to be undertaken as per recommendations 2 and 3 of the *Study of cumulative impacts on water quality of mining activities in the Fitzroy River Basin* (April 2009). The administering authority may, based on the information provided in the study report when it becomes available, all relevant information available at the time and the

regulatory framework applicable at that time, consult with the holder of this environmental authority about the conditions in the environmental authority concerning the treatment and disposal of waste water.

The aim of the consultation shall be the meaningful review of the contaminant release limits imposed in this authority having regard to:

- a) the study results;
- b) near field monitoring results;
- c) Qld Water Quality Guidelines; and
- d) best practice environmental management.

If this review leads to a change in the requirements on this environmental authority holder, this shall be advanced by way of an authority amendment or a Transitional Environmental Program and as is necessary or desirable.

**Definitions:**

**"20th percentile flow"** means the 20th percentile of all daily flow measurements (or estimations) of daily flow over a 10 year period for a particular site. The 20th percentile calculation should only include days where flow has been measured (or estimated), i.e. not dry weather days.

**"acid rock drainage"** means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

**"administering authority"** means the Department of Environment and Resource Management or its successor.

**"dam"** means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However; a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

**"environmental authority"** means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

**"environmental authority holder"** means the holder of this environmental authority.

**"flowable substance"** means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

**"hazard"** in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

**"hazard category"** means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in the Manual for Assessing Hazard Categories and Hydraulic Performance of Dams (Version 2.0, 2009) published by the Environmental Protection Agency on its website.

**"natural flow"** means the flow of water through waters caused by nature.

**"receiving environment"** means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

**"receiving waters"** means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

**"representative"** means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

**"saline drainage"** The movement of waters, contaminated with salt(s), as a result of the mining activity.

**"waters"** includes river, stream, lake, lagoon, pond, swamp, wetland, unconfined surface water, unconfined water natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

**Fitzroy River Basin – Mine Licence Water Conditions Workshop**  
**Held on 18 June 2009 at Sebel & Citigate King George Square Hotel, Brisbane**

**Record of workshop discussions and outcomes**

*Dean Ellwood, Department of Environment and Resource Management - Acting Assistant Director-General, welcomed the workshop participants and provided a brief introduction.*

*Professor Bob Miles, facilitator, addressed the workshop regarding proceedings for the day.*

*Frances Hayter, Queensland Resources Council - Director Environment and Social Policy addressed the group and noted the following key points and issues for resolution on behalf of the coal mining industry:*

- understand the political processes that have lead to this project
- the industry is interested in reaching a solution
- 12 days is a very tight timeframe to achieve stated outcomes
- seek agreement not to talk about the contents of the Cumulative Impacts Study at this workshop just recommendation 1 from the Study
- water quality monitoring across all industries not just mining needs to be improved and highlighted that as an issue for discussion during the workshop
- industry believes the Government does not have a good understanding of how mines operate and that needs to change otherwise processes like this could undo all the good work done in water management by mines.
- seek a rational outcome to the development of the conditions so that companies are not put in a position where they have to cut or stop production and recognise that if that is going to happen then it needs to be a conscious decision by Government and the Premier needs to be advised
- question whether DERM can resource the extra work this project will bring
- question what happens regarding wider consultation about these proposed amendments
- seek clarification of TWG role/Taskforce role.

*Ian Ramsay, DERM Chief Scientist Freshwater and Marine gave a presentation on the approaches used in developing discharge licence conditions.*

A summary of the points raised for clarification follows.

Question/issue	Clarification
How do we get conditions that are reasonable now if we need 2-5 years to collect data to determine ideal conditions for individual sites?	DERM recognises this approach is based on limited understanding of the ambient environmental conditions and that it's not perfect but it can be refined and it is not intended to have limits that can't be met
Process needs to be documented on how these changes may occur as information changes.	

How does a company know if it is in compliance or not when you have trigger values?	Compliance relates to limit numbers in licences. Trigger values are not compliance related but are related to environmental harm and trigger the need for investigation to see whether harm has occurred.
There may be compliance issues with sampling trace elements. Many mines have very remote locations and use sampling processes that are not totally adequate so it's not always possible to guarantee quality assurance of monitoring.  Site access can be a problem for monitoring, e.g. getting to a creek in the middle of a floodplain and relying on the goodwill of neighbours to access land.	This is a valid point and it was agreed some approaches to monitoring are not currently appropriate.
The issue of needing to discharge should be addressed as mines should be able to discharge if this will not cause environmental harm. Therefore receiving water should be the limit point not end of pipe. Mine discharge water can be a resource to the receiving environment.  Does DERM understand that you can't make end-of-pipe and receiving point monitoring the same limits?	End-of-pipe is needed to determine compliance and as proof of who is responsible for contaminants.
What is the relevance of this process to emergency discharges. How do we manage uncontrolled discharges when all this talk is about controlled discharges. Many of the mines have water storages built on waterways so is this about discharges occurring deliberately or storm events as that needs to be part of the consideration as to how you frame conditions.	The purpose of this workshop is to focus on revised conditions for controlled discharges
Is there an expectation suspended solids would be treated before release?	Yes, through a sediment treatment dam.
The issue of far field monitoring was raised but held for later discussion	

*Les Bevis, DERM – Regional Manager Townsville, and Steven Tarte, DERM – Principal Environmental Officer, gave a presentation on the Draft model water conditions for coal mines in the Fitzroy Basin - Parts A and B.*

A summary of the points raised for clarification follows.

<b>Question/issue</b>	<b>Clarification</b>
<b>Part A specific</b>	
As amendments are needed by the end of December 2009, why are future amendments being introduced over the next 2 years. An explicit statement on how this process will work is needed as condition W39 does not explain it	

well enough.	
Need mechanism for transition from current conditions to new regime.	DERM acknowledged there are time factors associated with some limits – this will be negotiated.
The 1500 uS/cm limit is a significant change for many mines which will take time to achieve and TEPs should not be the mechanism used to get there.  Ministers Jones and Swarten should be told that compliance is not immediately possible and TEPs should not be used.	DERM agreed to look at milestone conditions and acknowledged it may take time to implement changes. DERM also agreed to report on this to Minister Jones.
It was noted that corporate governance is an issue for companies if they sign up to something they can't achieve.	
Is there scope to lower the 18 points of data?	DERM advised there is a limit to how low you can go but this can be worked through with technical officers.
Issue with end-of-pipe discharge limits discussed. Shouldn't the emphasis be on the mine demonstrating no environmental harm. This could possible lead to a higher discharge limit at a lower volume.	DERM agreed that different scenarios for discharge could be considered but releases of higher EC need background data to manage near field toxicity. Also the issue of communication between mines needs to be considered to deal with assimilative issues.
<b>Part B specific</b>	
<ul style="list-style-type: none"> <li>• Why do we need this as a specific part of our licences what is the point when it just repeats what is in the conditions?</li> <li>• Condition should just relate to the need to have a water management plan.</li> <li>• This should be a guideline/code of practice.</li> <li>• Including a stack of how to's in a licence condition goes against all best practice standards.</li> <li>• Suggestion for a condition that states the need for a water management plan that demonstrates your ability to comply with your conditions.</li> </ul>	Agreed: Mines want to see less prescriptive approach to Part B – matter for working group to discuss.
<b>Far field monitoring comments</b>	
<ul style="list-style-type: none"> <li>• Have an issue with far field monitoring as an EA condition.</li> <li>• Some mines do not discharge at all or very infrequently.</li> <li>• Agree with principle but let's talk through how it fits in an EA. What should be in and what shouldn't. Agree that catchment wide</li> </ul>	

<b>Other comments</b>	
List of metals currently need 4 monitoring sites for 1 release.	
Why are dam conditions regulated in Part A when there is still only a draft policy for dams that hasn't been finalised.	This is so that monitoring of water storage occurs so you know what is in your dams
Is this for all dams or just those with a release point.	Intent is just to relate to water storages for which there is a release.
Cannot comply with W18 – should be where practicable and perhaps this should go into dam conditions instead.	

It was agreed that copies of all presentations given at the workshop would be made available to all attendees.

### Summary of morning session

Dean Ellwood summed up the morning session with the following key points.

- Will convey concerns to Minister Jones about TEPs being used as a transition process.
- Clarified that TWG/Taskforce intent is current TWG will finish and that a commitment has been made to reconstitute a new group.
- Regarding end-of-pipe, quite wedded to end-of-pipe emissions as most licensing is done at point of release.  
(Comment from group – then discussion needs to be about the numbers)
- Regarding far field monitoring – there is an opportunity to move away from conditioning and embrace a Healthy Waterways type of project. With commitment from mines this could be a good news item for all stakeholders.
- Deferred on Part B but noted DERM needs to see water management plans in place.

The following questions were put to Dean Ellwood

Q. We need to see some commitment on how issues should be dealt with and the process needs to be documented.

A: Agree to put a fence around amendments to water conditions in EAs in the Fitzroy Basin while this process continues until the end of 2009.

Q. Are the model conditions going to be opened up to community objection?

A: That is not the intent.

Frances Hayter then asked for a letter from Minister Jones stating that conditions were not open to community objection.

Following the presentations and summing up, the participants broke into groups to discuss 1) strategic issues, 2) condition specific issues, and 3) operational issues with a request to identify issues and possible solutions. A summary of the smaller group discussions follows.

### Strategic group

Issue	Solution
Major issue is management of short term stakeholder expectations. For example is we get floods next Christmas	Need a process of engaging with councils and NGO groups. Need to take stakeholders with us.
There is the potential for unintended conflict between legislation (EP Act and Water Act) and different land uses. For example, may need to build a big dam but this could create conflict with use of more land and less environmental flows and likewise using water allocations to shandy etc.	Great coordination between ex-EPA and ex-NRW.
Need to keep the focus on protecting the environment.	Develop a plan of research to understand impacts etc.
Broader catchment monitoring may demonstrate mines are not the bad guys everyone thought so need clear processes for governance of this.	Investigate a Healthy Waterways style of program as this have to be more than just a compliance exercise. It needs a dedicated group and a way of managing data is a critical need.

### Condition specific group

- whole group needs to see another version of conditions once changes have been made
- 1500 is not a reachable limit for most mines.
- pH must be 9
- metals in Table 3 should be about 10 in total which could be done in a cost effective and reasonable way
- receiving and near field environment should be one and the same
- Part B – only condition should be requirement for water management plan
- practicalities around monitoring need to be determined
- in release events 20% is not acceptable this figure needs to be lower
- W12 notification of release prior to event is ridiculous
- W13 some information may not be available in that time
- W16 is not necessary
- W17 wording needs changing
- W18 needs to include where practicable, reference sites should be part of regional strategy
- W34 in accordance with EPA Manual is not possible and timing is not possible
- W37(d) is that about discharge volume
- W16 and W36 are redundant because they're about general environmental duty
- add in conditions to provide for stock water, irrigation water, construction water and water transfer to adjoining mines.

### Operational group

Issue	Solution
Some sites cannot meet proposed limits in low flow and may not be able to comply with 1500 and list of metals needs to be reduced.	Need a mechanism for a dedicated DERM technical officer to review

Some mines don't have access to upstream and downstream sites for sampling/monitoring.	Mines may need to share data.
24 hour prior notice of discharge is not practical but need a suitable period after discharge.	2 hours notice after discharge for example.
Concerns about period of transition, particularly for older sites.	Milestones in EAs is a solution.
Concerns about far field monitoring.	Participating in a broader regional process.
Need extra conditions to deal with stock water, irrigation water, construction water and transfer of water to adjoining mines.	
DERM needs a dedicated team to process revised EAs.	

### Summing up of where to from here?

- Talked about representatives for working group with industry representative being determined as Andrew Grabski, Peter Roe and Tracey Tucker or Dale du Mee.
- Talked about rapidly assembling data from the mines to help in the individual mine assessment process. This would involve DERM advising what information they currently hold and what further information from mines would be helpful. It was determined this process would occur after 30 June 2009.
- Talked about how the assessment process would be managed and how changes from the workshop would be incorporated into the model conditions for further revisions.
- It was agreed DERM would incorporate comments from the workshop into Version 1.1 of the model conditions by COB 24/6/09. This version would be distributed to the working group members for further refining. It was also agreed that version revised by the working group needed to go back to the wider group present at the workshop for further comment.
- DERM agreed to investigate establishing a dedicated team to develop the new EAs for each mine site.
- In relation to meeting the 30 June 2009 deadline for finalising consistent and appropriate licence conditions it was discussed that it may be necessary to report to Minister Jones that agreement has been reached on xx number of conditions but xx number are still to be determined.

# **Draft Model Water Conditions for Coal Mines in the Fitzroy Basin**

## **Department of Environment and Resource Management**

### **Introduction**

The key points for discussion will include: contaminant release limits; releases linked to stream flow; metal trigger values; receiving environment monitoring – both of the discharge and in the catchment; and water management plan requirements including continual improvement. Limits are based on an assumption of limited/no monitoring information on background and discharge water quality. Limits could be amended in the future when this information becomes available.

The following proposed conditions have been broken up into two parts:

- A. Release limits, monitoring and reporting requirements; and
- B. Practices and measures to assist in achieving compliance with conditions. (These part B conditions will be provided prior to the workshop held on 18 June 2009.)

## Part A: Release limits, monitoring & reporting requirements

### Proposed conditions:

**W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters except as permitted under the conditions of this environmental authority.

### Contaminant Release Limits

**W2** The release of contaminants to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 **<this would be a plan locating all monitoring and release points>** attached to this environmental authority.

**Table 1 (Contaminant Release Points, Sources and Receiving Waters)**

Release Point (RP)	Latitude (GDA94)	Longitude (GDA94)	Contaminant Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	E.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	E.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

**W3** The release of contaminants to waters must not exceed the release limits stated in Table 2 when measured at the monitoring points specified Table 1 at the monitoring frequency specified in Table 2 for each quality characteristic.

**Table 2 (Contaminant Release Limits)**

Quality Characteristic	Interim Release Limits for all mines (limits to apply from the date of issue until XX/XX/XXXX the negotiated date)	Release Limits from XX/XX/XXXX (negotiated date) (subject to negotiation with a maximum implementation end date of 1 December 2010 depending on mine site location and receiving environment)		Monitoring frequency	Comment
		For mine sites that can demonstrate that release comprises no more than 20% of the natural flow in the receiving water	For mine sites located in the upper catchments with low natural flows in receiving water		
Electrical conductivity (uS/cm)	1500 (Maximum)*	1400 (maximum)*	720* (maximum)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	For Nogoia basin north of Emerald and upper Isaac River. For aquatic ecosystem protection, no drinking water storages downstream.
	1500 (Maximum)*	750 (maximum)*	340 (maximum)*	Daily during release (the first sample must be taken within 2 hours of commencement of release)	For all areas with downstream drinking water reservoir or use, apart from the Dawson (except Dee River Branch)

	1500 (Maximum)*	650 (maximum)*	340 (maximum)*	Daily during release (the first sample must be taken within 2 hours of commencement of release)	For the Dawson except Dee River Branch. For aquatic ecosystem protection with/without drinking water storages downstream
pH (pH Unit)	6.5 (minimum) 9.0 (maximum)	6.5 (minimum) 9.0 (maximum)	6.5 (minimum) 8.0 (maximum)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	This applies to the fourth column of this row only: Limits are conservative ambient limit from Ambient QWQ Guidelines for lowland streams. Higher upper limit of 8.5 may be allowed if dilution is sufficient to achieve in stream ambient WQ Guideline based on median (8.0 for lowland and 7.5 for upland streams)
Turbidity (NTU)	NA*	NA*	NA*	Daily during release* (first sample within 2 hours of commencement of release)	Turbidity is required to assess ecosystems impacts and can provide instantaneous results.
Suspended Solids (mg/L)	100 (maximum)	50 (maximum)	50 (maximum)	Daily during release* (first sample within 2 hours of commencement of release)	Suspended solids are required to measure the performance of sediment and erosion control measures.
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	Current limit or 1000 (maximum) which ever is the lower	1000 (maximum)	250 (Maximum) (Protection of drinking water Environmental Value) OR 1000 (Maximum) (Protection of irrigation environmental value)	Daily during release* (first sample within 2 hours of commencement of release)	Drinking water environmental values from NHMRC 2006 guidelines OR ANZECC & ARMCANZ 2000 stock water quality guidelines.

NA – not available, \* local trigger values need to be developed

**W4** The release of contaminants to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency and specified in Table 2.

**Table 3 (Toxicant Trigger Investigation Levels)**

Quality Characteristic <sup>1</sup>	Toxicant Trigger Levels (µg/L)	Monitoring Frequency	Comment
Aluminium #	55	Commencement of release and thereafter weekly during release	Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Ammonia (as N)	900		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Antimony	9		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Arsenic #	13		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Boron #	370		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Beryllium#	0.13		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Cadmium #	0.2		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Chromium #	1		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Cobalt #	1.4		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Copper #	1.4		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Fluoride (# only)	2000		Protection of livestock and short term irrigation trigger (ANZECC & ARMCANZ 2000)
Hardness (HCO <sub>3</sub> )	NA		To provide hardness correction factor to the quality characteristics in accordance with ANZECC & ARMCANZ 2000
Iron #	300		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Lead #	3.4	Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)	
Manganese #	1900	Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)	

Mercury <sup>#</sup>	0.1		Detection limit
Molybdenum <sup>#</sup>	34		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Nickel <sup>#</sup>	11		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
NO <sub>x</sub> (as N)	NA		Nitrite and nitrate are indicators required for stock watering, NO <sub>x</sub> is the aquatic ecosystem indicator.
Petroleum hydrocarbons (C6-C9)	20		
Petroleum hydrocarbons (C10-C36)	100		
Selenium <sup>#</sup>	5		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)
Uranium <sup>#</sup>	0.5		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Vanadium	6		Slightly to Moderately Disturbed Aquatic ecosystem – low reliability (ANZECC & ARMCANZ 2000)
Zinc <sup>#</sup>	8		Slightly to Moderately Disturbed Aquatic ecosystem (ANZECC & ARMCANZ 2000)

Note: All metals and metalloids (except for Fluoride) must be measured as dissolved (filtered). Where specified by a (#) total measurements (unfiltered) must also be taken and analysed. Trigger levels for metal/metalloids apply to dissolved results only.  
 NA – Not applicable.

**W5** If quality characteristics exceed any of the toxicant trigger levels specified in Table 3 during a release event, the environmental authority holder must:

- a) Compare the results of the release to the last 12 consecutive sampling results for the background receiving environment for that monitoring point. If the result is less than the maximum background result, no action is to be taken;
- b) If the result is greater than the maximum background results, complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
  1. details of the investigations carried out; and
  2. actions taken to prevent environmental harm.

Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with part b) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.

**W6** If an exceedance in accordance with Condition W5 b), the holder of the authority must notify the administering authority within 14 days of receiving the result.

### Contaminant Release Events

**W7** The holder must install, operate and maintain a stream flow gauging station to determine and record stream flows at the locations upstream of each Release Point as specified in Table 4 for any receiving water into which a release occurs.

**W8** Notwithstanding any other condition of this environmental authority, the release of contaminants to waters must only take place during periods of natural flow events specified as minimum flow in Table 4 for the contaminant release point(s) specified in Table 1.

**Table 4 (Contaminant Release during Flow Events)**

Receiving water description	Release Point	Gauging station description	Latitude (GDA94)	Longitude (GDA94)	Minimum Flow in Receiving Water Required for a Release Event	Flow recording Frequency
Wet Creek		Gauging station 1	XXXX	XXXX	<p>Depending on individual catchment this minimum flow trigger will be either the release comprising less than 20% of the natural flow or any natural flow in the receiving environment.</p> <p>The volume of flow can be determined by height of water or flow. The actual flow must be a quantifiable measure.</p> <p>Example: &gt; or = 5 m<sup>3</sup>/sec</p>	Continuous (minimum daily)

**W9** The quantity of contaminants released through the release point(s) must not exceed XX m<sup>3</sup>/s (minimum flow specified in Table 4 divided by 4).

**W10** The quantity of contaminants released from each release point must be measured and recorded at the monitoring points and at the frequencies specified in Table 2.

**W11** Releases of contaminants to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

#### Notification of Release

**W12** The authority holder must notify the administering authority of its intention to commence discharging mine affected water to the receiving environment, a minimum of twenty-four (24) hours prior to a discharge commencing. Notification must include the submission of written verification to the administering authority of the following information:

- release commencement date/time;
- expected release cessation date/time;
- release point/s;
- receiving water/s;
- details regarding the compliance of the proposed discharge with the conditions of Agency Interest: Water (ie contamination limits, natural flow, discharge volume); and
- release volume (estimated).

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

**W13** The authority holder must notify the administering authority, within twenty-four (24) hours after of cessation of a release notified under Condition W9 and provide the following information in writing:

- release cessation date/time;
- natural flow volume in receiving water;
- volume of water released;
- details regarding the compliance of the proposed release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
- all in-situ water quality monitoring results; and
- any other matters pertinent to the water release event.

**W14** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

- W15** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:
- the reason for the release;
  - the location of the release;
  - all water quality monitoring results;
  - any general observations;
  - all calculations; and
  - any other matters pertinent to the water release event.
- W16** In addition to the quality characteristic limits specified in Table 2 the release of contaminants must not have any properties nor contain any organisms or other contaminants in concentrations that are capable of causing environmental harm.

### Monitoring of Water Storage Quality

- W17** Monitoring of the water storages for the water quality characteristics specified in Table 2 and Table 3 must be undertaken from the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude (GDA94)	Longitude (GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

- W18** In the event that waters storages defined in Table 5, exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures to prevent access to waters by all livestock and minimise access by native fauna.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>

Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

<sup>1</sup> Contaminant limit based on ANZECC & ARMCANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARMCANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".

Note: Total measurements (unfiltered) must be taken and analysed

### Receiving Environment Contaminant Trigger Levels

**W19** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**W20** If the quality characteristics of the downstream monitoring sites specified in Table 8 exceed the trigger levels specified in Table 7 during release, the environmental authority holder must:

- a) Compare the results of the release to the last 12 consecutive sampling results for the background receiving environment for that down stream monitoring point. If the result is less than the maximum background result, no action is to be taken;
- b) If the result is greater than the maximum background results, complete an investigation in accordance with the ANZECC & ARMCANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
  1. details of the investigations carried out; and
  2. actions taken to prevent environmental harm.

Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with part b) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.

**W21** If an exceedance of a trigger level occurs notify the administering authority within 14 days of receiving the result.

**Table 7 (Receiving Environment Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency	Comments
pH	6.5 - 8	Daily during the release	<b>See Table 2 comments</b>
Electrical Conductivity (µS/cm)	1000		
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.		
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	250 (Protection of drinking water Environmental Value) OR 1000 (Protection of irrigation environmental value)		

**Table 8 (Stream receiving water monitoring points)**

Monitoring Point	Receiving Waters Location Description	Latitude (GDA94)	Longitude (GDA94)
Upstream Background Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Downstream Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

Notes:

- The upstream monitoring point should be within **1km** the release point.
- the downstream point should not be greater than **500m** from the release point.

### Receiving Environment Monitoring Program (REMP)

**W22** A REMP, focussing on near-field and far-field impacts, must be implemented, based on the outcomes of a background environmental investigation, pertaining to the receiving waters (i.e. **XXXX** and connected waters), that addresses at least the following:

- Description of potentially affected receiving waters including key communities and background water quality characteristics based on accurate and reliable monitoring data that takes into consideration any temporal variation (e.g. seasonality); and
- Description of applicable environmental values and water quality objectives to be achieved (i.e. as scheduled pursuant to the Environmental Protection (Water) Policy 1997); and
- Any relevant reports prepared by other governmental or professional research organisations that relate to the receiving environment within which the REMP is proposed; and
- Water quality targets within the receiving environment to be achieved, and clarification of contaminant concentrations or levels indicating adverse environmental impacts during the REMP.

### Near-field Monitoring Program (NFMP)

**W23** A NFMP must be implemented to monitor and record the effects of the release of contaminants on the near-field receiving environment periodically and whilst contaminants are being discharged from the site, with the aims of identifying and describing the extent of any adverse impacts to local environmental values, and monitoring any changes in the receiving water.

For the purposes of the NFMP, the receiving environment is the waters of the **XX** and connected waterways within **XX** (e.g. 5km) downstream of the release.

**W24** The NFMP proposal must address (but not necessarily be limited to) the following:

- Monitoring for any potential adverse environmental impacts caused by the release;
- Monitoring of stream flow and hydrology;
- Monitoring of toxicants and other indicators specified in Table 3 to assess the extent of the compliance of concentrations with water quality objectives and/or the ANZECC & ARMCANZ 2000 guidelines for slightly to moderately disturbed ecosystems;
- Monitoring of physical chemical parameters as a minimum those specified in Table 2 (in addition to dissolved oxygen saturation and temperature);
- Monitoring biological indicators (for macroinvertebrates in accordance with the **AusRivas** methodology) and metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*) for permanent, semi-permanent water holes and water storages;

6. The locations of monitoring points (including the locations specified in **Table 7** which are background and near field impacted sites for each release point);
7. The frequency or scheduling of sampling and analysis sufficient to determine water quality objectives and to derive site specific reference values within 2 years in accordance with the *Queensland Water Quality Guidelines 2006*. For ephemeral streams, this should include periods of flow irrespective of mine or other discharges;
8. Specify sampling and analysis methods and quality assurance and control;
9. Any historical datasets to be relied upon;
10. Description of the statistical basis on which conclusions are drawn, and
11. Any spatial and temporal controls to exclude potential confounding factors.

**W25** The NFMP must be prepared and submitted in writing to the administering authority by **1 October 2010**.

#### **Far-field Monitoring Program (FFMP)**

**W26** A FFMP must be implemented to monitor the effects of the release of contaminants on the receiving environment outside the near field with the aims of identifying and describing the extent of any adverse impacts to local environmental values.

For the purposes of the FFMP, the receiving environment is the waters of the Fitzroy Basin.

**W27** The FFMP proposal must address (but not necessarily be limited to) the following:

1. Monitoring of the condition of the Fitzroy Basin waters potentially impacted by the release and potential cumulative impacts;
2. Monitoring of stream flow and hydrology;
3. Monitoring of toxicants and other indicators specified in **Table 3** to assess the extent of the compliance of concentrations with water quality objectives and/or ANZECC & ARM CANZ 2000 guidelines for slightly to moderately disturbed ecosystems;
4. Monitoring of physical chemical parameters, as a minimum specified in **Table 2** (in addition to dissolved oxygen saturation and temperature);
5. Monitoring biological indicators (for macroinvertebrates in accordance with AusRivas methodology) and metals/metalloids in sediments (in accordance with ANZECC & ARM CANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*) for permanent, semi-permanent water holes and water storages;
6. The locations of monitoring points (including the locations specified in **Table 7** which are background and near field impacted sites for each release point), cumulative impact sites and reference sites;
7. The frequency or scheduling of sampling and analysis sufficient to determine water quality objectives and to derive site specific reference values within 2 years in accordance with the *Queensland Water Quality Guidelines 2006*; For ephemeral streams, this should include periods of flow irrespective of mine or other discharges
8. Specify sampling and analysis methods and quality assurance and control;
9. Any historical datasets to be relied upon;
10. Description of the statistical basis on which conclusions are drawn, and
11. Any spatial and temporal controls to exclude potential confounding factors.

**W28** The FFMP must be prepared and submitted in writing to the administering authority by the **1 October 2010**.

#### **Involvement in Regional Monitoring Studies (i.e. Far-field Monitoring Program FFMP)**

**W29** As an alternative to carrying out the FFMP specified in conditions: **W26; W27; and W28** the holder of the environmental authority may become and remain a "participating member" in the following regional water quality and ecosystem health monitoring studies, or any equivalent program:

1. The Ecosystem Health Monitoring Program.

For the purposes of regional (far-field) monitoring studies, the receiving environment is the waters of the Fitzroy Basin.

**W30** For the purposes of condition **W29**, the holder of the environmental authority will be deemed by the administering authority to be a "participating member" in regional studies in the following situations.

1. The operator is a "contributing member", to the regional studies of water quality and ecosystem health; and
2. The operator is identified as a "contributing member" in a written statement to the administering authority from the authority carrying out the regional studies; and
3. The registered operator continues to be a "contributing member", of such regional studies.

**W31** For the purposes of condition **W29**, the registered operator of the holder of the environmental authority will be deemed by the administering authority to be a "contributing member" until such time as:

1. the authority carrying out the regional studies notifies the administering authority in writing that the holder is no longer a "contributing member"; and
2. the administering authority has undertaken reasonable steps to confirm this with the registered operator and the authority carrying out the regional studies; and
3. the registered operator notifies the administering authority in writing that they are no longer a "contributing member".

**W33** The holder of the environmental authority must notify the administering authority and relevant affected stakeholders, as soon as practicable, of water quality results indicating that the release of contaminants from the mining activity has caused or threatened environmental harm in the receiving environment.

### **Water General**

**W34** All determinations of water quality must be:

- a) performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
- b) made in accordance with methods prescribed in the latest edition of the Environment Protection Agency Water Quality Sampling Manual;
- c) collected from the monitoring locations identified within this environmental authority, within one hour of each other where possible; and
- d) carried out on representative samples.

**W35** Records must be kept of the results of all determinations of the quality of contaminants released to waters.

**W36** The release of contaminants directly or indirectly to waters:

1. must not produce any visible discolouration of receiving waters; nor
2. must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

### **Water Monitoring Reporting**

**W37** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority with each annual return:

- a) the date on which the sample was taken;
- b) the time at which the sample was taken;
- c) the monitoring point at which the sample was taken;
- d) the measured or estimated daily flow of water contaminated by mining activities at the time of sampling; and
- e) the results of all monitoring with water quality monitoring data provided to the administering authority in the specified electronic format upon request.

### **Temporary Interference with waterways**

**W38** Temporary destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Natural Resources and Water *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

### **Fitzroy River Basin Study**

**W39** The holder of this environmental authority acknowledges that the conditions for release of contaminants to the **XX** River in this environmental authority have been calculated without the benefit of the findings of a study proposed to be undertaken as per recommendations 2 and 3 of the *Study of cumulative impacts on water quality of mining activities in the Fitzroy River Basin* (April 2009). The administering authority may, based on the information provided in the study report when it becomes available, all relevant information available at the time and the regulatory framework applicable at that time, consult with the holder of this environmental authority about the conditions in the environmental authority concerning the treatment and disposal of waste water.

The aim of the consultation shall be the meaningful review of the contaminant release limits imposed in this authority having regard to:

1. the study results; and
2. best practice environmental management.

If this review leads to more stringent requirements on the environmental authority holder, this shall be advanced by way of an authority amendment and/or a Transitional Environmental Program.

## **Background information for proposed DERM – QRC meeting to discuss projects arising from the Fitzroy Cumulative Impacts report**

On 11 May 2009, the Government adopted the Department of Environment and Resource Management (DERM) report entitled, *Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin* and agreed to the three recommendations in the report that DERM would:

1. develop appropriate conditions in environmental authorities for mine water discharges;
2. develop local water quality guidelines; and
3. develop a model for assessing cumulative impacts across the region.

DERM is delivering these recommendations as separate projects as outlined below.

### **Project 1 - develop appropriate conditions in environmental authorities for mine water discharges (Project Director – Lindsay Delzoppo)**

For this project DERM will work with Fitzroy Basin mining companies to agree to and implement standardised environmental authority conditions for water and wastewater management issues such as:

- on-mine water management,
- wastewater discharges to rivers and streams, and
- water quality monitoring of wastewater discharges and the rivers and streams receiving waste discharges.

This project is progressing well, with amendment of water and wastewater conditions in environmental authorities for all coal mines in the Fitzroy Basin due for completion by 31 December 2009.

### **Project 2 – establishing environmental values, water quality guidelines and water quality objectives for the Fitzroy Basin (Project Director – Paul Mills)**

This project will require collaboration between DERM and several key stakeholders, including local governments, the mining sector, the agricultural sector and the Fitzroy Basin Association and will entail:

1. Establishing Environmental Values and Water Quality Objectives (EV/WQOs) for fresh and estuarine waterways in the Fitzroy Basin suitable for inclusion in Schedule 1 of the *Environmental Protection (Water) Policy 2009*;
2. Establishing water quality guidelines for the Fitzroy based on best available information;
3. Formal amendment of Schedule 1 of the *Environmental Protection (Water) Policy 2009* to include EV/WQOs for fresh and waterways in the Fitzroy Basin

This project is due for completion by 30 June 2010.

### **Project 3 – develop a cumulative impact assessment model for the Fitzroy Basin (Project Director – Joe Pappalardo)**

This project will involve the development of a hydrological model of the Fitzroy Basin which will enable assessment and understanding of the cumulative impacts of existing and potential wastewater inputs to the Fitzroy River system.

The model would be likely to have the following attributes:

- The capability to distinguish mining-related water quality impacts from those attributable to other land use impacts;
- Focus on electrical conductivity (EC) as the key water quality indicator;
- Be capable of being expanded to allow modelling other environmentally relevant contaminants (e.g. heavy metals and sulphates);
- Preferably have linkages with other modelling initiatives such as the development of WaterCast through the eWater Cooperative Research Centre and the monitoring and modelling the framework being developed for Reef Water Quality Protection Plan and Reef Rescue projects.

A hydrological model using the Integrated Quantity and Quality (IQQM) framework will be developed to estimate existing and potential dissolved salt concentrations and loads at various sites within the Fitzroy Basin. EC will be used as the primary indicator for dissolved salts.

The success of this project will rely strongly on collaboration between DERM, mining companies, the Queensland Resources Council and other key stakeholders – particularly in relation to the development of suitable model scenarios.

This project is due for completion by 31 December 2010.

**DEPARTMENT OF ENVIRONMENT AND RESOURCE MANAGEMENT  
ASSOCIATE DIRECTOR-GENERAL'S GENERAL BRIEFING NOTE**

**TITLE:** Fitzroy water quality – implementation update

**Date:** 05 June 2009

**1. RECOMMENDATION**

- That the Associate Director-General **note** the progress of projects being implemented following Cabinet's endorsement of the Cumulative impacts study and other recommendations associated with Fitzroy water quality; and **agree** to open the DERM/industry workshop on 18 June.

**2. ISSUES**

- **Project 1 – consistent and appropriate water discharge conditions** (Attachment 1) is being led by the Environment and Natural Resource Regulation Division. DERM met with mining company and QRC representatives on 28 May and the project team, led by [REDACTED], met this week to prepare new draft discharge conditions for distribution to mining companies, prior to a full-day workshop in Brisbane on 18 June when the conditions will be discussed in detail.
- To ensure a productive workshop, the ground rules need to be set by a senior DERM representative, hence the request for you to open the workshop and explain DERM's mandate.
- A small working group of 3 x DERM representative and 3 x industry representative will be formed at the conclusion of the workshop to refine the conditions based on DERM's mandate and industry comment. A final version of draft conditions will be developed by 30 June 2009 and then discussed with individual mines, site by site for implementation by December 2009.
- **Project 2 -water quality guidelines** is being implemented by Water Accounting and Management Division. Lead division for this project is being scoped through discussion between Environment and Natural Resource Regulation, Water and Corporate Services and Sciences.
- Potential approaches include:
  - a new chapter in the Qld Water Quality Guidelines relating specifically to Fitzroy; or
  - development and scheduling of Environmental Values and Water Quality Objectives in the EPP Water (involving at least 2 Cabinet Decisions and 80 days of public consultation).
- Whichever approach is taken, there will be a need to collect more (preferably a minimum of 1 year) water quality data from across the Fitzroy catchment. DERM would undertake much of this work and the new discharge monitoring requirements for coal mines would also provide data. Potential costs are in the order of \$1.5 million.
- **Project 3 – cumulative impact assessment model** is being led by the Regional Service Delivery Division (Central West Region). This project has been scoped (Attachment 2) and a full project plan will be finalised by 30 June 2009.
- **Project 4 – continuation of the Fitzroy Water Quality Technical Working Group** (TWG) is being implemented by the Regional Service Delivery Division (Central West Region). The current TWG (established to respond the Ensham Mine flooding issues) would wound up and a new group, with broader membership (e.g. AgForce and QRC), new terms of reference, and a new name such as the "*Fitzroy Water Quality Taskforce*". It is proposed that arrangements for the new group would be prepared for consideration by the Minister in the first week of July 2009.
- **Project 5 – development of a web based portal** is being implemented by the Environment and Natural Resource Regulation Division in partnership with Corporate Services' web management staff. This project would start with redevelopment of the current Fitzroy Water Quality page on the DERM web site. This work has started and will be loaded by the end of June 2009. The redeveloped site will include input from other departments and links to other appropriate information. It will eventually form part of the whole-of-Government Queensland wide monitoring system that is being set up as a requirement of the Service Delivery and Productivity Commission.
- **Project 6 – Government's response to the Hart report** (Attachment 3). For discussion

**3. BACKGROUND**

- On 11 May 2009, Cabinet endorsed the final version of the *Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin*, which contained recommendations for dealing with water quality issues in the region.

**4. CONSULTATION**

- 

.....

**Date:** .....

**Executive Director**

**Executive Director's comment:**

**Associate Director-General's comments**

**DRAFT**

# PROJECT PROPOSAL & WORK PLAN

PROJECT TITLE:	Fitzroy River Basin – cumulative impact study recommendation1
PROJECT DIRECTOR:	Executive Director, Environmental Services
PROJECT MANAGER:	Regional Manager, Townsville Region for recommendation 1
Proposal Author:	██████████
DERM work unit/office of origin:	Regional Services, Environmental Services

## 1. Proposal

PROJECT TITLE:	Fitzroy River Basin – cumulative impact study recommendations
LEAD DIVISION:	Responsibility for implementing these recommendations rests with Environmental Services and Environmental Sciences.
BACKGROUND:	The Queensland Government approved the <i>Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin</i> on 11 May 2009. The study made the following recommendations: <ol style="list-style-type: none"> <li>1. develop appropriate conditions in environmental authorities for mine water discharges.</li> <li>2. develop local water quality guidelines</li> <li>3. develop a model for assessing cumulative impacts across the region</li> </ol>
OBJECTIVES:	The overall aim of the study's recommendations is to ensure confidence within the Fitzroy Basin community that water management at mine sites will not adversely affect their water quality; consistency in licence conditions is introduced; and efficiency for mining companies is achieved through certainty about water management conditions. Mining companies will be required to take greater responsibility for water management and face the consequences of any mismanagement. This will significantly help to protect the quality of water that flows to towns and areas downstream of the mines and eventually into the Great Barrier Reef Lagoon
EXPECTED DURATION:	Recommendation 1 – May 2009 to December 2009
METHODOLOGY	Recommendation 1 involves a small working group of government and industry technical experts working closely together to determine consistent and appropriate water discharge conditions for coal mines. This approach relies on close consultation with individual mining companies and their willingness to voluntarily adopt recommended conditions.
KEY PARTNERSHIPS:	The implementation of recommendation 1 relies strongly on partnerships with the coal mining companies.
KEY STAKEHOLDERS:	<ul style="list-style-type: none"> <li>• Fitzroy River Water Quality Technical Working Group</li> <li>• Queensland Resources Council</li> <li>• Individual coal mining companies in the Fitzroy Basin (around 38)</li> <li>• Queensland Conservation Council</li> <li>• Capricorn Conservation Council</li> </ul>

Action Officer: ██████████  
 Position: Project Manager  
 Telephone: ██████████

Director: Lindsay Delzoppo

## 2. Resources

PROJECT TEAM:	<p><b>Team</b></p> <ul style="list-style-type: none"> <li>• Project team involves 4 x DERM officers. The working group for stage 1 of this project (until end of June 2009) will involve 2 or 3 mining industry representatives.</li> </ul>
INDICATIVE COST/BUDGET:	<p><b>Personnel</b></p> <ul style="list-style-type: none"> <li>• Funding for salaries is derived from base funding.</li> </ul> <p><b>Operational</b></p> <ul style="list-style-type: none"> <li>• Funding for recommendation 1 will be derived from base funding</li> </ul>

## 3: Key actions /tasks

Action/Task	Timeframe
<b><i>Recommendation 1: develop appropriate conditions in environmental authorities (EA) for mine water discharges</i></b>	
Project Plan	May 09
Develop draft EA conditions	4 June 09
ADG sign off of draft conditions and provide ADG with weekly updates	9 June 09 ongoing
Invite mining companies to full-day workshop to discuss draft conditions	10 June 09
Liaise with mining companies via full-day workshop	18 June 09
Convene working group following workshop	18 June 09
Weekly working group meetings	June 09
Consultation across mining industry on working group proposals by working group	June 09
Finalise discharge conditions (working group)	End June 09

Action Officer: [REDACTED]  
Position: Project Manager  
Telephone: [REDACTED]

Director: Lindsay Delzoppo

Correspondence No: BNE2009/  
File No.:

<b>Amend EAs as voluntarily agreed</b>	<b>End July 09</b>
<b>Consider regulatory means for amending EAs if necessary</b>	<b>August 09</b>
<b>Complete amendment of EAs</b>	<b>December 09</b>

c:\documents and settings\cooperlx\desktop\statements\20110906 qfci crown law statement of michael birchley\attachments to statement of michael birchely\category 6\category 6\mfb-06-03-briefing-note.doc

**Terms of Reference for a Project Brief to implement:  
Recommendation 3 of  
'A study of the cumulative impacts on water quality of mining activities in the Fitzroy  
River Basin'**

**3. Develop a model for assessing cumulative impacts across the region.**

*The aim of this recommendation is to understand full extent of cumulative impacts of mine water discharges which will be only known once a model is developed to determine the capacity of the catchment in terms of all inputs. This is likely to take at least two years to develop.*

**Task:**

Develop a draft project brief to implement Recommendation 3 for consideration by the DERM Executive Management Group. The following is an example of a suitable template:

[Project brief template](#)

**Scope:**

The project should identify the most suitable means of developing and implementing a modelling approach which can be used to determine the impacts of mine water discharge on water quality in the Fitzroy system.

The brief should consider and discuss the linkages between modelling and monitoring for cumulative mine impacts and modelling and monitoring for the Great Barrier Reef.

The model is to be used as a decision-making tool to assess the likely outcomes of decisions on the issuing and amendment of environmental authorities for mine discharges.

The model should be able to distinguish mining-related water quality impacts from those attributable to other sources such as grazing, urban water as well as inputs from the natural environment.

The model should focus on electrical conductivity as the key water quality indicator related to the impacts of mine water discharge however the project should investigate opportunities to develop improved data, knowledge and modelling capabilities for other environmentally relevant contaminants, such as heavy metals and sulfides.

The brief should incorporate a process for achieving community and industry acceptance of the modelling approach.

The brief should take in account the interrelationships between Recommendation 3 and Recommendations 1 and 2 of the study.

The brief should consider the application of existing models and linkages with other modelling initiatives such as the development of WaterCast through the Ewater Cooperative Research Centre and the monitoring and modelling framework being developed for Reef Water Quality Protection Plan.

The brief should incorporate indicative timeframes and resource requirements for the implementation of the recommended modelling approach (including the consideration of external providers of particular components. eg. Independent review, software development)

**Brief Development Team**

Bob Packett Senior Project Officer.

Action Officer: [REDACTED]  
Position: Project Manager  
Telephone: [REDACTED]

Director: Lindsay Delzoppo

Correspondence No: BNE2009/  
File No.:

Support is to be provided by DERM Regional Managers Mellissa Wells, Andrew Buckley, Ian Gordon and Ed Donohue.

Consultation and advice should include a range of DERM offices including John Platten, John Bennett, Neil Tripodi and officers from NRSc

### **Sponsors**

The brief is sponsored jointly by:

- Joe Pappalardo, Regional Services Director CW Region
- Graeme Milligan, General Manager Water Accounting and Management
- Lindsay Delzoppo, Executive Director Environmental Services

### **Timing**

A draft brief is to be provided to the sponsoring group by 19 June 2009 with a final brief completed by 30 June 2009

-o0o-

## Attachment 2

## Response to Professor Hart's Report on Fitzroy River Water Quality

Recommendation (Summarised)	Government Response	Status	Responsibility
<p><b>No 1</b></p> <p>EPA to undertake a review of procedures for granting a Transitional Environmental Program (TEP)</p>	<p><b>Supported</b></p> <p>DERM has reviewed the TEP process and it implementing processes to ensure there is better communication and accountability associated with the issuing of TEPs.</p>		<p><b>Environmental Services</b></p>
<p><b>No 2</b></p> <p>A process for random audits of laboratories used by mining companies for analysing trace concentrations of heavy metals</p>	<p><b>Supported</b></p> <p>The Department of Environment and Resource Management is investigating a condition that laboratories doing this testing be accredited by the National Association of Testing Authority.</p>		<p><b>Environmental Services</b></p>
<p><b>No 3</b></p> <p>EPA to include Professor Hart's review comments in the Fitzroy water quality monitoring</p>	<p><b>Supported in Principle</b></p> <p>Comments from the review have been included in the water quality monitoring project.</p> <p>Requirements for ongoing monitoring will be reviewed in June 2009.</p>		<p><b>Environmental Services</b></p>

project and include a longer timeline for the study			
<b>No 4</b> Expand the Environmental Flows Assessment Program to measure effects on fish spawning and recruitment	<b>Supported</b> The DERM will implement the recommendation for additional monitoring.		<b>Environmental Services</b>
<b>No 5</b> Biosecurity Queensland study of health of fish in weirs to be repeated and enhanced	<b>Supported</b> Biosecurity Queensland is currently making arrangements for a further study of fish health.	<b>Need to follow up with DEEDI</b>	<b>Milligan</b>
<b>No. 6</b> Release water from Fairbairn Dam to dilute water in Bedford Weir and thus improve quality of town water supplies	<b>Supported in principle</b> The implementation of this recommendation is not required now that there has been significant natural inflow throughout the Nogoa–Mackenzie–Fitzroy river system, and water quality levels have returned to normal levels.	<b>No action required</b>	<b>N/A</b>

Action Officer: [REDACTED]  
Position: Project Manager  
Telephone: [REDACTED]

Director: Lindsay Delzoppo

Correspondence No: BNE2009/  
File No.:

<p><b>No 7</b></p> <p>Central Highlands Regional Council to establish a taskforce to develop a contingency plan for addressing drinking water issues for Blackwater, Tieri and Bluff</p>	<p><b>Supported</b></p> <p>Options have been investigated for alternate supplies to towns in the upper catchment.</p> <p>Under the Water Supply (Safety and Reliability) Act 2008 and the Public Health Act 2005, water service providers such as these councils are responsible for maintaining safe water supplies.</p> <p>The DERM will supply, guidelines on how to prepare drinking water quality management plans to councils, provide advice (if requested) on suitable consultants to prepare such plans, and review draft plans. Contingency Plans are a component of a Drinking Water Quality Management Plan.</p>	<p><b>Action required by CHRC</b></p>	<p><b>Ed Donohue to chase up</b></p>
<p><b>No 8</b></p> <p>Implement the Interim Operational Strategy for Lower Fitzroy and Fitzroy Barrage</p>	<p><b>Supported</b></p> <p>This recommendation was implemented by the former Department of Natural Resources and Water to ensure the best available water is in the Fitzroy barrage. Water quality levels are better than the long term averages.</p>	<p><b>Completed and no further action required</b></p>	<p><b>N/A</b></p>

<p><b>No 9</b></p> <p>NRW to develop a contingency plan to deal with the possibilities of mine-affected water from the Isaac / Connors system or general deterioration of water quality in the Fitzroy Barrage due to limited natural inflows</p>	<p><b>Supported</b></p> <p>The DERM will work with Fitzroy River Water to develop a contingency plan for dealing with these scenarios.</p> <p>The DERM will supply the Rockhampton Region Council with guidelines on how to prepare drinking water quality management plans (see also response to Recommendation 7).</p> <p>The DERM will install a temporary conductivity probe at the Deverill gauging station on the Isaacs River, and will consider the costs and benefits of having this as a permanent arrangement.</p>	<p><b>Action required by RRC</b></p>	<p><b>Ed Donohue to chase up</b></p>
<p><b>No 10</b></p> <p>Develop an emergency water management plan to improve water quality along the river system between storages that is innovative and not constrained by the current restrictive ROP rules.</p>	<p><b>Supported in part</b></p> <p>The implementation of this recommendation in no longer required now that water quality is back to normal flowing substantial summer storm runoff.</p> <p><b>Note:</b> It is recognised that the Fitzroy WRP and ROP do not specifically provide for establishing and managing a supplemented water allocation for environmental contingencies. However Queensland's water resource planning framework provides for the environment in a number of ways.</p> <p>The framework provides for environmental flows by effectively capping the level of existing and future water allocations within the basin so that the higher parts of the natural flow regime are maintained over the long term.</p>	<p><b>No action required see Recommendation 11</b></p>	<p><b>N/A</b></p>

	<p>The particular strategies used vary widely across different water resource planning areas and depend on the nature of the natural streamflows, the important environmental flow processes at play, and the scale and style of development provided for in the plan.</p> <p>Providing a supplemented water allocation for environmental flows may be considered appropriate for the more highly regulated river systems, such as the southern parts of the Murray–Darling Basin system where little semblance of the natural sequence of river flows remains. However, the merit of such an approach is questionable in systems where the more natural flow regimes have been maintained, which is the approach used in the Fitzroy and right across Queensland. Maintaining a natural flow regime in terms of the frequency, magnitude, duration and seasonality of river flows is widely recognised as best practice in maintaining river health.</p>		
--	---	--	--

<p><b>No 11</b></p> <p>For the review of the Fitzroy Water Resource Plan (underway), NRW is to consider a more equitable balance between consumptive use and the environment, and to include the provision of a state owned contingency allocation.</p>	<p><b>Supported</b></p> <p>The DERM will consider the balance between consumptive use and the environment, and the provision of a state owned contingency allocation, in the current review of the Fitzroy Basin Water Resource Plan.</p>	<p>Fitzroy Water resource Plan is currently under view with this issue being considered</p>	<p><b>GM WAP</b></p>
<p><b>No 12</b></p> <p>Government to consider the appointment of a lead agency as a 'river health caretaker', to prepare a catchment management plan and a co-ordinated monitoring and assessment program.</p>	<p><b>Supported in Principle</b></p> <p>The DERM has the lead for natural resource management and for supporting catchment based natural resource management groups and is leading the development of a policy paper setting out options for addressing this recommendation for consideration by Government.</p>	<p><b>DERM finalising a policy paper</b></p>	<p><b>GM WAM</b></p>

<b>No 13</b>  Develop a set of Emergency Response Principles for future situations like the present one	<b>Supported</b>  The DERM will lead the development of these principles, in consultation with key stakeholders.		<b>Environmental Services</b>

# PROJECT PROPOSAL & WORK PLAN

PROJECT TITLE:	Fitzroy River Basin Coal Mines –Review of EA Water Conditions (Cumulative impact study recommendation 1, phase 2 – Implementation)
PROJECT DIRECTOR:	Senior Director, Environment and Natural Resource Regulation
PROJECT MANAGER:	Regional Manager, Central West Region
<i>Proposal Author:</i>	[REDACTED]
<i>DERM work units</i>	<i>Central West Region &amp; Environment and Natural Resource Regulation Division</i>

## 1. Proposal

PROJECT TITLE:	Fitzroy River Basin Coal Mines –Review of EA Water Conditions (Cumulative impact study recommendations 1, phase 2 – Implementation)
LEAD DIVISION:	Environment and Resource Regulation
BACKGROUND:	<p>On 11 May 2009, the Queensland Government approved the <i>Study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin</i> which made the following recommendations:</p> <ol style="list-style-type: none"> <li>1. develop appropriate conditions in environmental authorities for mine water discharges.</li> <li>2. develop local water quality guidelines</li> <li>3. develop a model for assessing cumulative impacts across the region</li> </ol> <p>Sound communication will be vital to the successfully delivery of these recommendations. With this in mind, the Government has established a Fitzroy Water Fitzroy Water Quality Advisory Group to promote information exchange with stakeholders and the broader community. The Government will also establish a website to provide information about water quality management initiative in the Fitzroy Basin with the broader community.</p>
OBJECTIVES:	<p>The overarching aim of the study recommendations is to provide confidence to Fitzroy Basin residents (i.e. local governments, agricultural, mining and other industry sectors and the public) that water quality in the streams and rivers of the Basin will continue to be of sufficient quality to protect the environmental values and uses made of those waterways.</p> <ul style="list-style-type: none"> <li>• The objective of recommendation 1 is to ensure that wastewater discharges from coal mine sites do not unduly impact on water quality in streams downstream of mine wastewater discharge points. In other words, to ensure that the individual and combined wastewater discharges from coal mines in the Fitzroy Basin do not exceed the “assimilative capacity” of the waterways to accept and deal with those wastes.</li> <li>• This will be achieved by DERM and mining companies working together to develop and implement a set of “standard” environmental operating conditions incorporating best practice for coal mines in relation to:-             <ul style="list-style-type: none"> <li>○ on-mine water management,</li> <li>○ wastewater discharges to rivers and streams, and</li> <li>○ water quality monitoring of both wastewater discharges and the rivers and streams receiving those wastes.</li> </ul> </li> </ul>

EXPECTED DURATION:	1 July 2009 to 31 December 2009
METHODOLOGY	<p>DERM, the mining companies operating in the Fitzroy Basin and the Queensland Resource Council (QRC) to work together to develop and agree to a consistent set of model water management, wastewater release and receiving water monitoring conditions for adaptation and adoption by individual coal mines. <i>This part of the project was completed by 1 July 2009.</i></p> <p>DERM and coal mine operator in the Fitzroy Basin to use the standard conditions as the basis to negotiate new environmental authority conditions for water management, wastewater release and receiving water monitoring, under the <i>Environmental Protection Act 1994</i>.</p> <p>DERM will develop specific administrative support tools and guidelines to help streamline and support the amendment process, including:-</p> <ul style="list-style-type: none"> <li>• standardised information requests to assist mines prepare amendment applications;</li> <li>• transparent and consistent approaches to assessment of applications;</li> <li>• information packages; and</li> <li>• a guideline on the minimum requirements for on-site water management.</li> </ul>
KEY PARTNERSHIPS:	The implementation of recommendation 1 relies strongly on a good working relationship and ongoing consultation between government departments, coal mine operators in the Fitzroy Basin and the QRC.
KEY STAKEHOLDERS:	<ul style="list-style-type: none"> <li>• Fitzroy River Water Quality Advisory Group Members</li> <li>• Mining interests in the Fitzroy Basin</li> <li>• Conservation groups</li> <li>• Agricultural interests</li> <li>• State Government and Local Government</li> <li>• Land holders</li> <li>• Traditional Owners</li> <li>• Broader Community</li> </ul>
LINKS TO OTHER WORK:	<p>The cumulative impact study projects are linked with the following work:-</p> <ul style="list-style-type: none"> <li>• <b>State</b> <ul style="list-style-type: none"> <li>– DERM Statewide freshwater biological monitoring programs</li> <li>– DERM surface (fresh)water monitoring program (SWAN)</li> <li>– DERM GBR event monitoring program</li> <li>– DERM QScope modelling program</li> </ul> </li> <li>• <b>Regional</b> <ul style="list-style-type: none"> <li>– Fitzroy River Water Resource Plan Review</li> <li>– eWater modelling development projects</li> <li>– Fitzroy Basin Association Water Quality Improvement Report implementation</li> <li>– Implementation of report by Professor Barry Hart</li> </ul> </li> </ul>

## 2. Resources

PROJECT TEAM:	<p>The Project Team comprises:-</p> <ul style="list-style-type: none"> <li>• Project Director – Lindsay Delzoppo</li> <li>• Project Manager – [REDACTED]</li> <li>• Team Members – [REDACTED] Ian Ramsay, Data analyst, [REDACTED] person from Partnerships and Practice</li> </ul>
INDICATIVE COST/BUDGET:	<p><b>Personnel</b></p> <ul style="list-style-type: none"> <li>• Funding for salaries is derived from base funding.</li> <li>• This project will require that 1x1fte (Environmental Services – regional or central office) will be required to work specifically on this project – this officer must be determined ASAP in consultation with the project director/manager.</li> <li>• Allocation of 1fte to Environmental Sciences for the 6 month duration of the project has been requested.</li> </ul> <p><b>Operational</b></p> <ul style="list-style-type: none"> <li>• Funding for recommendation 1 will be derived from base funding</li> </ul>

## 3: Key actions /tasks

Action/Task	Timeframe	Responsible
<b><i>Recommendation 1, phase 2: develop appropriate conditions in environmental authorities (EA) for mine water discharges</i></b>		
Finalise model water conditions (working group)	<b>30 June 09 (Completed)</b>	
Identify training and/or other internal requirements	<b>31 July 09</b>	[REDACTED] Lindsay Delzoppo
Review Metal Table 3 in consultation with coal mine representatives	<b>24 July 09</b>	Ian Ramsay, [REDACTED]
Letter to mining companies outlining the implementation process which will include an Information Request proforma (include format for data supplied), process flow chart and timeframes (submission by 31 August 09?), assessment process for alternative conditions, limits and/or trigger values, and application fee waiver to assist both DERM and the mining companies in the site by site review of the licence conditions (note in the letter that DERM will change legislation if required). Also, a standard amendment application partially filled out with reason for amendment included.	<b>31 July 09</b>	[REDACTED]
Identify and develop the necessary support tools including an information package for Discharge Limit Setting and a Guideline for the Preparation of a Water Management Plan.	<b>31 August 09</b>	[REDACTED] an Ramsay/[REDACTED]
Develop a generic assessment package including Standard Operating Procedure, QA, and Standard	<b>31 July 09</b>	[REDACTED]

Cover Letter for use by DERM officers – to be supplied at training for internal staff.		<b>and Practice</b>
Training of DERM assessment staff and a general awareness session with representatives of the mining companies if required	<b>15 August 09</b>	██████████ an <b>Ramsay</b>
<p>Amend EAs by voluntary agreement in priority catchment based on order of potential level of cumulative risk as follows:</p> <ul style="list-style-type: none"> <li>• Anna/Isaac Subcatchment <ul style="list-style-type: none"> <li>○ Goonyella Riverside (very high)</li> <li>○ North Goonyella (High)</li> <li>○ Millennium (high)</li> <li>○ Burton (medium)</li> <li>○ Poitrel (medium)</li> </ul> </li> <li>• Bee/Walker Subcatchment <ul style="list-style-type: none"> <li>○ Coppabella (high)</li> <li>○ Hail Creek (medium)</li> <li>○ South Walker Creek (medium)</li> </ul> </li> <li>• Ripstone/Stephens/Isaac Subcatchment <ul style="list-style-type: none"> <li>○ Peak Downs (high)</li> <li>○ Saraji (medium)</li> <li>○ Norwich Park (medium)</li> </ul> </li> <li>• Crinum/Sandy/Nogoa Subcatchment <ul style="list-style-type: none"> <li>○ Ensham (high)</li> <li>○ Rolleston (medium)</li> <li>○ Cook Colliery (medium)</li> <li>○ Blackwater (medium)</li> </ul> </li> <li>• Dawson/Callide subcatchment <ul style="list-style-type: none"> <li>○ Callide (medium)</li> </ul> </li> </ul> <p>Note: EA amendment applications for the above listed mines are to be assessed in priority to non-listed mines. Mines with very high/high risk rating take priority over all other applications.</p> <p>Each mine should submit the application by 31 August 09?</p> <p>Once the applications have been received the applications will be forwarded to Freshwater and Marine Sciences for their input.</p>	<b>1 September 09 to 30 November 09</b>	<b>All</b>
Prepare regulatory changes means for amending EAs if necessary.	<b>31 October 09</b>	██████████ Lindsay <b>Delzoppo with</b> ██████████
Complete amendment of EAs	<b>31 December 09</b>	<b>All</b>

**Saturday, June 27, 2009**

### **TIGHTER REGULATIONS ON TRACK FOR WATER QUALITY IN FITZROY BASIN**

A draft set of wastewater discharge conditions to be uniformly applied for mines across central Queensland is on track to be completed next week as promised by the Bligh Government.

Climate Change and Sustainability Minister Kate Jones and Member for Rockhampton Robert Schwarten gave the update after the Fitzroy Water Quality Advisory Group meeting.

Ms Jones said the new conditions were being developed through collaboration between the State Government, mining companies and the Queensland Resources Council.

Mr Schwarten said it was a great development towards securing improved water quality in the Fitzroy Basin.

"It means the community can have greater confidence in how discharged water from mines is being regulated, monitored and managed by authorities," Mr Schwarten said.

"We set ourselves a deadline to have discharge conditions drafted by 30 June (next Tuesday) and I'm pleased to say that we're on track to deliver on that commitment."

Ms Jones said a State Government study about the impact of mining on the health of the Fitzroy River found that discharge requirements for coal mine water discharges across the Fitzroy basin were inconsistent and often didn't reflect best environmental practice.

"We commissioned this project to standardise and improve environmental authority wastewater discharge conditions for coal mines in the Fitzroy River basin," she said.

"To date negotiations between the State Government and mining companies over the development of a standard set of wastewater discharge conditions have gone very well.

"A workshop last week developed a set of draft wastewater discharge limits and requirements which will be refined further before being used to negotiate new environmental authority conditions for individual mines.

"A final version of draft conditions will be developed by 30 June 2009."

Mr Swarten said: "This is a new Climate Change and Sustainability Minister who in only 90 days has made significant progress towards improving water quality in this region."

## 1 Project Background

The dewatering of flooded mine pits at Ensham Coal Mine has resulted in water quality impacts, evidenced by a rise in sodium and salinity levels in the Fitzroy River system which in some places exceed the NHMRC Drinking Water Guidelines for aesthetic sodium levels in drinking water.

While it is recognised that the NHMRC Drinking Water Guidelines standard is an aesthetic based value (taste and smell) and there is no definitive health based value, readings exceeding the value have, and will continue to trigger a public health advisory to people who need to be aware of these levels and take action as appropriate. These are people who are monitoring their salt intake for high blood pressure, cardiovascular disease, chronic kidney failure or any dietary reason and parents of infants less than 6 months of age who are bottle fed.

These water quality impacts are being managed to minimise the effects on town water supplies, downstream river water users and the environment.

The dewatering of flooded mine pits at the Ensham Coal Mine is authorised by a Certificate of Approval for a Transitional Environmental Program issued under the *Environmental Protection Act 1994 (Act)* by the EPA. This is one of a number of approved Transitional Environmental Programs to assist in the recovery of mining operations following the flooding that occurred in the Fitzroy River Basin in January/February 2008.

Mining companies across the Fitzroy River system are permitted to discharge water under the conditions specified in environmental authorities issued under the Act by the EPA. Discharges of water from mines is not the only source of impacts on water quality with stormwater, treated effluent from townships, tail-water discharges from irrigation areas, dry land cropping, quarries and overland flows from disturbed areas all contributing to the quality of water in the river and its contaminant load.

The Rockhampton Regional Council and Central Highlands Regional Council in the second half of 2008 requested the State government to give consideration to undertaking a study of the cumulative impacts on water quality of mining activities in the Fitzroy River system.

## 2 Project Definition

This project will investigate the water quality arrangements for mines discharging water into the Fitzroy River system to provide a greater understanding of the likely cumulative impacts on water quality and to make recommendations consistent with the Terms of Reference.

Outputs will include:

- a brief history of mining development in the Fitzroy River Basin;
- a summary of the regulatory framework for management of the quality of water discharges from mining activities (and its evolution over time);
- a summary of existing approaches to minimising water quality impacts of water discharges from mining activities;
- an analysis of currently authorised discharges from mining activities;
- a forecast of future mining activities and their potential to impact on water quality;
- a review of water quality data, how and where it is collected, by whom and to whom it is reported;
- an analysis of trends in water quality and an assessment of cumulative impacts;
- an analysis of risks associated with changes in water quality;
- a compilation of water quality discharge arrangements from mines;
- recommendations for improving water quality data collection, its coordination and management;

Last Saved	Filename	Page
		4 of 15

- recommendations for the future management of water discharges from mining activities; and
- recommendations for any ongoing research, initiatives or project expansion.

## 2.1 Project Scope

The following are included in the scope of the project:

- The purpose of this study is to investigate current and where appropriate historical data and report on the overall implications of water discharges from mines on water quality in the Fitzroy River system, examine predictions of future expansion and then to make recommendations for the management of water discharges from mining activities with respect to water quality.
- The major focus of the project will be based on risk and is to focus on open cut coal mining because of the number of mines and public concern related to them. Other proposed mining and extraction developments such as coal seam methane extraction will be considered in formulating recommendations but data constraints will prevent in depth examination.
- This study focuses on water discharges from mines, the volumes and quantity of contaminants potentially discharged to local systems and the cumulative risk that those discharges may have on the river environment and the quality of water in the Fitzroy River system.
- Several case studies of known and well researched mines and their discharges will be used to examine likely impacts because of time constraints and data accessibility. These results will be compared with licensed discharge limits from mines to predict cumulative risk of current impact.
- Predictions of future expansion of mines will be used to examine future risk of the expected impact from water discharge.
- The study will attempt to examine how both cumulative and local impacts of discharges could be managed in the future to reduce impacts on water quality.
- The study will also attempt to identify knowledge gaps that impact on the ability of the Queensland Government to manage cumulative water quality impacts from mining activities.

The following are outside the scope of the project:

- It is recognised that a range of other land uses and management practices may have an impact on water quality but their impact is not within the scope of this study. It has also been recognised that longer term measures for addressing these issues include the Great Barrier Reef initiatives such as the Reef Water Quality Protection Plan and the investment with the Australian Government in the Caring for our Country program and Queensland's complementary natural resource management programs.
- Issues such as subsidence related to underground mining and consequent mobilisation of salt could impact on water quality, however it is beyond the scope of this study, does not relate to licensed discharges and therefore will not be included in this study but may form part of the recommendations.
- It is also likely that data and time constraints will preclude detailed examination of all historic or current mine discharges so analysis are likely to be only available for recent history.
- It is acknowledged that on-site management of water in mining establishments is critical to water discharge. However this study will not undertake a detailed examination of those methods that assist in managing water in terms of the quantity and quality of water discharged.
- Water resource management would also be expected to influence river flows and the consequent assimilative capacity of the system. However this cannot be examined within the constraints of the study other than as part of the studies recommendations.

## 2.2 Product Descriptions

Last Saved	Filename	Page
		5 of 15

The Products that will be delivered by this project are:

- A written report in draft form by December 2008.
- A finalised report by January 2009.

Product Descriptions for each of the Products are in Appendix A.

## 2.3 Assumptions and Constraints

The following assumptions have been made during the planning of this project:

- The study will use a risk based approach in focusing on analysing the key mining activities that impact on water quality.
- That data will be available and provided in a timely manner on the following:
  - licensed discharge limits from mines;
  - quantity and quality of discharges from selected mines;
  - ambient water quality of the river;
  - river flow;
  - a brief history of mining development in the Fitzroy River Basin; and
  - a summary of the regulatory framework and approaches to water quality management.

The following constraints have been placed on this project:

- The timelines for completion by December 2008.
- Availability of data in appropriate formats for analysis.

## 2.4 Project Schedule

The Project Schedule for this project is shown in Appendix B.

## 3 Project Roles

Role	Responsibilities
Project Director – [REDACTED] Regional Manager EPA	The Project Director has ultimate responsibility for the project
Senior User - Terry Wall, Director General EPA	The Senior User represents the end users and ensures that the project's products meet end user requirements.
Senior Supplier-Lindsay Delzoppo, A/ Executive Director EPA	The Senior Supplier represents the solution provider/s and is responsible for quality, development of the supplied product.
Project Manager – [REDACTED]	The Project Manager will manage the project on a day-to-day basis on behalf of the Project Board.

## 4 Related Initiatives

On 15 October 2008 the Premier, Anna Bligh appointed Emeritus Professor Barry Hart as her independent advisor and supervisor for an independent research project on the status of the Fitzroy River water quality. Subject to advice from Professor Hart, the study to be led by the EPA will monitor:

- Contaminants (e.g. pH, conductivity and salinity) in the water column – Fortnightly.
- Contaminants in Sediments (including a range of metals) – Quarterly.
- Aquatic Invertebrate Species – Quarterly.
- Fish and Turtles – Quarterly.

While the study supervised by Professor Hart is separate to this project, there will commonality in the data used in the two projects. Professor Hart will also be a key point for consultation related to this project.

Currently the development of a coordinated state wide monitoring programme has been recommended by the Service Delivery and Productivity Commission. This review study is separate from the work being undertaken to implement the recommendations of the SDPC.

## 5 Business Case

The Fitzroy Basin is a massive and crucial water system for Queensland. The ecological and resource value is immense to the environment, users and community. The effects of flood recovery actions of mines in dewatering inundated pits in 2008 has resulted in extremely high levels of concerns from many diverse stakeholders and groups. These concerns are particularly on drinking water supplies and extend to ecological and other water resource users including agricultural and industrial. This project will provide a clear understanding of the existing arrangements for water quality discharges from mines in the Fitzroy River system and make recommendations where improvements to management will further ensure the systems continues to support the environment and resource users now and in the future.

Water quality and its management is a core responsibility of the Environmental Protection Agency. The Agency administers the *Environmental Protection Act (1994)* and the associated *Environmental Protection (Water) Policy (1997)*. The EPA is also responsible for recommending and managing licensed discharge limits from mines. This project is central to these activities and as such is part of core business.

## 6 Project Costs

### 6.1 Financial Summary

A summary of the project costs is provided below.

Cost Factor	Estimated Cost \$
Salaries	PO5(2) * 4 months G. Schulz \$24929 AO7 (4) * 0.3 * 4 months M. Rodgeron \$7830 SO2(2) * 0.3 * 4 months A. Buckley & M. Wells \$25270 PO5 (2) * 0.3 * 4 months J. Platten \$7479 SO2? * 0.3 * 4 months J. Playford \$12635 PO6(4) * 0.3 * 4 months I. Ramsay \$8557
Contractors/Consultants	
Capital Costs	
Training	
Other	Report production, meeting attendance for consultation, travel: \$20,000
<b>PROJECT TOTAL</b>	<b>\$106,700</b>

### 6.2 Cost Assumptions

Assumptions include minimal travel, printing and consultation requirements, without vehicle use or flights.

Not all team member levels are certain.

No external agency costs are estimated.

Only replacement value for Project Manager is assumed.

## 7 Project Controls

Last Saved	Filename	Page
01-Sep-2011 4:15 PM	C:\Documents and Settings\CooperLx\Desktop\Statements\20110906 QFCI Crown Law Statement of Michael Birchley\Attachments to Statement of Michael Birchely\Category 6\Category 6\MFB-06-01-Review-water-quality-Fitzroy.doc	9 of 15

The following project level controls will be implemented to manage the project and provide mechanisms to feed back information to the project team, internal EPA steering committee and other key stakeholders.

**7.1 Reports and Assessment Points**

The project is to be led by the EPA with a project team made up of staff from the EPA, NR&W and DM&E. Oversight of the project will be coordinated through a project team of senior officers from the EPA and NR&W.

An internal EPA Steering Committee has been formed to provide oversight between this and other associated work being undertaken as part of the study by Professor Barry Hart on the status of the Fitzroy River water quality.

Consultation will occur with the various stakeholder groups utilising the existing Fitzroy River Technical Working Group led by NR&W for the life of the study and on the draft study report.

Meetings relating to the management of the study will be held as far as possible by teleconference. Meetings relating to consultation with stakeholders will be held in Rockhampton in coordination with the Technical Working Group meetings.

- a) Progress reports are to be produced by the Project Manager for circulation to the project team to inform them of project progress. These are to be prepared fortnightly.
- b) Exception Reports are to be raised by the Project Manager if he/she forecasts that Project Tolerance is likely to be exceeded, and the Project Board will then determine the need for Exception Planning or other action to be taken.
- c) An End Project Report is to be produced, by the Project Manager, for circulation to the project team at the end of the project and will include Follow-on Action Recommendations and a Lessons Learned Report.

**7.2 Tolerances**

The project manager is to report exceptions to the Project Board if at any time:

- a) the forecast timeframes are unlikely to be met, or
- b) the financial expenditure target will be exceeded.

<b>Tolerances</b>	<b>Project Board</b>	<b>Project Manager</b>
Time	Over 10%	+ or – 10%

Cost	Over 10%	+ or – 10%
Product Quality	Less than 80% acceptance criteria met	Less than 90% but not less than 80% acceptance criteria met
Customer Expectations	Less than 90% acceptance criteria met	Less than 95% but not less than 90% acceptance criteria met

## 8 Project Quality

### 8.1 Customer Quality Criteria

Product	Acceptance Criteria (measure of success)	Responsibility
Final report	Implementation of recommendations	EPA Environmental Services

### 8.2 Applicable Standards

As per EPA publishing.

## 9 Risks

The following significant risks have been identified to date:

No.	Risk (Cause and Effect)	Mitigation Strategies
1	Acquisition of data	EPA staff have indicated to key stakeholders that they should prepare for data requests
2	Availability of resources	EPA has established a cost code for the project.
3	Stakeholder calls for a broader scope for the project	To ensure the TORs are fulfilled and a timely completion of the project a communication plan will be developed and this is articulated in section 11 of this project plan.
4	Lack of cooperation from	A communication plan will be developed and this is

## 10 Configuration Management

All data acquisition and management issues will be managed by the Whitsunday Coalfields region of the EPA through the Emerald office. Project version control and draft management will be conducted by the project manager.

Data storage protocols and storage of data will be managed by the Freshwater and Marine Sciences unit of EPA.

All electronic files will be kept in the following shared network directory: N:\Mines\Cumulative Impacts Study 2008 - Emerald EPA server.

## Executive Summary

This study examines available data to report on the implications of water discharges from mines on water quality in the Fitzroy River Basin. This study was initiated in response to concerns about water quality following the discharge of very large quantities of water from mines in the Fitzroy River Basin from February to September 2008.

The terms of reference for this study (Appendix A) detailed key elements to be covered with the overall purpose being to make recommendations for the management of water discharges from mining activities with respect to water quality.

The study focuses on discharges from coal mining operations as the Fitzroy River Basin's large-scale mining activities are dominated by coal mining and planned coal mine expansions. These operations potentially release far greater volumes of water than any other mining source currently operating. They have also operated for long periods of time giving the best opportunity to examine changes in regulation and management of water quality over time.

The major water quality parameters of concern associated with coal mining are salinity (based on electrical conductivity), heavy metal ion concentrations and acidity/alkalinity. The study has focussed on salinity impacts as these were of major concern to the communities in the areas affected by the mine discharges in 2008 and the available data relates more to salinity than any other contaminant.

The major findings of this study concluded that in the Fitzroy Basin:

- discharge quality limits and operating requirements for coal mine water discharges are inconsistent;
- the discharge quality limits and operating conditions for some coal mines do not adequately protect the downstream values of the environment;
- background data relating to the quality of the waterways receiving discharge water is extremely limited;
- there is insufficient data to quantify the cumulative impacts of mining water discharges;
- additional and ongoing monitoring and analysis is needed to develop a modelling program for assessing cumulative impacts; and
- based on a risk assessment using salinity, six mines were identified as being the highest contributors to potential cumulative impacts (Coppabella, North Goonyella, Goonyella Riverside, Millennium, Peak Downs and Ensham).

The findings for each of the key elements of the study as listed in the terms of reference are provided in detail in the relevant chapters of this study and summarised below.

### **Regulatory framework for managing the quality of water discharges**

The regulation of water discharges from mines has undergone considerable change in relation to the applicable legislation and responsible Government Agency. Since 2001, the former Environmental Protection Agency (EPA), now the Department of Environment and Resource Management (DERM), has regulated water discharges from mines under conditions listed in each mine's environmental authority. When the EPA took control of mining environmental regulation, it generally converted the commitments from the environmental management overview strategies accepted by the former Department of Mines and Energy (DME) to conditions in new environmental authorities. Generally only new or recently amended environmental authorities contain new conditioning arrangements relating to monitoring parameters and toxicity trigger values. Some environmental authorities have not had conditions changed since they were issued so do not necessarily reflect current knowledge nor best management practice. Under the current provisions in the *Environmental Protection Act 1994* (EP Act), environmental authorities may only be amended without agreement of the holder under limited triggers.

### **Existing approaches to minimising water quality impacts**

Water quality impacts are generally managed under conditions set out in environmental authorities. These authorities place limits on water quality indicators such as pH, electrical conductivity or total dissolved solids and total suspended solids. However, the limits set are based on limited knowledge of ambient water quality conditions, are developed on a case by case basis and are subject to intensive negotiations with the mining companies. As a result, the conditions set in environmental authorities do not always reflect best practice for water quality management nor consider the potential cumulative impacts of several mines in the one catchment.

### **Analysis of currently authorised water discharges**

All of the mines in the Fitzroy River Basin except two are permitted to discharge water under varying conditions set out in environmental authorities under the EP Act. The environmental authorities include anywhere from one to 15 approved discharge locations and may list multiple receiving waters, each with different release conditions. A key reason for this variation is the scale of some sites, the ephemeral nature of streams in the region and the difficulty in determining ambient water quality.

### **Forecast of future mining activities**

At the time of writing this report there were about 45 coal mines, 10 significant mineral mines (excluding small mining operations and gemstone mines) and 20 medium to large quarries operating in the Central Queensland region, although not all are in the Fitzroy River Basin. Many of these mines have ore reserves that will enable production beyond 2020. The current global financial situation may impact on new or expansion projects, however, the environmental issues associated with future activities remain a key issue.

### **Review of water quality data**

All of the currently operating coal mines (38) in the Fitzroy River Basin provided data for this study. This data highlighted the different conditions in place across mines and the limited data available in the region. Mine environment monitoring was generally limited to mine tenure and to times when discharges were occurring. There is a general lack of ambient water data.

### **Analysis of trends in water quality and an assessment of impacts**

Previous studies into water quality suggest that the Fitzroy River Basin is a naturally moderate but variable saline system with substantial differences in electrical conductivity levels across sub-catchments. These studies give a broad picture of baseline information for ambient ranges of electrical conductivity (which is a typically a reliable surrogate for salinity) but not for other contaminants. Water quality monitoring, data collection and reporting in the region is undertaken by a diverse range of State and local government agencies, water providers, natural resource management groups, mines and other industries. There is no single entity that collates, manages and analyses water quality data for the catchment.

### **Analysis of risks associated with changes in water quality and potential cumulative impacts**

In the Fitzroy River Basin, the greatest risk to water quality from coal mines is increased salinity levels resulting from occasions when mine water is discharged. Drinking water and aquatic ecosystems are the most sensitive downstream values to be protected from mine discharge waters. The impacts on these ecosystems are not well known because there is insufficient baseline biological and ecological information and no long-term biological monitoring to identify ecological changes over time. Increased salinity will also affect the taste of drinking water and very high levels may affect crops if water is used for irrigation.

The potential for accumulation of salinity in ephemeral streams is high as stream inputs can only be removed by natural flows from rainfall events flushing accumulated salinity from waterholes and the numerous water impoundments along the river system. This study has examined the catchments most at risk of cumulative impacts associated with electrical conductivity through a risk assessment matrix that looks at the discharge information from

each mine (frequency, duration, volume and the water quality of the discharge and immediate receiving environment) and the relative location of mines in Fitzroy sub-catchments.

All mine discharges are likely to contribute to cumulative impacts to some degree. This study suggests that there are particular areas in the Fitzroy River Basin catchment of concern. Using the risk assessment matrix, six mines were identified as the highest contributors to potential cumulative impacts. Five of these were in the northern Isaac-Connors sub-catchment. In addition, six mines in the northern sub-catchments were identified as medium contributors, which add to the potential for cumulative impacts for this area. In the southern sub-catchments (e.g. Nogoia, Dawson, Mackenzie), the majority of mines were rated as low contributors, except for one mine.

## **Recommendations**

After considering the findings of this study and following consultation on the draft study with key stakeholders, including Queensland Resources Council; the Technical Working Group; the Queensland Conservation Council and Agforce, the following recommendations are made.

### **1. Develop appropriate conditions in environmental authorities for mine water discharges**

The aim of this recommendation is to standardise environmental authority conditions relating to water discharges so that consistent and appropriate conditions exist across the Fitzroy River Basin.

The aim is to work with mining companies to achieve this by convening a small working group comprising DERM and mining company technical specialists that would consider how discharge limits are set, what limits are acceptable and what this should be based on, when discharges may occur and what monitoring should occur. This is to occur by the end of June 2009.

The preferred option for implementing changes is via voluntary agreement with mining companies. If this is not possible, then it may be necessary to implement changes after requiring and reviewing an environmental audit or by changes to the EP Act to allow for the immediate review and amendment of coal mining authority conditions using the issues identified in this study. Changes to environmental authorities are to occur by the end of December 2009.

### **2. Develop local water quality guidelines**

The aim of this recommendation is establish a collaborative project that enables the setting of local water quality guidelines. This would include mining companies and other stakeholder groups to identify current data and monitoring occurring throughout the region as well as developing a suitable monitoring program to complement the current information. The project plan for this project is to be developed by June 2009.

### **3. Develop a model for assessing cumulative impacts across the region**

The aim of this recommendation is to understand full extent of cumulative impacts of mine water discharges which will be only known once a model is developed to determine the capacity of the catchment in terms of all inputs. This is likely to take at least two years to develop.

# 1. Introduction

The Fitzroy is the largest east draining river system in Australia. It is usually regarded as including six major rivers: the Dawson, the Comet, the Nogoa, the Isaac-Connors, the MacKenzie and the Fitzroy. In January and February 2008 rainfall events across the Fitzroy River Basin resulted in the flooding of a number of mines in central Queensland.

Mining companies across the Fitzroy River Basin are permitted to discharge water under conditions specified in Environmental Authorities (EA) issued under the *Environmental Protection Act 1994* (EP Act) by DERM. Transitional Environmental Programs (TEP) can be applied for under the EP Act when the holder of an EA cannot comply with its conditions.

In August 2008, while mines were discharging under TEPs, water quality monitoring indicated salinity was increasing in waterways, dams and weirs and that domestic water supply for some townships using these sources for their drinking supplies was being affected. Queensland Health issued a health alert to the community about the potential health effect of increased salinity for those members of the public having to monitor their sodium intake.

The dewatering of mines focussed public attention on the water quality impacts of all water discharges from coal mines across the Fitzroy River Basin.

The Queensland Government responded to this situation by:

- Establishing a Fitzroy River Water Quality Technical Working Group (TWG) that includes a number of government agencies and experts to further investigate issues including options for remediation of the heightened salt levels in the Fitzroy River Basin;
- The Premier, on 15 October 2008, in response to community concern about these potential issues, appointing Emeritus Professor Barry Hart as her independent advisor and supervisor for an independent research project on the status of the Fitzroy River water quality;
- The former Minister for Sustainability, Climate Change and Innovation, on 16 October 2008, announcing that an independent study into the cumulative impact of mining on the health of the Fitzroy River be undertaken and led by the former EPA; and
- The former EPA establishing a monitoring program to assess the status of the Fitzroy River Basin water quality in relation to the potential impact of mine water discharged from the Ensham Resources coal mine on environmental values: human health (drinking water); irrigation and stock watering and aquatic ecosystem health.

Emeritus Professor Barry Hart's report reviews the current situation regarding water quality in the Fitzroy River resulting from the discharge of 138 Gigalitres (138,000 Megalitres) of floodwater from the Ensham Resources Pty Ltd (Ensham) coal mine located near Emerald.

Emeritus Professor Hart's report found that the decision by the former EPA to issue Ensham with a TEP was justifiable. However, the report also found that the discharge has resulted in impacts on water quality in the Fitzroy River Basin, particularly in relation to increased salinity.

The report also found that the TWG has developed a number of management options to improve water quality in the Nogoa-Mackenzie-Fitzroy system. The report including the headline findings and recommendations can be found at <http://www.epa.qld.gov.au/publications/p02740aa.pdf/>.

This study on the cumulative impacts on water quality of mining activities in the Fitzroy River Basin examines available data to report on the implications of water discharges from mines on water quality in the Fitzroy River Basin. It provides recommendations to reduce the potential for cumulative impacts, ensure the conditions in environmental authorities reflect best practice for water quality management; and improve knowledge of water quality.

The scope of this study is the impact of water discharges from coal mines, the quality of the discharges, and the impact that those discharges may have on the river environment and the quality of water in the Fitzroy River Basin.

The discharge of water from mines is only one contributor to water quality impacts. Stormwater, treated effluent from townships, tail-water discharges from irrigation areas and overland flows all contribute to the quality of water in the river system and its contaminant load.

This study recognises that the key longer-term measures for addressing these broader impacts include the Great Barrier Reef initiatives such as the Reef Water Quality Protection Plan and investment with the Australian Government in the Caring for Our Country program and the Queensland complementary natural resource management program. The development and implementation of landscape scale responses that lead to the improvement of water quality in our rivers is the primary approach for dealing with cumulative impacts from a broader natural resource management perspective.

## **1.1 Approach**

Currently the major mining activities in the Fitzroy River Basin are related to energy resources. Some metaliferous mine development is planned but only one gold mine is currently operating. Small-scale sapphire gem mining currently occurs, however even in aggregate these mines are confined to a relatively small area. Other mines include quarries, limestone and zeolite mines and small-scale gem mining for thunder eggs and other valuable substances.

The major mining activity in the Fitzroy River Basin is coal mining and coal seam methane gas production. There are plans to significantly increase production through current mine expansions and by developing new mines. Coal seam methane is currently extracted at three general districts across the catchment. At present this activity is relatively small scale but is developing rapidly, with an estimated 10,000 new wells to be drilled over the next 10 years.

This study uses data relating to discharges from coal mining operations as they dominate the Fitzroy River Basin's large scale mining activities. These operations potentially release far greater volumes of water than any other mining source currently, and operate for long periods of time giving the best opportunity to examine changes in regulation and management of water quality over time.

A map of the study area (Fitzroy River Basin catchment) is shown at Figure 1 on page 10.

## 2. Mining development and water quality management

### 2.1 The history and future of mining in the Fitzroy River Basin

The Central Queensland Region produces most of Queensland's high-grade coking coal, and much of the export-traded thermal coal. Extensive coal resources within the region also provide the basis for significant coal seam gas development with potential to supply an emerging liquefied natural gas (LNG) export industry. Proximity to deepwater ports, the presence of a competitive rail system, bulk water and low-cost, reliable electricity supply have helped to establish Central Queensland as a major hub for energy-intensive mineral processing industries, particularly alumina, aluminium, magnesia and cement.

At the time of this report there are about 45 coal mines (12 underground), 10 significant mineral mines (excluding small mining operations and gemstone mines) and 20 medium to large quarries operating in the Central Queensland area, although not all these are in the Fitzroy River Basin. Many of these mines have ore reserves that will enable production beyond 2020. Figure 2 shows the location of current large scale mining activities in the Fitzroy River Basin.

**Figure 2 Fitzroy River Basin Active Mines**

Coal accounts for more than 95% of the value of all raw minerals produced in Central Queensland and more than 60% of the total value of raw minerals produced in Queensland (DME & ACIL Tasman, 2007). Queensland's total saleable coal production in 2007/08 was around 181Mt, with about 90% (~160Mt) derived from mines located in the Fitzroy River Basin. The value of 2007/08 coal production from Central Queensland was about \$17.8 billion. Coal mines in Central Queensland directly employed about 19,000 people.

Coal Seam Gas (CSG) has been growing as a valuable commodity since the first production from fields near Moura, at Fairview–Spring Gully near Injune, and Peat-Scotia near Wandoan in the 1990s. Moranbah is now also a contributor to commercial CSG production. CSG makes a significant contribution to Queensland's natural gas supply and will continue to do so with the Department of Mines and Energy (DME) estimating that CSG will satisfy 70% of Queensland's gas usage by 2010. It is expected that there will be minimal impact on water quality by coal seam gas in the future – please refer to Text Box 1 for details.

### **Text Box 1 Coal Seam Methane in the Fitzroy Basin**

Coal seam gas is currently extracted at three general locations across the catchment (in the north near Moranbah, near Moura on the Dawson River, and near Wandoan and Injune in the south of the catchment).

Coal seam gas production results in the production of associated water during the mining operations. Each gas well produces both gas and water, these are separated and the water component is aggregated at a number of central handling locations.

This water varies considerably in quality and quantity between locations and over time. In response to issues associated with managing this water the Queensland Government has established a policy that requires:

- wherever possible direct injection of the water into aquifers with water of equal or worse quality;
- if this is not possible, finding a beneficial use of the water; or
- if this is not possible, treatment of the water to a suitable standard before release to the environment (see <http://www.dip.qld.gov.au/growth-strategies/queensland-coal-seam-gas-water-management-policy.html> for more detail).

Therefore water quality issues associated with coal seam methane gas production in the catchment should be negligible. During 2007 approximately 4770 ML of water was produced across the Fitzroy Catchment at the three major sites (see Table 1).

**Table 1 Water volumes produced by coal seam methane gas wells in the Fitzroy Basin for 2007/08 (source DME, 2009)**

<b>Location</b>	<b>Volume (ML)</b>
Moura	24
Moranbah	513.5
Upper Dawson (Fairview, Spring Gully, Peat, Scotia)	4231.9
<b>Total</b>	<b>4769.4</b>

## **2.2 Mining's regulatory framework relating to water discharges**

Mining has been regulated in Queensland since the late 1800s. Legislative requirements relating to the potential impact of mining activities, including water discharges, only came into force under the *Mineral Resources Act 1989*. The right to produce associated water from petroleum and coal seam gas operations are provided for under the *Petroleum and Gas (Production and Safety) Act 2004* and the *Petroleum Act 1923*.

When the ANZECC/ARMCANZ (2000) National Water Quality Guidelines first appeared in 1992, EAs for mining companies were commonly conditioned only to protect the downstream environmental value of stock water quality. The protection of ecosystem health was not considered. Conditions placed on discharges were predominately set at the stockwater limit of 1500 mg/L total dissolved solids (TDS) or approximately 2205 $\mu$ S/cm (the standard approximation for converting TDS to  $\mu$ S/cm is  $TDS (mg/L) = 0.68 \times EC (\mu S/cm)$  or  $EC = 1.47 \times TDS$ ). When the ANZECC/ARMCANZ (1992) guidelines were updated in 2000 the limits were changed and some mines had their discharge limits amended.

On 1 January 2001, the responsibility for the environmental regulation of mining was transferred from the former DME to the former EPA. All previous licences and approvals for mining activities (around 5,500) became transitional authorities which had to be amended or replaced within five years. Since 2006, mining operations have been required to have DERM approved EAs. Many of the transitional authorities and consequent EAs retained the standards from the DME environmental management overview strategies commitments as conditions of the new EA. It is only new or recently amended EAs that cover a broader range of environmental conditions. Under the new regulatory framework DERM sets levels of environmental assessment for new applications, develops environmental conditions, monitors performance, conducts inspections and audits, ensures adequate rehabilitation and is responsible for enforcement of environmental controls. The steps to achieve this are outlined below.

## **2.3 Existing approaches to minimising water quality impacts**

### **2.3.1 Operational policy**

DERM's operational policy for licensing waste water discharge to Queensland waters provides policy advice and technical information for assessing development applications or environmental authority applications under the EP Act, *Environmental Protection (Water) Policy 1997* (EPP Water), *Integrated Planning Act 1997* and *State Development and Public Works Organisation Act 1971* for environmentally relevant activities discharging residual waste water to Queensland waters. The operational policy includes the consideration of mixing zones, assimilative capacity of receiving waters, environmental offsets, and environmental values and water quality objectives in assessing, deciding and conditioning applications. It also informs applicants in preparing applications.

*The Queensland Water Quality Guidelines* (2006) and *Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000* (ANZECC/ARMCANZ 2000) are the key technical guides for assessing and regulating the impacts of waste water discharges to water, particularly in terms of potential impacts on ecosystem health.

### **2.3.2 Environmental authorities**

All mining projects require one or more EA under the EP Act. The holder of a mining tenement cannot carry out any mining activities on site unless those activities are authorised by an EA for the relevant tenement.

DERM initially requires applicants for mining projects that are determined to have a medium to high risk of serious environmental harm to submit an Environmental Management Plan (EM

Plan) during the assessment process. The purpose of an EM Plan is to propose measures and activities that will protect environmental values. The potential impact on environmental values may extend beyond the mining lease to surrounding off lease areas (such as a mine water discharge) and include potential impacts of regional extent (such as the catchment area).

The applicant proposes an environmental protection objective, control strategy and EA condition containing measurable standards and indicators in the EM Plan for each environmental value.

In regards to water, a description of environmental values would include background receiving water monitoring data (where available) to enable DERM to establish release limits. Relatively little background receiving water quality data is available for the Fitzroy River Basin.

When preparing water quality contaminant limits for the release of mine affected water to surface waters the EPP Water requires DERM to consider the following:

- whether the size of the initial mixing zone will adversely affect an environmental value, especially biological integrity and suitability for recreational use;
- whether concentration of contaminants in the initial mixing zone are acutely toxic to the biota;
- the existing quality of the surface water;
- the cumulative effect of the release concerned and any other releases of contaminants to the surface water known to DERM;
- future releases to the surface water known to DERM; and
- water quality objectives for waters outside of (i.e. downstream of) the initial mixing zone.

The ANZECC/ARMCANZ (2000) guidelines are also considered when preparing water quality contaminant limits. These guidelines are used to:

- determine environmental values of receiving waters (i.e. pristine, recreational, agricultural etc.);
- set default limits for relevant contaminants in discharges of mine affected water based on the environmental values of receiving waters; and
- set local water quality objectives (i.e. guideline values) for receiving water quality, including the consideration of ambient water quality where available.

There are issues with using the reference-based water quality guideline values that are contained in the abovementioned documents as objectives for indicators such as pH, electrical conductivity and turbidity. These guidelines have generally been developed from permanent flowing streams. The Fitzroy River Basin has many ephemeral streams, which only flow for a limited time each year. Given the nature of ephemeral streams, it is difficult to obtain suitable water quality data from which to derive water quality guidelines/objectives. The ANZECC/ARMCANZ (2000) guidelines recommend a dataset of the most recent 24 monthly observations which is generally unachievable in ephemeral systems due to intermittent and inconsistent natural flows. Furthermore, this issue is compounded by the current conditions on mining EAs which, in the main, only require mines to monitor water quality during discharge events. This restricts the opportunity to gather ambient data when natural flows in waterways are occurring but the mine is not discharging.

Since amendments to the EP Act in 2000 and the transfer of responsibility for mining to DERM, EAs have included the following conditions for water management:

- divert rainfall runoff away from disturbed areas of the site;
- prevent mine affected and process waters from leaving the site and store in holding dams for on-site uses including process water and dust suppression;
- implement effective erosion and sediment control on site;
- designate authorised release point/s for controlled discharges as a last resort;
- designate a background flow volume or rainfall event required to allow discharges;

- monitor ambient and receiving water quality at a specified frequency and for specified parameters during discharges; and
- limits for specified parameters at end-of-pipe and/or the receiving environment.

For EA approvals and related water discharges, water quality-related licence limits are placed on permits for the following water quality indicators:

- pH;
- electrical conductivity (EC) or total dissolved solids (TDS); and
- total suspended solids (TSS) or turbidity.

The conditions in EAs for new operations have undergone continual improvement to help meet current best practice management. The range of parameters being monitored has expanded from pH, salinity and TSS or turbidity to include a range of additional nutrients and metals. Toxicity trigger values are also specified at end of pipe or the receiving environment which, if exceeded, are used to trigger an investigation into the cause of the exceedence, and if necessary, generate a review of discharging arrangements. However, these new conditioning arrangements have generally only been applied to new EAs, or recently amended EAs. EAs do not expire and there is no automatic process in place where best practice standards are applied to all mining EAs across the board.

As a result of water management conditions specified in EAs changing considerably over time, inconsistency exists in the conditions under which mines operating in the Fitzroy River Basin discharge water. For example, a number of historical EAs allow discharges when there is no other flow in the waterway, and include mixing zones of considerable length which, during discharges, may result in the aquatic ecosystems within the mixing zone being exposed to significantly poorer water quality than under ambient water quality conditions.

The lack of ambient water quality data has meant that the default limits have historically been based on ANZECC/ARMCANZ (2000) guidelines. The limits set may not achieve a suitable level of protection of downstream environmental values for the Fitzroy River Basin and are not always reflective of all relevant water quality objectives (e.g. not recognising the use of the water resource in supplying drinking water and supporting ecosystem values). The lack of long-term and/or regular ambient water quality data has meant that the water quality limits applied to EAs are developed on a case by case basis having consideration of the limited ambient or reference site dataset/s that is available, and negotiations with the individual mining companies.

DERM has been working with the Queensland Resources Council for some time in an effort to develop a template for standard EA conditions so that there is a level of consistency in licensing coal mines across the state.

### **2.3.3 Transitional Environmental Programs**

DERM is able to consider the use of a TEP for a business to continue operation during a period when the business is unable to meet a required environmental standard or the conditions of its EA (mining activities). A key requirement of the TEP is to minimise the potential for environmental harm. The proponent can submit a voluntary draft TEP for assessment or DERM can request a draft TEP be prepared if it considers there is potential or actual environmental harm on site.

Section 330 of the EP Act defines a TEP as “a specific program that, when approved, achieves compliance with this Act for the matters dealt with by the program by:

- a) reducing environmental harm; or
- b) detailing the transition to an environmental standard”.

The content requirements of a draft TEP are defined in section 331 of the EP Act and include:

- a) the objectives to be achieved and maintained under the program for an activity;
- b) how the objectives are to be achieved, and a timetable to achieve the objectives, taking into account—
  - i) the best practice environmental management for the activity; and
  - ii) the risks of environmental harm being caused by the activity;
- c) the appropriate performance indicators at intervals of not more than six months;
- d) monitoring and reporting compliance with the program.

In deciding a TEP, DERM must consider standard criteria which, among other things, include:

- the principles of ecologically sustainable development as set out in the 'National Strategy for Ecologically Sustainable Development';
- any applicable environmental protection policy (EPP) including the EPPs for air, noise, water and waste;
- the potential effects of any proposals on the character, values and resilience of the receiving environment;
- submissions made by the applicant for a TEP;
- best practice environmental management for the activities proposed;
- the financial implications of any requirements; and
- the public interest.

The legislation requires DERM to approve a draft TEP, approve it with conditions, or refuse the TEP. Public notification is required if the TEP is proposed to operate for longer than three years.

Emeritus Professor Hart's interim report found that there were deficiencies in the TEP process developed in response to the flooding events early in 2008, largely because of poor communication, but also because of the lack of credible monitoring information. DERM has commenced a review of its TEP process.

## **2.4 Key findings**

- Mining has not developed in the Fitzroy River Basin in a uniform way and has undergone periods of rapid expansion and contraction over time depending on the prevailing economic conditions.
- The regulation of water discharges from mines has changed over time in terms of the applicable legislation and responsible Government Agency.
- Many of the existing EAs that provide conditions for discharging waste water are based on very limited ambient water quality data, require little monitoring from the mining companies, and are developed on a case by case basis leading to a lack of consistency across the state.
- EAs for mines in the Fitzroy River Basin vary in terms of:
  - date granted;
  - geographic area;
  - parameters regulated; and
  - release conditions and compliance requirements.

### **3. Water quality in the Fitzroy River Basin**

#### **3.1 Water quality management framework and guidelines**

The National Water Quality Management Strategy sets the context for managing water quality and provides a framework for developing management strategies. This national approach to water quality management is underpinned by the development of guidelines which can provide guidance when issues arise. National guidelines allow flexibility of response to different circumstances at regional and local levels. State and/or local jurisdictions can refine these national water quality guidelines either into their own regional guidelines or into specific water quality objectives to protect waterways.

Water quality objectives are the levels or concentrations of indicators needed to protect all the values of a waterway. In defining water quality objectives, the first step is to define what values the water needs to support (e.g. drinking, irrigation, aquatic ecosystem, and recreational uses). Once defined, a suitable water quality guideline can be used as a reference to compare with current water quality and help develop water quality objectives that are catchment specific. For example, EC concentrations of less than 1000  $\mu\text{S}/\text{cm}$  may be required to support aquatic ecosystem protection in a stretch of waterway. If this is the most stringent guideline for all values in this waterway, it could become the draft water quality objective. Water quality objectives under the EPP Water are also to consider social and economic factors. This process allows management actions and decision making to be designed for the catchment that will help ensure the water quality objectives are achieved in the future.

The National Water Quality Management Framework has been used to establish water quality improvement plans (WQIPs) for a number of catchments discharging to the Great Barrier Reef. In places like the Mackay Whitsunday catchments the natural resource management group has worked with the Queensland and Federal governments to establish clearly defined water quality objectives and management actions to achieve water quality improvements (see Text Box 2 – WQIPs).

#### **Text Box 2 WQIPs**

The Mackay Whitsunday Water Quality Improvement Plan (WQIP) aims to provide water quality suitable for human uses and aquatic ecosystem protection. This plan describes local values deserving protection, how current water quality is impacting on local values and management interventions for rehabilitation of priority habitats and reduction of pollutant loads from diffuse and point sources. Implementation of the WQIP involves management interventions, monitoring and modelling, planning and legislation. A monitoring and modelling strategy has also been developed that recommends that many of the monitoring and modelling activities should also be implemented at a cross-regional reef-wide level. Modelling approaches should also be used in conjunction with appropriately targeted water quality monitoring at paddock, sub-catchment and catchment scale, and includes aquatic ecosystem response monitoring and modelling.

In the Fitzroy River Basin the ANZECC/ARMCANZ (2000) guidelines are used to help establish toxicity trigger values (TTVs) for aquatic ecosystems, recreational and aesthetic uses and primary industries, including irrigation and stock water quality. In some cases, the Queensland Water Quality Guidelines (EPA, 2007) define more localised reference-based guidelines for the protection of aquatic ecosystems where sufficient information from local monitoring is available. Reference-based guidelines are derived from monitoring data in the specific region from unimpacted waterways of a similar type. The guidelines are usually derived from 80<sup>th</sup> percentiles of long-term data (or 75<sup>th</sup> percentile for electrical conductivity)

and are designed to be compared to the median values of a long-term monitoring data set (typically 12 data points over a year) to provide an assessment of relative condition.

The *Queensland Water Quality Guidelines* provide information on ambient salinity ranges in Fitzroy North and Central Fitzroy. The guideline uses monitoring data from reference sites (permanent flowing streams) to present salinity zone percentiles for the sites in the region. As mentioned, the 75<sup>th</sup> percentile for electrical conductivity can be used to assess the relative long term condition of a waterway. The higher percentile (such as 90<sup>th</sup> percentile) could also be used to identify anomalously elevated sites where smaller datasets are available. It should be noted that more local monitoring and investigation may still be required in many cases, particularly where streams are ephemeral as is the case for much of the Fitzroy Catchment. In most of the catchment (Central Fitzroy), 90% of measures for EC were less than 520 $\mu$ S/cm, the 75<sup>th</sup> percentile was 340 $\mu$ S/cm and the median value was less than 250 $\mu$ S/cm. Values were higher in the Fitzroy north area (median 355 $\mu$ S/cm). However, 90% of measures were less than 1300 $\mu$ S/cm and the 75<sup>th</sup> percentile was 720 $\mu$ S/cm.

The National Health and Medical Research Council endorses the use of the *Australian Drinking Water Guidelines* (NHMRC, 2004) for setting drinking water quality limits as shown in Table 2 (page 19). This guideline recommends that, based on taste, total dissolved solids in drinking water should not exceed 500 mg/L. The equivalent figure in EC units can be roughly determined by doubling this value. In this report a conversion of 1/0.67 was used to give a limit for drinking water of 746 $\mu$ S/cm. The guidelines suggest that below 500mg/L TDS (conservatively 746 $\mu$ S/cm) the water should be good and above 1000 mg/L (which is 1500 $\mu$ S/cm) is unacceptable.

For other environmental values such as use for irrigation of crops or stock watering, the salinity (or electrical conductivity) threshold is dependent on the crop to be irrigated or stock to be watered, as shown in Table 2 (page 19). The salinity tolerance of crops shown ranges from 1000 $\mu$ S/cm to 4200 $\mu$ S/cm. The salinity tolerance for watering stock is less stringent, for example 5970 $\mu$ S/cm for beef cattle drinking.

**Table 2 ANZECC/ARMCANZ (2000) Guideline and ADWG limits for salinity measured as electrical conductivity for protecting livestock drinking water, irrigation water and drinking water for human consumption environmental values**

Environmental Value	Plant Salinity threshold tolerance in irrigation water*	Tolerance of livestock to salinity in drinking water**	ADWG <sup>†</sup> limit for salinity in drinking water for human consumption

### 3.2 Ambient water quality Fitzroy Basin

The major water quality parameters of concern associated with coal mining are salinity (based on electrical conductivity usually measured in  $\mu\text{S/cm}$ ), heavy metal and metalloid ion concentrations (mg/L) and acidity/alkalinity (pH).

Background ambient water quality of the Fitzroy River Basin has been examined in three main peer reviewed studies:

- a Fitzroy River Basin specific analysis based on data collected from 1993-1996 (Noble et al. 1996);
- a statewide review of water quality in Queensland waters based on data collected from 1992-1996 (Testing the waters – a report on the quality of Queensland Waters, DEH 1999); and
- a review of water quality as part of the Queensland Water Quality Guidelines (EPA, 2007).

These studies provide data that begins to show what could be described as ambient water quality in the Fitzroy River Basin.

A comparison of the results reported and the default ANZECC/ARMCANZ (2000) guidelines suggests that the Fitzroy is a moderate to highly salty system with slightly alkaline water. The results also show that there are substantial differences in EC levels across sub-catchments. The reports do not provide sufficient information to characterise metal and metalloid concentrations.

### 3.2.1 Electrical conductivity (EC)

EC is related to the number of dissolved ionic solids in water. Typically the most common ions are those found in salt (sodium chloride), so that EC is typically a reliable surrogate for salinity.

All three studies found that by far the majority of sites had EC levels less than 800 $\mu$ S/cm. The major location where higher EC levels were recorded were on the Dee River downstream from the Mount Morgan copper mine site which has a long history of water quality issues that are now managed by the Department of Mines and Energy.

DEH (1999) recorded only one site close to current coal mines (Crinum Creek) with a median conductivity above 800 $\mu$ S/cm. Noble (1996) recorded two sites (both on the Dee River) with median EC levels above 1500 $\mu$ S/cm. More than 80% of their samples were less than 280 $\mu$ S/cm, and 17% were between 280-800 $\mu$ S/cm. For the sub-basins, median values ranged from 170 $\mu$ S/cm (Comet) to 292 $\mu$ S/cm (Isaac).

### 3.2.2 Metal concentrations

Limited information has been recorded in relation to background dissolved heavy metal concentrations. Noble et al. (1996) conducted a very limited study of six sites designed to examine the impacts of discharges from the Mount Morgan mine site. This study found levels of heavy metals typically exceeded ANZECC/ARMCANZ (2000) guidelines downstream of the mine site.

### 3.2.3 pH

This parameter measures the acidity and alkalinity of water. Values less than seven are considered acidic and those above seven alkaline (Noble et al. 1996). The acidity or alkalinity of water can increase the bioavailability and concentration of contaminants such as metals and therefore the relative toxicity of certain contaminants as well as increasing the accumulative effect and potential impact on environmental values.

Most Fitzroy soils are alkaline and this is reflected in water quality. Noble et al. (1996) records the lowest median pH for water quality in the Connors catchment (7.15) and highest (7.97) for the water quality in the Nogoia catchment. Some sites monitored on the Dee River as part of this study did not meet ANZECC/ARMCANZ (2000) and QWQG (EPA, 2007) guideline trigger values (pH 6.5 – 8).

## 3.3 *Water quality data collection and reporting*

Water quality monitoring, data collection and reporting in the Fitzroy River Basin is undertaken by a diverse range of State and local government agencies, water providers, natural resource management groups, mines and other industries. Each of these groups does its monitoring, data collection and reporting on water quality differently. There is no single entity that synthesises all available water quality data for the Fitzroy River Basin in a catchment wide context. Text Box 3 illustrates the diverse nature of water quality monitoring that Department of Natural Resources and Water (NRW) and Fitzroy Basin Association (FBA) undertakes.

#### **Text Box 3    Water Quality Monitoring**

##### **The Department of Natural Resources and Water (NRW) Water Monitoring**

There are a total of 84 government operated water height monitoring stations in the Fitzroy River Basin (FRB). NRW operate a total of 57 gauging stations in the FRB, while SunWater operate another 27 stations.

The majority of NRW stations record stream height data on a continuous basis with 32 of these stations equipped with water quality probes. All stations with water quality equipment have a combined electrical conductivity (EC) and temperature probe. A number of stations also have a pH probe. Either probe is capable of collecting water quality data at 20 minute intervals. A number of stations on major rivers also have telemetry capability. In addition, water samples are collected at 25 of the station sites either 3 or 4 times per year. These samples are analysed for major ions and total and dissolved nutrients (nitrogen and phosphate).

As a part of the NRW Resource Operation Plan (ROP) environmental flow monitoring requirements NRW conduct the Environmental Flow Assessment Program (EFAP). The EFAP monitors spawning and recruitment success of native fish stocks in response to river flows, details can be found at <http://www.nrw.qld.gov.au/factsheets/pdf/water/w130.pdf>.

NRW also conduct seasonal flood water sampling as a part the Great Barrier Reef Water Quality Improvement Plan, and the Sediment Monitoring Program. Further information on NRW water quality monitoring can be found at <http://www.nrw.qld.gov.au/water/index.html>.

### **Fitzroy Basin Association Water Monitoring**

The Fitzroy Basin Association, through a regional planning process, is developing water quality targets for the region, identifying potential hotspot areas and prioritising management actions in order to help achieve this common objective.

This monitoring program focuses on sediment, salinity and nutrient (nitrogen and phosphorus) parameters. Simple load and concentration calculations are derived for these parameters. Monitoring is conducted at the neighbourhood catchment scale (~300km<sup>2</sup> to 2000km<sup>2</sup> or groups of smaller catchments).

The monitoring focuses on flood event sampling and captures data over the hydrograph for basic load calculations. This is being conducted to provide baseline data and eventually a baseline trend for the amount of sediment and nutrients being carried downstream during rain events. This information supports Natural Resource Management improvements brought about by stakeholders in each neighbourhood catchment.

For more information please visit the website below:

[http://www.fba.org.au/programs/priority\\_neighbourhood\\_catchments\\_water\\_quality\\_monitoring\\_program.html](http://www.fba.org.au/programs/priority_neighbourhood_catchments_water_quality_monitoring_program.html)

The Fitzroy River Water Quality TWG has developed a draft table of current water monitoring programs in the Fitzroy River Basin as at September 2008 (see Section 7.2 Appendix B on page 45). This list includes a range of monitoring activity that is occurring from ongoing monitoring to monitoring due to the flooding and subsequent dewatering of mines in the Fitzroy River Basin.

In response to the flooding and subsequent dewatering of mines DERM has started an independent Fitzroy River Water Quality, Sediment and Biological Monitoring Program that will monitor and then assess any potential impact(s) of flooded coal pit water discharged from the Ensham Resources coal mine on waterways and related environmental values in the affected reaches of the Fitzroy Basin.

This program will also provide important information for future monitoring. Further details on this monitoring program and progressive results are available from DERM's website at: [http://www.epa.qld.gov.au/publications/p02739aa.pdf/Project\\_Plan\\_Fitzroy\\_Basin\\_Water\\_Quality\\_Monitoring\\_assessing\\_the\\_impact\\_of\\_Ensham\\_Resources\\_flood\\_water\\_release.pdf](http://www.epa.qld.gov.au/publications/p02739aa.pdf/Project_Plan_Fitzroy_Basin_Water_Quality_Monitoring_assessing_the_impact_of_Ensham_Resources_flood_water_release.pdf)

DERM is developing a statewide integrated waterways quality monitoring program, comprising the following elements:

- monitoring frameworks based on the processes influencing aquatic ecosystems health in Queensland;
- common techniques, methods and metadata standards for sample collection, handling, analysis, data verification and storage;
- common interpretation and assessment techniques;
- storage and management of collected information in a way to ensure free and rapid access of appropriate information to all stakeholders;
- common indicators and reporting tools; and
- agency roles in water quality monitoring.

This integrated program would benefit from the coordination and inclusion of other monitoring activities such as those carried out by industry and other organisations.

### **3.4 Key findings**

- Drinking water and aquatic ecosystems are the most sensitive downstream environmental values to be protected from discharge waters.
- The Fitzroy River Basin is naturally a moderate but variable saline system with slightly alkaline water overall. Previous studies and the Queensland Water Quality Guidelines show that there are substantial differences in ambient EC levels across sub-catchments.
- There is no overarching comprehensive plan for water quality in the Fitzroy River Basin such as a WQIP that defines environmental values and water quality objectives and considers the cumulative impacts from diffuse and point sources.
- Currently DERM is in the process of developing a statewide integrated waterways quality monitoring program which is expected to be available by June 2009.

## 4. Data analysis

For the purposes of this study, the EPA contacted the coal mines holding EAs in the Fitzroy River Basin and asked for their monitoring data for the past five years and other relevant information on the approved discharges in their EAs.

The information provided by the coal mines in the catchment has been reviewed. Firstly, the location of the mines and their approved discharges were determined and then grouped into eight sub-catchments. The sub-catchments included:

- Bee/Walker Creeks (Isaac-Connors catchment),
- Anna Creek/Upper Isaac River (Isaac-Connors catchment),
- Ripstone/Stephens Creek/Isaac River (Isaac-Connors catchment),
- Roper/Oakey Creeks, (Nogoa catchment)
- Crinum/Sandy Creeks/Nogoa River, (Nogoa catchment)
- Blackwater Creek/Nogoa River, (Nogoa catchment)
- Ten Mile(Mackenzie catchment), and
- Dawson River /Callide Creek. (Dawson catchment)

Table 6, column three (page 33) identifies the sub-catchment to which the colour shading refers. In Tables 3 (page 25), 4 (page 28) and 5 (page 29) the different colour shading reflects the sub-catchment the mines discharge into.

### 4.1 Data from authorised discharges

#### 4.1.1 Environmental authorities

##### *Summary of licensed discharge conditions*

Current EAs are listed in Table 3 (page 25). These include 40 permits. Of these, mines 34a and 34b are considered together as these authorities are in the process of being amalgamated. All of the EAs permit discharges under certain conditions except for mine 18 and mine 22. Mine 10 was not operational at the time of preparing this report. The EAs include anywhere between one to fifteen approved discharge locations and an EA can have multiple receiving waters, each with different release conditions.

34b	Curragh North	MIM800185503	3000	1300	Flow equal to upstream (Max discharge specified)
35	Jellinbah	MIM800087302	2000	1500 or 110% upstream	During flow events
36	Yarrabee Coal	MIM800090202		2836*	During flow (upstream height specified)
37	Dawson North/South/Central	MIN100510607	4000 (500 for passive release <10m <sup>3</sup> /s)		Flow greater than 5 or 10 m <sup>3</sup> /s
38	Baralaba Coal	MIM800330805	2985* or 110% of background		None specified
39	Callide	MIN100507307	2000 to 3000	2000	None specified

Colours in column 2 group the mines into the same sub-catchment (named in column 3, Table 6)

\* based on EC to TDS conversion of 0.67

Of the most commonly regulated water quality indicators, EC is the most relevant to this study for the following reasons:

- stream inputs can only be removed by natural flows from rainfall events flushing accumulated salinity from waterholes and the numerous water impoundments along the river system (permanent removal), or through infiltration into the groundwater table (temporary removal), thus the potential for accumulation is high;
- there is little water quality data relating to metal based contaminants; and
- there has been recent concerns with elevated salinity in the Fitzroy River Basin.

### ***Applying EC limits***

Three main types of EC limits are applied in the EA conditions for the mines reviewed. These include:

- end-of-pipe limits based on a specified numerical value;
- end-of-pipe limits relative to upstream water quality measures (either 100% or 110%); and
- receiving environment limits based on a specified numerical value.

Combinations and permutations of these three limit types are used for the EAs as shown in Table 3 (page 25).

**Specified end-of-pipe limits** provide the greatest assurance that environment harm will not occur when set appropriately and complied with. They help provide direct knowledge of the discharge to be controlled and regulated. They also provide the best potential for assessing cumulative impacts. The disadvantage of end-of-pipe limits is that they need to be set based on good information which is not available for many sections of the Fitzroy River Basin.

**End-of-pipe limits based on upstream measurements** provide less assurance for regulation and environmental protection. Given the ephemeral nature of many of the receiving waters for mines in the Fitzroy River Basin, much of the stream flow will be event related. Monitoring of such streams can be technically and logistically challenging with results not always guaranteed. Furthermore, results will generally have large variability, requiring more frequent sampling to receive representative results. An additional important point to this study is that this type of limit does not lend itself to controlling cumulative impacts as it considers discharges occurring upstream but not downstream. Background water quality could potentially worsen moving down the catchment as relative discharge limits would increase with worsening water quality. This type of limit is therefore not suitable for indicators that relate to contaminants that could potentially accumulate in a waterway.

**Receiving environment water limits** provide a direct measure of water quality changes in the environment but cannot separate the effects of the discharge from other catchment influences. Also, the potential for the monitoring difficulties and potential variability of results arises as discussed above. Nonetheless, limits applied in the receiving environment may be the only alternative where monitoring of end-of-pipe water quality is not possible.

### ***EC-related discharge limits***

There was significant variability in the EC limits specified in the EAs reviewed. For end-of-pipe limits, maximum limits varied from 1500 $\mu$ S/cm to 4500 $\mu$ S/cm. Most limits were between 2000 $\mu$ S/cm to 3000 $\mu$ S/cm. Variability in the end-of-pipe limits applied is common and will depend on the circumstance of the release and the type of receiving waters. For example, discharge during high flow events can result in higher dilution, allowing higher EC values in the discharge. Alternatively, discharge during low or no flow would provide no dilution, requiring lower EC values. Understanding and specifying release conditions related to flow of receiving waters is particularly important for these higher EC limits in the EAs.

The majority of discharges approved in the EAs (25) link the release to flows in the receiving waters. However, of these 25 only eight EAs specified the stream flow (or gauging height) at which the release could occur. The remainder did not specify stream flow triggers or how it should be measured. The location where stream flow was required was typically specified.

The remaining thirteen EAs allowed releases in dry weather although monitoring of events was sometimes required.

Maximum EC limits also varied significantly across EAs for receiving environment limits. The limits were generally lower than end-of-pipe limits but ranged from values of 200µS/cm through to values of 4500µS/cm. Limits of 3000µS/cm or greater were common.

#### 4.1.2 Transitional Environmental Programs

Current TEPs for the Fitzroy Catchment are listed in Table 4. These include five approvals, all issued in 2008 following extreme rainfall early in the year. All of the TEPs allow discharge of waste water for extended periods of time, and some TEPs allow discharges during periods of no upstream flow. The TEPs all include a certain discharge period, after which the discharge has to cease to allow inspection of the stream under no discharge conditions.

The EC limits for the TEPs are specified numerical values applied to end-of-pipe measurements and/or receiving waters. Limits vary from 1000µS/cm to 3000µS/cm.

**Table 4 Review of Electrical Conductivity Limits for Coal Mine Transitional Environmental Programs (TEPs) in the Fitzroy Catchment**

Mine No.	Mine Permit Name	TEP Code	Dates/Duration	Discharge EC Limit (µS/cm, % background)	Receiving Environment EC Limit (µS/cm)	Conditions Relating to Receiving Environment Stream Flow
1	Hail Creek	MAN7274	20 February to 30 June 2008	1500	na	Permitted to occur on a seven day cycle, absence of natural stream flow.
4	Burton	MAN7374	27 March to 30 June 2008		2500	Permitted to occur on a seven day cycle, 14 day inspection
6	Goonyella Riverside	MAN7454	21 May 2008 to 20 May 2009		3000	Permitted to occur on a 28 day cycle, including periods of no detectable flow
29	Ensham	EMD 001-08	29 Feb -, 28 April-, 2 June- 08 to 2 March 09	1200 (2000*)	1000, changed to 1200-2000 (rolling median five weeks)	Permitted to occur on a seven day cycle, 7 day inspection
30	Minerva Coal	EMD 003-08	27 March to 30 June 2008		1493	Permitted to occur on a seven day cycle, 7 day inspection

Colours in column 2 group the mines into the same sub-catchment (named in Column 3, Table 6)

\* with approved discharge management plan

The metal-based discharge limits are listed in Table 5 (page 29). The limits are for total metals in receiving waters (i.e. the 'total' metal concentration in the water that includes the sum of metal associated with suspended sediment, and the metal dissolved in the water itself). The limits specified are significantly higher than toxicant trigger values for slightly-to-moderately disturbed systems in the ANZECC/ARMCANZ (2000) guideline. One reason for this is that natural background concentrations of some chemicals may exceed the stated guideline trigger values due to mineralisation from the catchment substrate. In these cases, it is not reasonable to use a guideline value below the background concentration. Monitoring and limit setting for

dissolved metals is likely to provide a more useful regulatory mechanism. Limits for aquatic ecosystem protection should also be considered in the future. Further monitoring for total and dissolved metals in the receiving environment of reference/background sites is probably required to determine what limits are achievable for compliance purposes given the likelihood of high background levels of some metals within such a mineral-rich catchment.

**Table 5 Review of Metal Limits for 1 Coal Mine Transitional Environmental Programs (TEPs) in the Fitzroy Catchment. Metals are total metals in mg/L.**

Mine No.	Mine Permit Name	TEP Code	Dates/ Duration	Aluminium	Arsenic	Boron	Cadmium	Chromium	Cobalt	Copper	Iron	Lead	Manganese	Mercury	Molybdenum	Nickel	Selenium	Zinc

Colours in column 2 group the mines into the same sub-catchment (named in column 3, Table 6)

#### **4.2 Risks associated with water quality changes and potential for cumulative impacts**

The locations of water quality monitoring sites for monitoring by coal mines are generally confined to mining tenure, which provides good information on local impacts but little information on cumulative impacts. In addition, monitoring is nearly always constrained to occurring while there is a discharge from the mine. This means that data collected would be difficult to use for assessing cumulative impacts unless discharges all occurred together. Furthermore, there is insufficient monitoring data available to determine reference or true background benchmark conditions.

To ascertain the full spatial extent of impact of the discharges and the actual cumulative impact, more downstream monitoring and data would be required.

It was evident that discharges from more than one mine were occurring in numerous sub-catchments at the same time. The potential for cumulative impacts spatially across the sub-catchment and catchment would be increased under such circumstances.

One observation resulting from the review of mine data is the close relative proximity of 19 of the mines in the northern three sub-catchments relating to the upper Isaac River and Connors River (Bee/Walker Creeks).

## 4.2.2 Risk assessment for each EA

The final step of the study was to undertake a risk assessment for each EA based on the information provided. Mines identified as high risk that are grouped together have the greatest potential for producing cumulative impacts. The risk assessment was based on the level of EC sampled immediately downstream from the discharge and the volume or frequency of the discharge. Risk assessment categories for each of these have been developed and are shown in Table 7 and Table 8, respectively.

**Table 7 Assessment categories for mine receiving waters EC sampled immediately downstream from discharge for Table 6**

Risk category	EC level	Rationale for EC level (percentiles based on Queensland Water Quality Guideline figures)
very low	<720 $\mu$ S/cm	Ambient conditions for North Fitzroy (based on 75 <sup>h</sup> percentile), approx 95 <sup>th</sup> percentile of guideline for Central Fitzroy
low	<1250 $\mu$ S/cm	90 <sup>th</sup> percentile (North Fitzroy) - limited effects on fish/macrinvertebrates, most crop irrigation possible (except beans & oranges), increased potential effect on drinking water
medium	<2500 $\mu$ S/cm	Reduction in some macro-invertebrate species, potential effect on some fish, greater number of crops effected, higher risk on drinking water
high	>2500 $\mu$ S/cm	Potential effects on all values - loss of aquatic ecosystem, less suitable for irrigation, highest risk to downstream water supplies

**Table 8 Assessment categories for frequency and volume of mine discharges for Table 6**

Risk category	Flow frequency and volume
very low	zero flow, release on only a few days, low volume, e.g. <100ML per year
low	In-frequent flow, couple of major releases, volume <1000ML per year
medium	frequent releases, associated with low stream flow, volumes <10,000ML per year
high	extended release for weeks, dry weather associated, volumes >10,000ML per year
very high	extended release for months, dry weather associated, volumes >10,000ML per year

In terms of risk assessment categories for EC, the likely environmental values and water quality objectives for the freshwater reach of the Fitzroy River were considered. Environmental values of particular interest and most sensitivity to salinity are protection of aquatic ecosystem, crop irrigation and potential use for drinking water.

For EC, four risk assessment categories were developed from very low through to high. Information on reference based aquatic ecosystem guidelines for the Fitzroy Catchment is provided in the Queensland Water Quality Guidelines (2006) and was used for defining the limits for the low and very low risk assessment categories. Percentiles for EC for different sub-catchments are presented in the guidelines and the northern catchments such as the upper Isaac River have naturally higher EC values compared to some other parts of the catchment such as the Nogoia River. Nonetheless, given that a significant proportion of the mines are in this northern area, the guidelines for this area were used for defining the levels (Table 7). It is noted that this break up may not be sufficiently conservative for all parts of the catchment. For the higher risk categories, published information on potential chronic effects on fish and macroinvertebrates was considered (Dunlop et al., 2005; Dunlop & McGregor, 2007; Hart 2008).

For irrigation, EC guideline concentrations from ANZECC/ARMCANZ (2000) were considered. The levels of EC suitable for drinking water are more difficult to define. As noted by the recent report by Hart (2008), sodium concentrations are the key element and water treatment in the area is unlikely to remove any salinity or sodium. The very low risk level will generally protect drinking water. Any of the higher levels listed in Table 7 (page 37) could be of concern if the water is used for reticulated drinking water. However, given the monitoring data under review are in close proximity to the mine discharge some dilution would be expected before the discharge water reached drinking water reservoirs.

The risk assessment categories for frequency/volume of discharge water were divided into five categories from very low to very high. The rationale behind the categories was that with greater volumes and more frequent releases, there would be a greater potential for cumulative effects. This is an essential part of the risk assessment given the locations of the monitoring sites were in close proximity to the mines, often in tributaries off the major streams and generally some distance from the environmental value, particularly for drinking water uses. The categorisation of the volumes was somewhat arbitrary and based on expert opinion. The very low risk assessment categories corresponded to discharges for a few days or less and low volumes (<100ML). The very high risk category corresponded to extended releases for months, dry weather associated and with large volumes greater than 10,000ML.

Based on these risk assessment categories, a cumulative risk assessment matrix was developed to help assess the potential for cumulative risk from the mines and is presented in Table 9. Cumulative risk is broken into five categories from very low through to very high. The rationale behind the matrix was that the cumulative impact risk is a combination of the frequency/volume of the discharge and the EC concentration in the environment during the time of discharge. Very low volume discharges with very low receiving water EC would have very low risk of cumulative impact. Alternatively, an extended continuous large volume release combined with high receiving water EC would have a very high risk of cumulative impacts.

**Table 9 Cumulative risk assessment matrix used to assess the mine discharges in the Fitzroy Catchment**

Frequency/Volume (ML/year)			EC ( $\mu\text{S/cm}$ )			
			v low	low	medium	high
			<720	<1250	<2500	>2500
v. low	zero/small	<100ML	v. low	low	low	medium
low	few releases, infrequent	<1000	low	low	medium	medium
medium	frequent	<10000	low	medium	medium	high
high	continuous, some dry weather	<100000	medium	medium	high	v. high
v. high	continuous, months	>100000	medium	high	v. high	v. high

The results of the cumulative impact risk assessment for the data obtained from the mines are shown in Table 6 (page 33). Six mines were identified as having a high or very high risk of contributing to cumulative impacts. Five of these were in the two northern Isaac River sub-catchments. In addition, six mines in those catchments were identified as a medium risk of contributing to cumulative impacts, which adds to the potential for cumulative impacts in this area. In comparison in the southern sub-catchments, the majority of mines were rated as low or very low risk of cumulative impact, other than mine 29. It should be noted however that naturally occurring levels of EC are lower in some of the southern catchments and the risk assessment may under predict the cumulative risks for these areas on aquatic ecosystems or drinking water.

Of the six mines rated as high or very high risk, only two were associated with a TEP. The discharges for the remaining four occurred under the existing EA.

To ascertain the full spatial extent of impact of the discharges and the actual cumulative impact, more downstream monitoring and data would be required.

Monitoring data on metal concentrations in receiving waters was received for some mines. In general, the total metal concentrations were quite low and complied with limits specified in the EAs. Some total metal concentration appeared to exceed toxicant triggers for slightly-to-moderately disturbed waters in ANZECC/ARMCANZ (2000) guidelines. In some cases this may be attributable to higher ambient levels due to natural processes of mineralisation. However, further work and data would be required to undertake local and cumulative impact assessment.

### **4.3 Key findings**

- Forty permit holders of coal mines were identified.
- Discharge limits for Environmental Authorities are set for pH, electrical conductivity (or TDS) and total suspended solids (or turbidity). Limits for metals and some additional water quality parameters are not on all EAs but have been imposed on more recent examples.
- Due to data constraints, electrical conductivity (which is a measure of salinity) is the most relevant contaminant to this cumulative impact study for the freshwater reach of Fitzroy River Basin. Knowledge and data on other contaminants will improve the understanding of cumulative impacts.
- Three types of electrical conductivity limits are used in the mine EAs:
  - an end-of-pipe limit based on a specified numerical value;
  - an end-of-pipe limit relative to upstream water quality measures (either 100 or 110%), and
  - receiving environment limit based on a specified numerical value.
- Combinations and permutations of these three limit types are used. End-of-pipe limits are not always used.
- End-of-pipe numerical limits linked to receiving water conditions are recommended as the most effective in regulating and managing the cumulative effect of water discharges.
- There was significant variability in the electrical conductivity limits specified in the EAs for both end-of-pipe and receiving waters. On currently operating mines, limits were as high as 4500 $\mu$ S/cm for end-of-pipe and 3500 $\mu$ S/cm for the receiving environment.
- Understanding and specifying release conditions related to flow of receiving waters is particularly important for these higher EC limits in the EAs. The higher limit values present a potential risk to both local environmental values and broader cumulative impacts during low flow and no flow conditions.
- Many discharges approved in the EAs link the discharge to flows in the receiving waters. However, the minority specified the stream flow (or gauging height) at which the release could occur. Numerous EAs appeared to allow dry weather releases (providing for a potentially higher associated risk of adverse environmental impacts).
- Mine receiving environment monitoring was limited to within mining tenure and was not ideal for assessing cumulative impacts. Monitoring was also generally limited to only times when releases occurred and thereby greatly limited the data relating to background water quality.
- Limits and monitoring of metals was limited to most recent EAs and TEPs and focussed on total metal concentrations. Dissolved metal concentrations would have provided a better gauge of the potential risk that they might pose to aquatic ecosystems. Discharge limits were set consistent with irrigation and stock watering guidelines that are significantly higher than ANZECC/ARMCANZ (2000) toxicant trigger values for aquatic ecosystems.
- Five TEPs were identified for the catchment, all issued in 2008 and all permitted discharge of waste water for extended periods of time, including periods of no natural stream flow.

- In general, data from 2008 (year of flooding in January and February) showed a significantly larger number of mine discharges compared to any other year. Discharges from more than one mine were occurring in numerous sub-catchments at the same time which increases the likelihood for cumulative impacts.
- More downstream data is required to quantify the cumulative impacts from water discharges from mines.
- In the cumulative impact risk assessment of salinity, six mines were identified as having a high or very high risk of cumulative impacts. Five of these were in the two northern Isaac River sub-catchments. In addition, six mines in the northern sub-catchments were identified as a medium risk of cumulative impacts, which adds to the potential for cumulative impacts for this area.
- In comparison in the southern sub-catchments, the majority of mines were rated as low or very low risk of cumulative impact, other than mine 29.
- Of the six mines rated as high or very high risk, only two were associated with a TEP. The discharges for the remaining four occurred under the existing EAs.

## 5. Recommendations

### Recommendations

After considering the findings of this study and following consultation on the draft study with key stakeholders, including Queensland Resources Council; the Technical Working Group; the Queensland Conservation Council and Agforce, the following recommendations are made.

#### 1. **Develop appropriate conditions in environmental authorities for mine water discharges**

The aim of this recommendation is to standardise environmental authority conditions relating to water discharges so that consistent and appropriate conditions exist across the Fitzroy River Basin.

The aim is to work with mining companies to achieve this by convening a small working group comprising DERM and mining company technical specialists that would consider how discharge limits are set, what limits are acceptable and what this should be based on, when discharges may occur and what monitoring should occur. This is to occur by the end of June 2009.

The preferred option for implementing changes is via voluntary agreement with mining companies. If this is not possible, then it may be necessary to implement changes after requiring and reviewing an environmental audit or by changes to the EP Act to allow for the immediate review and amendment of coal mining authority conditions using the issues identified in this study. Changes to environmental authorities are to occur by the end of December 2009.

#### 2. **Develop local water quality guidelines**

The aim of this recommendation is establish a collaborative project that enables the setting of local water quality guidelines. This would include mining companies and other stakeholder groups to identify current data and monitoring occurring throughout the region as well as developing a suitable monitoring program to complement the current information. The project plan for this project is to be developed by June 2009.

#### 3. **Develop a model for assessing cumulative impacts across the region**

The aim of this recommendation is to understand full extent of cumulative impacts of mine water discharges which will be only known once a model is developed to determine the capacity of the catchment in terms of all inputs. This is likely to take at least two years to develop.

## 7. Appendices

### 7.1 Appendix A

#### TERMS OF REFERENCE

##### **Background**

The dewatering of flooded mine pits at Ensham Coal Mine has resulted in water quality impacts, evidenced by a rise in sodium and salinity levels in the Fitzroy River system which in some places exceed the NHMRC Drinking Water Guidelines for sodium in drinking water.

While it is recognised that the NHMRC Drinking Water Guidelines standard is an aesthetic based value and there is no definitive health based value, readings above this have, and will continue to trigger a public health advisory to people who need to be aware of these levels and take action as appropriate. These are people who are monitoring their salt intake for high blood pressure, cardiovascular disease, chronic kidney failure or any dietary reason and parents of infants less than 6 months of age who are bottle fed.

These water quality impacts are being managed to minimise the effects on town water supplies, downstream river water users and the environment.

The dewatering of flooded mine pits at the Ensham Coal Mine is authorised by a Transitional Environmental Program issued under the *Environmental Protection Act 1994* by the EPA. This is one of a number of Transitional Environmental Programs approved to assist in the recovery of mining operations following the flooding that occurred in the Fitzroy River Basin in January/February 2008.

Mining companies across the Fitzroy River system are permitted to discharge water under the conditions specified in environmental authorities issued under the *Environmental Protection Act 1994* by the EPA. Discharges of water from mines is not the only source of impacts on water quality with stormwater, treated effluent from townships, tail-water discharges from irrigation areas and overland flows all contributing to the quality of water in the river and its contaminant load.

The Rockhampton Regional Council and Central Highlands Regional Council in the second half of 2008 requested the State government to give consideration to undertaking a study of the cumulative impacts on water quality of mining activities in the Fitzroy River system.

##### **Purpose / Scope**

The purpose of this study is to investigate current and historical data and report on the overall implications of water discharges from mines on water quality in the Fitzroy River system, and to make recommendations for the management of water discharges from mining activities with respect to water quality. This study focuses only on the impact of water discharges from mines, their quality, and the impact that those discharges may have on the river environment and the quality of water in the Fitzroy River system.

It is recognised that a range of other land uses and management practices may have an impact on water quality. The impact of these is not within the scope of this study.

##### **Key Elements of the Study**

The study is to include:

- a brief history of mining development in the Fitzroy River Basin
- a summary of the regulatory framework for management of the quality of water discharges from mining activities (and its evolution over time)

- a summary of existing approaches to minimising water quality impacts of water discharges from mining activities
- an analysis of currently authorised water discharges from mining activities
- a forecast of future mining activities and their potential to impact on water quality
- a review of water quality data, how and where it is collected, by whom and to whom it is reported
- an analysis of trends in water quality and an assessment of impacts
- an analysis of risks associated with changes in water quality
- recommendations for improving water quality data collection, its coordination and management (note this is related to the implementation of Service Delivery and Productivity Commission recommendations)
- recommendations for the future management of water discharges from mining activities

### ***Stakeholders***

EPA	NRW	Queensland Health
DPI&F	SunWater	DME
DTRD&I	Regional Councils	Queensland Resources Council
Mining companies	Agforce	Landholders
QFF	Fitzroy Basin Association	

### ***Study Management***

The study is to be led by the EPA with a project team made up of staff from the EPA and NRW. The EPA will designate a person from its staff to be the study leader. The study team will be based in Rockhampton. Oversight of the project will be coordinated through a Steering Committee of senior officers from the EPA and NRW.

Consultation will occur with the various stakeholder groups during the life of the study and on the draft study report.

Meetings relating to the management of the study will be held as far as possible by teleconference. Meetings relating to consultation with stakeholders will be held at locations in the Fitzroy River Basin.

It is intended that the study will be based on currently available data and information sets. It is not intended that the study collect new water quality data.

Each party to the study will contribute its own costs with the EPA contributing the cost of publishing the draft and final study report.

Dear <Title>

### **Water Quality Monitoring Results for Mine Water Discharges during past 5 years**

On 16 October 2008, Minister for Sustainability, Climate Change and Innovation the Hon. Andrew McNamara, announced that the Environmental Protection Agency (EPA) will lead an independent study into the cumulative impact of mining on the health of the Fitzroy River.

To properly complete this study an analysis of currently authorised mine water discharges is required. To facilitate the analysis of relevant water quality data the EPA requests that you submit electronic documentation (Excel spreadsheets for water quality results. No PDF documents) outlining all mine water discharges over the past 5 years. The submitted documentation should include:

- All raw water quality and flow data (e.g. ML/day or m<sup>3</sup>/s) in an Excel spreadsheet collected on discharges to the environment including dates, times, monitoring point site ID codes. This should include at least all discharge monitoring points and indicators specified in your environmental authority;
- All raw water quality and flow data (e.g. ML/day or m<sup>3</sup>/s) in an Excel spreadsheet collected for the receiving environment including dates, times, monitoring point site ID codes. This should include at least all upstream and downstream locations specified in environmental authorities or approved monitoring programs;
- A map showing the mine location, discharge location/s, monitoring locations and name of receiving environment (creek or river);
- Coordinates of discharge and monitoring locations (Lats and Longs in GDA 94);
- The circumstances under which any discharge occurred (e.g. flow or no flow conditions); and
- Any other relevant information to describe the conditions and circumstances of the discharge or the receiving environment that has not been specifically requested above (e.g. a comparison of water quality and Licence limits).

I request that this information be submitted via email to [REDACTED] of the EPA at [REDACTED] [@epa.qld.gov.au](mailto:[REDACTED]@epa.qld.gov.au) by no later than **Wednesday 19 November 2008**.

Should you require any further clarification about the nature of the water quality information required please contact Dr [REDACTED] of the EPA on telephone [REDACTED]  
[REDACTED]

Yours sincerely

Terry Wall

Mr [REDACTED]  
President  
Queensland Resources Council  
Level 13, 133 Mary Street  
BRISBANE QLD 4000

Dear Mr [REDACTED]

Thank you for your letter of 26 September 2008 regarding the need for a balanced approach to dealing with the impacts of a range of activities on the quality of water in the Nogoia, Mackenzie and Fitzroy Rivers.

Ensham Resources Pty Ltd is to be commended on the approach taken by the Ensham Coal Mine to support the Central Highland community through the difficult task of recovering from the flooding that occurred in the first two months of this year.

Additionally, Ensham Resources Pty Ltd's decision to cease dewatering of the mine and manage the substantial remaining volume of water on the mine site was an appropriate response to growing community concern about the potential for this activity to have wider impacts in the community.

I acknowledge that there is a range of activities that result in cumulative impacts on water quality in catchments. Key longer term measures for addressing these impacts include the Great Barrier Reef initiatives such as the Reef Water Quality Protection Plan and investment with the Australian Government in the Caring for Our Country program and Queensland's complementary natural resource management programs.

B/C

**The Honourable the Minister for Natural Resources and Water and Minister Assisting the Premier in North Queensland.**

By direction. For your information.  
Copy of inwards correspondence is attached.

Queensland Government

20/10/08

New investment opportunities are imminent, and the Fitzroy Basin Association is well placed to be involved in leading the process of developing our understanding and management of these cumulative impacts on the health of our river systems. I see the development and implementation of landscape scale responses that lead to the improvement of water quality in our rivers as the primary approach for dealing with cumulative impacts from a broader natural resource management perspective.

However, the collective issue of mine water quality discharge arrangements demands immediate attention, given the increasing community concern and the real impacts currently being experienced by some towns. In particular, the interaction of current Transitional Environmental Programs and Environmental Authorities issued to mines needs to be considered in the aggregate. This is why I have requested that relevant Ministers direct their departments to undertake a specific study 'Review of Water Quality Arrangements for Mines Discharging Water into the Fitzroy River System'. I have attached the terms of reference for this study.

The Environmental Protection Agency, as the regulator of water discharges from mining activities, will lead the study with support from the Department of Natural Resources and Water (DNRW). The draft report for review is to be prepared by the end of this year. The Queensland Resources Council is recognised as a key stakeholder and will be included in consultation on the draft report.

I am advised that the DNRW is responding directly to you on specific matters relating to implementation of the Fitzroy Resource Operations Plan.

Thank you for bringing these matters to my attention and I wish you well in your upcoming retirement. Should you have any questions regarding the study of water discharges from mining activities, please do not hesitate to contact Mr Terry Wall, Director-General, Environmental Protection Agency, on telephone

[REDACTED]

Yours sincerely

**ANNA BLIGH MP**  
**PREMIER OF QUEENSLAND**

## ***Attachment: A Review of Water Quality Arrangements for Mines Discharging Water into the Fitzroy River System***

### **Terms of Reference**

#### **Background**

The dewatering of flooded mine pits at Ensham Coal Mine has resulted in water quality impacts, evidenced by a rise in sodium and salinity levels in the Fitzroy River system which in some places exceed the NHMRC Drinking Water Guidelines for sodium in drinking water.

While it is recognised that the NHMRC Drinking Water Guidelines standard is an aesthetic based value and there is no definitive health based value, readings above this have, and will continue to trigger a public health advisory to people who need to be aware of these levels and take action as appropriate. These are people who are monitoring their salt intake for high blood pressure, cardiovascular disease, chronic kidney failure or any dietary reason and parents of infants less than 6 months of age who are bottle fed.

These water quality impacts are being managed to minimise the effects on town water supplies, downstream river water users and the environment.

The dewatering of flooded mine pits at the Ensham Coal Mine is authorised by a Transitional Environmental Program issued under the Environmental Protection Act 1994 by the EPA. This is one of a number of Transitional Environmental Programs approved to assist in the recovery of mining operations following the flooding that occurred in the Fitzroy River Basin in January/February 2008.

Mining companies across the Fitzroy River system are permitted to discharge water under the conditions specified in environmental authorities issued under the Environmental Protection Act 1994 by the EPA. Discharges of water from mines is not the only source of impacts on water quality with stormwater, treated effluent from townships, tail-water discharges from irrigation areas and overland flows all contributing to the quality of water in the river and its contaminant load.

The Rockhampton Regional Council and Central Highlands Regional Council in the second half of 2008 requested the State government to give consideration to undertaking a study of the cumulative impacts on water quality of mining activities in the Fitzroy River system.

#### **Purpose / Scope**

The purpose of this study is to investigate current and historical data and report on the overall implications of water discharges from mines on water quality in the Fitzroy River system, and to make recommendations for the management of water discharges from mining activities with respect to water quality. This study focuses only on the impact of water discharges from mines, their quality, and the impact that those discharges may have on the river environment and the quality of water in the Fitzroy River system.

It is recognised that a range of other land uses and management practices may have an impact on water quality. The impact of these is not within the scope of this study.

## Key Elements of the Study

The study is to include:

- a brief history of mining development in the Fitzroy River Basin
- a summary of the regulatory framework for management of the quality of water discharges from mining activities (and its evolution over time)
- a summary of existing approaches to minimising water quality impacts of water discharges from mining activities
- an analysis of currently authorised water discharges from mining activities
- a forecast of future mining activities and their potential to impact on water quality
- a review of water quality data, how and where it is collected, by whom and to whom it is reported
- an analysis of trends in water quality and an assessment of impacts
- an analysis of risks associated with changes in water quality
- recommendations for improving water quality data collection, its coordination and management ( Note this is related to the implementation of Service Delivery and Productivity Commission recommendations)
- recommendations for the future management of water discharges from mining activities

## Stakeholders

EPA	NRW	Queensland Health
DPI&F	SunWater	DME
DTRD&I	Regional Councils	Queensland Resources Council
Mining companies	Agforce	Landholders
QFF	Fitzroy Basin Association	

## Study Management

The study is to be led by the EPA with a project team made up of staff from the EPA and NRW. The EPA will designate a person from its staff to be the study leader.

The study team will be based in Rockhampton. Oversight of the project will be coordinated through a Steering Committee of senior officers from the EPA and NRW.

Consultation will occur with the various stakeholder groups during the life of the study and on the draft study report.

Meetings relating to the management of the study will be held as far as possible by teleconference. Meetings relating to consultation with stakeholders will be held at locations in the Fitzroy River Basin.

It is intended that the study will be based on currently available data and information sets. It is not intended that the study collect new water quality data.

Each party to the study will contribute its own costs with the EPA contributing the cost of publishing the draft and final study report.

**E-MAILED**  
28 September 2008

26 September 2008

The Hon Anna Bligh MP  
Premier of Queensland  
Executive Building  
George Street  
Brisbane Qld 4000

Dear Premier

**Nogoa~Mackenzie~Fitzroy River Systems – The Need for a Balanced Approach**

While the Central Highlands region continues its efforts at recovery following the unprecedented and devastating floods in January 2008, the Mayor of Rockhampton Regional Council Cr Brad Carter has drawn my attention to a letter he has written to you on 15 September 2008 expressing his Council's concerns over EPA monitoring of non-routine post-flood discharges into the Fitzroy River, and concerns about cumulative impacts of upstream discharges into the Nogoa~Mackenzie~Fitzroy River system that his letter rather presumptuously attributes to '*mining operations*'.

The letter from Mayor Carter appears to have caused a number of State agencies to focus their studies and reviews in relation to this vitally important river system exclusively on '*cumulative impacts of mining*' in a manner which is proscriptive of the uses and impacts imposed by other activities. The letter, *inter alia*, asks State agencies to exclude for example the impacts of the activities involved in irrigated and non-irrigated agricultural cropping, the raising of beef cattle and other livestock, the processing of related agricultural products, the effects of other industrial activity, as well as the presence of residential communities and their infrastructure.

The scale of this huge river system is best absorbed visually from the attached maps which depict the system and its major tributaries including the Theresa, Retreat, Nogoa and downstream from Ensham, the Sandhurst, Comet, Cooroora, Blackwater, Roper, Connors-Isaacs, Charlevue and Dawson sub-systems as well as the plethora of lesser streams and tributaries. The wide variety of human activity can be seen and imagined by reference to the maps. By way of scale, it is more than 500 kms by river from Ensham Mine to Rockhampton.

The proscription of other activities and the restrictive focus on '*cumulative mining impacts*' in isolation is inappropriate and unhelpful. Such incompleteness carries great dangers of producing misleading results. This concern has been communicated to the State agencies.

**The Queensland Resources Council recommends that the reviews under discussion between State agencies and Regional Councils should not be proscriptive and that scoping of such work requires a more objective and comprehensive approach to enable a good understanding of post-flood impacts. QRC officers are available to collaborate with agencies on the scoping task.**

A similar view favouring a more comprehensive approach also has been publicly expressed by the Fitzroy Basin Association.

Direct conversations between QRC President (and Ensham CEO) John Pegler and Mayor Peter Maguire (Central Highlands Regional Council) and Mayor Brad Carter (Rockhampton Regional Council) reveal that a proscriptive approach which focussed only on 'cumulative mining impacts' was not the intention of their requests. Both Mayors acknowledged the presence of a wide variety of activities of many sectors and their potential for impacts on this very large, vital river system.

As you know, there has been a very extensive dialogue between QRC Member, Ensham Resources Pty Ltd ("Ensham"), and Queensland Government agencies related to the Ensham Flood Recovery Project in which Ensham has been engaged continuously throughout 2008. The aim of the Ensham Project is to recover the Ensham Mine, safely and sustainably, following the devastation which accompanied the unprecedented flooding which occurred in January 2008. QRC notes that Ensham has been very appreciative of the professional and careful approach taken by the State agencies and Regional Councils in dealing with the many regulatory issues.

The flood event and its impacts on Ensham and others in the region were publicly documented in a presentation given by Ensham at a public forum organised by the Fitzroy Basin Association (FBA) in Rockhampton on 5 ~ 7 August 2008. This Forum was well attended by officers from all relevant State Government agencies as well as from Rockhampton Regional Council and Central Highlands Regional Council together with various groups representing agricultural and environmental interests, along with members of the public.

For convenience, the Ensham presentation is attached.

Other presentations and papers are available from FBA. For example, a number papers at the FBA Forum dealt with other non-mining impacts, such as the cumulative impacts of herbicides including Atrazine, Simazine, Diuron and Tebuthiuron as used in the agricultural sector. The toxic effect of such materials on plant, fish and animal life in and around the river system following the completely uncontrolled releases from agricultural holdings after flooding obviously is deserving of continuing attention. Such study is especially warranted given the recent publicly expressed concerns about the health of fish and mangroves and other aquatic life in the river system. If improperly used or unwittingly released, some of these herbicidal materials are also thought to have carcinogenic effects on human health and animal health. They are deserving of great care and control.

Meanwhile QRC advises that Ensham confirmed that it voluntarily suspended its pumping program on Tuesday 8 September 2008 and also subsequently confirmed that it had volunteered not to re-commence the program. It will absorb the imposts and complications of holding 12,000 to 14,000 megalitres of the remaining flood water at the Ensham Mine. Prior to this cessation, Ensham also purchased and used ~64,000 megalitres of water from local Nogoa-Mackenzie allocation holders at a cost of ~\$10 million, inclusive of SunWater charges of ~\$2 million. The purchases were made to ensure that Ensham met the EPA specifications concerning discharge water quality. The direct financial contribution to the region arising from these payments as well as the indirect impost paid to the State Government via SunWater by Ensham as a flood victim, is obvious.

QRC also reports that Ensham has also continued its voluntary proactive approach by providing assistance with engineering and actual works to assist the Central Highlands Regional Council with improvements to water supplies to regional towns. These initiatives were reported to Hon Paul Lucas MP, Acting Premier, during his visit to Emerald on Wednesday 24 September 2008. At the same time, QRC understands that Central Highlands Regional Council, supported by Ensham, has asked the State Government through the Department of Natural Resources and Water, to review how allocations or loss off-sets from Fairbairn Dam can be used to provide new water into the weirs supplying towns in the CHRC region.

Yours sincerely

## **Ensham supports Council improvements at Blackwater**

**23 September 2008** – Ensham Resources is supporting Council improvements to the Blackwater treatment plant which aim to quickly alleviate water quality concerns at Blackwater, Tieri and Bluff.

Discussions also continued last Friday with State Government with the aim of utilising water from Fairbairn Dam as the “top up” water for Bedford Weir to underwrite the improvements.

Over the weekend, crews organised by Ensham at the behest of Central Highlands Regional Council, installed a ‘bypass’ pump and pipeline around the large council holding dam at Blackwater to speed up the flow of better quality water through the system.

According to Council this should result in a rapid improvement in water quality for local residents. The arrangement will also provide the opportunity to clean out years of accumulated silt and backwashing from the large holding dam at Blackwater so that the dam does not continue to degrade the taste of the improved water supplied from Bedford Weir.

Ensham General Manager, Technical, Colin Moffatt said Ensham had completed installation of the temporary bypass pump and 500 metres of 300mm diameter pipeline, ready for commissioning by Council last Monday.

Council and Ensham's engineers have confirmed that there are opportunities and budgets to instal improved monitoring equipment to better control water quality in the aged Blackwater treatment plant.

Following the successful ‘bypass operation’ around the Council owned and operated Holding Dam supplying the Blackwater water treatment plant, Ensham will continue to aid Council in identifying ways and means to improve the system.

“The State Government is reviewing how allocations from Fairbairn Dam can be used to provide new water into the Bedford Weir. Ensham has already purchased 64,000 megalitres of water allocations as part of its program”, Mr Moffatt said.

ENDS

## FBA calls for long-term monitoring of Fitzroy

**LEADING** Central Queensland natural resource management group, the Fitzroy Basin Association Inc (FBA), says long-term monitoring is required to measure and improve the health of the Fitzroy River.

FBA chief executive officer Suzie Christensen said while the organisation was concerned about the health of the river, recent claims by a University of Queensland professor seemed to be based on a cursory examination, rather than actual local data.

### Q: Is the Fitzroy River dying?

A: Information presented recently in the media on mangrove die-back and fish health in the river was vague and there could be many potential causes.

"The mangrove die-back could have been caused by flood inundation, sediment, the impact of freshwater, and a reduced ability to photosynthesise. It is unlikely you would see such a severe result from chemicals unless there was a massive injection of undiluted pollutant

and there is no evidence of that," she said.

"In addition:

- Fisherman reported very large catches directly after the flooding in January and February '08

- There is no real indication of whether fish numbers have suddenly dropped

- Extended low water temperatures this winter may have affected fish

- Fish naturally move through estuaries and out to sea as a result of flooding

- Flooding aids fish breeding and numbers are expected to boom in coming years.

"The Fitzroy is a large and complex river system, and experiences periodic big flows rather than regular smaller floods. We haven't seen a flow of this size for 17 years, and the causes of the short-term ecological impacts require a sound scientific basis for action."

### Q: What work is underway to improve the Fitzroy?

A: Lots of good research and on-ground work is being done to improve catchment health, our knowledge

and our ability to manage our precious river resource.

"FBA recognises the need to improve the health of the Fitzroy and had been working with the community for more than 10 years to enhance the management of creeks and rivers," she said.

"We work directly with local landholders to improve land management to reduce erosion and run-off into waterways, and also to collect water-quality data. Evidence exists that we have had a positive impact.

"We support the development of a long-term monitoring plan and local water quality guidelines to get a clearer picture of river health. Specific investigations into the impacts of recent events are required and already under way.

"FBA also organised a large community forum in August this year to discuss the impact of recent flooding on our region, where issues including water quality, the impact of mining, mangrove health and fish stocks were discussed."

### Q: What else can be

done?

A: More information and support is needed. "Central Queensland said a collaborative approach was needed to fully understand and protect our region's important natural resources.

"Our region has undergone strong agricultural development and more recently the mining and heavy industry boom, which has seen lots of development over a short time period," she said.

"We need to be mindful of the collective impact these activities can have over time and not jump to unjustified conclusions."

She said it was also important that there was recognition of the region's role as the engine room of the Queensland economy and support for efforts to manage resources sustainably.

"CQ is the economic powerhouse of the state and FBA calls on the Queensland government to return some of that revenue to the area to ensure we can effectively manage the impacts of development."

## Fitzroy Model Water Conditions Review

### TERMS OF REFERENCE

#### 1.0 Abbreviations Used

Department of Environment and Resource Management	DERM
Electrical Conductivity	EC
Environmental Authority	EA
Environment and Natural Resource Regulation	ENRR
Environment and Resource Sciences	ERS
Fitzroy Water Quality Advisory Group	FWQAG
Queensland Resources Council	QRC
Receiving Environment Monitoring Program	REMP
Regional Service Delivery	RSD
Transitional Environmental Program	TEP
Water Management Plan	WMP

#### 2.0 Background

DERM proactively works with mining companies to improve the management of water on mine sites and reduce the risk of contaminated discharges. The improvements have focussed on areas such as:

- improvements to on-site storages to better handle large rainfall events
- diversion of clean water around sites so as to prevent mixing with contaminants
- management of water so that any release is of the best quality water and occurs during periods of high flow in the receiving waters
- contingency and response plans to account for various scenarios and provide clear, staged actions for the mining company in the event of above average rainfall
- emergency response plans which detail how the site will respond in the event of a contamination incident.

It is recognised that due to the nature of mining and the unpredictability of the wet seasons it is impossible to eliminate the risks of discharges from mine sites. To effectively manage environmental impacts of mine water releases it is necessary to control and limit discharges in a manner that considers both local and cumulative effects of mine releases on relevant environmental values of downstream receiving waters (ref Environmental Protection (Water) Policy 2009).

In 2009 DERM worked closely with coal mines and QRC to introduce the new water discharge management and monitoring requirements in the Fitzroy Basin. The new Fitzroy Water Model Conditions set limits for the quality of water discharged, including salinity levels, and restrict the volume of water discharged to a percentage of the flow in the receiving waters.

DERM has also prepared a draft report on environmental values and water quality objectives for Fitzroy sub-catchments, including locally specific water quality guidelines

based on DERM reference monitoring. The draft report was publicly released for consultation in December 2010.

Recent wet season events have highlighted the importance of the model conditions in managing mine discharges. Monitoring data collected during the last two years provides an opportunity to review the model conditions and ensure that the conditions are suitable in relation to the key objective of maximising the ability of mines to discharge water while ensuring the protection of the environment and downstream water users.

DERM is therefore undertaking a review of the methodologies and specifications relating to the objectives of the model conditions in conjunction with the mining sector.

### 3.0 Objective

The objective of the review is to:

- evaluate the methodologies and conditions relating to the objectives of the conditions
- evaluate the conditions in light of recent wet seasons and collected data
- ensure the conditions are outcome based
- avoid repeated and ongoing use of TEPs as a method of authorising discharges.

### 4.0 Key Considerations

In particular the review will focus on:

- In the context of the ability to achieve water quality objectives and avoid detrimental impacts on environmental values of receiving waters, a comparative study of:
  - old EAs and new (2009) EA lower end of pipe limits and their justification; and
  - EAs vs recent TEPs
- High and low flow discharge conditions/emergency releases to avoid future TEPs
- Defining 'mine affected water'
- Passive (ie. spillway) and active discharges and the requirement to notify
- Linkages with WMPs
- Populating the right parameters and limits for releases based on the latest data and information (including release point and environment monitoring undertaken by mines, reference monitoring undertaken by DERM and relevant environmental values, water quality objectives and guidelines.)
- Monitoring and reporting requirements
- Use of gullies/depressions/diversion drains as a conduit on site for mine affected water
- Notification requirements
- Evaluating receiving water flow rate specifically in relation to dilution ratios and location of flow gauges.

The review will involve examination of the monitoring data for the last two years from mines in the Fitzroy Basin. The data is required to evaluate the performance of the existing model conditions in achieving key environmental objectives and will consequently form the basis of any proposed or considered changes to the key water quality parameters in the Fitzroy Model Water Conditions. The data includes:

- Site and monitoring location information

- All discharge water quality and quantity/flow data from these sites for the last two years (EA and TEPs)
- All environmental water quality data for the last two years (EA, TEP and REMP)
- All creek flow data from gauging stations for the last two years (EA, TEP and REMP)
- Site representative contact details
- Spatial coordinates.

The collated data will be used in the scientific process of reviewing the model conditions. With sufficient high quality data readily available in excel format, the review of the model conditions may include an assessment of the “triggers” table, that is, to ascertain whether certain indicators may not be needed in future routine monitoring. A review of EC will also be undertaken.

A formal request for the data was sent to QRC by DERM on 30 March 2011. QRC is collating this information for provision to DERM by 5 May 2011. QRC’s assistance in gathering this information is appreciated and will be critical to the success of the review.

A report will not be produced at the completion of the review. Any outcomes from the review will be reflected in an update to the model conditions, as necessary.

## 5.0 Methodology

The review methodology will comprise DERM internal and DERM/QRC workshops and consultation with relevant Mayors and the FWQAG. Details for timing of these activities are as follows:

- The first DERM internal workshop is to be held on 9/10 May in Brisbane (confirmed date) and will concentrate on licensing conditions. Workshop participants are to include nominees from RSD, ENRR and ERS.
- A working draft document of the model conditions from the first DERM internal workshop is to be developed and circulated to QRC for review one week (23 May) prior to the first DERM/QRC workshop (31 May).
- The first DERM/QRC workshop is to be held on 31 May in Brisbane (date to be confirmed with QRC) and will discuss the working draft of the model conditions.
- The second DERM internal workshop is to be held on 8/9 June in Brisbane (confirmed date) and will concentrate on parameters, limits, flow triggers and dilution rates based on a review of available monitoring data and guidelines. Dr Ian Ramsay, Chief Scientist and his team will develop and present potential licensing approaches for review by workshop participants. Technical officers only are required to attend this workshop - other nominees are optional.
- The working draft of the model conditions from the second internal DERM meeting to be circulated to QRC for review one week (20 June) prior to the second QRC workshop (week commencing 27 June).
- The second DERM/QRC workshop is to be held in the week commencing 27 June (tentative date) and will focus on the science data in the working draft of the model conditions. Relevant expertise and company technical staff will be invited to attend.
- The working draft of the model conditions from these workshops is to be circulated to the FWQAG for comment (30 June) one week prior to the FWQAG meeting set for

7 July. Andrew Brier to attend the FWQAG in July to finalise the working draft of the model conditions with FWQAG.

- Relevant Mayors are to be briefed at the same time as the FWQAG (via email).
- Final comments/amendments on the working draft of the model conditions to be finalised with appropriate Industry representatives (via email) by 22 July.
- Final model conditions to be circulated by 31 July.
- The first DERM internal and DERM/QRC workshops will be set dates and will not change. The workshops are not the only opportunity for interaction/consultation and additional meetings and correspondence will be organised as required. Any further clarification or amendments required to be undertaken to the draft working documents will be done out of session via email.
- The second DERM internal and DERM/QRC workshops are tentative and may be subject to change dependant on nominee availability and development of adequate working drafts of the model conditions.

## 6.0 Management Arrangements

The review will be managed by the General Manager, Coal and CSG Operations, RSD. The General Manager will be supported in conducting the review by staff from:

- RSD, Environmental Services, Central West Region, DERM
- ENRR, DERM
- ERS, DERM

The panel will draw on expert advice as required.

## 7.0 Approach

The review will consult internally, across government and with non-government agencies, relevant industry representatives and key stakeholders.

The review will incorporate the following key stakeholders:

- Appropriate Industry representatives
- QRC
- FWQAG, whose membership includes:
  - AgForce
  - Banana Regional Council
  - Capricorn Conservation Council
  - Central Highlands Regional Council
  - Central Queensland University
  - Department of Employment, Economic Development and Innovation
  - Fitzroy Basin Association
  - Fitzroy Basin Elders Committee
  - Fitzroy Food and Fibre
  - Fitzroy River Fish Stocking Association
  - Isaac Regional Council
  - Queensland Conservation Council
  - Queensland Health
  - Rockhampton Regional Council/Fitzroy River Water
  - Stanwell Corporate Limited

- SunWater

## 8.0 Timing

The review is to commence in May 2011 and be completed by 31 July 2011 in order to enable time for processing of EA amendments prior to the 2011/12 wet season.

**Prepared by:** General Manager, Coal & CSG Operations, Regional Service Delivery, DERM  
**Date:** 11 May 2011  
**Version:** 1.2

### Attachment 3.

#### FMWCR - DERM Responses to Industry Comments received

Industry Comment	DERM Response
<b>22 July 2011</b>	
<p>While we are pleased that DERM has included an explanatory note that ‘alternative approaches’ can be proposed, but on the face of it this appears just to relate to site-specific conditions to deal with normal weather. At our meeting on 29 June, item 3 was specifically about ‘model conditions and extraordinary events’. When DERM agreed to insert an explanatory note about the ability to consider site-specific cases, obviously in the context of the agenda item no-one understood this as just being generally about the ability to negotiate different conditions from the model conditions, but rather, we were talking specifically about planning upfront for extraordinary events. Dr Ian Ramsay agreed that there had been learnings from the last wet season which could be applied to site-specific negotiations for conditions to deal with extraordinary events, so as to avoid the need for TEPs. Industry said that there could be an explanatory note that, if specified weather or flooding thresholds were reached, this would trigger a schedule of overriding conditions (obviously based on what was previously negotiated site-by-site for TEPs). This would not cater to all types of possible future events (which would be impossible, as none of us has a crystal ball), but it would at least prevent a repetition of the TEPs process if the next wet season is fairly similar to the last one. Conditions would have the advantage of kicking in straight away, enabling prompt and suitably staged releases, rather than diverting government and industry resources unnecessarily, during the</p>	<p>DERM agrees with the value in forward preparation, emergency and contingency planning, however is not convinced that the model conditions can cater for unknown emergency circumstances. This is not due to inability to predict events of certain magnitudes, but more to do with the ability to predict how a large number of variables may interact following an unknown extraordinary event, e.g. how many mines are impacted, what about influences from other affected land uses, natural effects such as saline groundwater discharge etc.</p> <p>In the event that a mining company supplied information including detailed contingency planning exercises to support an emergency discharge scenario, including evaluating the effect on local / regional environmental values then DERM would consider any alternative condition proposed on a case by case basis.</p> <p>One of the difficulties in pre-solving water management problems associated with extraordinary events, is the need to consider cumulative impacts associated with an authorised discharge. If reasoning starts from the basis of protecting environmental values (including human use values such as drinking water supplies), then a broad approach to extraordinary events is likely to result in a conservative approach that assumes each mine has similar emergency needs when considering cumulative impacts.</p>

<p>height of an emergency, to negotiating paperwork.</p>	<p>Contingency planning information may be of great benefit to a mining company in making preparations for future extraordinary events. Being prepared ahead of time with an emergency response proposal supported by quality information about associated risks to environmental values, and even seeking advanced comment from DERM on likely needs for consideration during a similar wet season event, will prepare both industry and DERM for future extraordinary events.</p>
<p>The authorisation of releases under condition W41 is a little more narrow than we had in mind for the water management plan and ESMP, because it is restricted to ‘stormwater’. The types of clean water which are released from a mining lease, but which do not pass through unrehabilitated disturbed areas are obviously not just restricted to stormwater, unless we take an extremely broad definition of ‘stormwater’, including groundwater emerging into springs etc. An example we gave at the November workshop was a watercourse contaminated by agricultural chemicals from an upstream farm, passing through the perimeter of a mining lease. This was why our original suggestion was that the simplest solution to this broader problem would be to amend condition W1 to refer to ‘Contaminants <u>from the mining activities</u>’, but if condition W1 remains completely unreconstructed, then we need to have specific authorisations for every conceivable category of water passing through the mining lease.</p>	<p>On clarifying this point, there are a couple of associated points. One is the lack of exclusion of water in ‘true’ sediment dams in the ‘mine affected water’ definition, as was an original intent, and secondly is the perception that existing conditions may cause an EA holder to become liable for contaminants released to waters by a third party upstream that subsequently flow through a mining lease area.</p> <p>The first point is accepted and a modification to the definition of ‘mine affected water’ has been made.</p> <p>The second point is not agreed, but to provide less cause for dispute and maintain the intent of the condition, condition W1 has been amended to explicitly prohibit the release of contaminants to waters as a result of the mining activities (unless otherwise permitted under the EA).</p>
<p>Another problem is that, because condition W2 is not required to authorise releases of mine affected water from one internal storage to another, there is currently no authorisation anywhere in the conditions for these types of internal transfers but condition W1 still prohibits them (given that W1 uses a different definition of ‘waters’). Again, there would be various drafting options for these problems.</p>	<p>It is agreed that previous drafting changes did not resolve this issue. A changed approach is necessary and is now based on providing specific authorisations for particular needs e.g. W3 provides a specific permission to release to internal water management infrastructure, reuse conditions include permission to deliver to a third party</p>

<p>Assuming that we stay with the restriction in condition W41 for 'stormwater', QRC's recommended solution would be along the following lines:</p> <ul style="list-style-type: none"> <li>○ W1 – Add '<i>from the mining activities</i>', after 'contaminants'. We acknowledge that this suggestion has been previously rejected, but it still has the advantage of simplicity, in dealing with waters other than stormwaters which are just 'passing through'.</li> <li>○ W2 Add a second part to this condition: '<i>The release of mine affected water to internal water management infrastructure that is installed and operated in accordance with a water management plan that complies with conditions W32 to W37 inclusive is permitted.</i>'</li> </ul>	<p>artificial water storage e.g. farm dam.</p>
<p>We are still missing an authorisation for re-use water to be delivered to the third party in the third party's artificial storage structure. Presumably, the intention is that it is not ok to deliver the mine affected water to the third party's natural watercourse, lake, lagoon, groundwater, swamp or wetland, but the conditions do not mention this anywhere (other than generally under W1), and they do not draw a specific distinction between this and the fact that it is ok to deliver to a farm dam, tank, artificial channel etc (which is also generally prohibited by condition W1). This is not just a minor technical point. There are in fact third parties out there who have asked for mine affected water to be delivered to natural watercourses on their properties, and the mines cannot point to anything in their conditions which makes a specific distinction in this regard, which places the mines in a difficult position in dealing with their communities.</p>	<p>Agreed and as above.</p>
<p>We would still like to see a reference to delivery by artificial open channel. If DERM is not keen to include this in the model condition,</p>	<p>OK on explanatory notes, for artificial channel, what is risk to groundwater seepage, is the channel contained or does it flow past the</p>

<p>then we would at least like to see an explanatory note to the effect that site-specific modes of delivery other than piping or trucking may be specifically authorised. The explanatory notes could also mention that conditions may authorise delivery to types of businesses other than those referenced in the model conditions. (Many existing conditions have already replaced the ‘adjoining mines’ reference in W26 with more general references to ‘other businesses’ or government agencies, which is useful for mines located within a reasonable distance of industrial areas.)</p>	<p>particular customer.</p> <p>These types of questions can only really be contemplated by site specific consideration but can possibly be captured in an explanatory note.</p>
<p>Some companies do not feel that the inclusion of Sulphate is required in Table 4 / Mine-affected water release events. Targeting an EC limit of 1000 mg/L ensures that Sulphate remains below 250 mg/L</p>	<p>DERM data review reveals sulphate as a parameter of interest in release waters. If the assurance of controlling EC means that sulphate will also comply as suggested here, and sulphate is to be monitored anyway, then there is no reason to object to the limit being imposed.</p>
<p>Sodium constitutes a significant new burden on already extensive monitoring requirements. Given that the aim of Table 3 is to only include the contaminants that do pose a risk and to remove those which have never excluded trigger values, it would be good to also have the ability to remove sodium from Table 3 once data become available (for instance in one year).</p>	<p>Sodium is intended to be dealt with in the same way as other ‘potential contaminants’ in Table 3. It is true that sufficient data could be collected inside of a year to consider a review of the requirement, depending on rainfall and the frequency of release events. It is also possible that it could take longer than 2 years if release events were infrequent. Footnote 2 beneath Table 3 has been amended to provide some added flexibility to considering the adequacy of such a data set.</p>
<p>Monday, 25 July 2011</p>	
<p><i>Table 3. Potential Contaminants</i>  Removing the need to test for substances that have never been detected in release water is an improvement on previous conditions. This should be extended to excluding those substances that occur in mine water in similar or lesser concentrations than they do in the receiving environment.</p> <p><u>The explanatory note to Table 3 testing parameters should be expanded to facilitate exclusion of contaminants in release waters that occur in similar concentrations in the release waters as they do in</u></p>	<p>The key issue here is having sufficient data as well as having methodology for excluding potential contaminants. If the contaminants are low in all dams and less than receiving waters (where receiving waters sampling numbers and QA is sufficient), there would be a case for removing contaminants. The challenge is that some dams will have high levels of contaminants and others will have low levels (perhaps those with the RPs). This provides a case to keep this as a contaminant end of pipe (may be a case for dropping</p>

<p><u>the receiving waters.</u></p>	<p>RE monitoring) unless the mine can demonstrate cross contamination will not occur.</p> <p>It is difficult to make a broad statement such as that proposed here. If the receiving water was already ‘overloaded’ with a particular contaminant then removing measurement of further inputs is not desirable. If it is not ‘overloaded’ then the case can be successfully made and footnote 2 beneath Table 3 provides the guidance to allow an informed review and consideration of these monitoring requirements. It is true that sufficient data may be collected inside of 2 years in order to revise monitoring requirements depending on rainfall and release events. In some circumstances it may also take longer to collect sufficient data. Footnote 2 is amended to provide greater clarity and flexibility in this regard.</p>
<p><i>W7. Flow Measurement</i> This condition does not allow for the holder to rely on existing flow gauging infrastructure that was installed and is operated and maintained by others under agreement or otherwise.</p> <p><u>This condition should be amended to allow flexibility in relation to the arrangements under which flow data is acquired. For example a company may contract a 3rd party to supply data at the nominated sites, with the 3rd party owning, installing and maintaining the necessary equipment.</u></p>	<p>Fair comment. Condition W7 amended to require EA holder to ensure it happens rather than require it to be done by the holder.</p>
<p><i>W8. Natural Flow During Release.</i> W8 is read to mean that regardless of any other condition in the EA, releases in accordance with W2 must only occur during periods of natural flow. It is not clear how this applies to managing water where sediment is the only contaminant or any mine affected water by definition, that is clean water or has been treated or to a level suitable for</p>	<p>Amendment made to definition of ‘mine affected water’ to deal with ‘true’ sediment dam water differently to mine affected water.</p> <p>The new model conditions do provide scope to release good quality water during low or no flows on the tail end of flow events. The basic</p>

<p>release.</p> <p>W2 relates to release of all mine affected water, and appears to include runoff from areas in which sediment is the only contaminant. Is W8 then intended to require that releases from sediment dams only occur when flow triggers are met?</p> <p>W8 also appears to preclude releasing surplus fresh water during times of no flow. For example fresh water may accumulate in mine water dams during periods of no flow as a result of localised storm activity. This water is best removed to reinstate storage capacity and prevent deterioration, or in the case of sediment dams, removed to reinstate the storage capacity and allow inspection and maintenance of the dam. Sediment dams may also surcharge during localised rainfall events that do not induce a flow in the receiving water.</p> <p>Clarification is sought as to the exclusion of fresh water and treated water releases from W8, or alternatively, explicitly provide for the release of fresh water and treated water at times when flow triggers are not met through W2 and Table 4.</p>	<p>premise here is that the better the quality of the water, the greater the volume that will be permitted for release.</p>
<p><i>Table 4. Explanatory Notes</i>  (For example) The water quality in the Mackenzie River and Blackwater Creek varies considerably. During low flows of the receding hydrograph, salinity can increase significantly. The principles as set out in the Table 4 notes could lead to circumstances where the site holds surplus water of a quality consistent with or better than that of the receiving water, yet release is precluded on the basis that the receiving water quality is exceeding the long term background reference.</p> <p><u>There should be an allowance for releases to occur under such circumstances. It should be noted in the principles that releases be allowed when the release water quality is consistent with or better than the upstream receiving water WQ. This would apply to the low flow and medium flow conditions.</u></p>	<p>It doesn't work like this – there is a need to consider both near-field and far-field impacts. Long term data is necessary to rely on as we don't want to result in accumulation in the far-field. Higher salinity tends to happen towards the tail of events. We don't want to make this more exaggerated in terms of salt loads. We have already put in that we will consider local reference data over WQOs to provide more flexibility.</p>

<p><i>Table 4. Maximum Release Rates</i></p> <p>Table 4 states that the maximum release rates are to be calculated on case by case basis. It is not clear whether this is intended to be a site by site basis or rather on the basis of release by release. WCPL is seeking the ability to manage the rate of release in order to maximise release of surplus water while meeting water quality objectives in the receiving water.</p> <p>Receiving water flow rates and stored water quality are largely outside the control of WCPL, yet both are significant variables in determining a suitable release configuration. Table 4 seeks to manage release flows on the basis of fixed intervals for these variables. WCPL considers that the most effective way of determining a suitable release configuration is to calculate the target release rate on the basis of upstream flow rate and water quality, release water quality, downstream target water quality and a factor of safety which is reflective of measurement accuracy and flow control.</p> <p>Is it envisaged that a formula is inserted in the maximum release rate column, or alternatively, the maximum release capacity of the infrastructure? Should Table 4 require the nomination of fixed scenarios then WCPL will seek to populate this table with a comprehensive selection of scenarios so as not to limit the ability to discharge when suitable conditions exist.</p>	<p>DERM is using overall WQOs rather than event WQOs (which are significantly lower for EC) to manage these discharges. If DERM allows mines to “pollute” up to the WQO for all of the hydrograph, there is a strong likelihood that the EC in regional waterways will noticeably increase and may exceed EC targets for reservoirs. Currently, the model conditions allow for two points on the hydrograph at which the majority (or a proportion for Zone 3) of the assimilative capacity at that flow point can be utilised. Because this point is likely to occur at different times and different locations for mines, the likelihood of far-field issues are significantly reduced.</p>
<p>Wednesday 27 July 2011</p>	
<p>QRC is quite happy with the proposed definition of ‘mine affected water’. Legal advice is that the proposed W41 about stormwater is also quite workable, as far as it goes (ie, to the extent that it just covers stormwater from undisturbed areas). W41 still doesn’t cover a few other types of releases which we had intended to cover. DERM could either choose to add those issues to W41 or these could instead be added to W2 (or just</p>	

after W2). The additional types of releases that we would like DERM to think about are:

- (a) Internal transfers - There is no authorisation anywhere for releases of mine affected water from one internal storage to another, but W1 still prohibits these internal transfers because it relies on the wider definition of 'waters'. The second part of W2 currently provides that these types of releases do not need to be authorised under W2, but it does not go on to provide that they are positively authorised by some other provision. (In passing, could we also mention that the example given in item (b) '<e.g. internal dam to dam transfer for managing internal dam free board' could be interpreted too literally as only being intended 'to manage internal dam freeboard'. There are various reasons for internal dam to dam transfer. Could you please delete the words 'for managing internal dam free board'?)
- (b) Clean water other than 'stormwater' which is released from the mining lease, whether this has been actively diverted around the disturbed areas or not, eg, diverted watercourses are not exactly 'stormwater'.
- (c) Water contaminated by upstream users which is just passing through the mining lease, not necessarily as 'stormwater';
- (d) How would DERM like to deal with relatively minor releases of 'mine affected waters' such as run-off from haul roads? We assume that you do not want these individually listed under W2 and comprehensively monitored on the same scale as tailings dams. On the other hand, this is not 'stormwater other than mine affected water', so is not covered by W41 as currently drafted.
- (e) Releases from 'true' sediment dams. QRC is comfortable with describing this water as 'mine affected', because in fact it is,

- (a) provided by amendment to W2.
- (b) I don't view a diverted watercourse as a 'release to waters', it is a potential receiving 'waters'. But for the sake of clarity can't see any issue with linking this prohibited release to the mining activity - it is the only activity after all that is authorised by the EA and that the conditions are applicable to.
- (c) as for (b).
- (d) Haul roads can present different levels of risk depending on how well they are managed. There is a possibility for other types of contamination in these areas, e.g. hydrocarbons. Haul roads should not be excluded specifically from mine affected water definition, but where companies can demonstrate areas that are maintained clean and sediment is the only parameter of concern to manage, and appropriate infrastructure is installed to manage risks through ESCPs then they will achieve compliance with conditions as drafted.
- (e) amendment to mine affected water definition. 'True' sediment dams are intended to capture rainfall runoff to settle out sediment.

<p>strictly speaking, 'mine affected' if it includes water from areas stripped in advance of mining or from rehabilitation works that are underway (as opposed to completed). Once the dam picks up the sediment and the sediment is allowed to settle, the dam has done its job. We just need a condition which authorises the clean releases from this type of 'true' sediment dam, which we would like to see under the standards and requirements of the ESCP. However, these releases are not strictly "stormwater, other than mine affected water".</p>	
<p>Thursday 28 July 2011</p>	
<p>In condition W1, the words 'as a result of the authorised mining activities' should be positioned so as to qualify the word 'contaminants', rather than the words 'any waters', eg: 'Contaminants that are a result of the authorised mining activities, and that also will, or have the potential to, cause environmental harm, must not be released directly or indirectly to any waters, except...'</p>	<p>Contaminants that are a result of the mining industry would imply that the contaminants were produced by the mining activity. A more likely scenario is that contaminants already existed but are relatively immobile, but have the potential to be mobilised by the mining activities. The current placement of the wording is intended to clarify that contaminants must not be released to waters specifically as a result of the mining activity (i.e. they must not be mobilised by the activity and released to waters at levels capable of causing environmental harm), to address any concern that previous wording could cause the EA holder to be penalised for contaminants in waters passing through the lease that were put there by an upstream third party. I recommend DERM retain proposed drafting.</p>
<p>In W2, it would be easier to read if you could break this up into sub-clauses.</p>	<p>Agreed. Redrafted as a separate condition and entire EA conditions renumbered.</p>
<p>Also, we are still not sure where you are planning to address runoff from private haul roads, which do form part of the 'mining activities', so this is 'mine affected water'. (Public haul roads are not part of the 'mining activities'.)</p>	<p>Haul roads can present different levels of risk depending on how well they are managed. There is a possibility for other types of contamination in these areas, e.g. hydrocarbons. Haul roads should not be excluded specifically from mine affected water definition, but where companies can demonstrate areas that are maintained clean and</p>

	<p>sediment is the only parameter of concern to manage, and appropriate infrastructure is installed to manage risks through ESCPs then they will achieve compliance with conditions as drafted.</p>
<p>On thinking about it, I would also like to raise now that we still have concerns about the re-drafted explanatory note relating to ‘extraordinary events’. While we understand your concerns about the difficulties of foreseeing all possible types of ‘extraordinary events’ and also the issues with cumulative impacts, we are hoping that you can express this explanatory note a little more positively in terms of addressing similar types of events to those that have already occurred and some guidance on a methodology for drafting those tailored conditions. This is the kind of wording we have in mind:</p> <p>Model conditions do not preclude applicants from proposing alternative or additional conditions, nor restrict the administering authority from using alternative conditions where the case warrants. However, applications proposing alternative approaches will need to be supported by sufficient environmental risk assessment and contingency planning information to allow the administering authority to adequately consider the proposal.</p> <p>In particular, there may be instances where case-by-case proposals can be considered for conditions to address management of particularly heavy rainfall and flooding that is similar to previous events, where there is sufficient information available based on: previous transitional environmental programs, monitoring and analysis, the environmental values of the receiving environment in those circumstances together with the experience of impacts on those environmental values, rigorous contingency and disaster response planning, and with particular regard to actual and potential cumulative</p>	<p>This proposed wording is generally quite good, but I have shortened up the second paragraph. I think our understanding of the potential to predict extraordinary events is a little different. I think it is reasonable to predict that wet seasons that are out of the ordinary will occur in future, the difficulty in drafting model conditions is the ability to consider all possible variables thrown up by the situation due to the influences from other mines or different activities, or other environmental effects throughout the catchment, such as saline groundwater recharge. Due to the need to consider cumulative effects, any attempt to standardise an approach through model conditions is likely to be overly conservative to the point that the objective of reducing the need for future TEPs in such circumstances will only be achieved to the point we have made it to with the model conditions. Acknowledging that there may be sites that can demonstrate a robust approach based on their own surroundings that goes further than the model conditions is acceptable.</p>

impacts. For example, there would be potential to tailor a schedule of conditions to be triggered upon reaching nominated thresholds of rainfall, flow, flooding (or a combination) similar to a an event that has occurred in the past, generally adopting a similar framework to the content requirements for a previous TEP, but adapted so as to take account of any relevant information obtained through a previous TEP process. However, it is not possible to predict all possible 'extraordinary events' which may occur in the future, so these model conditions have not attempted to provide a 'catch-all' condition for 'extraordinary events' in general. Each application to address flood events needs to be assessed on its individual merits.

Department of Environment and Resource Management  
**MINISTERIAL BRIEFING NOTE**

**TO: Minister for Environment**

**SUBJECT: 2011 Review of Fitzroy Model Water Conditions**

Advisor .....	OK
Dated        /        /	
	Approved Not Approved Noted
	Further information required
Minister.....	
Dated        /        /	

**TIMEFRAME/REQUESTED BY**

- This brief was initiated by the Department
- There is no specific timeframe associated with this briefing note

**RECOMMENDATION**

- It is recommended that the Minister:
- **note** that the department has completed a scheduled review of the Fitzroy Model Water Conditions for coal mines across the Fitzroy Basin.

**BACKGROUND**

- Following severe flooding in 2008 the former Environmental Protection Agency authorised a release of water (150 gigalitres) trapped at the Ensham Coal Mine near Emerald into the Nogoa River.
- High salinity in the discharge impacted waterways and affected drinking water supplies at Rockhampton and surrounds resulting in intense scrutiny of departmental actions.
- A number of actions occurred, including: the Premier commissioning Professor Barry Hart to provide a report on the incident; a study of cumulative impacts by the department; formation of the Fitzroy Water Quality Advisory Group consisting of industry, government and conservation group representatives; and an improved approach to providing water quality information to the community via web published information.
- The department resolved to amend its Environmental Authority (EA) conditions for coal mine water discharges, develop local water quality guidelines for the Fitzroy Basin, and develop a model for assessing cumulative impacts across the region.
- Model conditions for coal mine water management (the Fitzroy Model Water Conditions) were developed in 2009 and were scheduled for review in October 2011 to coincide with the anticipated scheduling of local water quality objectives.

**CURRENT ISSUES**

- Repeat heavy wet seasons across the Fitzroy Basin led to a decision to bring forward the scheduled review of the Fitzroy Model Water Conditions (model conditions).
- As a result of the 2010-11 wet season the department assessed in excess of 100 applications for Transitional Environmental Programs (TEPs) or amendments to TEPs relating to coal mine companies seeking to discharge water captured on site during the wet season events.
- Information obtained through monitoring programs following the 2008 flooding and TEP assessments for case-specific discharge requests informed the review of the model conditions.
- Most notably the advanced state of development of Water Quality Objectives (WQOs) for waterways throughout the Fitzroy Basin has provided the department with a sound basis for considering a broader range of discharge options that can be designed on achieving the WQOs and consequently protecting identified environmental values throughout the basin.
- The key change to the model conditions is the provision for greater flexibility in the options for discharge conditions. The limiting factor for most coal mines in the Fitzroy is salinity, which is measured as electrical conductivity (EC).
- In general terms, the concentration of EC is simply a measure of the amount of salt in a given volume of water, i.e. a higher amount of salt within a fixed volume of water will result in a higher EC.

<b>Author</b> Name: Andrew Connor Position: Director, Coal Operations Tel No: 3330 6335 Date: 11 August 2011	<b>Cleared by</b> Name: Andrew Brier Position: General Manager Tel No: 4529 1220	<b>Cleared by</b> Name: Andrew Buckley Position: A/Assistant Director-General Tel No: 0403 340 808 <i>Approved</i>	<b>Recommended</b> Name: <i>Debbie Best</i> A/Director-General, DERM Tel No: 3330 6298 Date: <i>18.8.11</i>
	Name: Position: Tel No:	Name: <i>Terry Wall</i> Position: <i>Assoc. DG, CER</i> Tel No: <i>3330 6240</i> <i>16.8.11</i>	Name: <i>Debbie Best</i> Date: <i>18.8.11</i>

- When considering authorising a discharge of mine-affected water for a coal mine (either via an EA or TEP), key considerations include ensuring the amount of EC does not cause acute toxicity effects directly at the point of discharge and that, following mixing of the released water with the stream flow passing the mine, the load of EC will not cause chronic or cumulative effects on identified environmental values including ecosystem and human use values, such as drinking water or irrigation uses.
- The model conditions now provide a basis for considering higher end-of-pipe concentration limits for mine-affected water releases, with an associated reduction in the volume permitted to be released.
- This approach remains limited by the management of localised acute toxicity effects at the point of discharge by capping allowable EC discharge concentrations and volumes based on site-specific consideration of local flow conditions and water quality objectives.
- A further change is variable discharge options based of receiving water flows, which essentially provides changing discharge opportunities on low, medium or high receiving water flows to ensure opportunities for discharges are improved when conditions are favourable, whereas previous conditions remained static once the minimum flow trigger was reached.
- The model conditions now provide a methodology for conditioning releases based on a mine's location within the catchment. This improvement is based on an improved understanding of the cumulative effects of releases from mines in upper catchment (less than 10km from the top of catchment), mid catchment and lower catchment (regional waterways with developed water quality objectives 50km or more downstream of the top of catchment) areas.
- The model conditions also include limits for other important water quality parameters, such as pH, turbidity and sulphate and they require rigorous monitoring of a range of potential contaminants including heavy metals, petroleum hydrocarbons and sodium.
- While the new approach provides greater flexibility to mine operators to tailor conditions to the characteristics of the water held on site and the location of their mine within the catchment, the methodology is still based on the overall protection of the environmental values associated with the waterways throughout the Fitzroy Basin.
- The approach is not a relaxation in environmental protection, but is a refinement of how environmental protection is best achieved.
- The flexibility introduced into the new model conditions formalises a simple principle whereby the better the quality of mine-affected water held on site, the greater the volume that can be released when a release opportunity occurs. This provides incentives to either improve the quality of water held on site through water treatment, or reduce the potential for producing great volumes of mine-affected water by, for example, accelerating rehabilitation and improving on-site water management systems.
- While offering increased flexibility when compared to the existing EA conditions, the adoption of the new model conditions will not result in mines being able to discharge more water than was authorised by TEPs during the recent wet season. The new conditions will mean that more than half of the TEPs that have been issued will no longer be required as these mines will be able to discharge under similar situations due to the new model conditions.
- The model conditions will increase the number of options available for mining companies that are managing legacy water accumulation issues by providing a basis for considering releases of poorer quality water at reduced volumes during periods of higher flow without the need to apply for a TEP. Such a strategy will necessarily need to be combined with a suite of effective water management strategies to ensure any given company improves its water inventory outlook.
- On 11 August 2011 the Australian Financial Review ran an article (Attachment 2) giving broad details about the new arrangements. It quoted the Queensland Resources Council as saying the industry was happy with the more flexible arrangements but frustrated that the changes had not been implemented before the past summer.

## RESOURCE/IMPLEMENTATION IMPLICATIONS

- The department expects to process a significant number of Environmental Authority applications as mining companies seek to incorporate the new model conditions into their operations. This will create a service demand that will be met through existing resource levels.

<b>Author:</b> Name: [REDACTED] Position: Director, Coal Operations Tel No: [REDACTED] Date: 11 August 2011	<b>Cleared by</b> Name: Andrew Brier Position: General Manager Tel No: [REDACTED] <hr/> Name: Position: Tel No:	<b>Cleared by</b> Name: [REDACTED] Position: A/Assistant Director-General Tel No: [REDACTED] <hr/> Name: Position: Tel No:	<b>Recommended:</b> Name: Terry Wall A/Director-General, DERM Tel No: [REDACTED] Date:
---	---	--	--

- The increase in amendment demand for Environmental Authority assessment will be offset somewhat by a reduced potential for TEP applications in future.

**PROPOSED ACTION**

- The department will progress amendment applications and focus its compliance efforts on inspecting mine sites ahead of the next wet season to evaluate their on-site water management performance and preparation for the wet season ahead and
- Prepare a matter to note for Monday 22 August 2011 to formally advice Cabinet members of the changed conditions.

**OTHER INFORMATION**

*Consultation:*

- There has been extensive consultation with the Queensland Resources Council, which is supportive of the enhanced flexibility in the new model conditions.
- The Fitzroy Water Quality Advisory Group was also given a working draft, provided with a presentation about the key changes and given an opportunity to comment on the conditions. Only a small number of comments were received, but they did result in the inclusion of sodium as a monitoring parameter relevant to drinking water quality. Group members include AgForce, Banana Regional Council, Capricorn Conservation Council, Central Highlands Regional Council, Central Queensland University, Department of Employment, Economic Development and Innovation, Fitzroy Basin Association, Fitzroy Basin Elders Committee, Fitzroy Food and Fibre, Fitzroy River Fish Stocking Association, Isaac Regional Council, Queensland Conservation Council, Queensland Health, Queensland Resources Council, Rockhampton Regional Council / Fitzroy River Water, SunWater and Stanwell Corporation Limited.
- *Key Communication Messages:* A review of model water conditions applied to coal mines in the Fitzroy Basin has resulted in an improved methodology for managing mine-affected water releases from mine sites. The improved methodology provides greater flexibility to mining companies to develop water management systems that best suit their site-specific circumstances, while reinforcing environmental protection requirements through the incorporation of design water quality objectives to protect the environmental values of the Fitzroy Basin waterways.

**MINISTER'S COMMENTS**

**ATTACHMENTS**

- Attachment 1. New Fitzroy Model Water Conditions

## Final Model Water Conditions for Coal Mines in the Fitzroy Basin

**Note:**

Explanatory notes are in green. DELETE prior to issue of EA.

Insertions required by applicants and or the administering authority are in blue. DELETE prior to issue.

**Contaminant Release**

- W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters as a result of the authorised mining activities, except as permitted under the conditions of this environmental authority.
- W2** Unless otherwise permitted under the conditions of this environmental authority, the release of mine affected water to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 <this would be a plan or plans locating all monitoring (water quality and flow) and release points> attached to this environmental authority.
- W3** The release of mine affected water to internal water management infrastructure that is installed and operated in accordance with a water management plan that complies with conditions W33 to W38 inclusive is permitted.

**Table 1 (Mine Affected Water Release Points, Sources and Receiving Waters)**

**EXPLANATORY NOTES – Determining Mine Affected Water Release Points:**

Mine affected water release points should be specified in Table 1 where they represent a potential source of water contaminated by the mining activity. Release points associated with erosion and sediment control structures that have been installed in accordance with the standards and requirements of an Erosion and Sediment Control Plan to manage run-off containing sediment only that is not likely to contain contaminants or have properties that would cause environmental harm, do not need to be separately identified in Table 1.

Release Point (RP)	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)	Mine Affected Water Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	e.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	e.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

- W4** The release of mine affected water to waters in accordance with condition W2 must not exceed the release limits stated in Table 2 when measured at the monitoring points specified in Table 1 for each quality characteristic.

**Table 2 (Mine Affected Water Release Limits)**

Quality Characteristic	Release Limits	Monitoring frequency	Comment
Electrical conductivity (uS/cm)	Release limits specified in Table 4 for variable flow criteria.	Daily during release (the first sample must be taken within 2 hours of commencement of	

		release)	
pH (pH Unit)	6.5 (minimum) 9.0 (maximum)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	
Turbidity (NTU)	Current limit or limit derived from suspended solids limit and demonstrated correlation between turbidity to suspended solids historical monitoring data for dam water*	Daily during release* (first sample within 2 hours of commencement of release)	Turbidity is required to assess ecosystems impacts and can provide instantaneous results.
Suspended Solids (mg/L)	Limit to be determined based on receiving water reference data and achievable best practice sedimentation control and treatment*	Daily during release* (first sample within 2 hours of commencement of release)	Suspended solids are required to measure the performance of sediment and erosion control measures.
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	Release limits specified in Table 4 for variable flow criteria.	Daily during release* (first sample within 2 hours of commencement of release)	Drinking water environmental values from NHMRC 2006 guidelines OR ANZECC.

Note: \*Limit for suspended solids can be omitted if turbidity limit is included. Limit for turbidity not required if suspended solids limit included. Both indicators should be measured in all cases.

**W5** The release of mine affected water to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency specified in Table 2 and Table 3.

*Note: the administering authority will take into consideration any extenuating circumstances prior to determining an appropriate enforcement response in the event condition W5 is contravened due to a temporary lack of safe or practical access. The administering authority expects the environmental authority holder to take all reasonable and practicable measures to maintain safe and practical access to designated monitoring locations.*

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

**EXPLANATORY NOTES – Table 3 Potential Contaminants:**

The quality characteristics listed below should be assessed on a site by site basis by each mine prior to finalisation of amendment applications. Based on this assessment, the quality characteristic should be either disregarded if below trigger levels; or included as priority contaminants in Table 3 if above trigger levels. Assessment should involve comparison of representative data from dams that have historically been discharged or likely to be discharged from contaminant release points in Table 1. Data may include historical results or sampling undertaken for this specific purpose. The intent here is that not all dams on site would need to be sampled but those that would make up the majority of water in dams with release points. It could also be demonstrated based on existing water quality information that the water source and relative water quality of some dam are the same, in which case such dams may not need to be sampled individually. For metals and metalloids, trigger levels apply if dissolved results exceed trigger levels. However, total (unfiltered) results for metals and metalloids can be used to disregard a characteristic for inclusion in Table 3. Terms include SMD – slightly moderately disturbed level of protection, guideline - refers ANZECC & ARMCANZ (2000), LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical methods required to achieve LOR.

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

Quality Characteristic	Trigger Levels (µg/L)	Comment on Trigger Level	Monitoring Frequency
Aluminium	55	For aquatic ecosystem protection, based on SMD guideline	Commencement of release and thereafter

**Department of Environment and Resource Management**  
Conserving and managing Queensland's environment and natural resources

Arsenic	13	<i>For aquatic ecosystem protection, based on SMD guideline</i>	weekly during release
Cadmium	0.2	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Chromium	1	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Copper	2	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>	
Iron	300	<i>For aquatic ecosystem protection, based on low reliability guideline</i>	
Lead	4	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Mercury	0.2	<i>For aquatic ecosystem protection, based on LOR for CV FIMS</i>	
Nickel	11	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Zinc	8	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Boron	370	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Cobalt	90	<i>For aquatic ecosystem protection, based on low reliability guideline</i>	
Manganese	1900	<i>For aquatic ecosystem protection, based on SMD guideline</i>

Ammonia	900	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Nitrate	1100	<i>For aquatic ecosystem protection, based on ambient Qld WQ Guidelines (2006) for TN</i>	
Petroleum hydrocarbons (C6-C9)	20		
Petroleum hydrocarbons (C10-C36)	100		
Fluoride (total)	2000	<i>Protection of livestock and short term irrigation guideline</i>	
Sodium	TBA		
Include additional contaminants as required	Include additional contaminants as required		

**Note:**

1. All metals and metalloids must be measured as total (unfiltered) and dissolved (filtered). Trigger levels for metal/metalloids apply if dissolved results exceed trigger.
2. The quality characteristics required to be monitored as per Table 3 can be reviewed once the results of two years monitoring data is available, or if sufficient data is available to adequately demonstrate negligible environmental risk, and it may be determined that a reduced monitoring frequency is appropriate or that certain quality characteristics can be removed from Table 3 by amendment.
3. SMD – slightly moderately disturbed level of protection, guideline refers ANZECC & ARMCANZ (2000).
4. LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical method required to achieve LOR.

**W6** If quality characteristics of the release exceed any of the trigger levels specified in Table 3 during a release event, the environmental authority holder must compare the down stream results in the receiving waters to the trigger values specified in Table 3 and:

1. where the trigger values are not exceeded then no action is to be taken; or
2. where the down stream results exceed the trigger values specified Table 3 for any quality characteristic, compare the results of the down stream site to the data from background monitoring sites and;
  - (a) if the result is less than the background monitoring site data, then no action is to be taken; or
  - (b) if the result is greater than the background monitoring site data, complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
    - (i) details of the investigations carried out; and
    - (ii) actions taken to prevent environmental harm.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W6 2(b) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

- W7** If an exceedance in accordance with condition W6 2(b) is identified, the holder of the authority must notify the administering authority within 14 days of receiving the result.

#### **Mine Affected Water Release Events**

- W8** The holder must ensure a stream flow gauging station/s is installed, operated and maintained to determine and record stream flows at the locations and flow recording frequency specified in Table 4.
- W9** Notwithstanding any other condition of this environmental authority, the release of mine affected water to waters in accordance with condition W2 must only take place during periods of natural flow events in accordance with the receiving water flow criteria for discharge specified in Table 4 for the release point(s) specified in Table 1.
- W10** The release of mine affected water to waters in accordance with condition W2 must not exceed the Electrical Conductivity and Sulphate release limits or the Maximum Release Rate (for all combined release point flows) for each receiving water flow criteria for discharge specified in Table 4 when measured at the monitoring points specified in Table 1.

**Table 4 (Mine Affected Water Release during Flow Events)**

#### **EXPLANATORY NOTES – Table 4**

##### **Gauging station description:**

The intent here is that every release point in Table 1 is associated with a gauging station that measures flow upstream of the discharge point. More than one discharge point may be associated with the same gauging station. The gauging station should be at a minimum distance from the discharge point such that water flow under trigger flow events will not significantly diminish by the time it reaches the discharge point. The location of the gauging station should ideally be such that it is not significantly affected by other upstream point source releases or times of discharge are limited to periods of "natural" flow.

Under certain circumstances it may be appropriate to have a downstream gauging station in addition to or in replace of an upstream gauging station. The location should ideally not be affected by the discharge (e.g. be measured off the main waterway). The need for this must be demonstrated on a case by case basis to show why an upstream gauging station is insufficient. This may be the case when mines are located in the upper parts of catchments or near the downstream confluence or a major waterway. Similarly, the gauging station should be at a distance from the discharge point such that water flow during triggered flow events will not significantly diminish between the discharge point and the measuring point (or the confluence with the creek being measured). For downstream flow triggers, some changes to calculation for flow triggers and maximum release flows would typically be required based on the relative sizes of the waterways involved.

##### **Flow Triggers and EC Quality Criteria:**

The intent for flow triggers is that the times of discharge are limited to times around natural flow events only. Different flow regime methodologies are used to define mine affected water release opportunities, provide flexibility for site operators and to protect identified environmental values within receiving waters. The expectation

is that where flow gauging data is available, it is used to calculate flow triggers. Where gauging data is not available or is insufficient, flow triggers should be based on runoff/stream flow estimates using appropriate hydrological calculations or models and known catchment area, rainfall estimations etc.

Separate methodologies for discharges which occur to local waterways rather than regional waterways will be applied as part of this revised approach. Due to the increased flexibility of the revised approach and consideration of a wider range of local factors the application of these model conditions to individual sites will require case-by-case assessment and require sufficient background information to be provided. For example, it should be noted that discharges upstream of dams or lakes may require special considerations and generally stricter controls. Also, where multiple mines discharge to the same or closely connected waterways consideration of cumulative impacts will be necessary as part of the assessment process.

Model conditions do not preclude applicants from proposing alternative or additional conditions, nor restrict the administering authority from using alternative conditions where the case warrants. However, applications proposing alternative approaches will need to be supported by sufficient environmental risk assessment and contingency planning information to allow the administering authority to adequately consider the proposal.

There may be instances where case-by-case proposals can be considered for conditions to address management of particularly heavy rainfall and flooding that is similar to previous events, where there is sufficient information available based on: previous transitional environmental programs, monitoring and analysis, the environmental values of the receiving environment together with the experience of impacts on those environmental values, rigorous contingency and disaster response planning, and with particular regard to actual and potential cumulative impacts. For example, there may be potential to tailor a schedule of conditions to be triggered upon reaching nominated thresholds of rainfall, flow, flooding (or a combination) based on learning from an event that has occurred in the past; possibly adopting a similar framework to previous discharge permissions granted in similar circumstances, provided the framework was demonstrated to adequately address environmental risk to the satisfaction of the delegate.

**No/low flow stream conditions (best quality / low EC mine affected water):**

Discharge water quality will need to meet or be better than water quality objectives (or long term background reference 75<sup>th</sup> / 80<sup>th</sup> percentile) for EC and will only be permitted for temporary periods after periods of significant flow. The focus of this is to allow "good" quality water to be released when collected rather than having it stored over long durations resulting in deteriorating water quality. Any discharges made under no/low flow stream conditions must not contribute to or cause erosion and due consideration should be given to road/rail access, stock crossings etc (particularly in relation to multiple mines discharging under no/low flow stream conditions on connected waterways). General principles include:

- Release at times when flow is on tail end of flow event only i.e. following a flow above specified event flow trigger and when the flow reduces below the flow trigger again. This trigger will commence a discharge window of 4-6 weeks for good quality water only.
- End of pipe WQ  $\leq$ WQO (or long term background reference 75<sup>th</sup>/80<sup>th</sup> percentile). May require assessment of downstream environmental values where WQO is more stringent (e.g. drinking water supply).
- Duration of release is limited (dry ephemeral stream, 4 weeks after flow event ceases, use time after flow trigger for below – add additional time).
- Volume/rate will be considered on a case by case basis.

**Medium flow stream conditions (medium quality mine affected water):**

A flow trigger for the stream is required and will be set to avoid discharge of medium quality water during periods of no or low flow. General principles include:

- Requires the use of a stream flow trigger above which release can occur. The stream flow trigger must be representative of event flow and be above base/low flow (typically determined from hydrographs, historical flow/water quality data and/or modeling).

- End-of pipe EC <3500uS/cm. Options for either <1500us/cm and <3500uS/cm as maximum limits can be considered which will result in different maximum discharge rates for different quality water. The better the quality of water to be released, the greater the volume that can be permitted.
- The design dilution/maximum discharge rate should be based on a site specific risk assessment. These should be designed to achieve an in-stream EC based on the location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment. The EC<sub>WQO high flow</sub> should be adopted as background EC for design calculations.
  - o Zone 1, upper catchment mines, approximately <10km from top of waterway catchment.  
EC<sub>in stream</sub> = 1000uS/cm (toxicity guideline).
  - o Zone 2, mid catchment mines, zones not within Zone 1 or Zone 3  
EC<sub>in stream</sub> = 700uS/cm
  - o Zone 3, lower catchment mines (All regional waterways are considered Zone 3 from distance >50km from top of waterway catchment, refer to Zone 3 map) –  
EC<sub>in stream</sub> = EC<sub>high flow WQO</sub> + multiplier x (EC<sub>WQO low flow</sub> – EC<sub>WQO high flow</sub>)  
  
e.g. multiplier = 0.2 for Isaac, Nogoia, Dawson
- EC<sub>in stream</sub> for calculations may vary according to other locally relevant environmental values that may need to be considered.

**High flow stream conditions (poorer quality water):**

This option might be used in some cases for mines that need to discharge higher EC wastewater than is allowable under medium flow stream conditions. Any discharge is required to have a higher level of dilution than with medium flow cases but still achieve a maximum incremental increase in the waterway. This option is most feasible for mines situated on regional waterways as the window for discharge is likely to be limited for local waterways. Some additional considerations on management of mixing zones and acute/chronic toxicity may be required in this case. General principles include:

- Requires the use of a stream flow trigger above which release can occur. The stream flow trigger must be representative of high event flow and be above medium flow (typically determined from hydrographs, historical flow/water quality data and/or modeling).
  - End-of pipe EC must be > 3500uS/cm (but <10,000uS/cm). The better the quality of water to be released, the greater the volume that can be permitted.
  - The design dilution/maximum discharge rate should be based on a site specific risk assessment. These should be designed to achieve an in-stream EC based on the location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment as described above.
  - May need some additional indicators/requirements and requires case by case assessment.
  - This option is likely to be less feasible for Zone 1 and 2 mines.
-

Receiving waters/ stream	Release Point (RP)	Gauging station	Gauging Station Latitude (decimal degree, GDA94)	Gauging Station Longitude (decimal degree, GDA94)	Receiving Water Flow Recording Frequency	Receiving Water Flow Criteria for discharge (m <sup>3</sup> /s)	Maximum release rate (for all combined RP flows)	Electrical Conductivity and Sulphate Release Limits
e.g. Wet Creek	Insert all release points that will release based on this gauging station flow. e.g. RP1, RP2 & RP3	e.g. Gauging station 1	XXXX	XXXX	Continuous (minimum daily)	Low Flow <XX m3/s for a period of <insert number of days> after natural flow events that exceed XX m3/s (where XX is a specified event flow trigger)	Insert < xx ML/day or < xx m3/s  Volume/rate to be determined on case by case basis	Electrical conductivity (uS/cm): <insert water quality objective or 75 <sup>th</sup> percentile of long term background reference data> Sulphate (SO <sub>4</sub> <sup>2-</sup> ): 250 mg/L
						Medium Flow > XX m3/s (where XX is specified event flow trigger)	< XX m3/s (where XX is the maximum release rate determined on case by case basis )	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically <1500 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum) >
							< YY m3/s (where YY is the maximum release rate determined on case by case basis)	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically <3500 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum)>
						High Flow > ZZ m3/s (where ZZ is a specified high flow event trigger)	< ZZ m3/s (where ZZ is the maximum release rate determined on case by case basis)	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically within a range of <3500 to <10,000 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum)>

**W12** The daily quantity of mine affected water released from each release point must be measured and recorded at the monitoring points in Table 1.

**W13** Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

**Notification of Release Event**

**W14** The environmental authority holder must notify the administering authority as soon as practicable and no later than 24 hours after commencing to release mine affected water to the receiving environment.

Notification must include the submission of written advice to the administering authority of the following information:

- a) release commencement date/time;
- b)    expected release cessation date/time;
- c)    release point/s;
- d)    release volume (estimated);
- e)    receiving water/s including the natural flow rate; and
- f)    any details (including available data) regarding likely impacts on the receiving water(s).

Formatted: Bullets and Numbering

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

**W15** The environmental authority holder must notify the administering authority as soon as practicable (nominally within twenty-four (24) hours after cessation of a release event) of the cessation of a release notified under Condition W14 and within 28 days provide the following information in writing:

- a) release cessation date/time;
- b)    natural flow volume in receiving water;
- c)    volume of water released;
- d)    details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
- e) all in-situ water quality monitoring results; and
- f) any other matters pertinent to the water release event.

Formatted: Bullets and Numbering

*Note: Successive or intermittent releases occurring within twenty-four (24) hours of the cessation of any individual release can be considered part of a single release event and do not require individual notification for the purpose of compliance with conditions W14 and W15, provided the relevant details of the release are included within the notification provided in accordance with conditions W14 and W15.*

#### Notification of Release Event Exceedance

**W16** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

**W17** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:

- a) the reason for the release;
- b)    the location of the release;
- c)    all water quality monitoring results;
- d)    any general observations;
- e)    all calculations; and
- f)    any other matters pertinent to the water release event.

Formatted: Bullets and Numbering

---

#### EXPLANATORY NOTES – Water storage monitoring conditions:

Note: Conditions W18 and W19 can be removed if already conditioned in the authority or in the event that model conditions for regulated dams are finalised and they include relevant replacement conditions.

---

#### Monitoring of Water Storage Quality

**W18** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

**W19** In the event that waters storages defined in Table 5 exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures, where practicable, to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

Note:

<sup>1</sup> Contaminant limit based on ANZECC & ARM CANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARM CANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".

Note: Total measurements (unfiltered) must be taken and analysed

**Receiving Environment Monitoring and Contaminant Trigger Levels**

**W20** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency
pH	6.5 – 8.5	Daily during the release
Electrical Conductivity (µS/cm)	1000 Note: for protection against toxicity this may need to be reduced in some circumstances e.g. where in close proximity upstream of a drinking water dam or regional waterway	
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.	
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	250 (Protection of drinking water Environmental Value)	
Sodium (mg/L)	TBA	

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

**EXPLANATORY NOTES – Selection of monitoring sites:**

The intent here is that that each discharge point has both an upstream and downstream monitoring point associated with it. These monitoring points should be located as close as practicable to the release point and the distances should be defined in the footnotes in Table 8. The location of flow monitoring points should also be considered in selecting upstream monitoring points. Other considerations include accessibility, particularly during wet weather conditions.

Monitoring Points	Receiving Waters Location Description	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)
Upstream Background Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Downstream Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

Notes:

- a) The upstream monitoring point should be within Xkm the release point.
- b) the downstream point should not be greater than Xm from the release point.
- c) The data from background monitoring points must not be used where they are affected by releases from other mines.

Formatted: Bullets and Numbering

**W21** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:

1. where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or

2. where the down stream results exceed the upstream results complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:

- (i) details of the investigations carried out; and
- (ii) actions taken to prevent environmental harm.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W21(2) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

## Receiving Environment Monitoring Program (REMP)

### EXPLANATORY NOTES – Designing a REMP:

Generally the Receiving Environment Monitoring Program (REMP) should be used to assess the local receiving waters for the specified discharge locations. The monitoring should not be specifically designed to assess compliance of the release – this is covered by other conditions. The key purpose of the REMP is to assess the overall condition of the local receiving waters and assessment should be against water quality objectives and relevant guidelines. Note that in some cases where discharge occurs to ephemeral streams, there may be a need to include downstream sensitive receiving waters or environmental values outside of the specified REMP area. An example of this would be where there are no semi-permanent /permanent waterholes in the specific area but one is located further downstream prior to the confluence with the next major waterway. For further guidance on what to include in a REMP, please refer to the Draft DERM REMP Document for Fitzroy Coal Mines and Additional Information.

There is a potential for beneficial linkages of REMP monitoring to regional waterway monitoring programs, such as the Fitzroy Partnership monitoring program. For example DERM intends to maintain monitoring information compiled through individual REMP programs through an internal database under development. Industry has indicated its willingness to see this data shared with the Fitzroy Partnership for the purpose of a regional water monitoring program. Likewise it is possible for environmental authority holders to utilise relevant and available water monitoring information collected by other parties, such as the Fitzroy Partnership, as reference data for the purposes of the REMP required by this section.

**W22** The environmental authority holder must develop and implement a Receiving Environment Monitoring Program (REMP) to monitor, identify and describe any adverse impacts to surface water environmental values, quality and flows due to the authorised mining activity. This must include monitoring the effects of the mine on the receiving environment periodically (under natural flow conditions) and while mine affected water is being discharged from the site.

For the purposes of the REMP, the receiving environment is the waters of the XX and connected or surrounding waterways within XX (e.g. Xkm) downstream of the release. The REMP should encompass any sensitive receiving waters or environmental values downstream of the authorised mining activity that will potentially be directly affected by an authorised release of mine affected water.

**W23** The REMP must:

- a) Assess the condition or state of receiving waters, including upstream conditions, spatially within the REMP area, considering background water quality characteristics based on accurate and reliable monitoring data that takes into consideration temporal variation (e.g. seasonality); and
- b) Be designed to facilitate assessment against water quality objectives for the relevant environmental values that need to be protected; and
- c) Include monitoring from background reference sites (e.g. upstream or background) and downstream sites from the release (as a minimum, the locations specified in Table 8); and
- d) Specify the frequency and timing of sampling required in order to reliably assess ambient conditions and to provide sufficient data to derive site specific background reference values in accordance with the *Queensland Water Quality Guidelines 2006*. This should include monitoring during periods of natural flow irrespective of mine or other discharges; and

Formatted: Bullets and Numbering

- e) Include monitoring and assessment of dissolved oxygen saturation, temperature and all water quality parameters listed in Table 2 and 3 ); and
- f) Include, where appropriate, monitoring of metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*); and
- g) Include, where appropriate, monitoring of macroinvertebrates in accordance with the AisRivas methodology, and
- h) Apply procedures and/or guidelines from ANZECC & ARMCANZ 2000 and other relevant guideline documents; and
- i) Describe sampling and analysis methods and quality assurance and control; and
- j) Incorporate stream flow and hydrological information in the interpretations of water quality and biological data.

**W24** A REMP Design Document that addresses each criterion presented in Conditions W22 and W23 must be prepared and submitted to the administering authority no later than 3 months after the date of issue of this environmental authority [include for new sites or expansion projects, remove for existing mine sites which already have REMP Design Documents]. Due consideration must be given to any comments made by the administering authority on the REMP Design Document and subsequent implementation of the program.

**W25** A report outlining the findings of the REMP, including all monitoring results and interpretations in accordance with conditions W22 and W23 must be prepared annually and made available on request to the administering authority. This must include an assessment of background reference water quality, the condition of downstream water quality compared against water quality objectives, and the suitability of current discharge limits to protect downstream environmental values.

## Water Reuse

### EXPLANATORY NOTES – Water reuse conditions

*Mine affected water reuse conditions acknowledge that there is beneficial potential for using mine affected water. The conditions below provide examples of how such authorisation can be conditioned. The examples are not exhaustive and there may be valid proposals received to supply water to other industry types, or using different methods of transportation. In such cases it is important to consider any environmental risk associated with a proposal by considering what environmental values may be impacted by a given proposal, using an approach that accords with current criteria for environmental management decisions made by the administering authority, prior to presenting a recommendation to the relevant delegate for the decision.*

**W26** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority and deposited into artificial water storage structures, such as farm dams or tanks, or used directly at properties owned by the environmental authority holder or a third party for the purpose of:

- i) supplying stock water subject to compliance with the quality release limits specified in Table 9; or
- ii) supplying irrigation water subject to compliance with quality release limits in Table 10; or
- iii) supplying water for construction and/or road maintenance in accordance with the conditions of this environmental authority.

Formatted: Bullets and Numbering

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with ANZECC & ARMCANZ (2000) Irrigation Guidelines

**W27** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority and deposited into artificial water storage structures, such as dams or tanks, for the purpose of supplying water to <name adjoining mine>. The volume, pH and electrical conductivity of water transferred to <name adjoining mine> must be monitored and recorded.

**W28** If the responsibility for mine affected water is given or transferred to another person in accordance with conditions **W26 or W27**:

- a) the responsibility for the mine affected water must only be given or transferred in accordance with a written agreement (the third party agreement); and
- b) the third party agreement must include a commitment from the person utilising the mine affected water to use it in such a way as to prevent environmental harm or public health incidents and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters; and
- c) the third party agreement must be signed by both parties to the agreement.

Formatted: Bullets and Numbering

**Water General**

**W29** All determinations of water quality and biological monitoring must be:

- a) performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - b) made in accordance with methods prescribed in the latest edition of the Department of Environment and Resource Management's Monitoring and Sampling Manual;
- Note: Condition W29 requires the Monitoring and Sampling Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
- c) collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible;
  - d) carried out on representative samples; and
  - e) analysed at a laboratory accredited (e.g. NATA) for the method of analysis being used.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

**W30** The release of any contaminants as permitted by this environmental authority, directly or indirectly to waters, other than internal water management infrastructure that is installed and operated in accordance with a water management plan that complies with conditions W33 to W38 inclusive:

- a) must not produce any visible discolouration of receiving waters; and
- b) must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

Formatted: Bullets and Numbering

**Annual Water Monitoring Reporting**

**W31** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:

- a) the date on which the sample was taken;
- b) the time at which the sample was taken;
- c) the monitoring point at which the sample was taken;
- d) the measured or estimated daily quantity of mine affected water released from all release points;
- e) the release flow rate at the time of sampling for each release point;
- f) the results of all monitoring and details of any exceedances of the conditions of this environmental authority; and
- g) water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

Formatted: Bullets and Numbering

#### Temporary Interference with waterways

- W32** Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Environment and Resource Management *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

#### Water Management Plan

- W33** A Water Management Plan must be developed by an appropriately qualified person and implemented by XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE).

- W34** The Water Management Plan must:

- a) provide for effective management of actual and potential environmental impacts resulting from water management associated with the mining activity carried out under this environmental authority; and
- b) be developed in accordance with Department of Environment and Resource Management guideline *Preparation of water management plans for mining activities* and include:
  - i. a study of the source of contaminants;
  - ii. a water balance model for the site;
  - iii. a water management system for the site;
  - iv. measures to manage and prevent saline drainage;
  - v. measures to manage and prevent acid rock drainage;
  - vi. contingency procedures for emergencies; and
  - vii. a program for monitoring and review of the effectiveness of the water management plan.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

- W35** The Water Management Plan must be reviewed each calendar year and a report prepared by an appropriately qualified person. The report must:

- a) assess the plan against the requirements under condition W34;
- b) include recommended actions to ensure actual and potential environmental impacts are effectively managed for the coming year; and
- c) identify any amendments made to the water management plan following the review.

Formatted: Bullets and Numbering

- W36** The holder of this environmental authority must attach to the review report required by condition W35, a written response to the report and recommended actions, detailing the actions taken or to be taken by the environmental authority holder on stated dates:

- a) to ensure compliance with this environmental authority; and
- b) to prevent a recurrence of any non-compliance issues identified.

Formatted: Bullets and Numbering

- W37** The review report required by condition W35 and the written response to the review report required by condition W36 must be submitted to the administering authority with the subsequent annual return under the signature of the appointed signatory for the annual return.

**W38** A copy of the Water Management Plan must be provided to the administering authority on request.

#### **Saline Drainage**

**W39** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

#### **Acid Rock Drainage**

**W40** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

#### **Stormwater and Water sediment controls**

**W41** An Erosion and Sediment Control Plan must be developed by an appropriately qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to receiving waters and contamination of stormwater.

**W42** Stormwater, other than mine affected water, is permitted to be released to waters from:

- i) erosion and sediment control structures that are installed and operated in accordance with the Erosion and Sediment Control Plan required by condition W41; and
- ii) water management infrastructure that is installed and operated, in accordance with a Water Management Plan that complies with conditions W33 to W38 inclusive, for the purpose of ensuring water does not become mine affected water.

Formatted: Bullets and Numbering

**W43** The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any receiving waters.

**W44** Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or receiving waters.

#### **All Dams**

---

#### **EXPLANATORY NOTES – Dam conditions:**

Note: Conditions W45 and W46 to be removed if already conditioned in the authority or in the event that model conditions for regulated dams are finalised and relevant replacement conditions are to be included into the EA.

---

**W45** The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.

**W46** Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

**Definitions:**

**"acid rock drainage"** means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

**"administering authority"** means the Department of Environment and Resource Management or its successor.

**"appropriately qualified person"** means a person who has professional qualifications, training, skills or experience relevant to the nominated subject matter and can give authoritative assessment, advice and analysis on performance relative to the subject matter using the relevant protocols, standards, methods or literature.

**"dam"** means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However; a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

**"environmental authority"** means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

**"environmental authority holder"** means the holder of this environmental authority.

**"flowable substance"** means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

**"hazard"** in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

**"hazard category"** means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in "Manual for Assessing Hazard Categories and Hydraulic Performance of Dams", prepared by the Department of Environment and Resource Management, as amended from time to time.

**"mine affected water"** means the following types of water:

- i) pit water, tailings dam water, processing plant water;
- ii) water contaminated by a mining activity which would have been an environmentally relevant activity under Schedule 2 of the *Environmental Protection Regulation 2008* if it had not formed part of the mining activity;
- iii) rainfall runoff which has been in contact with any areas disturbed by mining activities which have not yet been rehabilitated, excluding rainfall runoff discharging through release points associated with erosion and sediment control structures that have been installed in accordance with the standards and requirements of an Erosion and Sediment Control Plan to manage runoff containing sediment only, provided that this water has not been mixed with pit water, tailings dam water, processing plant water or workshop water;
- iv) groundwater which has been in contact with any areas disturbed by mining activities which have not yet been rehabilitated;
- v) groundwater from the mine's dewatering activities;
- vi) a mix of mine affected water (under any of paragraphs i)-v)) and other water.

Formatted: Bullets and Numbering

**"natural flow"** means the flow of water through waters caused by nature.

**"receiving environment"** means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

**"receiving waters"** means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

**"representative"** means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

**"saline drainage"** The movement of waters, contaminated with salt(s), as a result of the mining activity.

**"waters"** includes river, stream, lake, lagoon, pond, swamp, wetland, unconfined surface water, unconfined natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

# Floodwater undermines coal accord

Mark Ludlow

The Queensland government and Australia's largest coal producers have struck a compromise deal that will allow miners to release water from their operations in central Queensland next wet season to avoid a repetition of the lost production that followed this year's floods.

While the more flexible rules will assist companies such as BHP Billiton, Rio Tinto and Xstrata to deal with any future flooding, it will not help with the 500 gegalitres of water — the equivalent of Sydney Harbour — that remains in mine pits throughout the Bowen Basin.

The flooded pits contributed to a shortfall of up to 40 million tonnes in coal exports, worth \$7 billion, last financial year. This has had a major impact on Queensland and Australia's economic growth as well as the amount of coal royalties flowing into state coffers.

Coal companies are spending tens of millions of dollars to pump out excess water to enable them to mine their pits, because environmental regulations mean they cannot pump the water out

into nearby creeks or rivers, especially out of the wet season.

Queensland Resources Council chief executive Michael Roche said the industry was happy with the more flexible arrangements

proposed for next summer but companies were frustrated that the changes had not been implemented before the recent summer's floods.

"They are more sensible rules but we would have preferred they were in place two years ago," he told *The Australian Financial Review*.

"The industry now has a set of conditions which means they will be in better shape to handle above-average rainfall in the up-coming wet season," Mr Roche said.

"However, they are not so generous to offer much prospect for mines to deal with the legacy of water they already hold." Three-quarters of Queensland's 57 coalmines were affected by the summer's heavy rain, with 54 mines needing special approvals from the state government to deal with efforts to release excess water.

While some companies have been able to release water and return to full production, excess water has been an on-going issue for coal producers in central Queensland.

Coal exports from Queensland fell back to 12.7 million tonnes in July after reaching 14.7 million tonnes in June — the best month for the industry since November 2010.

The 12.7 million tonnes exported last month was 13 per cent below July last year and the lowest export

volume for that month since 2006.

Coal companies have experimented — with mixed success — with new ways to disperse the extra water, such as by irrigation, water treatment and evaporation.

The new rules for the discharge of water negotiated between the Department of Environment and Resource Management (DERM) and the coal industry can be adapted for each mine, depending on where they sit in the catchment.

Importantly, the rules will give coal producers more opportunities to release excess water during high river flows while still meeting environmental standards.

DERM has previously defended the permit systems used last summer.

A spokesman for Xstrata Coal said the miner supported more practical solutions that would allow more timely, controlled discharges of water.

The company, which is the majority owner of the Rolleston open-cut mine, west of Gladstone, was looking into new ways to deal with extra water.

"We are currently investing significantly into capital works to alleviate water-management issues more efficiently across all of our sites," the Xstrata spokesman said.

In many cases, companies have not been able to pump out all the floodwater that swamped coalmines in central Queensland earlier this year.

# Final Model Water Conditions for Coal Mines in the Fitzroy Basin

**Note:**

Explanatory notes are in green. DELETE prior to issue of EA.

Insertions required by applicants and or the administering authority are in blue. DELETE prior to issue.

**Contaminant Release**

- W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters as a result of the authorised mining activities, except as permitted under the conditions of this environmental authority.
- W2** Unless otherwise permitted under the conditions of this environmental authority, the release of mine affected water to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 <this would be a plan or plans locating all monitoring (water quality and flow) and release points> attached to this environmental authority.
- W3** The release of mine affected water to internal water management infrastructure that is installed and operated in accordance with a water management plan that complies with conditions W33 to W38 inclusive is permitted.

**Table 1 (Mine Affected Water Release Points, Sources and Receiving Waters)**

**EXPLANATORY NOTES – Determining Mine Affected Water Release Points:**

Mine affected water release points should be specified in Table 1 where they represent a potential source of water contaminated by the mining activity. Release points associated with erosion and sediment control structures that have been installed in accordance with the standards and requirements of an Erosion and Sediment Control Plan to manage run-off containing sediment only that is not likely to contain contaminants or have properties that would cause environmental harm, do not need to be separately identified in Table 1.

Release Point (RP)	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)	Mine Affected Water Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	e.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	e.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

- W4** The release of mine affected water to waters in accordance with condition W2 must not exceed the release limits stated in Table 2 when measured at the monitoring points specified in Table 1 for each quality characteristic.

**Table 2 (Mine Affected Water Release Limits)**

Quality Characteristic	Release Limits	Monitoring frequency	Comment
Electrical conductivity (uS/cm)	Release limits specified in Table 4 for variable flow criteria.	Daily during release ( the first sample must be taken within 2 hours of commencement of	

		release)	
pH (pH Unit)	6.5 (minimum) 9.0 (maximum)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	
Turbidity (NTU)	Current limit or limit derived from suspended solids limit and demonstrated correlation between turbidity to suspended solids historical monitoring data for dam water*	Daily during release* (first sample within 2 hours of commencement of release)	Turbidity is required to assess ecosystems impacts and can provide instantaneous results.
Suspended Solids (mg/L)	Limit to be determined based on receiving water reference data and achievable best practice sedimentation control and treatment*	Daily during release* (first sample within 2 hours of commencement of release)	Suspended solids are required to measure the performance of sediment and erosion control measures.
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	Release limits specified in Table 4 for variable flow criteria.	Daily during release* (first sample within 2 hours of commencement of release)	Drinking water environmental values from NHMRC 2006 guidelines OR ANZECC.

Note: \*Limit for suspended solids can be omitted if turbidity limit is included. Limit for turbidity not required if suspended solids limit included. Both indicators should be measured in all cases.

**W5** The release of mine affected water to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency specified in Table 2 and Table 3.

*Note: the administering authority will take into consideration any extenuating circumstances prior to determining an appropriate enforcement response in the event condition W5 is contravened due to a temporary lack of safe or practical access. The administering authority expects the environmental authority holder to take all reasonable and practicable measures to maintain safe and practical access to designated monitoring locations.*

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

**EXPLANATORY NOTES – Table 3 Potential Contaminants:**

The quality characteristics listed below should be assessed on a site by site basis by each mine prior to finalisation of amendment applications. Based on this assessment, the quality characteristic should be either disregarded if below trigger levels; or included as priority contaminants in Table 3 if above trigger levels. Assessment should involve comparison of representative data from dams that have historically been discharged or likely to be discharged from contaminant release points in Table 1. Data may include historical results or sampling undertaken for this specific purpose. The intent here is that not all dams on site would need to be sampled but those that would make up the majority of water in dams with release points. It could also be demonstrated based on existing water quality information that the water source and relative water quality of some dam are the same, in which case such dams may not need to be sampled individually. For metals and metalloids, trigger levels apply if dissolved results exceed trigger levels. However, total (unfiltered) results for metals and metalloids can be used to disregard a characteristic for inclusion in Table 3. Terms include SMD – slightly moderately disturbed level of protection, guideline - refers ANZECC & ARMCANZ (2000), LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical methods required to achieve LOR.

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

Quality Characteristic	Trigger Levels (µg/L)	Comment on Trigger Level	Monitoring Frequency
Aluminium	55	For aquatic ecosystem protection, based on SMD guideline	Commencement of release and thereafter

Arsenic	13	For aquatic ecosystem protection, based on SMD guideline	weekly during release
Cadmium	0.2	For aquatic ecosystem protection, based on SMD guideline	
Chromium	1	For aquatic ecosystem protection, based on SMD guideline	
Copper	2	For aquatic ecosystem protection, based on LOR for ICPMS	
Iron	300	For aquatic ecosystem protection, based on low reliability guideline	
Lead	4	For aquatic ecosystem protection, based on SMD guideline	
Mercury	0.2	For aquatic ecosystem protection, based on LOR for CV FIMS	
Nickel	11	For aquatic ecosystem protection, based on SMD guideline	
Zinc	8	For aquatic ecosystem protection, based on SMD guideline	
Boron	370	For aquatic ecosystem protection, based on SMD guideline	
Cobalt	90	For aquatic ecosystem protection, based on low reliability guideline	
Manganese	1900	For aquatic ecosystem protection, based on SMD guideline	
Molybdenum	34	For aquatic ecosystem protection, based on low reliability guideline	
Selenium	10	For aquatic ecosystem protection, based on LOR for ICPMS	
Silver	1	For aquatic ecosystem protection, based on LOR for ICPMS	
Uranium	1	For aquatic ecosystem protection, based on LOR for ICPMS	
Vanadium	10	For aquatic ecosystem protection, based on LOR for ICPMS	
Ammonia	900	For aquatic ecosystem protection, based on SMD guideline	
Nitrate	1100	For aquatic ecosystem protection, based on ambient Qld WQ Guidelines (2006) for TN	
Petroleum hydrocarbons (C6-C9)	20		
Petroleum hydrocarbons (C10-C36)	100		
Fluoride (total)	2000	Protection of livestock and short term irrigation guideline	
Sodium	TBA		
Include additional contaminants as required	Include additional contaminants as required		

**Note:**

1. All metals and metalloids must be measured as total (unfiltered) and dissolved (filtered). Trigger levels for metal/metalloids apply if dissolved results exceed trigger.
2. The quality characteristics required to be monitored as per Table 3 can be reviewed once the results of two years monitoring data is available, or if sufficient data is available to adequately demonstrate negligible environmental risk, and it may be determined that a reduced monitoring frequency is appropriate or that certain quality characteristics can be removed from Table 3 by amendment.
3. SMD – slightly/moderately disturbed level of protection, guideline refers ANZECC & ARMCANZ (2000).
4. LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical method required to achieve LOR.

**W6** If quality characteristics of the release exceed any of the trigger levels specified in Table 3 during a release event, the environmental authority holder must compare the down stream results in the receiving waters to the trigger values specified in Table 3 and:

1. where the trigger values are not exceeded then no action is to be taken; or
2. where the down stream results exceed the trigger values specified Table 3 for any quality characteristic, compare the results of the down stream site to the data from background monitoring sites and;
  - (a) if the result is less than the background monitoring site data, then no action is to be taken; or
  - (b) if the result is greater than the background monitoring site data, complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
    - (i) details of the investigations carried out; and
    - (ii) actions taken to prevent environmental harm.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W6 2(b) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

- W7** If an exceedance in accordance with condition W6 2(b) is identified, the holder of the authority must notify the administering authority within 14 days of receiving the result.

#### **Mine Affected Water Release Events**

- W8** The holder must ensure a stream flow gauging station/s is installed, operated and maintained to determine and record stream flows at the locations and flow recording frequency specified in Table 4.
- W9** Notwithstanding any other condition of this environmental authority, the release of mine affected water to waters in accordance with condition W2 must only take place during periods of natural flow events in accordance with the receiving water flow criteria for discharge specified in Table 4 for the release point(s) specified in Table 1.
- W10** The release of mine affected water to waters in accordance with condition W2 must not exceed the Electrical Conductivity and Sulphate release limits or the Maximum Release Rate (for all combined release point flows) for each receiving water flow criteria for discharge specified in Table 4 when measured at the monitoring points specified in Table 1.

**Table 4 (Mine Affected Water Release during Flow Events)**

#### **EXPLANATORY NOTES – Table 4**

##### **Gauging station description:**

The intent here is that every release point in Table 1 is associated with a gauging station that measures flow upstream of the discharge point. More than one discharge point may be associated with the same gauging station. The gauging station should be at a minimum distance from the discharge point such that water flow under trigger flow events will not significantly diminish by the time it reaches the discharge point. The location of the gauging station should ideally be such that it is not significantly affected by other upstream point source releases or times of discharge are limited to periods of "natural" flow.

Under certain circumstances it may be appropriate to have a downstream gauging station in addition to or in replace of an upstream gauging station. The location should ideally not be affected by the discharge (e.g. be measured off the main waterway). The need for this must be demonstrated on a case by case basis to show why an upstream gauging station is insufficient. This may be the case when mines are located in the upper parts of catchments or near the downstream confluence or a major waterway. Similarly, the gauging station should be at a distance from the discharge point such that water flow during triggered flow events will not significantly diminish between the discharge point and the measuring point (or the confluence with the creek being measured). For downstream flow triggers, some changes to calculation for flow triggers and maximum release flows would typically be required based on the relative sizes of the waterways involved.

##### **Flow Triggers and EC Quality Criteria:**

The intent for flow triggers is that the times of discharge are limited to times around natural flow events only. Different flow regime methodologies are used to define mine affected water release opportunities, provide flexibility for site operators and to protect identified environmental values within receiving waters. The expectation

is that where flow gauging data is available, it is used to calculate flow triggers. Where gauging data is not available or is insufficient, flow triggers should be based on runoff/stream flow estimates using appropriate hydrological calculations or models and known catchment area, rainfall estimations etc.

Separate methodologies for discharges which occur to local waterways rather than regional waterways will be applied as part of this revised approach. Due to the increased flexibility of the revised approach and consideration of a wider range of local factors the application of these model conditions to individual sites will require case-by-case assessment and require sufficient background information to be provided. For example, it should be noted that discharges upstream of dams or lakes may require special considerations and generally stricter controls. Also, where multiple mines discharge to the same or closely connected waterways consideration of cumulative impacts will be necessary as part of the assessment process.

Model conditions do not preclude applicants from proposing alternative or additional conditions, nor restrict the administering authority from using alternative conditions where the case warrants. However, applications proposing alternative approaches will need to be supported by sufficient environmental risk assessment and contingency planning information to allow the administering authority to adequately consider the proposal.

There may be instances where case-by-case proposals can be considered for conditions to address management of particularly heavy rainfall and flooding that is similar to previous events, where there is sufficient information available based on: previous transitional environmental programs, monitoring and analysis, the environmental values of the receiving environment together with the experience of impacts on those environmental values, rigorous contingency and disaster response planning, and with particular regard to actual and potential cumulative impacts. For example, there may be potential to tailor a schedule of conditions to be triggered upon reaching nominated thresholds of rainfall, flow, flooding (or a combination) based on learning from an event that has occurred in the past; possibly adopting a similar framework to previous discharge permissions granted in similar circumstances, provided the framework was demonstrated to adequately address environmental risk to the satisfaction of the delegate.

#### **No/low flow stream conditions (best quality / low EC mine affected water):**

Discharge water quality will need to meet or be better than water quality objectives (or long term background reference 75<sup>th</sup> / 80<sup>th</sup> percentile) for EC and will only be permitted for temporary periods after periods of significant flow. The focus of this is to allow "good" quality water to be released when collected rather than having it stored over long durations resulting in deteriorating water quality. Any discharges made under no/low flow stream conditions must not contribute to or cause erosion and due consideration should be given to road/rail access, stock crossings etc (particularly in relation to multiple mines discharging under no/low flow stream conditions on connected waterways). General principles include:

- Release at times when flow is on tail end of flow event only i.e. following a flow above specified event flow trigger and when the flow reduces below the flow trigger again. This trigger will commence a discharge window of 4-6 weeks for good quality water only.
- End of pipe WQ  $\leq$  WQO (or long term background reference 75<sup>th</sup>/80<sup>th</sup> percentile). May require assessment of downstream environmental values where WQO is more stringent (e.g. drinking water supply).
- Duration of release is limited (dry ephemeral stream, 4 weeks after flow event ceases, use time after flow trigger for below – add additional time).
- Volume/rate will be considered on a case by case basis.

#### **Medium flow stream conditions (medium quality mine affected water):**

A flow trigger for the stream is required and will be set to avoid discharge of medium quality water during periods of no or low flow. General principles include:

- Requires the use of a stream flow trigger above which release can occur. The stream flow trigger must be representative of event flow and be above base/low flow (typically determined from hydrographs, historical flow/water quality data and/or modeling).

- End-of pipe EC <3500uS/cm. Options for either <1500us/cm and <3500uS/cm as maximum limits can be considered which will result in different maximum discharge rates for different quality water. The better the quality of water to be released, the greater the volume that can be permitted.
- The design dilution/maximum discharge rate should be based on a site specific risk assessment. These should be designed to achieve an in-stream EC based on the location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment. The EC<sub>WQO high flow</sub> should be adopted as background EC for design calculations.
  - o Zone 1, upper catchment mines, approximately <10km from top of waterway catchment.  
EC<sub>in stream</sub> = 1000uS/cm (toxicity guideline).
  - o Zone 2, mid catchment mines, zones not within Zone 1 or Zone 3  
EC<sub>in stream</sub> = 700uS/cm
  - o Zone 3, lower catchment mines (All regional waterways are considered Zone 3 from distance >50km from top of waterway catchment, refer to Zone 3 map) –  
EC<sub>in stream</sub> = EC<sub>high flow WQO</sub> + multiplier x (EC<sub>WQO low flow</sub> – EC<sub>WQO high flow</sub>)  
  
e.g. multiplier = 0.2 for Isaac, Nogoia, Dawson
- EC<sub>in stream</sub> for calculations may vary according to other locally relevant environmental values that may need to be considered.

#### **High flow stream conditions (poorer quality water):**

This option might be used in some cases for mines that need to discharge higher EC wastewater than is allowable under medium flow stream conditions. Any discharge is required to have a higher level of dilution than with medium flow cases but still achieve a maximum incremental increase in the waterway. This option is most feasible for mines situated on regional waterways as the window for discharge is likely to be limited for local waterways. Some additional considerations on management of mixing zones and acute/chronic toxicity may be required in this case. General principles include:

- Requires the use of a stream flow trigger above which release can occur. The stream flow trigger must be representative of high event flow and be above medium flow (typically determined from hydrographs, historical flow/water quality data and/or modeling).
  - End-of pipe EC must be > 3500uS/cm (but <10,000uS/cm). The better the quality of water to be released, the greater the volume that can be permitted.
  - The design dilution/maximum discharge rate should be based on a site specific risk assessment. These should be designed to achieve an in-stream EC based on the location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment as described above. .
  - May need some additional indicators/requirements and requires case by case assessment.
  - This option is likely to be less feasible for Zone 1 and 2 mines.
-

Receiving waters/ stream	Release Point (RP)	Gauging station	Gauging Station Latitude (decimal degree, GDA94)	Gauging Station Longitude (decimal degree, GDA94)	Receiving Water Flow Recording Frequency	Receiving Water Flow Criteria for discharge (m <sup>3</sup> /s)	Maximum release rate (for all combined RP flows)	Electrical Conductivity and Sulphate Release Limits
e.g. Wet Creek	Insert all release points that will release based on this gauging station flow. e.g. RP1, RP2 & RP3	e.g. Gauging station 1	XXXX	XXXX	Continuous (minimum daily)	<b>Low Flow</b> <XX m3/s for a period of <insert number of days> after natural flow events that exceed XX m3/s (where XX is a specified event flow trigger)	Insert < xx ML/day or < xx m3/s Volume/rate to be determined on case by case basis	Electrical conductivity (uS/cm): <insert water quality objective or 75 <sup>th</sup> percentile of long term background reference data> Sulphate (SO <sub>4</sub> <sup>2-</sup> ): 250 mg/L
						<b>Medium Flow</b> > XX m3/s (where XX is specified event flow trigger)	< XX m3/s (where XX is the maximum release rate determined on case by case basis )	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically <1500 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum) >
							< YY m3/s (where YY is the maximum release rate determined on case by case basis)	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically <3500 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum)>
<b>High Flow</b> > ZZ m3/s (where ZZ is a specified high flow event trigger)	< ZZ m3/s (where ZZ is the maximum release rate determined on case by case basis)	Electrical conductivity (uS/cm) <insert value determined on case specific basis but typically within a range of <3500 to <10,000 Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L) <insert limit to be determined based on achieving downstream target of 250 (Maximum)>						

**W12** The daily quantity of mine affected water released from each release point must be measured and recorded at the monitoring points in Table 1.

**W13** Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

**Notification of Release Event**

**W14** The environmental authority holder must notify the administering authority as soon as practicable and no later than 24 hours after commencing to release mine affected water to the receiving environment.

Notification must include the submission of written advice to the administering authority of the following information:

- a) release commencement date/time;
- b) expected release cessation date/time;
- c) release point/s;
- d) release volume (estimated);
- e) receiving water/s including the natural flow rate; and
- f) any details (including available data) regarding likely impacts on the receiving water(s).

Formatted: Bullets and Numbering

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

**W15** The environmental authority holder must notify the administering authority as soon as practicable (nominally within twenty-four (24) hours after cessation of a release event) of the cessation of a release notified under Condition W14 and within 28 days provide the following information in writing:

- a) release cessation date/time;
- b) natural flow volume in receiving water;
- c) volume of water released;
- d) details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
- e) all in-situ water quality monitoring results; and
- f) any other matters pertinent to the water release event.

Formatted: Bullets and Numbering

*Note: Successive or intermittent releases occurring within twenty-four (24) hours of the cessation of any individual release can be considered part of a single release event and do not require individual notification for the purpose of compliance with conditions W14 and W15, provided the relevant details of the release are included within the notification provided in accordance with conditions W14 and W15.*

#### Notification of Release Event Exceedance

**W16** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

**W17** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:

- a) the reason for the release;
- b) the location of the release;
- c) all water quality monitoring results;
- d) any general observations;
- e) all calculations; and
- f) any other matters pertinent to the water release event.

Formatted: Bullets and Numbering

---

#### EXPLANATORY NOTES – Water storage monitoring conditions:

**Note:** Conditions W18 and W19 can be removed if already conditioned in the authority or in the event that model conditions for regulated dams are finalised and they include relevant replacement conditions.

---

#### Monitoring of Water Storage Quality

**W18** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

**W19** In the event that water storages defined in Table 5 exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures, where practicable, to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

Note:

<sup>1</sup> Contaminant limit based on ANZECC & ARMCANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARMCANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".

Note: Total measurements (unfiltered) must be taken and analysed

### Receiving Environment Monitoring and Contaminant Trigger Levels

**W20** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency
pH	6.5 – 8.5	Daily during the release
Electrical Conductivity ( $\mu\text{S}/\text{cm}$ )	1000 Note: for protection against toxicity this may need to be reduced in some circumstances e.g. where in close proximity upstream of a drinking water dam or regional waterway	
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.	
Sulphate ( $\text{SO}_4^{2-}$ ) (mg/L)	250 (Protection of drinking water Environmental Value)	
Sodium (mg/L)	TBA	

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

**EXPLANATORY NOTES – Selection of monitoring sites:**

The intent here is that that each discharge point has both an upstream and downstream monitoring point associated with it. These monitoring points should be located as close as practicable to the release point and the distances should be defined in the footnotes in Table 8. The location of flow monitoring points should also be considered in selecting upstream monitoring points. Other considerations include accessibility, particularly during wet weather conditions.

Monitoring Points	Receiving Waters Location Description	Latitude (decimal degree, GDA94)	Longitude (decimal degree, GDA94)
Upstream Background Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Downstream Monitoring Points			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

**Notes:**

- a) The upstream monitoring point should be within Xkm the release point.
- b) the downstream point should not be greater than Xkm from the release point.
- c) The data from background monitoring points must not be used where they are affected by releases from other mines.

← Formatted: Bullets and Numbering

**W21** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:

1. where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or

2. \_\_\_\_\_ where the down stream results exceed the upstream results complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:

← - - - - Formatted: Bullets and Numbering

- (i) details of the investigations carried out; and
- (ii) \_\_\_\_\_ actions taken to prevent environmental harm.

← - - - - Formatted: Bullets and Numbering

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W21(2) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

## Receiving Environment Monitoring Program (REMP)

---

### EXPLANATORY NOTES – Designing a REMP:

*Generally the Receiving Environment Monitoring Program (REMP) should be used to assess the local receiving waters for the specified discharge locations. The monitoring should not be specifically designed to assess compliance of the release – this is covered by other conditions. The key purpose of the REMP is to assess the overall condition of the local receiving waters and assessment should be against water quality objectives and relevant guidelines. Note that in some cases where discharge occurs to ephemeral streams, there may be a need to include downstream sensitive receiving waters or environmental values outside of the specified REMP area. An example of this would be where there are no semi-permanent /permanent waterholes in the specific area but one is located further downstream prior to the confluence with the next major waterway. For further guidance on what to include in a REMP, please refer to the Draft DERM REMP Document for Fitzroy Coal Mines and Additional Information.*

*There is a potential for beneficial linkages of REMP monitoring to regional waterway monitoring programs, such as the Fitzroy Partnership monitoring program. For example DERM intends to maintain monitoring information compiled through individual REMP programs through an internal database under development. Industry has indicated its willingness to see this data shared with the Fitzroy Partnership for the purpose of a regional water monitoring program. Likewise it is possible for environmental authority holders to utilise relevant and available water monitoring information collected by other parties, such as the Fitzroy Partnership, as reference data for the purposes of the REMP required by this section.*

---

**W22** The environmental authority holder must develop and implement a Receiving Environment Monitoring Program (REMP) to monitor, identify and describe any adverse impacts to surface water environmental values, quality and flows due to the authorised mining activity. This must include monitoring the effects of the mine on the receiving environment periodically (under natural flow conditions) and while mine affected water is being discharged from the site.

For the purposes of the REMP, the receiving environment is the waters of the **XX** and connected or surrounding waterways within **XX** (e.g. **X**km) downstream of the release. The REMP should encompass any sensitive receiving waters or environmental values downstream of the authorised mining activity that will potentially be directly affected by an authorised release of mine affected water.

**W23** The REMP must:

- a) Assess the condition or state of receiving waters, including upstream conditions, spatially within the REMP area, considering background water quality characteristics based on accurate and reliable monitoring data that takes into consideration temporal variation (e.g. seasonality); and
- b) Be designed to facilitate assessment against water quality objectives for the relevant environmental values that need to be protected; and
- c) Include monitoring from background reference sites (e.g. upstream or background) and downstream sites from the release (as a minimum, the locations specified in Table 8); and
- d) Specify the frequency and timing of sampling required in order to reliably assess ambient conditions and to provide sufficient data to derive site specific background reference values in accordance with the *Queensland Water Quality Guidelines* 2006. This should include monitoring during periods of natural flow irrespective of mine or other discharges; and

← - - - - Formatted: Bullets and Numbering

- e) Include monitoring and assessment of dissolved oxygen saturation, temperature and all water quality parameters listed in Table 2 and 3 ); and
- f) Include, where appropriate, monitoring of metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*); and
- g) Include, where appropriate, monitoring of macroinvertebrates in accordance with the AusRivas methodology, and
- h) Apply procedures and/or guidelines from ANZECC & ARMCANZ 2000 and other relevant guideline documents; and
- i) Describe sampling and analysis methods and quality assurance and control; and
- j) Incorporate stream flow and hydrological information in the interpretations of water quality and biological data.

**W24** A REMP Design Document that addresses each criterion presented in Conditions W22 and W23 must be prepared and submitted to the administering authority **no later than 3 months after the date of issue of this environmental authority** [include for new sites or expansion projects, remove for existing mine sites which already have REMP Design Documents]. Due consideration must be given to any comments made by the administering authority on the REMP Design Document and subsequent implementation of the program.

**W25** A report outlining the findings of the REMP, including all monitoring results and interpretations in accordance with conditions W22 and W23 must be prepared annually and made available on request to the administering authority. This must include an assessment of background reference water quality, the condition of downstream water quality compared against water quality objectives, and the suitability of current discharge limits to protect downstream environmental values.

## Water Reuse

### EXPLANATORY NOTES – Water reuse conditions

*Mine affected water reuse conditions acknowledge that there is beneficial potential for using mine affected water. The conditions below provide examples of how such authorisation can be conditioned. The examples are not exhaustive and there may be valid proposals received to supply water to other industry types, or using different methods of transportation. In such cases it is important to consider any environmental risk associated with a proposal by considering what environmental values may be impacted by a given proposal, using an approach that accords with current criteria for environmental management decisions made by the administering authority, prior to presenting a recommendation to the relevant delegate for the decision.*

**W26** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority and deposited into artificial water storage structures, such as farm dams or tanks, or used directly at properties owned by the environmental authority holder or a third party for the purpose of:

- i) supplying stock water subject to compliance with the quality release limits specified in Table 9; or
- ii) supplying irrigation water subject to compliance with quality release limits in Table 10; or
- iii) supplying water for construction and/or road maintenance in accordance with the conditions of this environmental authority.

Formatted: Bullets and Numbering

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with ANZECC & ARMCANZ (2000) Irrigation Guidelines

**W27** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority and deposited into artificial water storage structures, such as dams or tanks, for the purpose of supplying water to <name adjoining mine>. The volume, pH and electrical conductivity of water transferred to <name adjoining mine> must be monitored and recorded.

**W28** If the responsibility for mine affected water is given or transferred to another person in accordance with conditions **W26** or **W27**:

- a) the responsibility for the mine affected water must only be given or transferred in accordance with a written agreement (the third party agreement); and
- b) the third party agreement must include a commitment from the person utilising the mine affected water to use it in such a way as to prevent environmental harm or public health incidents and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters; and
- c) the third party agreement must be signed by both parties to the agreement.

← --- Formatted: Bullets and Numbering

**Water General**

**W29** All determinations of water quality and biological monitoring must be:

- a) performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - b) made in accordance with methods prescribed in the latest edition of the Department of Environment and Resource Management's Monitoring and Sampling Manual;
- Note: Condition W29 requires the Monitoring and Sampling Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
- c) collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible;
  - d) carried out on representative samples; and
  - e) analysed at a laboratory accredited (e.g. NATA) for the method of analysis being used.

← --- Formatted: Bullets and Numbering

← --- Formatted: Bullets and Numbering

**W30** The release of any contaminants as permitted by this environmental authority, directly or indirectly to waters, other than internal water management infrastructure that is installed and operated in accordance with a water management plan that complies with conditions W33 to W38 inclusive:

- a) must not produce any visible discolouration of receiving waters; and
- b) must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

← --- Formatted: Bullets and Numbering

**Annual Water Monitoring Reporting**

**W31** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:

- a) the date on which the sample was taken;
- b) the time at which the sample was taken;
- c) the monitoring point at which the sample was taken;
- d) the measured or estimated daily quantity of mine affected water released from all release points;
- e) the release flow rate at the time of sampling for each release point;
- f) the results of all monitoring and details of any exceedances of the conditions of this environmental authority; and
- g) water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

Formatted: Bullets and Numbering

#### Temporary Interference with waterways

**W32** Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Environment and Resource Management *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

#### Water Management Plan

**W33** A Water Management Plan must be developed by an appropriately qualified person and implemented by **XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE)**.

**W34** The Water Management Plan must:

- a) provide for effective management of actual and potential environmental impacts resulting from water management associated with the mining activity carried out under this environmental authority; and
- b) be developed in accordance with Department of Environment and Resource Management guideline *Preparation of water management plans for mining activities* and include:
  - i. a study of the source of contaminants;
  - ii. a water balance model for the site;
  - iii. a water management system for the site;
  - iv. measures to manage and prevent saline drainage;
  - v. measures to manage and prevent acid rock drainage;
  - vi. contingency procedures for emergencies; and
  - vii. a program for monitoring and review of the effectiveness of the water management plan.

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

**W35** The Water Management Plan must be reviewed each calendar year and a report prepared by an appropriately qualified person. The report must:

- a) assess the plan against the requirements under condition W34;
- b) include recommended actions to ensure actual and potential environmental impacts are effectively managed for the coming year; and
- c) identify any amendments made to the water management plan following the review.

Formatted: Bullets and Numbering

**W36** The holder of this environmental authority must attach to the review report required by condition W35, a written response to the report and recommended actions, detailing the actions taken or to be taken by the environmental authority holder on stated dates:

- a) to ensure compliance with this environmental authority; and
- b) to prevent a recurrence of any non-compliance issues identified.

Formatted: Bullets and Numbering

**W37** The review report required by condition W35 and the written response to the review report required by condition W36 must be submitted to the administering authority with the subsequent annual return under the signature of the appointed signatory for the annual return.

**W38** A copy of the Water Management Plan must be provided to the administering authority on request.

#### **Saline Drainage**

**W39** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

#### **Acid Rock Drainage**

**W40** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

#### **Stormwater and Water sediment controls**

**W41** An Erosion and Sediment Control Plan must be developed by an appropriately qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to receiving waters and contamination of stormwater.

**W42** Stormwater, other than mine affected water, is permitted to be released to waters from:

- i) erosion and sediment control structures that are installed and operated in accordance with the Erosion and Sediment Control Plan required by condition W41; and
- ii) water management infrastructure that is installed and operated, in accordance with a Water Management Plan that complies with conditions W33 to W38 inclusive, for the purpose of ensuring water does not become mine affected water.

← - - - - Formatted: Bullets and Numbering

**W43** The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any receiving waters.

**W44** Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or receiving waters.

#### **All Dams**

---

#### **EXPLANATORY NOTES – Dam conditions:**

**Note:** Conditions W45 and W46 to be removed if already conditioned in the authority or in the event that model conditions for regulated dams are finalised and relevant replacement conditions are to be included into the EA.

---

**W45** The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.

**W46** Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

**Definitions:**

“**acid rock drainage**” means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

“**administering authority**” means the Department of Environment and Resource Management or its successor.

“**appropriately qualified person**” means a person who has professional qualifications, training, skills or experience relevant to the nominated subject matter and can give authoritative assessment, advice and analysis on performance relative to the subject matter using the relevant protocols, standards, methods or literature.

“**dam**” means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However; a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

“**environmental authority**” means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

“**environmental authority holder**” means the holder of this environmental authority.

“**flowable substance**” means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

“**hazard**” in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

“**hazard category**” means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in “Manual for Assessing Hazard Categories and Hydraulic Performance of Dams”, prepared by the Department of Environment and Resource Management, as amended from time to time.

“**mine affected water**” means the following types of water:

- i) pit water, tailings dam water, processing plant water;
- ii) water contaminated by a mining activity which would have been an environmentally relevant activity under Schedule 2 of the *Environmental Protection Regulation 2008* if it had not formed part of the mining activity;
- iii) rainfall runoff which has been in contact with any areas disturbed by mining activities which have not yet been rehabilitated, excluding rainfall runoff discharging through release points associated with erosion and sediment control structures that have been installed in accordance with the standards and requirements of an Erosion and Sediment Control Plan to manage runoff containing sediment only, provided that this water has not been mixed with pit water, tailings dam water, processing plant water or workshop water;
- iv) groundwater which has been in contact with any areas disturbed by mining activities which have not yet been rehabilitated;
- v) groundwater from the mine's dewatering activities;
- vi) a mix of mine affected water (under any of paragraphs i)-v)) and other water.

Formatted: Bullets and Numbering

“**natural flow**” means the flow of water through waters caused by nature.

“**receiving environment**” means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

“**receiving waters**” means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

“**representative**” means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

“**saline drainage**” The movement of waters, contaminated with salt(s), as a result of the mining activity.

“**waters**” includes river, stream, lake, lagoon, pond, swamp, wetland, unconfined surface water, unconfined natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

Department of Environment and Resource Management  
GENERAL BRIEFING NOTE

<input checked="" type="checkbox"/> Approved <input type="checkbox"/> Not Approved <input type="checkbox"/> Noted <input type="checkbox"/> Further information required
Signed: [Redacted]
Dated: 3 12/01/11

TO: General Manager – Strategic  
Implementation, Coal and Coal Seam Gas

SUBJECT: Fitzroy Model Water Conditions for Coal Mines

TIMEFRAME

- Approval/Noting of this brief is required urgently to complete the review of model conditions within committed timeframes.

RECOMMENDATION

It is recommended that you:

- endorse the final Fitzroy Model Water Conditions for Coal Mines as attached (Attachment 1).
- endorse the enclosed Ministerial briefing note advising of the completion of the model condition review (Attachment 2).

BACKGROUND

- Following severe flooding in 2008 the former Environmental Protection Agency authorised a release of water (150 gigalitres) trapped at the Ensham Coal Mine near Emerald into the Nogoa River.
- High salinity in the discharge impacted waterways and affected drinking water supplies at Rockhampton and surrounds resulting in intense scrutiny of departmental actions.
- A number of actions occurred, including: the Premier commissioning Professor Barry Hart to provide a report on the incident; a study of cumulative impacts by the Department; formation of the Fitzroy Water Quality Advisory Group consisting of industry, government and conservation group representatives; and an improved approach to providing water quality information to the community via web published information.
- The Department resolved to improve its Environmental Authority (EA) conditions for coal mine water discharges, develop local water quality guidelines for the Fitzroy Basin, and develop a model for assessing cumulative impacts across the region.
- Model conditions for coal mine water management (the Fitzroy Model Water Conditions) were developed in 2009 and were scheduled for review in October 2011 to coincide with the anticipated scheduling of local water quality objectives.

CURRENT ISSUES

- The review of model conditions is now complete, subject to your endorsement of the final model conditions.
- Key changes to the conditions include the development and inclusion of alternative discharge conditioning methodology based on variable locations for mines and flow conditions in receiving waters.
- Other changes include the development of a definition for 'mine affected water', improved accountability with respect to Water Management Plans, and a number of changes to improve the literal wording of conditions and currency of the model condition package.
- There has been significant consultation undertaken throughout this review, most notably with the Queensland Resources Council (QRC) and the members of the Fitzroy Water Quality Advisory Group.

Author Name: [Redacted] Position: Director, Coal Operations Tel No: [Redacted] Date: 29 July 2011	Cleared by Name: Position: Tel No: <hr/> Name: Position: Tel No:	Cleared by Name: Position: Tel No: <hr/> Name: Position: Tel No:	Recommended: Name: [Redacted] Position: Director, Coal Operations Tel No: [Redacted] Date: 29 July 2011
---	--	--	---

- Internally, work contributed by the Aquatic Ecosystem Risk & Decision Support team in the Environment and Resource Sciences Division has been invaluable, as has contributions from the Central West Region and Environment and Natural Resource Regulation Division.
- The model conditions have been prepared with due regard to comments received from stakeholders, while maintaining the Department's intent to protect environmental values throughout the Fitzroy Basin.
- Comments and proposed responses to QRC (to be provided following your endorsement of the conditions) are at Attachment 3.
- The Department has committed to provide a report outlining changes to the next Fitzroy Water Quality Advisory Group meeting.

### RESOURCE/IMPLEMENTATION IMPLICATIONS

- The Department expects to process a significant number of Environmental Authority applications as mining companies seek to incorporate the new model conditions into their operations. This will create a service demand that will be met through existing resource levels.
- The increase in amendment assessment demand will be offset somewhat by a reduced potential for TEP applications in future, although it is estimated that just under half of mines seeking TEPs to discharge during the 2010-11 wet season may seek a similar approval in future during a wet season of a similar magnitude.
- In consultation with Environment and Resource Sciences Division the Department may undertake to provide a workshop for mine companies to provide case examples of information required to work through the new conditioning methodology.

### PROPOSED ACTION

- Endorse the model conditions to allow progression of Environmental Authority amendments and associated departmental compliance activities around coal mine water management throughout the Fitzroy Basin.

### COMMENTS

### ATTACHMENTS

- Attachment 1. Proposed Final Fitzroy Model Water Conditions for Coal Mines.
- Attachment 2. Proposed Ministerial Briefing Note advising of completion of the review.
- Attachment 3. QRC comments and proposed responses.

## **Model Water Conditions for Coal Mines in the Fitzroy Basin**

**Note:**

Explanatory notes are in green. DELETE prior to issue of EA.

Insertions required by applicants and or the administering authority are in blue. DELETE prior to issue.

**Contaminant Release**

**W1** Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters except as permitted under the conditions of this environmental authority.

**W2** The release of mine affected water to waters must only occur from the release points specified in Table 1 and depicted in Figure 1 <this would be a plan or plans locating all monitoring (water quality and flow) and release points> attached to this environmental authority. For the purpose of this condition only, 'waters' does not include:

- a) <list any on-site water management infrastructure that for the purpose of effective site water management in accordance with the conditions of the EA should not be prohibited from receiving mine affected water i.e. infrastructure identified in the Water Management Plan>;
- b) <e.g. internal dam to dam transfer for managing internal dam free board. Infrastructure needs to be clearly identified as per site plans e.g. Dam 1, Dam 2>;
- c) <e.g. internal stormwater channel used to transfer mine affected water on-site>; etc

**EXPLANATORY NOTES – Exclusions from the 'waters' definition for condition W2**

The need for including specific exclusions from the 'waters' definition for the release condition acknowledges that the deliberately broad definition of 'waters' can literally capture on-site water storage and transfer infrastructure. Reasonable consideration should be given to the need for practical on-site management. Exclusions from the 'waters' definition should not include natural waterways, stormwater channels that will flow directly to natural waterways, or other waters with identified environmental values requiring protection.

**Table 1 (Mine Affected Water Release Points, Sources and Receiving Waters)**

**EXPLANATORY NOTES – Determining Mine Affected Water Release Points:**

Mine affected water release points should be specified in Table 1 where they represent a potential source of water contaminated by the mining activity. Release points associated with erosion and sediment control structures that have been installed in accordance with the standards and requirements of an Erosion and Sediment Control Plan to manage run-off containing sediment only that is not likely to contain contaminants or have properties that would cause environmental harm, do not need to be separately identified in Table 1.

Release Point (RP)	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Contaminant Source and Location	Monitoring Point	Receiving waters description
RP 1	XXXX	XXXX	e.g. Stormwater Dam Spillway Overflow	Dam Spillway	Wet Creek
RP 2	XXXX	XXXX	e.g. Dam overflow pipe	Sampling Tap on pipe where the pipe enters Sandy Creek	Sandy Creek

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**W3** The release of mine affected water to waters in accordance with condition W2 must not exceed the release limits stated in Table 2 when measured at the monitoring points specified in Table 1 for each quality characteristic.

**Table 2 (Mine Affected Water Release Limits)**

Quality Characteristic	Release Limits	Monitoring frequency	Comment
Electrical conductivity (uS/cm)	Release limits specified in Table 4 for variable flow criteria.	Daily during release (the first sample must be taken within 2 hours of commencement of release)	
pH (pH Unit)	6.5 (minimum) 9.0 (maximum)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	
Turbidity (NTU)	Current limit or limit derived from suspended solids limit and demonstrated correlation between turbidity to suspended solids historical monitoring data for dam water*	Daily during release* (first sample within 2 hours of commencement of release)	Turbidity is required to assess ecosystems impacts and can provide instantaneous results.
Suspended Solids (mg/L)	Limit to be determined based on receiving water reference data and achievable best practice sedimentation control and treatment*	Daily during release* (first sample within 2 hours of commencement of release)	Suspended solids are required to measure the performance of sediment and erosion control measures.
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	Limit to be determined based on achieving downstream target of 250 (Maximum) (Protection of drinking water Environmental Value)	Daily during release* (first sample within 2 hours of commencement of release)	Drinking water environmental values from NHMRC 2006 guidelines OR ANZECC.

*Note: \*Limit for suspended solids can be omitted if turbidity limit is included. Limit for turbidity not required if suspended solids limit included. Both indicators should be measured in all cases.*

**W4** The release of mine affected water to waters from the release points must be monitored at the locations specified in Table 1 for each quality characteristics and at the frequency specified in Table 2 and Table 3.

*Note: the administering authority will take into consideration any extenuating circumstances prior to determining an appropriate enforcement response in the event condition W4 is contravened due to a temporary lack of safe or practical access. The administering authority expects the environmental authority holder to take all reasonable and practical measures to maintain safe and practical access to designated monitoring locations.*

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

**EXPLANATORY NOTES – Table 3 Potential Contaminants:**

The quality characteristics listed below should be assessed on a site by site basis by each mine prior to finalisation of amendment applications. Based on this assessment, the quality characteristic should be either disregarded if below trigger levels; or included as priority contaminants in Table 3 if above trigger levels. Assessment should involve comparison of representative data from dams that have historically been discharged or likely to be discharged from contaminant release points in Table 1. Data may include historical results or sampling undertaken for this specific purpose. The intent here is that not all dams on site would need to be sampled but those that would make up the majority of water in dams with release points. It could also be demonstrated based on existing water quality information that the water source and relative water quality of some dam are the same, in which case such dams may not need to be sampled individually. For metals and metalloids,

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

trigger levels apply if dissolved results exceed trigger levels. However, total (unfiltered) results for metals and metalloids can be used to disregard a characteristic for inclusion in Table 3. Terms include SMD – slightly moderately disturbed level of protection, guideline - refers ANZECC & ARMCANZ (2000), LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical methods required to achieve LOR.

**Table 3 (Release Contaminant Trigger Investigation Levels) Potential Contaminants**

Quality Characteristic	Trigger Levels (µg/L)	Comment on Trigger Level	Monitoring Frequency
Aluminium	55	<i>For aquatic ecosystem protection, based on SMD guideline</i>	Commencement of release and thereafter weekly during release
Arsenic	13	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Cadmium	0.2	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Chromium	1	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Copper	2	<i>For aquatic ecosystem protection, based on LOR for ICPMS</i>	
Iron	300	<i>For aquatic ecosystem protection, based on low reliability guideline</i>	
Lead	4	<i>For aquatic ecosystem protection, based on SMD guideline</i>	
Mercury	0.2	<i>For aquatic ecosystem protection, based on LOR for CV FIMS</i>

Petroleum hydrocarbons (C6-C9)	20		
Petroleum hydrocarbons (C10-C36)	100		
Fluoride (total)	2000	<i>Protection of livestock and short term irrigation guideline</i>	
Include additional contaminants as required	Include additional contaminants as required		

Note:

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

1. All metals and metalloids must be measured as total (unfiltered) and dissolved (filtered). Trigger levels for metal/metalloids apply if dissolved results exceed trigger.
2. The quality characteristics required to be monitored as per Table 3 can be reviewed once the results of two years monitoring data is available and it may be determined that a reduced monitoring frequency is appropriate or that certain quality characteristics can be removed from Table 3 by amendment.
3. SMD – slightly moderately disturbed level of protection, guideline refers ANZECC & ARMCANZ (2000).
4. LOR – typical reporting for method stated. ICPMS/CV FIMS – analytical method required to achieve LOR.

- W5** If quality characteristics of the release exceed any of the trigger levels specified in Table 3 during a release event, the environmental authority holder must compare the down stream results in the receiving waters to the trigger values specified in Table 3 and:
1. where the trigger values are not exceeded then no action is to be taken; or
  2. where the down stream results exceed the trigger values specified Table 3 for any quality characteristic, compare the results of the down stream site to the data from background monitoring sites and;
    - (a) if the result is less than the background monitoring site data, then no action is to be taken; or
    - (b) if the result is greater than the background monitoring site data, complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
      - (i) details of the investigations carried out; and
      - (ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W5 2(b) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

- W6** If an exceedance in accordance with condition W5 2(b) is identified, the holder of the authority must notify the administering authority within 14 days of receiving the result.

**Contaminant Release Events**

- W7** The holder must install, operate and maintain a stream flow gauging station to determine and record stream flows at the locations upstream of each Release Point as specified in Table 4 for any receiving water into which a release occurs.
- W8** Notwithstanding any other condition of this environmental authority, the release of mine affected water to waters in accordance with condition W2 must only take place during, or immediately following, periods of natural flow events in accordance with the electrical conductivity quality and receiving water flow criteria specified in Table 4 for the release point(s) specified in Table 1.
- W8(a)** The release of mine affected water to waters in accordance with condition W2 must not exceed the Electrical Conductivity release limits for each receiving water flow criteria stated in Table 4 when measured at the monitoring points specified in Table 1.

**Table 4 (Mine Affected Water Release during Flow Events)**

---

**EXPLANATORY NOTES – Table 4**

**Gauging station description:**

The intent here is that every release point in Table 1 is associated with a gauging station that measures flow upstream of the discharge point. More than one discharge point may be associated with the same gauging station. The gauging station should be at a minimum distance from the discharge point such that water flow under trigger flow events will not significantly diminish by the time it reaches the discharge point. The location of the gauging station should ideally be such that it is not significantly affected by other upstream point source releases or times of discharge are limited to periods of "natural" flow.

Under certain circumstances it may be appropriate to have a downstream gauging station in addition to or in replace of an upstream gauging station. The location should ideally not be affected by the discharge (e.g. be

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

measured off the main waterway). The need for this must be demonstrated on a case by case basis to show why an upstream gauging station is insufficient. This may be the case when mines are located in the upper parts of catchments or near the downstream confluence or a major waterway. Similarly, the gauging station should be at a distance from the discharge point such that water flow during triggered flow events will not significantly diminish between the discharge point and the measuring point (or the confluence with the creek being measured). For downstream flow triggers, some changes to calculation for flow triggers and maximum release flows would typically be required based on the relative sizes of the waterways involved.

**Flow Triggers and EC Quality Criteria:**

The intent for flow triggers is that the times of discharge are limited to times around natural flow events only. Different flow regime methodologies are used to define mine affected water release opportunities, provide flexibility for site operators and to protect identified environmental values within receiving waters. The expectation is that where flow gauging data is available, it is used to calculate flow triggers. Where gauging data is not available or is insufficient, flow triggers should be based on runoff/stream flow estimates using appropriate hydrological calculations or models and known catchment area, rainfall estimations etc.

Separate methodologies for discharges which occur to local waterways rather than regional waterways will be applied as part of this revised approach. Due to the increased flexibility of the revised approach and consideration of a wider range of local factors the application of these model conditions to individual sites will require case-by-case assessment and require sufficient background information to be provided. For example, it should be noted that discharges upstream of dams or lakes may require special considerations and generally stricter controls. Also, where multiple mines discharge to the same or closely connected waterways consideration of cumulative impacts will be necessary as part of the assessment process.

**No/low flow stream conditions (best quality / low EC mine affected water):**

Discharge water quality will need to meet or be better than water quality objectives (or long term background reference 75<sup>th</sup> / 80<sup>th</sup> percentile) for EC and will only be permitted for temporary periods ~~after periods of significant~~ flow. The focus of this is to allow "good" quality water to be released when collected rather than having it stored over long durations resulting in deteriorating water quality. Any discharges made under no/low flow stream conditions must not contribute to or cause erosion and due consideration should be given to road/rail access, stock crossings etc (particularly in relation to multiple mines discharging under no/low flow stream conditions on connected waterways). General principles include:

- Release when below 20<sup>th</sup> percentile flow is on tail end of flow event only i.e. following a flow above 20<sup>th</sup> percentile the trigger is when the flow reduces below the 20<sup>th</sup> percentile again. This trigger will commence a discharge window of 4-6 weeks for good quality water only.
- End of pipe WQ ≤ WQO (or long term background reference 75<sup>th</sup>/80<sup>th</sup> percentile). May require assessment of downstream environmental values and where WQO is more stringent (e.g. drinking water supply) ~~and where they could be significantly affected by the release.~~
- Duration of release is limited (dry ephemeral stream, 4 weeks after flow event ceases, use time after flow trigger for below – add additional time)
- Volume/rate will be considered on a case by case basis.

**Medium flow stream conditions (medium quality mine affected water):**

A flow trigger for the stream is required and will be set to avoid discharge of medium quality water during periods of no or low flow. General principles include:

- Require flow trigger > 20<sup>th</sup> percentile flow (above base flow).
- End-of pipe EC <3500uS/cm. Options for <1500uS/cm and <3500uS/cm can be considered which will result in different maximum discharge rates for different quality water.
- The better the quality of water to be released, the greater the volume that can be permitted.
- Design dilution/maximum discharge rate based on risk assessment and should achieve in-stream EC for design based on location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment. All regional waterways are considered Zone 3.

**Comment [NJ1]:** See below for particular comments - Recommend in all cases that downstream assimilative capacity to ensure industry doesn't contribute to WQOs not being met in dry (ambient) conditions be considered using best available model (DERMs cumulative impact IQQM).

**Comment [r2]:** The models are not yet in a state that they can be used to make fine scale decisions for licensing. Hopefully, these can be improved in the future. Regardless, modelling should be used where a significant risk is identified (this is not necessarily required in the model conditions).

**Comment [NJ3]:** Define if not defined already

**Comment [r4]:** Change made

**Deleted:** over the wet season

**Comment [NJ5]:** WQOs for salinity in downstream catchments are often more stringent (eg Fitzroy lower than Isaacs). If not already underway it may pay for DERM and the mines to start thinking about how this statement transpires in practical terms. It will also require a modelling approach and be cognisant of cumulative impacts.

**Comment [r6]:** True in regards to drinking catchments. The reality is that there is some spatial component to this comment in addition to the size of the release. It is probably in the order of up to 50 km. We deliberately haven't defined this on the basis case specific consideration is needed. We have added some words to clarify the point.

**Deleted:**

**Comment [NJ7]:** Define if not defined already

**Comment [r8]:** Agreed - this whole section has been rewritten to tidy up and the zone 3 regional waterways are better defined now – with zone 3 map in development.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

- o Zone 1, upper catchment mines – in stream EC = 1000uS/cm (toxicity guideline). May vary according to other locally relevant environmental values.
  - o Zone 2, mid catchment mines – in stream EC = 700uS/cm (assume high flow background EC) or high flow EC + YY% (WQO low – EC high) where YY is closer to 1.
  - o Zone 3, lower catchment mines (regional waterway) – in stream EC = high flow EC WQO + XX% (WQO low – EC high).
- Depending on site specific risk assessment, may need to consider downstream limits (least restrictive) to cease discharge for EC, pH, sulphate.
  - Map outlining catchment Zones delineates these zones for assessment (yet to be provided).

**High flow stream conditions (poorer quality water):**

A minimum flow trigger for the stream needs to be set at an 80<sup>th</sup> percentile of natural stream flow. This option might be used in some cases for mines that need to discharge higher EC wastewater than is allowable under medium flow stream conditions. Any discharge is required to have a higher level of dilution than with medium flow cases but still achieve a maximum incremental increase in the waterway. This option is most feasible for mines situated on regional waterways as the window for discharge is likely to be limited for local waterways. Some additional considerations on management of mixing zones and acute/chronic toxicity may be required in this case. General principles include:

- Flow trigger > 80<sup>th</sup> percentile flow.
- End-of pipe EC > 3500uS/cm (but <10,000uS/cm).
- The better the quality of water to be released, the greater the volume that can be permitted.
- Design dilution/maximum discharge rate based on risk assessment. Should achieve in-stream EC for design based on location – upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment. All regional waterways considered Zone 3.
- May need some additional indicators/requirements and requires case by case assessment.
- Not likely to be feasible for Zone 1 and 2 mines.
- Depending on site specific risk assessment, may need to consider downstream limits (least restrictive) to cease discharge for EC, pH, sulphate.

**Comment [NJ9]:** Where is the safety margin built in? Recommend a rigorous, open and transparent approach if this is the case. Also need to prove that the assimilative capacity for all downstream environs to meet ambient WQOs is guaranteed by the amount of water that will come down the creek once it hits low flow (below 20<sup>th</sup> percentile).

**Comment [r10]:** The safety margin is factored in by the flow trigger and confinement to event flow. The only point on the hydrograph where this design factor is relevant is the trigger point.

**Comment [NJ11]:** Define if not defined already.

**Comment [NJ12]:** Consider providing a worked example to minimise confusion?

**Comment [NJ13]:** Consider providing a worked example to minimise confusion.

**Comment [ac14]:** This section reworked in model condition package.

**Comment [NJ15]:** Consider including provisions for requirement of diffusion technology to minimise the hypersaline zone in the waterway.

**Comment [r16]:** Not necessary for medium flow as we consider flow will be turbulent.

**Comment [NJ17]:** Refer comments on zone 1

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

Receiving waters description	Release Point	Gauging station	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Electrical Conductivity Release Limits (uS/cm)	Receiving Water Flow Criteria	Volume / Percentage for maximum release	Flow recording Frequency
e.g. Wet Creek	e.g. RP1	e.g. Gauging station 1	XXXX	XXXX	<insert water quality objective or 75 <sup>th</sup> / 80 <sup>th</sup> percentile of long term background reference>	Following a natural flow event that exceeds the 20 <sup>th</sup> percentile flow, mine affected water meeting this quality limit is permitted to be released for a period of <insert 4 – 6 weeks depending on mine location / receiving water characteristics> following the day that the natural flow recedes below the 20 <sup>th</sup> percentile flow volume.  The volume of flow can be determined by height of water or flow. The actual flow must be a quantifiable measure.  Example: > or = 5 m <sup>3</sup> /sec	Volume to be determined on case by case basis	Continuous (minimum daily)
					Quality determined on case specific basis but typically <1500	Greater than 20 <sup>th</sup> percentile flow (above base flow)	% to be determined on case by case basis	
					Quality determined on case specific basis but typically <3500	Greater than 20 <sup>th</sup> percentile flow (above base flow)	% to be determined on case by case basis	
					Quality determined on case specific basis but typically within a range of <3500 to <10,000	Greater than 80 <sup>th</sup> percentile flow (above base flow)	% to be determined on case by case basis	

**\*Note: Flow must also be measured at the Wet Creek gauging station for release to be permitted based on this flow trigger.**

- W9** The volume of mine affected water released through the release point(s) must not exceed:
- the maximum allowable flow at any time determined by multiplying the recorded receiving water flow at the corresponding gauging station in Table 4 with the corresponding percentages for maximum release in Table 4; or
  - the stated volume for maximum release where specified in Table 4.
- W10** The daily quantity of contaminants released from each release point must be measured and recorded at the monitoring points in Table 1.
- W11** Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

**DRAFT -- FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**Notification of Release Event**

**W12** The environmental authority holder must notify the administering authority as soon as practicable and no later than 24 hours after commencing to release mine affected water to the receiving environment. Notification must include the submission of written advice to the administering authority of the following information:

- a) release commencement date/time;
- b) expected release cessation date/time;
- c) release point/s;
- d) release volume (estimated);
- e) receiving water/s including the natural flow rate; and
- f) any details (including available data) regarding likely impacts on the receiving water(s).

*Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.*

**W13** The environmental authority holder must notify the administering authority as soon as practicable, (nominally within twenty-four (24) hours after cessation of a release event) of the cessation of a release notified under Condition W12 and within 28 days provide the following information in writing:

- a) release cessation date/time;
- b) natural flow volume in receiving water;
- c) volume of water released;
- d) details regarding the compliance of the release with the conditions of Agency Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
- e) all in-situ water quality monitoring results; and
- f) any other matters pertinent to the water release event.

*Note: Successive or intermittent releases occurring within twenty-four (24) hours of the cessation of any individual release can be considered part of a single release event and do not require individual notification for the purpose of compliance with conditions W12 and W13, provided the relevant details of the release are included within the notification provided in accordance with conditions W12 and W13.*

**Notification of Release Event Exceedance**

**W14** If the release limits defined in Table 2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

**W15** The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:

- a) the reason for the release;
- b) the location of the release;
- c) all water quality monitoring results;
- d) any general observations;
- e) all calculations; and
- f) any other matters pertinent to the water release event.

**Monitoring of Water Storage Quality**

**W16** Water storages stated in Table 5 which are associated with the release points must be monitored for the water quality characteristics specified in Table 6 at the monitoring locations and at the monitoring frequency specified in Table 5.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**Table 5 (Water Storage Monitoring)**

Water Storage Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)	Monitoring Location	Frequency of Monitoring
XXXX	XXXX	XXXX	To be negotiated- will depend on the individual storage structure volume. This will deal with stratification – depth profiles and be appropriate to in situ quality characteristics.	Quarterly

**W17** In the event that waters storages defined in Table 5 exceed the contaminant limits defined in Table 6, the holder of the environmental authority must implement measures, where practicable, to prevent access to waters by all livestock.

**Table 6 (Onsite Water Storage Contaminant Limits)**

Quality Characteristic	Test Value	Contaminant Limit
pH (pH unit)	Range	Greater than 4, less than 9 <sup>2</sup>
EC (µS/cm)	Maximum	5970 <sup>1</sup>
Sulphate (mg/L)	Maximum	1000 <sup>1</sup>
Fluoride (mg/L)	Maximum	2 <sup>1</sup>
Aluminium (mg/L)	Maximum	5 <sup>1</sup>
Arsenic (mg/L)	Maximum	0.5 <sup>1</sup>
Cadmium (mg/L)	Maximum	0.01 <sup>1</sup>
Cobalt (mg/L)	Maximum	1 <sup>1</sup>
Copper (mg/L)	Maximum	1 <sup>1</sup>
Lead (mg/L)	Maximum	0.1 <sup>1</sup>
Nickel (mg/L)	Maximum	1 <sup>1</sup>
Zinc (mg/L)	Maximum	20 <sup>1</sup>

Note:

<sup>1</sup> Contaminant limit based on ANZECC & ARM CANZ (2000) stock water quality guidelines.

<sup>2</sup> Page 4.2-15 of ANZECC & ARM CANZ (2000) "Soil and animal health will not generally be affected by water with pH in the range of 4–9".

Note: Total measurements (unfiltered) must be taken and analysed

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**Receiving Environment Monitoring and Contaminant Trigger Levels**

**W18** The quality of the receiving waters must be monitored at the locations specified in Table 8 for each quality characteristic and at the monitoring frequency stated in Table 7.

**Table 7 (Receiving Waters Contaminant Trigger Levels)**

Quality Characteristic	Trigger Level	Monitoring Frequency	Comments
pH	6.5 – 8.5	Daily during the release	See Table 2 comments
Electrical Conductivity (µS/cm)	1000 Note: for protection against toxicity this may need to be reduced in some circumstances e.g. where upstream of a drinking water dam or regional waterway		
Suspended solids (mg/L)	To Be Determined. Turbidity may be required to assess ecosystems impacts and can provide instantaneous results.		
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	250 (Protection of drinking water Environmental Value)		

**Comment [NJ18]:** Aren't all mines in the Fitzroy above drinking water supplies?

**Comment [r19]:** True in regards to drinking catchments. The reality is that there is some spatial component to this component in addition to the size of the release. It is probably in the order of up to 50 km. We deliberately haven't defined this to emphasise need for case specific risk assessments. Have added words 'in close proximity' to model conditions package.

**Table 8 (Receiving Water Upstream Background Sites and Down Stream Monitoring Points)**

**EXPLANATORY NOTES – Selection of monitoring sites:**

The intent here is that that each discharge point has both an upstream and downstream monitoring point associated with it. These monitoring points should be located as close as practicable to the release point and the distances should be defined in the footnotes in Table 8. The location of flow monitoring points should also be considered in selecting upstream monitoring points. Other considerations include accessibility, particularly during wet weather conditions.

Monitoring Points	Receiving Waters Location Description	Latitude or northing (GDA94)	Longitude or easting (GDA94)
<b>Upstream Background Monitoring Points</b>			
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres upstream of RP XX	XXXX	XXXX
<b>Downstream Monitoring Points</b>			
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX
Monitoring Point XX	XXXX Creek XX metres downstream of RP XX	XXXX	XXXX

**Comment [NJ20]:** Consist including the method in which distance is determined, it does it relate to stream order and rainfall gradients and what equation is applied?

**Comment [r21]:** There is a methodology but difficult to include here (is locally specific). Will work up better support material on approach for training purposes.

**Notes:**

- a) The upstream monitoring point should be within 10km the release point.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

- b) the downstream point should not be greater than Xkm from the release point.  
c) The data from background monitoring points must not be used where they are affected by releases from other mines.

**Comment [NJ22]:** Consider including the method in which this distance is determined. Does it relate to stream order and rainfall gradients and what equation is applied?

- W19** If quality characteristics of the receiving water at the downstream monitoring points exceed any of the trigger levels specified in Table 7 during a release event the environmental authority holder must compare the down stream results to the upstream results in the receiving waters and:
1. where the downstream result is the same or a lower value than the upstream value for the quality characteristic then no action is to be taken; or
  2. where the down stream results exceed the upstream results complete an investigation into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining:
    - (i) details of the investigations carried out; and
    - (ii) actions taken to prevent environmental harm.

*Note: Where an exceedance of a trigger level has occurred and is being investigated, in accordance with W19(2) of this condition, no further reporting is required for subsequent trigger events for that quality characteristic.*

**Receiving Environment Monitoring Program (REMP)**

**EXPLANATORY NOTES – Designing a REMP:**

*Generally the Receiving Environment Monitoring Program (REMP) should be used to assess the local receiving waters for the specified discharge locations. The monitoring should not be specifically designed to assess compliance of the release – this is covered by other conditions. The key purpose of the REMP is to assess the overall condition of the local receiving waters and assessment should be against water quality objectives and relevant guidelines. Note that in some cases where discharge occurs to ephemeral streams, there may be a need to include downstream sensitive receiving waters or environmental values outside of the specified REMP area. An example of this would be where there are no semi-permanent/permanent waterholes in the specific area but one is located further downstream prior to the confluence with the next major waterway. For further guidance on what to include in a REMP, please refer to the Draft DERM REMP Document for Fitzroy Coal Mines and Additional Information.*

- W20** The environmental authority holder must develop and implement a Receiving Environment Monitoring Program (REMP) to monitor, identify and describe any adverse impacts to surface water environmental values, quality and flows due to the authorised mining activity. This must include monitoring the effects of the mine on the receiving environment periodically (under natural flow conditions) and while mine affected water is being discharged from the site.

For the purposes of the REMP, the receiving environment is the waters of the XX and connected or surrounding waterways within XX (e.g. Xkm) downstream of the release. The REMP should encompass any sensitive receiving waters or environmental values downstream of the authorised mining activity that will potentially be directly affected by an authorised release of mine affected water.

- W21** The REMP must:
- a) Assess the condition or state of receiving waters, including upstream conditions, spatially within the REMP area, considering background water quality characteristics based on accurate and reliable monitoring data that takes into consideration temporal variation (e.g. seasonality); and
  - b) Be designed to facilitate assessment against water quality objectives for the relevant environmental values that need to be protected; and
  - c) Include monitoring from background reference sites (e.g. upstream or background) and downstream sites from the release (as a minimum, the locations specified in Table 8); and
  - d) Specify the frequency and timing of sampling required in order to reliably assess ambient conditions and to provide sufficient data to derive site specific background reference values in accordance with

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

the *Queensland Water Quality Guidelines* 2006. This should include monitoring during periods of natural flow irrespective of mine or other discharges; and

- e) Include monitoring and assessment of dissolved oxygen saturation, temperature and all water quality parameters listed in Table 2 and 3); and
- f) Include, where appropriate, monitoring of metals/metalloids in sediments (in accordance with ANZECC & ARMCANZ 2000, BATLEY and/or the most recent version of AS5667.1 *Guidance on Sampling of Bottom Sediments*); and
- g) Include, where appropriate, monitoring of macroinvertebrates in accordance with the AusRivas methodology, and
- h) Apply procedures and/or guidelines from ANZECC & ARMCANZ 2000 and other relevant guideline documents; and
- i) Describe sampling and analysis methods and quality assurance and control; and
- j) Incorporate stream flow and hydrological information in the interpretations of water quality and biological data.

**W22** A REMP Design Document that addresses each criterion presented in Conditions W20 and W21 must be prepared and submitted to the administering authority no later than 3 months after the date of issue of this environmental authority [include for new sites or expansion projects, remove for existing mine sites which already have REMP Design Documents]. Due consideration must be given to any comments made by the administering authority on the REMP Design Document and subsequent implementation of the program.

**W22(a)** A report outlining the findings of the REMP, including all monitoring results and interpretations in accordance with conditions W20-W22 must be prepared annually and made available on request to the administering authority. This must include an assessment of background reference water quality, the condition of downstream water quality compared against water quality objectives, and the suitability of current discharge limits to protect downstream environmental values.

**Water Reuse**

**W23** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority for the purpose of supplying stock water to properties owned by the environmental authority holder or a third party and subject to compliance with the quality release limits specified in Table 9.

**Table 9 (Stock Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	5000

**W24** Mine affected water may be piped or trucked or transferred by some other means that does not contravene the conditions of this environmental authority for the purpose of supplying irrigation water to properties owned by the environmental authority holder or a third party and subject to compliance with quality release limits in Table 10.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**Table 10 (Irrigation Water Release Limits)**

Quality characteristic	Units	Minimum	Maximum
pH	pH units	6.5	8.5
Electrical Conductivity	µS/cm	N/A	Site specific value to be determined in accordance with ANZECC & ARMCANZ (2000) Irrigation Guidelines

- W25** Mine affected water may be piped or trucked off the mining lease for the purpose of supplying water to a third party for purpose of construction and/or road maintenance in accordance with the conditions of this environmental authority.
- W26** Mine affected water may be piped or trucked for the purpose of supplying water to <name adjoining mine> in accordance with the conditions of this environmental authority. The volume, pH and electrical conductivity of water transferred to <name adjoining mine> must be monitored and recorded.
- W27** If the responsibility for mine affected water is given or transferred to another person in accordance with conditions **W23, W24, W25 or W26**:
- the responsibility for the mine affected water must only be given or transferred in accordance with a written agreement (the third party agreement); and
  - include in the third party agreement a commitment from the person utilising the mine affected water to use it in such a way as to prevent environmental harm or public health incidents and specifically make the persons aware of the General Environmental Duty (GED) under section 319 of the *Environmental Protection Act 1994*, environmental sustainability of the water disposal and protection of environmental values of waters.

**Water General**

- W28** All determinations of water quality and biological monitoring must be:
- performed by a person or body possessing appropriate experience and qualifications to perform the required measurements;
  - made in accordance with methods prescribed in the latest edition of the Department of Environment and Resource Management's Monitoring and Sampling Manual;
- Note: Condition W28 requires the Monitoring and Sampling Manual to be followed and where it is not followed because of exceptional circumstances this should be explained and reported with the results.*
- collected from the monitoring locations identified within this environmental authority, within XX hour of each other where possible;
  - carried out on representative samples; and
  - analysed at a laboratory accredited (e.g. NATA) for the method of analysis being used.
- W29** The release of mine affected water directly or indirectly to waters:
- must not produce any visible discolouration of receiving waters; and
  - must not produce any slick or other visible or odorous evidence of oil, grease or petrochemicals nor contain visible floating oil, grease, scum, litter or other objectionable matter.

**Annual Water Monitoring Reporting**

- W30** The following information must be recorded in relation to all water monitoring required under the conditions of this environmental authority and submitted to the administering authority in the specified format with each annual return:
- the date on which the sample was taken;

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

- b) the time at which the sample was taken;
- c) the monitoring point at which the sample was taken;
- d) the measured or estimated daily quantity of the contaminants released from all release points;
- e) the release flow rate at the time of sampling for each release point;
- f) the results of all monitoring and details of any exceedences with the conditions of this environmental authority; and
- g) water quality monitoring data must be provided to the administering authority in the specified electronic format upon request.

**Temporary Interference with waterways**

- W31** Temporarily destroying native vegetation, excavating, or placing fill in a watercourse, lake or spring necessary for and associated with mining operations must be undertaken in accordance with Department of Environment and Resource Management *Guideline - Activities in a Watercourse, Lake or Spring associated with Mining Activities*.

**Water Management Plan**

- W32** A Water Management Plan must be developed by an appropriately qualified person and implemented by XX/XX/XXXX (WITHIN 3 MONTHS OF THE DATE OF ISSUE).

- W33** The Water Management Plan must:

- a) provide for effective management of actual and potential environmental impacts resulting from water management associated with the mining activity carried out under this environmental authority; and
- b) be developed in accordance with Department of Environment and Resource Management guideline *Preparation of water management plans for mining activities* and include:
  - i. a study of the source of contaminants;
  - ii. a water balance model for the site;
  - iii. a water management system for the site;
  - iv. measures to manage and prevent saline drainage;
  - v. measures to manage and prevent acid rock drainage;
  - vi. contingency procedures for emergencies; and
  - vii. a program for monitoring and review of the effectiveness of the water management plan.

- W34** The Water Management Plan must be reviewed each calendar year and a report prepared by an appropriately qualified person. The report must:

- a) assess the plan against the requirements under condition W33;
- b) include recommended actions to ensure actual and potential environmental impacts are effectively managed; and
- c) identify any amendments made to the water management plan following the review.

- W34(a)** The holder of this environmental authority must attach to the review report required by condition W34, a written response to the report and recommended actions, detailing the actions taken or to be taken on stated dates:

- a) by the holder of this environmental authority to ensure compliance with this environmental authority; and
- b) to prevent a recurrence of any non-compliance issues identified.

- W34(b)** The review report required by condition W34 and the written response to the review report required by condition W34(a) must be submitted to the administering authority with the subsequent annual return under the signature of the appointed signatory for the annual return.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**W35** A copy of the Water Management Plan must be provided to the administering authority on request.

**Saline Drainage**

**W36** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of saline drainage.

**Acid Rock Drainage**

**W37** The holder of this environmental authority must ensure proper and effective measures are taken to avoid or otherwise minimise the generation and/or release of acid rock drainage.

**Stormwater and Water sediment controls**

**W38** An Erosion and Sediment Control Plan must be developed by an appropriately qualified person and implemented for all stages of the mining activities on the site to minimise erosion and the release of sediment to receiving waters and contamination of storm water.

**W39** The maintenance and cleaning of any vehicles, plant or equipment must not be carried out in areas from which contaminants can be released into any receiving waters.

**W40** Any spillage of wastes, contaminants or other materials must be cleaned up as quickly as practicable to minimise the release of wastes, contaminants or materials to any stormwater drainage system or receiving waters.

**All Dams**

---

**EXPLANATORY NOTES – Dam conditions:**

Note: Conditions W41 and W42 to be removed if already conditioned in the authority.

---

**W41** The hazard category of each dam must be determined by a suitably qualified and experienced person at least once in each two year period.

**W42** Dams having a hazard category determined to be significant or high, must be specifically authorised by an environmental authority.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

**Definitions:**

**"20th percentile flow"** means the 20th percentile of all daily flow measurements (or estimations) of daily flow over the period of record for a particular site where there is sufficient data. The 20th percentile calculation should only include days where flow has been measured (or estimated), i.e. not dry weather days.

**Comment [NJ23]:** Consider including 80<sup>th</sup> percentile

**Comment [NJ24]:** Perhaps the period on record rather than just 10 years?

**Deleted:** a 10 year period

**Comment [r25]:** Agree with comment but definition deleted as only previously used in explanatory text and following a clean up of that section it is no longer necessary.

**"acid rock drainage"** means any contaminated discharge emanating from a mining activity formed through a series of chemical and biological reactions, when geological strata is disturbed and exposed to oxygen and moisture as a result of mining activity.

**"administering authority"** means the Department of Environment and Resource Management or its successor.

**"appropriately qualified person"** means a person who has professional qualifications, training, skills or experience relevant to the nominated subject matter and can give authoritative assessment, advice and analysis on performance relative to the subject matter using the relevant protocols, standards, methods or literature.

**"certify" or "certification" or "certified"** in relation to any other matter other than a design plan, 'as constructed' drawings or an annual report regarding dams in this environmental authority means a Statutory Declaration by a suitably qualified person accompanying the written document stating that:

- i) all relevant material has been considered in the written document; and
- ii) that the content of the written document is accurate and true; and
- iii) that the written document meets the requirements of the relevant conditions of the environmental authority.

**"dam"** means a land-based structure or a void that is designed to contain, divert or control flowable substances, and includes any substances that are thereby contained, diverted or controlled by that land-based structure or void and associated works. However, a dam does *not* mean a fabricated or manufactured tank or container designed to a recognised standard, *nor* does a dam mean a land-based structure where that structure is designed to an Australian Standard. In case there is any doubt, a levee (dyke or bund) is a dam, but (for example) a bund designed for spill containment to AS1940 is *not* a dam.

**"environmental authority"** means an environmental authority granted in relation to an environmentally relevant activity under the *Environmental Protection Act 1994*.

**"environmental authority holder"** means the holder of this environmental authority.

**"flowable substance"** means matter or a mixture of materials which can flow under any conditions potentially affecting that substance. Constituents of a flowable substance can include water, other liquids fluids or solids, or a mixture that includes water and any other liquids fluids or solids either in solution or suspension.

**"hazard"** in relation to a dam as defined, means the potential for environmental harm resulting from the collapse or failure of the dam to perform its primary purpose of containing, diverting or controlling flowable substances.

**"hazard category"** means a category, either low significant or high, into which a dam is assessed as a result of the application of tables and other criteria in the Manual for Assessing Hazard Categories and Hydraulic Performance of Dams (Version 2.0, 2009) published by the Environmental Protection Agency on its website.

**"mine affected water"** means:

- i) water that has been used for a task in the mining activity (e.g. pit water, tailings dam water, processing plant water and water contaminated by workshop activities); and
- ii) rainfall runoff contacting any disturbed and non-rehabilitated areas of the mining activity; and
- iii) groundwater that has contacted disturbed and non-rehabilitated areas of the mining activity; and
- iv) groundwater from dewatering activities.

**"natural flow"** means the flow of water through waters caused by nature.

**"receiving environment"** means all groundwater, surface water, land, and sediments that are not disturbed areas authorised by this environmental authority.

**"receiving waters"** means all groundwater and surface water that are not disturbed areas authorised by this environmental authority.

**"representative"** means a sample set which covers the variance in monitoring or other data either due to natural changes or operational phases of the mining activities.

**"saline drainage"** The movement of waters, contaminated with salt(s), as a result of the mining activity.

**DRAFT – FOR CONSULTATION PURPOSES ONLY - NOT GOVERNMENT POLICY**

"waters" includes river, stream, lake, lagoon, pond, swamp, wetland, unconfined surface water, unconfined natural or artificial watercourse, bed and bank of any waters, dams, non-tidal or tidal waters (including the sea), stormwater channel, stormwater drain, and groundwater and any part thereof.

**Fitzroy Model Water Conditions Review**  
**DERM/QRC Internal Workshop 2**  
**29 June 2011**  
**(EA Conditions)**

Issue:	Discussion:
Coordinator	██████████, A/Director, Coal Operations is managing coordination of the review.
Conditions W1 and W2 Definition of Mine Affected Water	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ Industry was generally satisfied with the intent but still felt that 'mine affected water' was not appropriately defined, particularly given the definition of mining activity in section 147 of the EP Act. Water not intended to be captured by the definition, possibly still would be e.g. water used to irrigate rehabilitation areas.</li> <li>▪ QRC suggested that a listing be developed of either what is included or excluded in the definition and offered to assist with wording.</li> <li>▪ QRC was concerned that the word 'contaminants' in W1 still has overly restrictive literal consequences given that the conditions for Water Management Plan and Soil Erosion Control Management Plan do not actually permit a release of 'contaminants'.</li> <li>▪ QRC advised that there needs to be provisions applied in the above plans and that the intent be reflected in the conditions.</li> <li>▪ QRC noted that the wording 'on-site water management infrastructure' in W2 could reference a schedule in the relevant water management plan.</li> </ul> <p>1 <b>Action:</b> QRC to provide written considerations for improvements to the above conditions.  <b>COMPLETED</b></p>
Water Management Plan conditions (W32-W34(c))	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ The group noted the requirement for increasing rigour around the plans.</li> <li>▪ The group did not see the need for third party certification of plans.</li> <li>▪ It was suggested that an appropriate Industry person sign-off that a water management plan was in place in the Annual Return process as it will meet current accountability processes.</li> <li>▪ DERM briefly highlighted to the group that there were differences in the quality of water management plans from across Industry.</li> <li>▪ QRC mentioned that there had been delays by DERM in providing responses to the quality of water management plans required under the current Fitzroy conditions.</li> <li>▪ Other suggestions / comments included: <ul style="list-style-type: none"> <li>- Condition W33 should specifically link to water management as at present it refers generally to environmental harm.</li> <li>- In condition W34 the wording be amended to remove reference to annual certification.</li> <li>- in condition W34a) the wording could be amended to "as soon as reasonably practicable, implementing measures or taking necessary action to ensure compliance with the requirements of this environmental authority, if necessary."</li> <li>- In condition W34(a)b) the wording could be amended to "as soon as reasonably practicable, implementing measures or taking necessary action to ensure compliance with the requirements of this environmental authority, if necessary."</li> </ul> </li> <li>▪ The group generally agreed to the intent for these conditions and agreed to settle condition wording out of session through liaison between DERM and QRC.</li> </ul> <p>2 <b>Action:</b> QRC/DERM to work together to finalise appropriate wording for the above conditions.  <b>COMPLETED</b></p>
Model conditions and extraordinary events	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ DERM advised that following consideration it had determined that model conditions are not an appropriate document to attempt to deal with extraordinary events for reasons outlined in the response to Action items from the first workshop.</li> <li>▪ Industry suggested that a condition be added for DERM to liaise with Industry on a site by site basis to enable discharge in emergency/extraordinary conditions.</li> <li>▪ DERM agreed to insert an explanatory note referring to the ability to consider cases beyond the scope of model conditions, where adequate contingency planning and risk assessment information can be demonstrated by the applicant.</li> </ul> <p>3 <b>Action:</b> DERM to develop an appropriate explanatory note for insertion into the working draft.</p>
Investigation triggers (W5-W19)	<ul style="list-style-type: none"> <li>▪ In relation to W5 2(b), the group agreed to DERM's proposal to remove the wording "ANZECC and ARMCANZ 2000 methodology" following discussion of DERM's consideration outlined in the responses to Workshop 1 Action items. No further action required.</li> </ul>
Monitoring point accessibility (W4)	<ul style="list-style-type: none"> <li>▪ The group agreed to the additional noting developed for W4. No further action required.</li> </ul>
TSS / Turbidity, EC / Sulphate, Metals (Tables 2 and 3)	<ul style="list-style-type: none"> <li>▪ The group agreed to the changes in Tables 2 and 3. No further action required.</li> </ul>
REMP template status / REMP revised conditions	<ul style="list-style-type: none"> <li>▪ The group was advised that the contact person for Industry to ask any questions on the REMPs is through the Regional Managers in their regional areas.</li> <li>▪ The group agreed to the amendments for W20, W21 and W28. No further action required.</li> </ul>
Fitzroy Partnership	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ QRC asked whether DERM is considering how the REMP design and reporting will fit within the Fitzroy Partnership modelling from a data management aspect.</li> <li>▪ DERM advised that it is anticipated that coordination of data from REMPs and the linkage into the Fitzroy Partnership will be via the WATERS system. The WATERS system is under development and is to be</li> </ul>

	<ul style="list-style-type: none"> <li>implemented for Fitzroy coal mines in 2012.</li> <li>▪ DERM will share data, including REMP data, with the Fitzroy Basin Association.</li> <li>▪ The group requested that wording be included in the explanatory notes regarding the intent of the linkages.</li> </ul>
	<p>4 <b>Action:</b> DERM to develop an appropriate explanatory note for insertion into the working draft.</p>
Internal dam to dam transfer (W2)	<ul style="list-style-type: none"> <li>▪ The group agreed to the addition to W2 regarding internal dam to dam transfer. No further action required.</li> <li>▪ The group brought up the issue of the regulated dams review and concern about how any suggestions made by Industry did not appear to be captured in the review. The group mentioned that they would like the opportunity to workshop the regulated dams model conditions, in the same way as the Fitzroy Model Condition review.</li> <li>▪ Andrew Brier mentioned that he would pass on Industry's request to the relevant officers undertaking that review.</li> </ul>
Notification requirements (W12)	<ul style="list-style-type: none"> <li>▪ The group agreed to the amendments to W12. No further action required.</li> </ul>
Reuse conditions (W23-W24)	<ul style="list-style-type: none"> <li>▪ The group agreed to the intent of amendments to W23 and W24, but highlighted that the issues with W1 and W2 and the definition of mine affected water still created a restrictive issue for these conditions, which can be resolved by further refinement of those conditions.</li> </ul> <p>See Action Item 1.</p>
Dams references eg cattle access	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ The group felt that conditions W41 and W42 were of minimal use by themselves and covered by the regulated dams model conditions. Industry also said W17 was captured by the regulated dams model conditions.</li> <li>▪ It was suggested that these conditions could remain for now but could all be covered by a note similar to that already existing for W41 and W42, stating the conditions can be deleted if they are already conditioned in the authority and referencing the regulated dams model conditions.</li> </ul> <p>5 <b>Action:</b> DERM to refine notes for W17, W41 and W42.</p>
Revised discharge conditioning – the science	<ul style="list-style-type: none"> <li>▪ Ian Ramsay explained the science of the revised discharge conditions (Table 4).</li> <li>▪ The group requested clarity around calculator outcomes and approaches for different zones, particularly zone 3 multipliers.</li> </ul> <p>6 <b>Action:</b> DERM to develop discharge mapping for Zone 3 management areas and distribute to the group for comment.</p> <p>7 <b>Action:</b> DERM to circulate the presented Fitzroy catchment discharge calculator to the group, through Bronwyn Story.</p>
Revised discharge conditioning – the structure	<p>DERM outlined the following:</p> <ul style="list-style-type: none"> <li>▪ EC monitoring remains linked to Table 2 and condition W4.</li> <li>▪ Release windows modified by amendment to condition W8 and Table 4.</li> <li>▪ EC limits now imposed by condition W8(a) and Table 4.</li> <li>▪ Release volume continued to be capped by Table 4 and condition W9 with amendment to provide volume in low or no flow periods.</li> <li>▪ Definition of 20<sup>th</sup> percentile over 10 years to be removed.</li> <li>▪ Table 4 to be clearer with an EC flow rate included on a site by site basis.</li> </ul>
General	<ul style="list-style-type: none"> <li>▪ A copy of a working draft of the model conditions to be circulated to the Fitzroy Water Quality Advisory Group this week for discussion at the meeting on 7 July.</li> <li>▪ Final comments on the working draft of the model conditions due to DERM by 22 July.</li> <li>▪ Any further consultation with Industry will occur via email and phone calls.</li> <li>▪ It is intended that the model conditions will be finalised by 31 July.</li> </ul>
Implementation	<ul style="list-style-type: none"> <li>▪ Discussions within DERM to occur regarding strategies for implementation of the model conditions.</li> <li>▪ There was a suggestion that DERM may hold information sessions for Industry to assist them with being compliant with the revised model conditions.</li> <li>▪ Industry asked that the planned pending automatic inclusion of the regulated dams model conditions upon application for any EA amendment, not apply for applications to amend to include the revised model Fitzroy Water Conditions.</li> <li>▪ DERM agreed to consider this option and provide a response to QRC</li> </ul> <p>8. <b><u>DERM to consider excluding the automatic inclusion of the regulated dams conditions into EAs when companies apply for the Fitzroy conditions and provide a response to QRC.</u></b></p>
Salinity Trading Scheme	<ul style="list-style-type: none"> <li>▪ QRC updated the group on the status of the Salinity Trading Scheme study.</li> <li>▪ The group agreed that any data submitted to DERM regarding EC flow could be used for the salinity trading scheme study. Companies may also have extended information that they wish to supply. Contact with companies should be through head office not site personnel.</li> <li>▪ It is proposed that a workshop for the study would be held at the end of August/early September.</li> </ul>

**Fitzroy Model Water Conditions Review  
DERM/QRC Internal Workshop 1  
31 May 2011  
(Licensing Conditions)**

**Participants:** Andrew Brier (RSD – CCSG), [REDACTED] (RSD – CCSG), Chris Loveday (RSD – ES CW), [REDACTED] (RSD – ES SW), [REDACTED] (RSD – CCSG), Frances Hayter and [REDACTED] (QRC), [REDACTED] (Anglo), [REDACTED] (Yancoal), [REDACTED] (Leanne Bowie Lawyers), [REDACTED] (Ison Environmental), [REDACTED] (Peabody), [REDACTED] and [REDACTED] (BIMA), [REDACTED] (RTCA), [REDACTED] (Xstrata Coal) [REDACTED] (Macarthur Coal)

Issue:	Discussion:
Coordinator	[REDACTED] A/Director, Coal Operations is managing coordination of the review.
Introduction	<p>Andrew Brier opened the workshop and advised that:</p> <ul style="list-style-type: none"> <li>▪ Model conditions provide a minimum set of standards that are acceptable to the administering authority and will not replace EAs and TEPs</li> <li>▪ EAs are the appropriate tool for authorising discharges</li> <li>▪ The model conditions are a basic tool. If companies need consideration of options outside what the model conditions provide, then they are to negotiate conditions in their EA, or alternatively submit a detailed TEP outlining appropriate water management strategies and a transition to compliance with the EA.</li> </ul>
EAs vs TEPs	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ Andrew Connor provided an overview of the background context leading to this review, the development of water quality objectives, use of TEPs and DERM's forward strategy continuing to be based on protecting identified environmental values within the Fitzroy Basin waterways and the need to consider cumulative effects.</li> <li>▪ QRC members were concerned that it was not possible to discharge water ahead of the wet season flows and TEPs did not provide management options at all sites.</li> <li>▪ There was concern that the end of pipe limit does not provide flexibility to discharge low volumes of water containing high EC while still maintaining the desired dilution outcome.</li> <li>▪ It was acknowledged that the TEPs would have been of greater value if they had been in place ahead of the wet season..</li> <li>▪ The key advantage of the TEP approach was the flexibility it provided to release higher concentrations of EC based on achieving downstream limits.</li> <li>▪ It was considered that TEPs helped overall but the review should focus on attempting to avoid the need for future use in similar circumstances.</li> <li>▪ [REDACTED] (Anglo) commented that the TEP provided little relief in their situation, however said that the EA conditions are OK normally but it was the extreme nature of rainfall received over the wet season that is the key issue.</li> <li>▪ Participants agreed that the objective is the need to maximise options for water disposal whilst achieving environmental objectives. The preference is for EAs, as EA conditions can manage extreme rainfall events.</li> </ul> <p><b>1    <u>Action:</u> [REDACTED] to circulate a copy of DERM's PowerPoint presentation to workshop participants.</b></p>
Mine Affected Water – Definition	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ In relation to condition W2, it was agreed that definitions for "mine affected water" and "waters" needed to be developed.</li> <li>▪ QRC commented that the commonwealth was adopting 'worked water' terminology but said the specific term used was not the priority here, rather that it is well defined.</li> <li>▪ QRC also requested that condition W1 be reviewed as the term 'contaminants' and 'environmental harm' when defined are sufficiently broad so as to make most activities on site, or even activities occurring adjacent to the site, to be prohibited by a literal interpretation of the condition.</li> <li>▪ Diversions are being used as a key water management strategy and the model conditions need to clearly define what can be diverted.</li> <li>▪ The number of plans required for different authorisations, e.g. sediment control plan / water management plan is a requirement under the model conditions. These plans should be key documents to identify 'clean' water over land flow vs mine affected water.</li> <li>▪ DERM suggested that these plans could include maps which had been certified by a third party. The plans would then be required to be reviewed annually and also available upon request.</li> <li>▪ It was suggested that a statement be provided in the EA annual return advising that a certified map has been produced and is available on request, rather than sending the maps to DERM.</li> </ul> <p><b>3    <u>Action:</u> DERM to review conditions W1 and W2 and a definition for 'mine affected water' to provide a draft for consideration at the next workshop.</b></p> <p><b>4    <u>Action:</u> DERM to consider the certification issue and provide advice for discussion at the next workshop.</b></p>
Discharge Conditions	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ [REDACTED] provided an overview of the concepts under development for revised model discharge conditions, including low/no flow, medium and high flow discharge options.</li> <li>▪ DERM advised that from analysing applications it was found that TEPs submitted by coal mines contained very little information demonstrating an assessment of the environmental risk and impact on nearby environmental values for each individual proposal and this made the decision making process difficult.</li> <li>▪ QRC raised its concern over the current rigid end of pipe limit approach promoted by the existing model conditions. An approach providing greater flexibility to use smaller volumes of higher concentration water during flow events based on achieving the in stream dilution objective would aid effective on-site water management.</li> <li>▪ DERM commented that from a compliance perspective it is important to have a measurable limit on discharge, but the point raised was valid and would be considered further prior to the next workshop.</li> </ul>

Issue:	Discussion:
Data Review Use	<p>DERM is reviewing the data provided by Industry and is compiling TEP information to:</p> <ul style="list-style-type: none"> <li>▪ analyse completeness</li> <li>▪ analyse environmental risks</li> <li>▪ analyse difference between local and regional waterways</li> <li>▪ develop case studies to test licensing approach.</li> </ul> <p>The results from this data analysis will be discussed in more detail at the next workshop.</p>
Emergency Releases	<ul style="list-style-type: none"> <li>▪ DERM advised of legal advice obtained about the use of the emergency provisions in the Environmental Protection Act 1994 with respect to requests to discharge water from mine sites.</li> <li>▪ QRC acknowledged it would prefer to deal with release options through the conditions of the EA but had sought emergency directions on the basis the EA did not provide options.</li> <li>▪ It was agreed to work forward from here and that any request for exercising emergency powers would only be required if there was an imminent risk of dam failure that could cause an even greater amount of environmental harm or public risk than a controlled release would.</li> <li>▪ QRC maintains that there is a need to give consideration to how EAs might deal with extraordinary rainfall events.</li> <li>▪ A case point was raised about a mine in the headwaters that has 5-10,000 EC water on-site. DERM restated that the model conditions would only provide so much but that if a mine operator presented a well reasoned argument including a risk assessment demonstrating that identified environmental values could be protected using an alternative approach, DERM would consider it.</li> <li>▪ DERM also acknowledged that each mine site would have its own set of environmental constraints to work within and that any proposal should include a full analysis of alternative options, such as water treatment.</li> </ul> <p><b>5 <u>Action:</u> DERM to give consideration to whether model conditions could be structured to deal with extraordinary events.</b></p>
Monitoring Point	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ In relation to condition W19, QRC raised an issue in an investigation being triggered even where the downstream value of EC was only 1 uS/cm higher than the upstream. The comment being that on-site Environmental Officers were tied up doing investigations into small variations rather than applying themselves to maximise water management effectiveness.</li> <li>▪ QRC suggested that condition W19 be reworded to be more pragmatic.</li> <li>▪ DERM noted the condition only triggers an investigation to determine whether the mine is causing the elevated receiving environment levels and discussed difficulties in setting a percentage increase. A QRC member also commented that there would still be occasion to question what to do when you are only 1uS/cm over the new limit.</li> </ul> <p><b>6 <u>Action:</u> DERM to review condition W19 and provide a response for the next workshop.</b></p> <ul style="list-style-type: none"> <li>▪ With regard to monitoring locations, QRC considers wording needs to be included along the lines of “as long as the location is safely accessible”.</li> <li>▪ DERM will consider the argument out of session, but noted that selection of monitoring points and making provisions for access also remain a responsibility of the mine operator and are typically defined through agreement with DERM during EA assessment.</li> </ul> <p><b>7 <u>Action:</u> DERM to consider accessibility issue between workshops.</b></p>
Parameters and Receiving Water Flow Rate	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ Regarding TSS/turbidity QRC suggested that a turbidity measurement be used as the default measurement. It was noted this had been discussed previously and it was agreed that mines could present information to demonstrate the correlation for their sites for TSS and turbidity for DERM to consider the appropriate limit.</li> <li>▪ QRC also raised correlation between EC and sulphate and questioned why the need to measure sulphate. Ian Ramsay said the sulphate was an indicator of mine water in the area. DERM did note there was a possibility to remove the end of pipe sulphate limit on the basis of including a more serious downstream number for sulphate.</li> <li>▪ For Metals, QRC believe frequency is too often. DERM acknowledged that where adequate data exists (i.e. two years monitoring data) then on a case by case basis the frequency of metals monitoring could be evaluated. This is addressed in the foot note to Table 3. It was proposed that DERM review the footnote to Table 3 to clarify the possibility of reducing monitoring frequency following submission of two years data demonstrating no issues with particular metals.</li> </ul> <p><b>8 <u>Action:</u> DERM to consider relevant conditions and explanatory text in internal workshop and provide a draft for consideration at the next QRC workshop.</b></p> <p><b>9 <u>Action:</u> DERM to review footnotes for Table 3 and provide a draft for consideration at the next workshop.</b></p>
Proposed Changes to REMP Conditions	<p>Industry advised that there was confusion as to whether there is a final version of the draft REMP template.</p> <p><b>10 <u>Action:</u> DERM to clarify the status of the REMP template and advise accordingly.</b></p> <p>██████████ discussed a paper titled “Draft REMP conditions to replace conditions W20 to W22”.</p> <p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ The word “contaminants” should be replaced by “mine affected water” (or a similar definition once developed) in W20.</li> <li>▪ There was concern that the order of condition W21 was confusing and should be revised.</li> <li>▪ Condition WXX should be removed as it was similar to condition W28.</li> <li>▪ QRC emphasised the need for DERM to capture data submitted over time for future reference to avoid requests for information. ██████████ discussed a system for collecting data that should be ready by the end of the year. QRC stated its preference was that mines hold off on submitting required reports in the interim</li> </ul>

while this system is developed. DERM said that in the interim mine companies should comply with their EA requirements and submit reports when necessary.

- 11 **Action:** DERM to consider above suggestions and review conditions W20-W22 and provide a draft for consideration at the next workshop.

Issue:	Discussion:
Link with Regulated Dam Requirements	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ There was discussion about how the regulated dam guideline and model conditions relate and/or overlap and whether each regulated dam needed to be listed as a release point.</li> <li>▪ DERM explained that the regulated dam guideline relates to minimum design, operational and decommissioning requirements for the dam structures and the model conditions are designed to protect environmental values from water discharged to the receiving environment.</li> <li>▪ There was concern about the potential to capture dams managed under the erosion and sediment control plans through the risk assessment for regulated dams.</li> <li>▪ QRC was seeking clarity around any distinction between sediment dams under the ESCPs and the regulated dams guideline.</li> </ul>
	<p>12 <b>Action:</b> DERM to clarify how sediment control dams are to be dealt with under the regulated dams guideline – links to defined release points in model conditions but may be more a consideration for regulated dams guideline.</p>
Timing of Current TEPs	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ TEPs seeking a straight discharge with no additional transition to a new standard will no longer be accepted by DERM.</li> <li>▪ QRC enquired about interim release arrangements for low/no flow events while the model conditions review is being completed. DERM replied that industry can apply for extensions to current TEPs which will be considered on a case by case basis by DERM in the context of risk to environmental values.</li> <li>▪ Industry will be required to provide detailed information in TEP applications regarding transition to appropriate water management strategies to manage a sustainable water cycle.</li> </ul>
Water Management Plans	<ul style="list-style-type: none"> <li>▪ QRC clearly stated its view that what is currently in the conditions is acceptable and there is no requirement for third party certification of WMPs.</li> <li>▪ It was discussed that where sites had failed to do enough with their WMPs they now had to deal with the consequences of excessive water on-site.</li> <li>▪ DERM commented that this included seeking permission to discharge. QRC said that this was true of all mines given the extreme rainfall experienced and not just those that may have been tardy with WMPs.</li> <li>▪ DERM discussed the advantages it could see in third party certification of WMPs, including comfort in defining the separation of waters from mine affected waters. DERM agreed to consider this further out of session in light of QRC's views on the topic.</li> </ul>
Notification Requirements	<p>Discussion by the group considered the following:</p> <ul style="list-style-type: none"> <li>▪ There was concern regarding the requirement of two different timeframes for compliant releases, both of which are more stringent than the 24 hours provided for notifying of a breach of conditions.</li> <li>▪ DERM pointed out that the timeframes for notification applied to both compliant and non-compliant water discharges (i.e. any water discharge).</li> <li>▪ QRC suggested that water releases should have a 24 hour notification requirement to be consistent with other industries and EA conditions.</li> <li>▪ Issues around practical site considerations (e.g. mobile coverage) were discussed in the context of complying with 6 hours.</li> <li>▪ There was concern that some breaches identified and being considered by DERM for enforcement action were for failure to meet the notification requirement rather than for a compliance issue (e.g. breach due to environmental harm).</li> <li>▪ It was suggested that condition W12 be reviewed to clearly define notification timeframes for compliant/non compliant activities and notification requirement times.</li> </ul>
	<p>13 <b>Action:</b> DERM to review condition W12 and provide a draft for consideration at the next workshop.</p>
Other Drafting Considerations	<ul style="list-style-type: none"> <li>▪ There was agreement to review the need for condition W43 in the model conditions.</li> <li>▪ In relation to water re-use, conditions W23-W24 need to ensure that supply of water to a third party is not constrained.</li> <li>▪ QRC proposed the wording "other than a natural watercourse" needs to be added to conditions W23-W24.</li> <li>▪ The wording "dry weather" in conditions W23-W24 needs to be clarified/defined.</li> </ul>
	<p>14 <b>Action:</b> DERM to review conditions W23, W24 and W43 and provide a draft for consideration at the next workshop.</p>
General	<p><i>It is anticipated that the next DERM/QRC Workshop will be held on Wednesday 29 June and will focus on the science data in the model conditions. Venue to be confirmed.</i></p>

<b>DERM / QRC WORKSHOP 1 – ACTION ITEMS AND CONSIDERATIONS</b> <b>** SORTED **</b>		
<b>ACTION ITEM 1</b>		
Brief -	DERM Consideration -	Modification to Model Conditions: Yes/No – Explain
<p>██████████ to circulate a copy of DERM's PowerPoint presentation to workshop participants.</p>	<p>Action completed.</p>	<p>No</p>
<b>ACTION ITEM 2</b>		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
<p>Review of Conditions (W1 + W2) – DERM to review conditions W1 and W2 and a definition for 'mine affected water' to provide a draft for consideration at the next workshop.</p>	<p>Review considerations:</p> <ul style="list-style-type: none"> <li>- Definition of 'contaminants' is defined by EP Act. No amendment to this definition is proposed but excluding the term from condition W2 is accepted with the insertion of 'mine affected water' and an associated definition.</li> <li>- Definition of 'waters' is deliberately broad and acknowledge argument that current definition can capture on-site water management infrastructure in a literal sense. Propose to specifically exclude identified on-site infrastructure from definition of 'waters' through amendment to condition W2.</li> <li>- This may not be as problematic within W1 as it would be in combination with the original W2 given the reference here to 'except otherwise permitted ....." There remains a need from DERM's perspective to ensure other contaminants are captured here. Original proposal to include only mine</li> </ul>	<p><b>W1</b> No change. There remains a need from DERM's perspective to ensure other contaminants are captured here. QRC proposal to include only mine affected water and solid waste in one definition is not sufficient to capture other possible contamination sources such as diesel / oil / other chemical spills from contained storages. Given the reference in W1 to 'except otherwise permitted by the EA", the solution to condition W2 should deal with drafting concerns raised.</p> <p><b>W2</b> Modified. Replacement of the word 'contaminants' with 'mine affected water'. This negates the argument about the broad definition of contaminants within the EP Act and the restrictive nature of the former condition in a very literal sense. Also included explanatory text to provide specific 'exclusions' from the 'waters' definition for the purposes of condition W2.</p>

DERM Review Actions

	affected water and solid waste in one definition is not sufficient to capture other possible contamination sources such as diesel / oil / other chemical spills.	
<b>ACTION ITEM 3</b>		
<b>Brief -</b>	<b>DERM Consideration -</b>	<b>Modification to Model Conditions Completed: Yes/No – Explain</b>
DERM to consider the certification issue and provide advice for discussion at the next workshop.	<p>DERM's main interest here is to achieve a robust process of review and improvement through on-site actions to achieve compliance with EA conditions.</p> <p>Considerations include annual third party review of water management plans and certification of recommended actions to improve site water management practices. DERM notes industry opposition and request for further discussion. Draft WMP conditions are included in the working draft document for discussion purposes.</p>	<b>Yes –</b> modification to conditions W32 to W35 for further discussion at next workshop.
<b>ACTION ITEM 4</b>		
<b>Brief -</b>	<b>DERM Consideration -</b>	<b>Modification to Model Conditions Completed: Yes/No – Explain</b>
DERM to give consideration to whether model conditions could be structured to deal with extraordinary events.	<p>Both industry and DERM agree that a desirable outcome of the model conditions review is to reduce the need for future TEP applications in similar circumstances.</p> <p>DERM's review of data provided by mines to date, while incomplete, indicates the proposed approach to providing low/no flow, medium and high flow discharge options would have reduced the need for TEPs this wet season, but would not have eliminated it entirely.</p>	No – there is no particular condition drafted to cater for unknown extraordinary events, however the proposed changes to the discharge conditions attempt to minimise the need for future TEP applications by providing greater windows of opportunity for discharges to occur while aiming to protect environmental values within the system.

DERM Review Actions

	<p>It is also apparent that there are technological options available to better manage mine water to effectively maximise discharge opportunities for mines, including water treatment.</p> <p>Given this there exists a potential to transition to a new standard of water management which would suit the intent of a future TEP for reduced numbers of mines faced with similar circumstances in the future.</p> <p>Model conditions do not appear to be an appropriate place to provide discharge options in exceptional circumstances, given the inability to give prior consideration to factors only relevant to the unknown circumstance. DERM must consider possible impacts on water quality objectives and cumulative effects, which are important and obligatory considerations for making an environmental management decision, including imposing EA conditions.</p>	
<b>ACTION ITEM 5</b>		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
<p>DERM to review condition W19 and provide a response for the next workshop.</p>	<p>The key industry concern with this condition is the perceived sensitivity in the trigger for the upstream / downstream variation in water quality; in particular given the measurement of a quality parameter just one unit higher than an upstream measurement would trigger a 2 year water quality investigation.</p> <p>In DERM's internal discussion it was agreed that there is little benefit in continuing such lengthy investigations for small variations, however it was acknowledged the previous condition was drafted in order to add to data collections for broader consideration of cumulative impacts.</p> <p>It is noted that an exceedance only triggers one investigation</p>	<p>Yes – remove reference to investigation in accordance with ANZECC methodology in conditions W5 and W19.</p>

DERM Review Actions

	i.e. multiple exceedances do not trigger separate investigations if one is already occurring, but DERM agreed to remove reference to ANZECC methodology to provide greater flexibility to scale the size of an investigation according to the nature of the trigger exceedance.	
<b>ACTION ITEM 6</b>		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
DERM to consider accessibility issue between workshops.	<p>Industry raised an issue about safely accessing defined monitoring locations during extreme events and proposed to have words such as “as long as the location is safely <u>accessible and practical</u> ” inserted into condition W4 and any other monitoring location requirement.</p> <p>While acknowledging this issue was raised in good faith and following real access issues resulting from recent disaster events, consideration of inserting the words proposed or any alternative wording raises unintended risk areas for DERM as follows:</p> <ol style="list-style-type: none"> <li>1. Shifts onus of proof onto DERM to demonstrate that access is safe if failure to monitor occurs.</li> <li>2. While unlikely, could provide incentive for an operator to neglect maintenance of safe access i.e. reduce maintenance and monitoring costs and still achieve compliance.</li> </ol> <p>DERM agrees it is possible to include a note under condition W4 about considering circumstances around safe access prior to determining enforcement action in response to any perceived contravention of the condition.</p>	No – however a proposed note is included under condition W4 to address the issue raised.

ACTION ITEM 7		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
<p>DERM to consider relevant conditions and explanatory text in internal workshop and provide a draft for consideration at the next QRC workshop.</p>	<p>Review considerations –</p> <p><b>TSS / Turbidity:</b> Industry suggested that a turbidity measurement be used as the default measurement as opposed to TSS. The existing Table 2 and footnote provide for a turbidity limit to be derived from TSS correlation. The footnote already states clearly that a limit for suspended solids can be omitted if a turbidity limit is included. No further action required.</p> <p><b>EC / sulphate:</b> Industry also raised correlation between EC and sulphate and questioned why the need to measure both.</p> <p>At DERM's internal workshop it was concluded that there is insufficient data to provide a blanket approach through model conditions for an EC / sulphate correlation. In addition to this, DERM's review of water quality data provides cause to ensure the end of pipe limit for sulphate is maintained and this will be discussed further at the next workshop. It was determined that the limit can be reviewed based on achieving a downstream target of 250 mg/L to ultimately protect downstream drinking water values. Amend Table 2 to this effect.</p> <p><b>Metals:</b> Industry believes the monitoring frequency is too often. DERM acknowledges that where adequate data exists (i.e. two years monitoring data) then on a case by case basis the frequency of metals monitoring can be evaluated. This issue is essentially agreed. The outcome of the review is to amalgamate both 'Table 3s' in the existing model conditions and call them all 'potential contaminants', including and</p>	<p><b>TSS / Turbidity:</b> No change required.</p> <p><b>EC / sulphate: Yes</b> - Table 2 amended to provide for review of sulphate EoP limit based on achieving downstream target of 250 mg/L. Table 2 also amended generally to remove references to 'interim' limits and 'future limits'.</p> <p><b>Metals: Yes</b> - Amalgamation of previous 'two' Table 3s and amendments to foot notes to Table 3. Review has also determined that the trigger levels for Aluminium and Lead do not currently match the accepted LORs, an amendment has been proposed accordingly.</p>

DERM Review Actions

	amendment to footnotes to capture the 2 year data collection which can lead to reduced frequency and / or removal of monitoring requirements for particular parameters – considered on a case by case basis.	
<b>ACTION ITEM 8</b>		
<b>Brief -</b>	<b>DERM Consideration -</b>	<b>Modification to Model Conditions Completed: Yes/No – Explain</b>
DERM to review footnotes for Table 3 and provide a draft for consideration at the next workshop.	As above for Action 7.	Yes – Agreed and to be modified as per above
<b>ACTION ITEM 9</b>		
<b>Brief -</b>	<b>DERM Consideration -</b>	<b>Modification to Model Conditions Completed: Yes/No – Explain</b>
DERM to clarify the status of the REMP template and advise accordingly.	DERM has not produced a template for REMP documents. The draft documents referred to in the explanatory text for updated REMP conditions are two existing 'draft' documents produced in March and October of 2010, which were intended to provide additional guidance to mining companies for the production of REMP documents.  The reference to these documents will not be replicated in the EA conditions, it only occurs in explanatory text.	No

ACTION ITEM 10		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
DERM to consider above suggestions and review conditions W20-W22 and provide a draft for consideration at the next workshop.	<p>Comments made related to draft REMP condition package. The revisions to the REMP conditions are not material in nature but where instead an attempt to clarify the pre-existing requirements of the REMP. The following comments were made:</p> <ol style="list-style-type: none"> <li>1. The word “contaminants” should be replaced by “mine affected water” (or a similar definition once developed) in W20. Agreed.</li> <li>2. There was concern that the order of condition W21 was confusing and should be revised. DERM has revised the order of W21.</li> <li>3. Condition WXX should be removed as it was similar to condition W28. Agreed, however there is a resultant need to amend condition W28 to ensure all monitoring, including biological monitoring, carried out under the water schedule is captured.</li> </ol>	<p>Yes –</p> <ol style="list-style-type: none"> <li>1. <b>W20</b> removed ‘contaminants’ and inserted ‘mine affected water’.</li> <li>2. <b>W21</b> Order revised in working draft.</li> <li>3. <b>W28</b> Included ‘biological monitoring’ and general tidy up e.g. reference to former department’s name amended.</li> </ol>
ACTION ITEM 11		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
DERM to clarify how model conditions can provide a clear	Clarification on internal dam transfers will be achieved by excluding on-site water management infrastructure from the definition of ‘waters’. There is no requirement for a regulated dam to be defined as a release point for the purpose of an EA.	<b>Yes</b> – included provision for excluding on-site water management infrastructure from the definition of ‘waters’ in condition W2 to ensure allowance made for dam to dam transfers etc.

DERM Review Actions

<p>framework for internal dam to dam transfers and how sediment control dams are to be dealt with under the regulated dams guideline – links to defined release points in model conditions but may be more a consideration for regulated dams guideline.</p>	<p>Release points will only be included where the dam is intended to form part of a normal operation release management framework e.g. a tailings dam at a gold mine will be a regulated dam, however EA conditions will not authorise a release from such a dam, despite the safety requirement for the dam to contain a spillway. For such dams operators must manage the structure not to discharge – in exceptional circumstances where a discharge occurs from such a structure DERM would investigate the circumstances and likely determine the company had breached its EA conditions.</p>	
<p><b>ACTION ITEM 12</b></p>		
<p>Brief -</p>	<p>DERM Consideration -</p>	<p>Modification to Model Conditions Completed: Yes/No – Explain</p>
<p>DERM to review condition W12 and provide a draft for consideration at the next workshop.</p>	<p>This issue is due to perceived inconsistency in approach to mining as opposed to other industries and also the complexity created by having different notification timelines for deliberate vs uncontrolled releases.</p> <p>There is adequate justification for the initial decision to impose more stringent timeframes on notifications of water discharges, particularly where considerations of cumulative impacts are critical to DERM's decision making processes in times where releases are occurring and the period of data collection that has occurred now since 2008.</p> <p>DERM has already accepted arguments presented about the practicality of complying with 6 hours for uncontrolled release in the November 2010 review. That acceptance resulted in the two tiered approach of 6 and 12 hours and is adequate justification to not revert to a single 6 hour notification window.</p>	<p>Yes – W12 modified to remove two tier notification requirements and include 24 hour maximum notification timeframe.</p>

DERM Review Actions

	<p>In practice the revised condition is not adequately clear and enforceable and given the risk associated with a non-deliberate release is higher than that of a deliberate release in accordance with EA conditions; there is no environmental risk based justification for a tighter timeframe to exist for deliberate releases. It is arguable that all releases from authorised discharge points are controlled given they are designed to release when full. An uncontrolled release is not defined.</p> <p>A 12 hour limit on email notification as opposed to 24 hour limit as applied in most other industries is unlikely to yield any great benefit to DERM as regulator. It is accepted that for email notification the vast majority will be made or received during business hours.</p> <p>Other industry standards currently require notification as soon as practicable and no later than 24 hours after commencement.</p> <p>To remove uncertainty and complexity, and to improve consistency DERM proposes to restore the maximum notification timeframe to a single duration of 24 hours, while maintaining the requirement to notify as soon as practicable and reinforcing the message that same day notification will continue to be expected from the regulator where it is practical to do so.</p>	
<b>ACTION ITEM 13</b>		
Brief -	DERM Consideration -	Modification to Model Conditions Completed: Yes/No – Explain
DERM to review conditions W23, W24 and W43 and provide a draft for consideration at the next workshop.	<p>DERM agreed to review conditions W23 and W24 to improve clarity of the conditions and provide for reuse options in accordance with water quality limits.</p> <p>DERM also agreed to consider the ongoing need for condition W43</p>	<p>Yes</p> <p><b>W23</b> and <b>W24</b> amended.</p> <p><b>W43</b> deleted from model condition package.</p>

DERM Review Actions

**Fitzroy Model Water Conditions Review**  
**DERM Internal Workshop 1**  
**9/10 May 2011**  
**(Licensing Conditions)**

**Participants:** Andrew Brier (RSD – CCSG), [REDACTED] (RSD – CCSG), [REDACTED] (RSD – ES CW), Chris Loveday (RSD – ES CW), [REDACTED] (RSD – ES SW), [REDACTED] (RSD – ES SW), [REDACTED] (ERS), [REDACTED] (ERS), [REDACTED] (ERS), Lindsay Delzoppo (ENRR), [REDACTED] (ENRR), Jon Womersley (ENRR), [REDACTED] (RSD – CCSG)

Issue:	Discussion:
Coordinator	<ul style="list-style-type: none"> <li>[REDACTED] A/Director, Coal is undertaking the main coordination of the review.</li> </ul>
Terms of Reference (ToR)	<ul style="list-style-type: none"> <li>Slight changes were made to the ToR.</li> <li><b>Input is required from Andrew Connor, [REDACTED] Melissa Wells, [REDACTED] and [REDACTED] Changes to the ToR to be finalised by Thursday 12 May.</b></li> <li>The final ToR will then be circulated on 12 May to DERM workshop participants, QRC and the Fitzroy Water Quality Advisory Group for information.</li> <li>[REDACTED] to distribute the ToR to the FWQAG on behalf of DERM.</li> </ul>
Model conditions	<ul style="list-style-type: none"> <li>The working draft of the model conditions is to be finalised by 20 May.</li> <li>Documentation is to be circulated to QRC on 23 May for review prior to the DERM/QRC workshop on 31 May.</li> </ul>
DERM/QRC Workshop 31 May	<ul style="list-style-type: none"> <li>It was agreed that at the first DERM/QRC workshop, discussion would not go into the detail of the science but would be focussed on the licensing conditions.</li> <li>Andrew Brier to do an opening presentation at this workshop. This presentation is to include: <ul style="list-style-type: none"> <li>- background/framework for the review</li> <li>- explanation that the model conditions is to be used a basic approval tool</li> <li>- WOLA</li> <li>- obligations for companies to work within TEPs</li> <li>- explanation that EAs are the appropriate tool for authorising discharges – the model conditions are a basic tool and if companies want more, they are to negotiate conditions in their EA, or alternatively submit a proper TEP.</li> </ul> </li> </ul>
Brainstorming	<ul style="list-style-type: none"> <li>The following three questions were used to guide discussion throughout this session: <ul style="list-style-type: none"> <li>- Should it be in the model conditions?</li> <li>- Should it be site specific?</li> <li>- Can we manage the cumulative impacts?</li> </ul> </li> </ul>
Issue 4 Key Consideration 1 (comparative study EAs/TEPs)	<ul style="list-style-type: none"> <li>Ed Donohue is the point of contact for the presentation on Key Consideration 1.</li> <li><b>Ed to develop a powerpoint presentation for this consideration and return to [REDACTED] and [REDACTED] by Wednesday 18 May.</b></li> <li>Lindsay Delzoppo to assist [REDACTED] with wording for presentation in relation to “Old EAs vs new EAs”.</li> <li>[REDACTED] to assist Ed with wording for presentation in relation to “Compare EAs vs TEPs”.</li> </ul>
Issue 5 Key Consideration 2 (discharge conditions)	<ul style="list-style-type: none"> <li>No/Low flow discharge limits (nothing - insignificant): <ul style="list-style-type: none"> <li>- Aiming to use EOP limits</li> <li>- Discharge limit – maximum volume to be set once the data has been analysed</li> <li>- Discharge rate (release up to a certain number of weeks) – to be developed once the data has been analysed</li> </ul> </li> <li>Medium flow discharge limits (insignificant - 20%) <ul style="list-style-type: none"> <li>- Maximum EOP EC limit to be developed (currently 1500 in original conditions – anticipated to move to larger number once data has been analysed)</li> <li>- Dilution rate – EC trigger downstream – to be developed once the data has been analysed (it is anticipated that the current ratio of 20% is too restrictive)</li> </ul> </li> <li>High flow discharge limits (20% - 80%) <ul style="list-style-type: none"> <li>- High EC – may be able to adopt slightly higher figures of 4000-10000 – final figures to be developed once the data has been analysed</li> <li>- Case by case assessment is required</li> <li>- Higher limits may be authorised via written approval by DERM – to be reviewed further.</li> </ul> </li> <li>[REDACTED] to develop ½ page of information as outlined below and return to [REDACTED] and [REDACTED] by Wednesday 18 May.</li> <li>Paragraphs to include: <ul style="list-style-type: none"> <li>- DERM’s considerations in developing no/low flow, medium flow and high flow discharge conditions</li> <li>- Outlining what information is required from QRC (eg. What did QRC experience; what are the concerns/issues; do QRC’s members want straight dilution etc).</li> </ul> </li> </ul>
Issue 6 Key Consideration 3 (mine affected water)	<ul style="list-style-type: none"> <li>It was determined that a possible definition of “mine affected water” could be “water contaminated by mining activities”.</li> <li>[REDACTED] to contact QRC to clarify why it raised this issue.</li> </ul>
Issue 7 Key Consideration 4 (passive and active discharges)	<ul style="list-style-type: none"> <li>Condition W12 is to be reviewed/redrafted.</li> <li>[REDACTED] to add wording to condition W12 along the following lines: <ul style="list-style-type: none"> <li>- Multiple releases from the same discharge point within X for active discharges and Y for passive discharges (anticipated X = 24 hours; Y = 6 hours – to be reviewed/clarified at DERM/QRC workshop).</li> </ul> </li> <li>[REDACTED] to contact QRC to clarify if it had any further concerns with this consideration.</li> </ul>
Issue 8 Key Consideration 5	<ul style="list-style-type: none"> <li>Condition W32-35 is to be reviewed/redrafted.</li> <li>[REDACTED] to provide wording from the dam regulations in relation to certification requirements</li> </ul>

(linkages with WMPs)

**and annual inspection/return submissions and return to [REDACTED] and [REDACTED] by Wednesday 18 May.**

Issue 9  
Key Consideration 9  
(populating right parameters and limits)

- It was agreed to defer this condition at the moment until the data can be analysed.
- If any workshop participants have concerns with Tables 2, 3 or 7 – please submit to Andrew Connor and Ian Ramsay by 18 May.

Issue 10  
Key Consideration 10 (monitoring and reporting requirements)

- Conditions W18-W22 to reviewed/redrafted.
- Wording to be finalised once release conditions are finalised.
- [REDACTED] **to provide reviewed draft wording for these conditions through to [REDACTED] and [REDACTED] by Wednesday 18 May.**

Issue 11  
Key Consideration 11 (use of gullies, etc)

- This condition is to be flagged for discussion with QRC at the DERM/QRC workshop.

Issue 12  
Key Consideration 12 (notification requirements)

- This point was discussed under Issue 7 / Key Consideration 4.

Issue 13  
Key Consideration 13 (evaluating dilution rate)

- Relates specifically to explanatory text in Table 4 (gauging stations).
- If anyone has concerns or would like amendment to the wording, please advise Andrew Connor by Wednesday 18 May.

# **Model Water Conditions for Coal Mines in the Fitzroy Basin**

## ***Industry Training***

25 August 2011

## Introductions

- Name, company/client representing, role
- Sign Attendance list

## Day Overview

Introduction (Overview, Objective of the Day, Background)

Release limits, triggers and indicators (Table 2 & 3)

Release during Events (Table 4) – *Part 1*

### **12.30pm Lunch**

Release during Events (Table 4) – *Part 2*

Receiving water monitoring, triggers & programs

Individual/General Questions/Wrap-up

**4pm Finish**

## Objectives for the Day:

- Help understand revised model water conditions for coal mines in the Fitzroy Basin.
- Providing guidance/support to assist companies in providing quality EA amendment applications.
- Focus will primarily be on technical aspects of release condition/limits

## Background – Role of Model Conditions

- Provide a base structure for Environmental Authority conditions.
- Improve consistency of conditioning approaches.
- Provide transparency to applicants for environmental performance expectations.
- Model conditions do not prevent applicants from proposing alternative conditions, nor restrict DERM from using alternative conditions where the site or proposed activity warrant it.

## Background – Intent of Model Condition Review

- Planned for end of 2011, brought forward 6 months
- Retain intent of previous model conditions
- Review limits and approaches based on available data and experience (request for data)
- Provide greater flexibility to avoid TEPs where possible but not cause environmental harm or cumulative impacts

Note: Amended EAs will NOT include all TEP approaches, e.g. local EVs must be assessed/protected

## Key Review Outcomes:

- ‘Mine affected water’ definition finalised
- Low / medium / high flow discharge methodology introduced
- Conditions simplified where possible (e.g. release notification)
- Receiving Environment Monitoring Program expectations clarified
- Water Management Plan reviews tied to infrastructure improvement commitments.

## The Bottom Line:

- Regulation of mine water discharges will continue to be based on management against WQO and protecting EVs.
- Assessment and conditioning of EAs must continue to consider cumulative impacts.
- The review outcomes are not a ‘compromise’ on environmental protection, but it was aided by lessons learned from recent wet season experiences & data.
- Extreme events are mentioned in explanatory notes - not specifically conditioned. Planning is required.

## **Release Permissions:**

### **Mine affected water:**

1. Controlled releases with end of pipe quality and quantity limits;  
or
2. To internal water management infrastructure

### **Non mine affected water:**

1. ESCP releases – no end of pipe specified, but in-stream monitoring of TSS will trigger investigation if not managed;
2. Water management plan diversions.

# **Release Limits, Triggers & Indicators Model Conditions - Table 2 & 3**

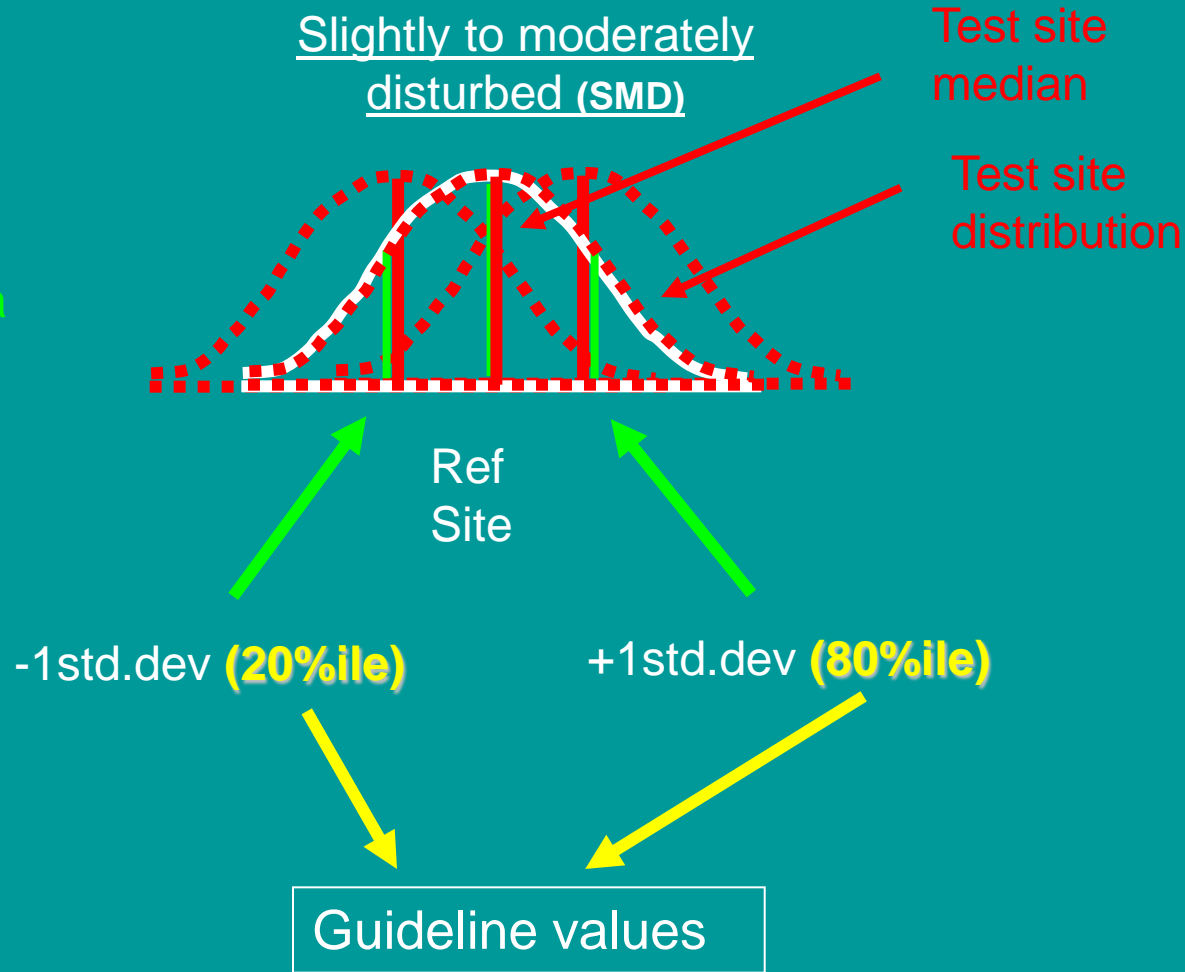

## Table 2 – Suspended solids

- Suspended solids (SS) traditionally used to regulate discharges
- Dried solids > 0.45  $\mu\text{m}$  filter
- Limit often determined from treatment design for sedimentation
- SS impact by smothering/silting ecosystems
- Naturally high in Fitzroy during events - use reference data (80<sup>th</sup> percentile to check/derive limit)
- Delay in getting results

# ANZECC 2000 recommendations on reference-based guideline values

Distribution of Indicator values at a REFERENCE SITE

# Developing/applying Guidelines

## Method

Referential approach:

- benchmarking against reference systems

## Table 2 – Turbidity

- Turbidity traditional as an ecosystem measure
- Measures light scatter – finer material dominate
- Difficult to remove via treatment – need to flocculate
- **I**mpact by blocking light to benthic communities
- In-situ measurement - quick result
- Can correlate with SS. May be rough and dependent on particle size distribution etc

## Table 2 – Suspended solids vs. Turbidity

### *Model Conditions guidance*

Suspended solids (mg/L) – primary focus:

- Limit based on receiving water reference data and achievable treatment
- Limit can be omitted if turbidity limit is included – still measure

## Table 2 – Suspended solids vs. Turbidity

### *Model Conditions guidance*

Turbidity (NTU) – secondary focus:

- Current limit or limit derived from suspended solids
- Need demonstrated correlation between turbidity to suspended solids historical monitoring data for dam water
- Limit can be omitted SS limit is included – still measure

## Table 2 – Sulphate

- Previously: fixed limit in Table 2 – current limit or 1000mg/L
- Now: limit used to protect Drinking Water (250mg/L). Could be specified in Table 2 if 250mg/L limit is applied.
- Now: For variable flow criteria and higher limit, specify in Table 4 (like EC approach).

## Table 3 – Potential Contaminants

- All contaminants now considered as potentially relevant – one table, with triggers
- Some minor change to LOR triggers, sodium added
- Option 1 – Adopt all indicators & triggers from Model Conditions
- Option 2 – Screen contaminants or adjust triggers on a site by site basis for each mine.

## Table 3 – Potential Contaminants

### Screening contaminants

- Contaminants may be removed from Table 3 where it can be demonstrated they are not of concern for a site.
- Need representative & historical data of all dams which have or could release.
- Essentially, field filtered results need to be < or near trigger values for whole data set.

## Table 3 – Potential Contaminants

### Modifying trigger levels

- Applicable to metal/metalloids only.
- Need sufficient data from reference sites (non mine affected), e.g. two years, >24 data points.
- Need field filtered data, grab samples – disregard other data.
- Compare 95<sup>th</sup> percentile of data to ANZECC trigger. If greater, derive 80<sup>th</sup> percentile reference guideline as per previous.

# Release during Events - Table 4 Part 1

# Overview

## Part 1

- Flow regimes and flow triggers
- No/low flow stream & example
- Zone overview & rules

## Flow regimes and flow triggers

- Three different flow regimes for possible discharge of different qualities:
  - no/low flow, medium flow (event), high flow.
- Need to develop two flow triggers: event commencement (used for no/flow & medium discharge) and high flow Need case-by-case assessment & data to calculate triggers
- Gauging station location important, e.g. upstream vs downstream, local vs major waterway

# Flow regime considerations

# Flow Regime – Flow Regimes & EC

## How to determine event flow triggers?

- Plot flow (cumecs) versus EC – more data the better
- Find point where EC increases and starts to exceed event guideline (usually  $250\mu\text{S}/\text{cm}$ )
- Estimate flow at this point – becomes event trigger.
- Release flow trigger can be any point at or above this flow.
- Where limited data, estimates using catchment area correlations/models

## Example – North Goonyella data using WQA (flow)

## Example – North Goonyella data using WQA (Flow & EC)

# Example – North Goonyella data using WQA (EC vs Flow)

# Example – North Goonyella data using WQA (flow) Event Trigger

## How to determine high flow triggers?

- Proposed method is visual, may be others.
- Need hydrograph, remove no/low flow data
- Examine cumulative frequency curve for flow
- Mark event trigger and draw line, where line significantly departs from curve represents high flow commencement & trigger

# Example – North Goonyella data using WQA (flow, histogram, <0.5 cumecs removed)

# Example – North Goonyella data using WQA (flow, histogram, <0.5 cumecs removed)

# Example – North Goonyella data using WQA (flow) High Flow Trigger

## No/low flow stream (1)

- Discharge of “good” quality water, meet WQO for EC end-of-pipe.
- Discharge only permitted temporarily after significant flow, avoid storage.
- Other consideration – erosion, road/rail access, stock crossings etc
- Volume/rate will be considered on a case by case basis.

## No/low flow stream (2)

### Methodology

- Release following flow above event flow trigger and flow reduces below the flow trigger
- Discharge window of 4 weeks plus typical time for flow to reduce from event trigger to 5% to 10% of event trigger.
- End of pipe  $WQ \leq WQO$  or long term background reference 75<sup>th</sup> percentile.
- May require assessment of downstream environmental values where  $WQO$  is more stringent (e.g. drinking water supply).
- Volume/rate will be considered on a case by case basis.

# Example – North Goonyella data using WQA (flow) No/low flow duration

# Example – Nogoia Duckponds data using WQA (flow) No/low flow duration

## Zone Overview and Rules

Three zones for different event release strategies.

- Upper (Zone 1), mid (Zone 2) or lower (Zone 3) catchment.
- Zone 1, upper catchment mines, approximately <10km from top of waterway catchment.
- Zone 2, mid catchment mines, zones not within Zone 1 or 3
- Zone 3, lower catchment mines (All regional waterways are considered Zone 3 from distance >50km from top of waterway catchment, refer to Zone 3 map)

# Discharge Approach – conceptual model for Zones

# Potential Zone 3 Areas

**Potential Zone 3 Areas**

# DERM Draft EV Map

**Burton Gorge Dam**

**Central tributaries**

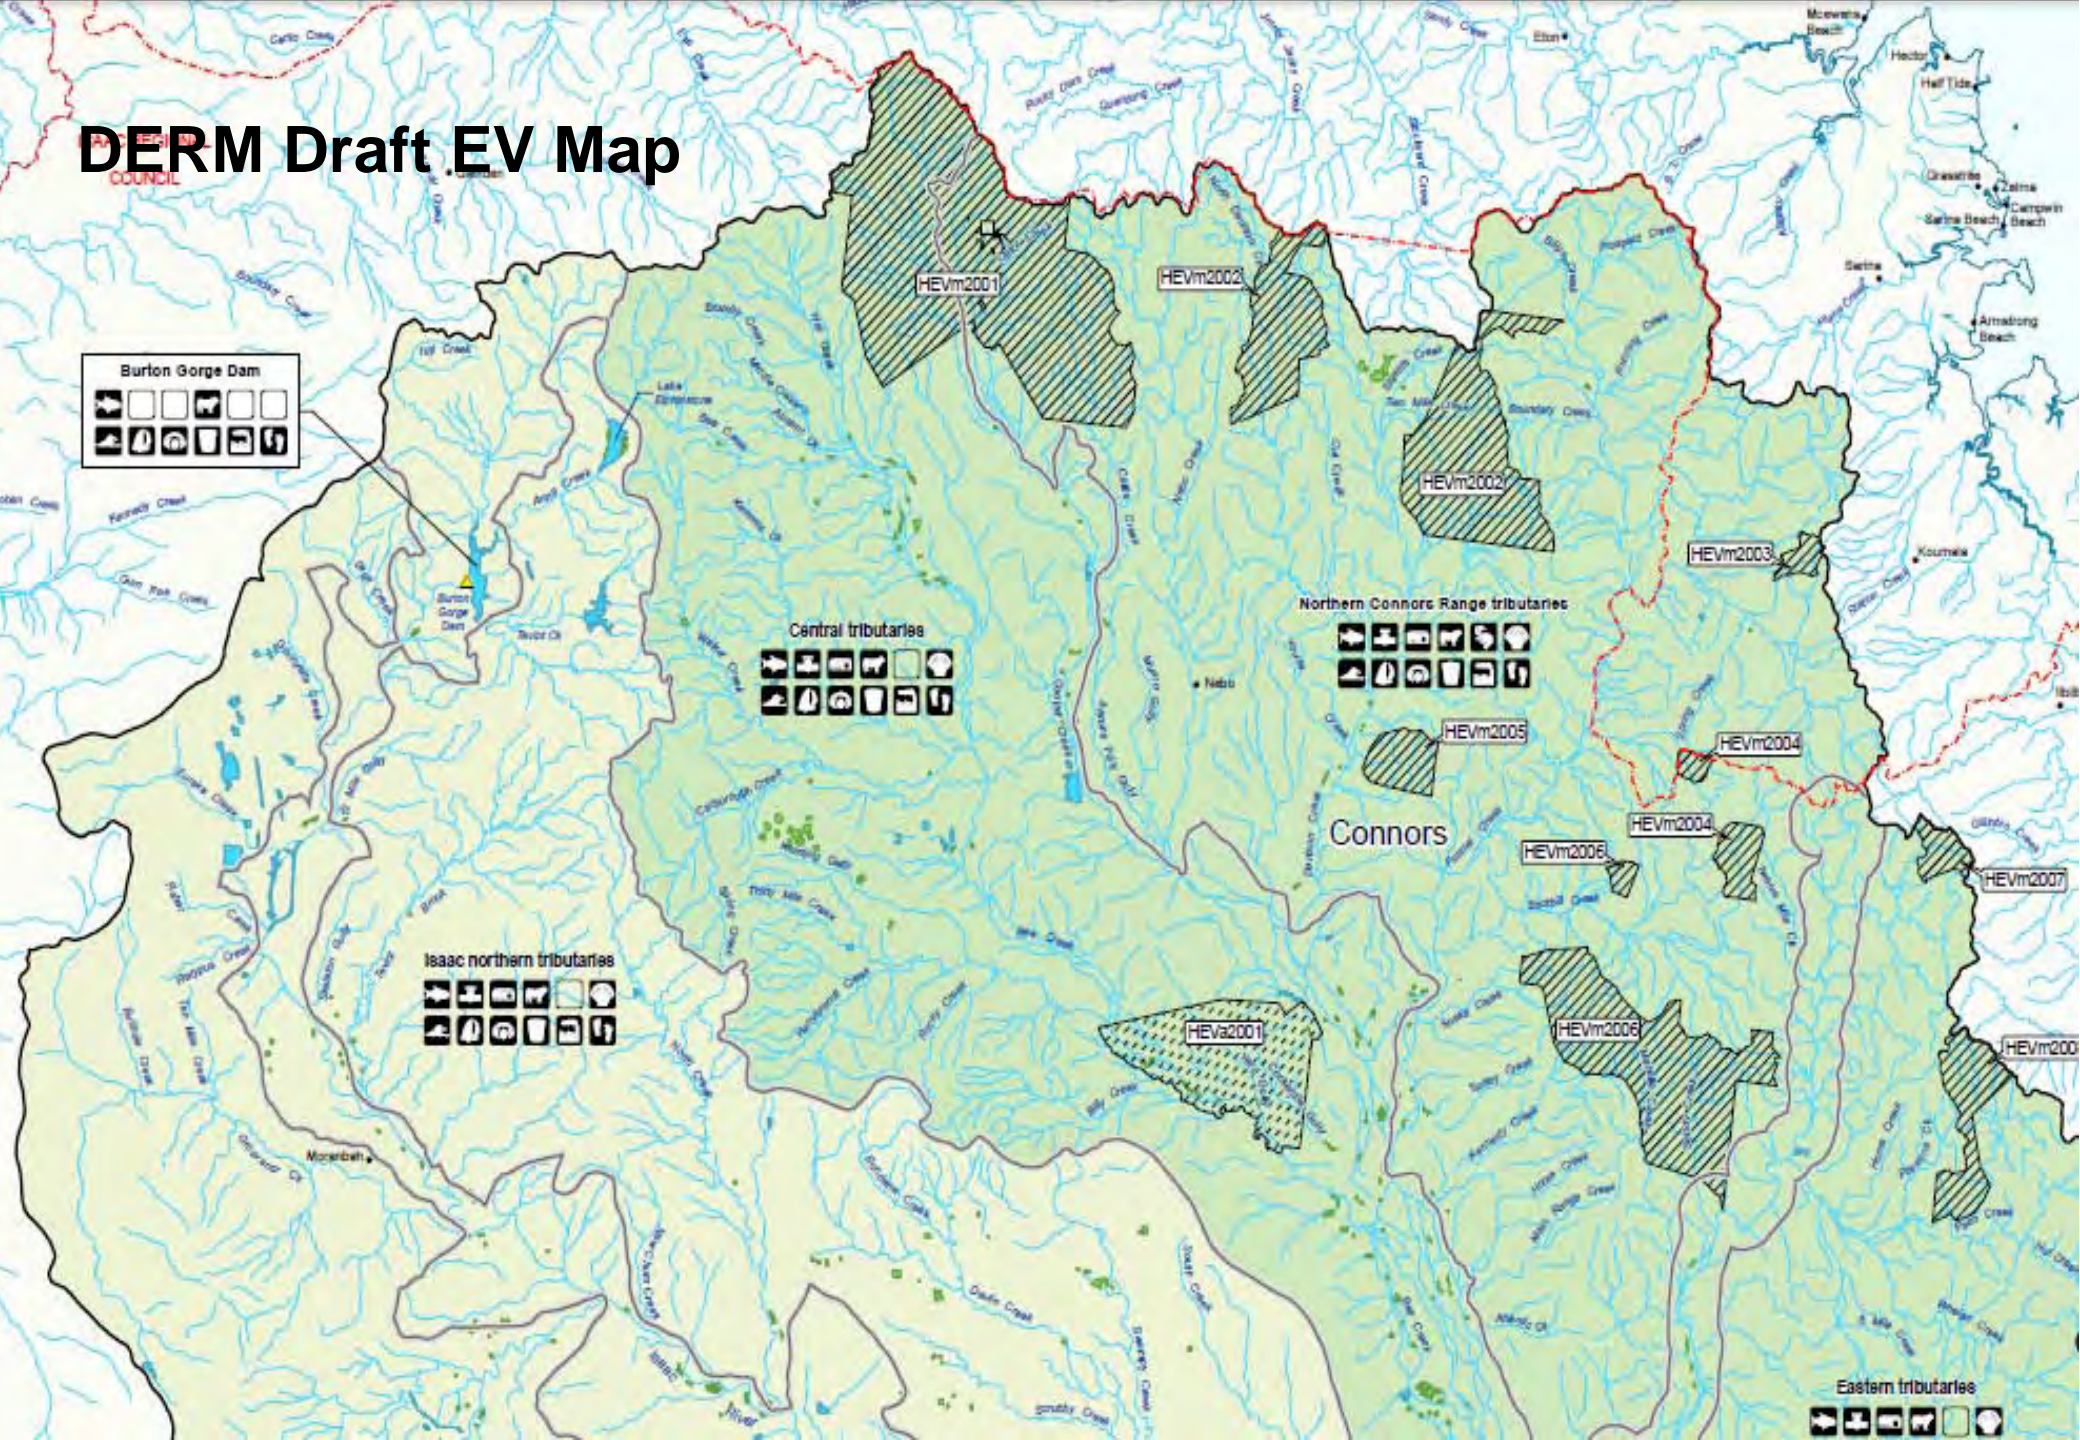

**Northern Connors Range tributaries**

**Isaac northern tributaries**

**Eastern tributaries**

# Release during Events - Table 4 Part 2

## Overview

### Part 1

- Zone approaches for determining EC limit for medium flow
  - Zone 1 – upper catchment
  - Zone 2 – middle catchment
  - Zone 3 – lower catchment
- High flow limits

# Discharge Approach – conceptual model for Zones

## Zone approaches for determining EC for medium flow

- Medium flow focus of previous model conditions, may be same
- New approach – more flexible for EC limit (1500 & 3500 EOP)
- Conceptually use assimilative capacity for limit design based on WQOs & event concentrations
- In place of catchment model, adopt Zone 1, 2 & 3 with varying approaches
- Design dilution/maximum discharge rate based on a site specific risk assessment

## EVs, WQOs & Guidelines

### Other EV considerations

#### Drinking Water/Reservoirs

- Generally  $EC < 300 \mu S/cm$  target probably required, or 75<sup>th</sup> percentile, e.g.
  - Mackenzie (Bedford weir 224), (Bingegang 270)
  - Nogoa (Fairbairn 258)
  - Dawson (Glebe 190), (Theodore 274)
  - Fitzroy (Eden Ban 227)
- Proposed approach not applicable for release to or immediately above lakes/reservoirs.

# EVs, WQOs & Guidelines

## Other EV considerations

### Aquatic Ecosystem

- Semi permanent/permanent water hole locations

### Drinking Water

- Assumed potential farm drinking water in most cases –  
EC<700 $\mu$ S/cm, sulphate<250mg/L.

### Irrigation/Stock

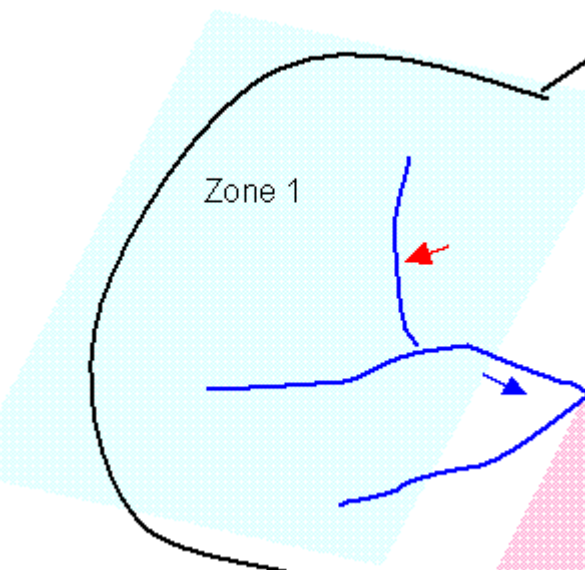

- EC guideline higher. Consider for emergency release, flow considerations.

UNDERTAKE RISK ASSESSMENT

-

## Zone 1 approach for determining EC for medium flow

1. Select  $EC_{\text{event}}$ , e.g. 210 or 250  $\mu\text{S}/\text{cm}$
2. Design  $EC_{\text{in stream}} = 1000 \mu\text{S}/\text{cm}$   
(~ecosystem toxicity)
3. Allowable  $\Delta EC = 750 \mu\text{S}/\text{cm}$
4. Determine event flow trigger, e.g. 0.05 m<sup>3</sup>/s

## Zone 1 approach for determining EC for medium flow

5. Choose end-of-pipe EC, e.g.  $<1500 \mu\text{S}/\text{cm}$
6. Calculate maximum discharge rate:

$$= \text{Flow Trigger} * \Delta\text{EC} / (\text{EC}_{\text{limit}} - (\text{EC}_{\text{event}} + \Delta\text{EC}))$$

$$= 0.05 \times 750 / (1500 - (250 + 750))$$

$$= 0.05 \times 750 / 500 = \underline{0.075 \text{ m}^3/\text{s}}$$

(can use DERM calculator)

## Zone 1 approach for determining EC for medium flow

- Can choose higher flow trigger and repeat
- Repeat for other EC if desired, to determine max rate, e.g.  $3500\mu\text{S}/\text{cm}$ .
- Discharge flow will be lower for higher EC
- Can only release from one or other EC limit approach

## Zone 2 approach for determining EC for medium flow

1. Select  $EC_{\text{event}}$ , e.g.  $250\mu\text{S}/\text{cm}$  (or  $210\mu\text{S}/\text{cm}$ )
2. Design  $EC_{\text{in stream}} = 700\mu\text{S}/\text{cm}$  (~drinking, <ecosystem tox.)
3. Allowable  $\Delta EC = 450\mu\text{S}/\text{cm}$
4. Determine event flow trigger, e.g.  $0.2 \text{ m}^3/\text{s}$

## Zone 2 approach for determining EC for medium flow

5. Choose  $EC_{limit}$ , e.g.  $<1500\mu\text{S}/\text{cm}$

6. Calculate maximum discharge rate:

$$= \text{Flow Trigger} * \Delta EC / (EC_{limit} - (EC_{event} + \Delta EC))$$

$$= 0.2 \times 450 / (1500 - (250 + 450))$$

$$= 0.2 \times 450 / 800 = \underline{0.113 \text{ m}^3/\text{s}}$$

(can use DERM calculator)

## Zone 2 approach for determining EC for medium flow

- Can choose higher flow trigger and repeat
- Repeat for other EC if desired, to determine max rate, e.g.  $3500\mu\text{S}/\text{cm}$ .
- Discharge flow will be lower for higher EC
- Only release from one or other approach
- Assess potential influence of any other mine releases (share assimilative capacity – adjust  $\text{EC}_{\text{event}}$  and/or  $\Delta\text{EC}$  )

## Zone 3 approach for determining EC for medium flow

1. Select  $EC_{\text{event}}$ , e.g. 250uS/cm (or 210)
2. Design  $EC_{\text{in stream}} = WQO_{\text{baseflow}}$
3. Use multiplier of 0.2
4. Calculate  $\Delta EC = 0.2 \times (EC_{WQO} - EC_{\text{event}})$
5. Determine event flow trigger, e.g. 10 m<sup>3</sup>/s

## Zone 3 approach for determining EC for medium flow

5. Choose end-of-pipe EC, e.g.  $<1500 \mu\text{S}/\text{cm}$
6. Calculate maximum discharge rate:  

$$= \text{Flow Trigger} * \Delta\text{EC} / (\text{EC}_{\text{limit}} - (\text{EC}_{\text{event}} + \Delta\text{EC}))$$

Example, Lower Dawson Rv (10m<sup>3</sup>/s trigger)

$$\Delta\text{EC} = 0.2 \times (340 - 210) = 26 \mu\text{S}/\text{cm}$$

Max Discharge

$$= 10 \times 26 / (1500 - (210 + 26)) = \underline{0.206 \text{ m}^3/\text{s}}$$

(can use DERM calculator)

## Zone 3 approach for determining EC for medium flow

- Can choose higher flow trigger and repeat
- Repeat for other EC if desired, to determine max rate, e.g. 3500  $\mu\text{S}/\text{cm}$ .
- Discharge flow will be lower for higher EC
- Only release from one or other approach
- No need to assess potential influence of any other mine releases – incorporated already

## Zone approaches for determining EC for high flow

- Uses high flow trigger for release commencement
- End-of pipe EC can be  $> 3500 \mu\text{S}/\text{cm}$  (but  $< 10,000 \mu\text{S}/\text{cm}$ ). Better WQ, greater volume permitted.
- Design dilution/maximum discharge rate as per medium flow approaches and Zones.
- Must include site specific risk assessment. May include additional indicators/requirements.
- This option less feasible for Zone 1 and 2 mines.

## Zone 3 approach for determining EC for high flow

Example, Lower Dawson Rv (100m<sup>3</sup>/s trigger, EC<sub>limit</sub>=7500 μS/cm )

$$\Delta EC = 0.2 \times (340 - 210) = 26 \mu\text{S/cm}$$

Max Discharge

$$= (100 - 10) \times 26 / (7500 - (210 + 26))$$

$$= \underline{0.32 \text{ m}^3/\text{s}}$$

Where 10m<sup>3</sup>/s is medium flow discharge trigger to still discharge medium quality water

# REMP & Supporting Information for Application

## Overview

- Receiving environment triggers
- Changes to REMP instructions
- EA Application information
- Raw Monitoring Data

## Receiving Environment Triggers

- Triggers only on high priority indicators, during release
- Slight changes to EC, sulphate & addition of sodium
- EC is high risk trigger, may reduce in some cases
- Sulphate for drinking water protection
- Addition of sodium, limit TBA

## Table 7 (Receiving Waters Contaminant Trigger Levels) changes

Quality Characteristic	Trigger Level
Electrical Conductivity ( $\mu\text{S}/\text{cm}$ )	1000 Note: for protection against toxicity this may need to be reduced in some circumstances e.g. where in close proximity upstream of a drinking water dam or regional waterway
Sulphate ( $\text{SO}_4^{2-}$ ) (mg/L)	250 (Protection of drinking water Environmental Value)
Sodium (mg/L)	TBA

## Changes to REMP instructions

- Purpose of REMP to assess overall condition of local receiving waters
- Not specifically for compliance but to help longer term decisions, trigger reviews etc
- For ephemeral streams, downstream sensitive receiving waters/EVs outside specified REMP may need to be considered, e.g. nearest water holes.
- For further guidance, Draft DERM REMP Document for Fitzroy Coal Mines and Additional Information available.

## Changes to REMP condition W23/W24

- W23 re-ordered and tried to make clearer
- Emphasise condition assessment/use of WQO, not EA limits
- Sites include upstream/background, downstream + additional
- Frequency and timing to assess ambient conditions and derive site specific background reference values
- Include monitoring DO, temp, and all water quality parameters listed in Table 2 and 3,
- Sediment & biological only where appropriate.
- Need stream flow for interpretations, monitor during flow.
- W24 for design document

## Supporting Information for Application

Risk assessment considering:

- Waterways potentially affected – based flow WQOs, areas of high ecological values, human drinking water supply, stock watering, crop irrigation etc.
- WQOs tabulated/source of values.
- Clear maps including discharge locations, MPs, EVs including reservoirs/important habitats
- Clearly stipulate discharge proposal – flow triggers, EC, max discharge rate & potential affects (worse case increase)

## Supporting Information for Application

- Provide clear justification for any changes to the EA. Ideally provide track-change EA if minor changes.
- Provide summary data/graphs to support changes – cover methodology presented here for flow, WQ etc.
- Number of data points, data stats and quality important for acceptance
- Provide all calculations and summary of data used (Excel sheets would suffice) to allow checking.
- Provide supporting raw time-series data – electronically via DERM Excel template or WQA database

Department of  
**Environment and Resource  
Management**

10 December 2010

Mr [REDACTED]  
Manager Environment  
BMA Coal Pty Ltd  
Email: [REDACTED]@bmacoal.com

Dear Mr [REDACTED]

As per our discussions earlier this week, officers from the Department of Environment and Resource Management have been working closely with your officers from Peak Downs Mine to assess the impact of the recent heavy rains in central Queensland have had on the management of water at the mine.

I am advised that verbal advice provided by your officers to the department indicates that the Peak Downs Mine is considering applying for a Transitional Environmental Program (TEP).

As previously advised, the department expects mines to operate within the terms of their Environmental Authorities (EA). In exceptional circumstances, where EA conditions cannot be met, and where the mine can demonstrate that the impact on the receiving environment does not cause environmental harm, the department will assess applications for TEPs as quickly as possible. This will ensure that mines can take advantage of the large flows which are currently in the receiving waters.

The department has deployed considerable resources to ensure that assessments can be undertaken expeditiously, however a major factor in determining processing times is the adequacy of the information provided. Therefore, in order to assist you in supplying the information required to streamline the assessment process, I have attached a template that you may wish to use to support the TEP application. Please note the explanatory notes in the template which discuss matters that should be considered when submitting the information, in particular:

- Keeping the submission and the discharge plan to a scale, based on the company's immediate and urgent priorities, that will allow timely consideration;
- Specifying which conditions of the EA can't be complied with;

Level 13, 400 George Street, Brisbane QLD 4000

GPO Box 2454, Brisbane QLD 4000

Telephone (07) 3330 6302

Facsimile (07) 3330 6306

Website [www.derm.qld.gov.au](http://www.derm.qld.gov.au)

ABN 46 640 294 485

- Providing a clear and specific plan covering at least discharge locations, volumes, timeframes, criteria, information about receiving waters and importantly, monitoring that the company will undertake;
- Using all relevant information from any previous similar events, any data relating to those releases, and any relevant information regarding environmental impacts;
- Clearly stating information gaps and why they exist (inability to sample etc), using any available information to make an inference on those gaps; and
- Stating any assumptions;

The department will advise an expected assessment time within 24 hours of receipt of the application.

As you will be aware, the department has an expectation that stakeholders with an interest in water quality in the Fitzroy, as well as the broader community, will be kept informed on these issues. The Fitzroy Water Quality Advisory Group (the Advisory Group), which was established at the direction of the Honourable Kate Jones MP, Minister for Climate Change and Sustainability, is meeting in Rockhampton on 16 December 2010. The department will be briefing and seeking the views of the Advisory Group on the current issues in the Fitzroy.

In an effort to also expeditiously provide feedback to relevant stakeholders on TEP applications, the department asks that if you are planning to submit a TEP, that it be submitted by 14 December 2010. Not only will this enable it to be assessed urgently but it will enable the department to consult with the Advisory Group about it on 16 December 2010. Note that this timeframe is not intended as a "deadline", simply an opportunity, given the urgency, to utilise a pre-planned meeting of the Advisory Group.

Feel free to contact me on [REDACTED] should you wish to discuss this further.

Yours sincerely

[REDACTED]  
[REDACTED]  
**Assistant Director-General  
Regional Service Delivery**

# Mines Water Discharges

Authorised since 1 December 2011

## Transitional Environmental Program (TEP)

23 August 2011

The Department of Environment and Resource Management has approved 100 applications for Transitional Environmental Programs (TEPs) for mines since 1 December 2010. These comprise 61 new applications and 39 amendments to existing TEPs.

The department will continue to review and process TEPs as required.

A TEP allows a mine site to complete actions outside of its agreed environmental authority (EA) conditions. The program is in place for a specified timeframe and requires adherence to special conditions. Once a TEP has expired the mine site is again expected to comply with its EA conditions.

The objective of the TEP is to ensure the mine can safely recommence operations and that dewatering activities can be conducted in a manner that does not harm the environment.

Mine	Issue date	End date	Purpose
Rolleston	<del>28 Oct 2010</del> (amended 1 Feb 2011)	29 Aug 2011	Water Management: TEP allows mine-affected water to be released to avoid the potential for uncontrolled release during the wet season. Authorised release is outside current EA conditions.  TEP amended to extend timeframe to allow continuation of release.
	23 Feb 11	29 Aug 2011	Water Management: TEP allows for the release of mine-affected water from an additional discharge point into Meteor Creek, via Sandy Creek.
Ensham	10 Dec 2010 (amended 5 Jan 2011) (amended 11 Feb 2011)	30 Jun 2011	Water Management: TEP allows for the release of approximately 15,000 megalitres, at about 250 megalitres per day, to dewater open cut mine pits on site.  TEP amendment allows an increase EC limits, revised receiving water flow rate, and modified discharge locations.
Poitrel	15 Dec 2010 (amended 19	30 Jun 2011	Water Management: TEP authorises release of water when the receiving water flow rate is lower than current EA requirements, provided there is significant

Mine	Issue date	End date	Purpose
	Jan 2011) (amended 11 Feb 2011)  8 Aug 2011	31 Jan 2012	flow in downstream waters of the Isaacs River. Water quality is within EA limits. The amendment authorises the release of water with elevated EC to no flow in New Chum Creek. The 11 February amendment allows for the release of water with elevated EC into New Chum Creek with downstream monitoring and flow triggers in the Isaac River.  Water Management: TEP authorises release of water with higher EC levels to New Chum Creek with no minimum flow requirement but with minimum flow of 10m <sup>3</sup> /sec in the Isaac River.
Isaac Plains	18 Dec 2010 (amended 17 Jan 2011 (amended 3 March 2011 and 18 March 2011)	30 Jun 2011	Water Management: TEP allows the release of water from the operational mining pit. Good quality water being discharged and this will be monitored closely to ensure quality is maintained downstream. Authorises the release of water from an additional release point and allows for releases into no flow in the Isaac River.  Amendment of 3 March allows slight increases in EC.
South Walker	18 Dec 2010 (amended 20 Jan 2011) (amended 9 Feb 2011) (amended 15 Feb 2011)	30 Jun 2011	Water Management: TEP allows the release of excess water, stored on site as a result of recent rain. The water to be released contains elevated electrical conductivity. The TEP will ensure water is only released during time of high flow in receiving waters to ensure adequate dilution is achieved. Amendment allows for discharge to Walker Creek during low flow. Amended TEP of 9 February allows for the release of water with elevated electrical conductivity to Walker Creek with an amended downstream EC trigger.  The amendment of 15 Feb allows for the release of water with elevated EC levels from Bee Creek into Sandy Creek. These releases will be consistent with the amended TEP issued on 9 February for releases into Walker Creek.
	27 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of excess water stored on site with elevated EC levels to no flow in Sandy Creek.
	(amended 8 Jun 2011)	31 Jan 2012	Water Management: TEP authorises to extend the end date of TEP MAN1579.
	(amended 8 Jun 2011)	31 Jan 2012	Water Management: TEP authorises to extend the end date of TEP MAN11720.
Cook	24 Dec 2010	30 Jun 2011	Water Management: TEP authorises the release of water with Electrical Conductivity and Turbidity limits above those authorised in the current EA. Downstream monitoring is required with downstream water quality triggers.
Callide	24 Dec 2010	30 Jun 2011	Water Management: TEP authorises the release of water with Electrical Conductivity limits above those authorised by the current EA, provided there is adequate flow in the receiving waters to dilute levels to near background immediately downstream of the release. Downstream monitoring is required with downstream water quality triggers.

Mine	Issue date	End date	Purpose
	11 Feb 2011 (amended 25 Mar 2011)	29 Jul 2011	Water Management: TEP authorises the release of mine affected water from Lake Gasteen discharge location into Callide Creek at low or no flow conditions. Electrical conductivity limits vary depending on receiving water flow rates.
	25 Feb 2011 (amended 31 Mar 2011)	29 July 2011	Water Management: TEP authorises the release of mine affected water, with higher EC levels, into Oaky Creek from an authorised discharge location. Allows releases to no flow. Amended TEP allows for increased EC levels during no flow conditions into Oaky Creek.
Moranbah North	24 Dec 2010	30 Jun 2011	Water Management: Electrical conductivity authorises the release of water with Electrical Conductivity limits above those authorised by the current EA, provided there is adequate flow in the receiving water of the Isaac River. Downstream monitoring is required with downstream water quality triggers.
	24 Dec 2010 (amendment)	30 Jun 2011	
	22 Mar 2011 (amended)	24 Feb 2012	The TEP was approved to remove the use of evaporator fans.
Minerva	24 Dec 2010  (amended 10 Feb 2011)  (amended 24 Feb 11)	30 Jun 2011	Water Management: TEP authorises the release of water when the receiving water flow rate is lower than current EA requirements. Water quality is higher than EA limits for conductivity. Downstream monitoring is required with downstream water quality triggers.
			Amended TEP authorises the release of water with elevated EC levels into Sandhurst Creek with downstream monitoring and flow triggers.
			Amended TEP on 24 February allows for changes to the downstream flow monitoring control point from the department's Duck Ponds gauge to the Comet Weir gauge. Allows for water discharge to continue at a lower rate when the flow in the Comet River falls below 5 cumecs.
Kestral	24 Dec 2010	30 Jun 2011	Water Management: TEP authorises the release of water when the receiving water flow rate is lower than current EA requirements. Water quality is higher than EA limits for conductivity. Downstream monitoring is required with downstream water quality triggers.
Carborough Downs	24 Dec 2010	30 Jun 2011	Water Management: TEP authorises the release of water when the receiving water flow rate is lower than current EA requirements, with increased dilution of releases. Water quality is higher than EA limits for conductivity. Downstream monitoring is required with downstream water quality triggers.
Burton	13 Jan 2011	31 May 2011	Water Management: TEP authorises the discharge of mine affected water of higher electrical conductivity, though a maximum downstream conductivity will be achieved through only discharging at a minimum flow in the receiving waters.
	8 Feb 2011	01 Sep 2011	Water Management: TEP authorises the release of water with higher EC levels to receiving waters of Anna Creek. Downstream monitoring is required in

Mine	Issue date	End date	Purpose
			the Isaac River.
Peak Downs	13 Jan 2011 (amended 1 Mar 2011)	30 Jun 2011	Water Management: TEP authorises a discharge at a higher electrical conductivity and a lower minimum flow in receiving waters, though it also contains maximum limits for electrical conductivity in receiving waters that flows will have to be controlled to meet these limits. Amendment allows for releases Ripstone Creek and requires a flow trigger in the Isaac River during releases to the creek.
	(amended 10 Jun 2011)	30 Aug 2011	Water Management: TEP authorises mine to continue to discharge mine affected water until 20 June 2011 to take advantage of anticipated high flows.
	14 Jul 2011	30 Jan 2012	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
Dawson South	13 Jan 2011	30 Jun 2011	Water Management: TEP authorises a discharge at a higher electrical conductivity (EC). Downstream monitoring is required.
	11 Jun 2011	08 Aug 2011	Water Management: TEP authorises extension of TEP until 8 August 2011 due to forecast of rainfall event.
Lake Lindsay	14 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of water with elevated EC and with reduced flow in receiving waters.
German Creek – Oak Park	14 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of water with elevated EC and a reduction in the receiving water flow rate. Downstream monitoring is required.
Goonyella Riverside	19 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of water with elevated EC and a reduction in the receiving water flow rate. Downstream monitoring required.
	14 Jul 2011	30 Jan 2012	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
German Creek	20 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of water with elevated EC and a reduction in the receiving water flow rate. Downstream monitoring required.
Saraji	27 Jan 2011 (amended 18 Feb 2011)	30 Jun 2011	Water Management: TEP authorises the release of excess water with elevated EC to Phillips Ck and Hughes Ck with a reduction in the receiving water flow rate. Downstream monitoring is required.  Amended TEP authorises releases with elevated EC levels that are dependent on downstream flow triggers. Downstream monitoring required.
	(amended 10 Jun 2011)	30 Aug 2011	Water Management: TEP authorises mine to continue to discharge mine affected water until 30 June 2011 to

Mine	Issue date	End date	Purpose
			take advantage of anticipated high flows.
	14 Jul 2011	30 Jan 2011	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
Millenium	28 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of excess water with elevated EC to New Chum Ck with a reduction in the receiving water flow rate. Downstream monitoring is required.
Hail Creek	29 Jan 2011	30 Jun 2011	Water Management: TEP authorises the release of mine affected water through additional discharge points and reduced flow in receiving waters.
	(amended 10 Jun 2011)	30 Sep 11	Water Management: TEP authorises the discharge of mine affected water to Bee Creek (Connors River).
	(amended 11 Jul 2011)	30 Sep 11	Water Management: TEP authorises the discharge of water with elevated electrical conductivity to Bee Creek with no minimum flow requirement.
Lake Vermont	29 Jan 2011	30 Aug 2011	Water Management: TEP authorises the release of mine affected water to Carfax Gully with no natural flow and a reduction in flow in the Isaac River.
Newlands	23 Dec 2011 (amended 28 Jan 2011)	30 Jun 2011	Water Management: TEP authorises the release of excess water with elevated EC and a reduction in the receiving water flow rate. Downstream monitoring is required. Amendment authorised new discharge points and reduced flow in receiving waters. Also increased downstream monitoring requirements.
Sonoma	7 Jan 2011 (amended 24 Feb 11)	30 Jun 2011	Water Management: TEP authorises the release of excess water with elevated EC. Downstream monitoring is required. TEP amendment of 24 February authorises the release of water with elevated EC.
Kogan Creek	11 Jan 2011	29 Apr 2011	Water Management: TEP authorises the release of mine effected water (above existing TSS licence limits) to enable access to coal reserves to ensure coal supply to Kogan Creek Power Station.
Texas Silver	24 Jan 2011	30 Apr 2011	Water Management: TEP authorises the release from stormwater water pond to enable completion of construction and lining of dam.
New Oakleigh	1 Feb 2011	11 Feb 2011	Water Management TEP authorises discharge of captured flood water from extraction pit at a higher electrical conductivity. Monitoring required along discharge path and downstream.
Baralaba	8 Feb 2011	29 Jul 2011	Water Management: TEP authorises the release of mine affected water to the Dawson River from an inundated mine pit. Water quality is in accordance with Baralaba's Environmental Authority (EA).
	(amended 12 May 2011)	30 Sep 2011	Water Management: TEP authorises the release through the 2011 dry season at different release rates.
	(amended 10		Water Management: TEP authorises revision of

Mine	Issue date	End date	Purpose
	Jun 2011)		receiving water pH concentration due to elevated pH concentration in upstream environment.
	(amended 9 Jul 2011)		Water Management: TEP authorises to decrease discharge volume due to decreased flow in the receiving environment.
Yarrabee	10 Feb 2011	30 Jun 2011	Water Management: TEP authorises the release of water with elevated electrical conductivity to 12 Mile Creek. Monitoring of receiving waters is also required in the Mackenzie River.
	(amended 3 May 2011)	15 Sep 2011	Water Management: TEP amendment authorises change of downstream monitoring point in Mackenzie River and extend the timeframe by six weeks.
Red Mountain Joint Venture	11 Feb 2011	31 Jul 2011	Water Management: TEP authorises the release of water with elevated EC levels into New Chum Creek. Downstream flow triggers and dilution is required.
Jellinbah	11 Feb 2011	30 Jun 2011	Water Management: TEP authorises release of mine affected water with elevated EC (~2500 uS/cm) to Blackwater Creek. Amendment authorises further 20 days of pumping mine affected water.
	(amended 5 April 2011) (amended 19 April 2011) 3 June 2011	31 Oct 2011	Water Management: TEP authorises release of mine affected water to Blackwater and Twelve Mile Creek during no flow event.
Norwich Park	11 Feb 2011	30 Jul 2011	Water Management: TEP authorises the release of mine affected water with elevated electrical conductivity.
	8 Jun 2011	30 Aug 2011	Water Management: TEP authorises mine to continue to discharge mine affected water until 30 June 2011 to take advantage of anticipated high flows.
	14 Jul 2011	30 Jan 2012	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
Boonal Joint Venture	14 Feb 2011	30 Jun 2011	Water Management: TEP authorises the release of water from the Boonal loadout facility to Bullock Creek.
Thalanga Copper Mine	18 Feb 2011	31 Oct 2013	Water Management: TEP authorises releases from east evaporation pond whilst the company undertakes studies and site changes.
Dawson	18 Feb 2011	30 Jun 2011	Water Management: TEP authorises the release of up to 75ML/day with elevated EC into Kianga Creek at low and no flow conditions.
	11 Jun 2011	08 Aug 2011	Water Management: TEP authorises extension until 8 August 2011 due to forecast of rainfall event.

Mine	Issue date	End date	Purpose
Blackwater	18 Feb 2011	1 July 2011	Water Management: TEP authorises the release of water with elevated EC to New Deep Creek with low flow in receiving water.
	14 Jul 2011	30 Jan 2012	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
Mt Rawdon	18 Feb 2011	30 Nov 2011	Water Management: TEP authorises dams below the waste rock dump and the tailings dam to overflow rather than returning the water into the tailings storage facility
Gregory/Crinum	28 Feb 2011	30 Jun 2011	Water Management: Allows for releases to low flow in Crinum Creek with downstream monitoring in Crinum Creek.
	(amended 10 Jun 2011)	30 Aug 2011	Water Management: TEP authorises mine to continue to discharge mine affected water until 30 June 2011 to take advantage of anticipated high flows.
	14 Jul 2011	30 Aug 2012	Water management: TEP authorises the extension of time that mine water can be released providing flow and water quality conditions are met until 30 November 2011. The TEP includes a works program for planned upgrades of the water management system.
D'Aguilar Gold	11 Mar 2011	29 Apr 2011	Water Management. TEP authorises release of water that has overflowed the TSF into the Shamrock Pit by pumping, and deals with measures to increase storage capacity for contaminated water.
North Goonyella	15 Mar 2011	30 Sep 2011	Water Management: TEP authorises the release of mine affected water into reduced flow in the Isaac River and no flow in Goonyella Creek.
East End	28 Mar 2011 (amended 20 Apr 2011)	29 Jul 2011	Water Management: TEP authorises discharge based on a staged EC concentrations and receiving water flow rates, low and no flow conditions are also included. Amended TEP authorises increased EC limit downstream.
Foxleigh	1 Apr 2011	30 Jun 2011	Water Management: TEP authorises the release of mine affected water with elevated levels into Roper Creek.
Oak Creek	11 Apr 2011	1 Apr 2013	Water Management: TEP authorises the release of water from several additional release points.
	(amended 8 Jul 2011)		Water Management: TEP authorises extending the timeline for developing and submitting a second TEP detailing the capital works upgrade. No change to conditions.
Moorvale	20 Apr 2011	31 Aug 2011	Water Management: TEP authorises the release of water with elevated EC levels to North Creek under no flow conditions. Flow is required in the Isaac River.
	(amended 20 Apr 2011)	30 Sep 2011	Water Management: TEP authorises release of water to North Creek under no flow conditions.

Mine	Issue date	End date	Purpose
	(amended 10 Jun 2011)	30 Sep 2011	Water Management: TEP authorises amendment to existing TEP as a result of accumulation of mine affected water in the main environment dam.
Peabody Wilkie Creek	29 Apr 2011	31 May 2012	Water Management: TEP authorises discharge of water with elevated EC to Wilkie Creek.
Commodore Coal Mine	5 May 2011	30 Nov 2013	Water Management: TEP authorises discharge of mine affected water outside TSS limits. TEP is to upgrade current water management infrastructure
Curragh	13 May 2011	31 Nov 2011	Water Management: TEP authorises release of mine affected water with elevated EC.

### CSG TEPs approved since 1 December 2010

The Department of Environment and Resource Management has approved 10 applications for Transitional Environmental Programs (TEPs) for CSG operations since 1 December 2010. These comprise 6 new applications and 4 amendments to existing TEPs.

The department will continue to review and process TEPs as required.

A TEP allows a CSG operation to complete actions outside of its agreed environmental authority (EA) conditions. The program is in place for a specified timeframe and requires adherence to special conditions. Once a TEP has expired the mine site is again expected to comply with its EA conditions.

The objective of the TEP is to ensure the CSG operation can safely recommence operations and that dewatering activities can be conducted in a manner that does not harm the environment.

Operation	Issue date	End date	Purpose
Spring Gully	28 Dec 2010 (amendments 28 Jan 2011; 25 Feb 2011; 4 Mar 2011)	30 Sep 2011	Water Management: NO discharges yet required.  Discharge of RO brine if MRL reached or an engineering concern identified but only if 1:100 dilution, a base flow in creek equal to minor flood and mixing zone limits achieved.
Moranbah Gas Project (MGP)	4 Feb 2011	31 Mar 2011	Water Management: Discharge of CSG water to Isaac River only if dams 1, 2, 5 or 10 at MGP exceed target fill heights (
Daandine	18 Jan 2011  19 Aug 2011	28 Feb 2011  28 Feb 2012	Water Management: Discharge of RO permeate to flood flows – Wilkie Ck  Water Management: Authorises discharge of RO

Operation	Issue date	End date	Purpose
			permeate to reduce risk of discharge from associated water ponds when required.
Mt Kingsley/Arcadia	22 Mar 2011	03 Feb 2011	Water Management: TEP requires Santos to undertake an assessment as to the reasons behind overtopping of mud and water dams at three sites in November 2010 in order to develop strategies to prevent recurrence.
Scotia	28 Apr 2011 (amendment 8 Jun 11)	25 Oct 2011	Water Management: TEP allows discharge from a site dam in order to avoid overtopping while awaiting commissioning of a RO plant on site

Last updated [23 August 2011](#)

**DRAFT TRANSITIONAL ENVIRONMENTAL PROGRAM UNDER SECTION 333  
OF THE ENVIRONMENTAL PROTECTION ACT 1994**

**Principal Holder:** XXXXXXXX  
XXXXXXXX  
XXXXXXXX

**EA Number:** XXXXXXXX

**Title:** XXXXXXXXXXXXXXXXXXXX

**Date:** XXXXXXXX

**Finish Date:** *NOTE: The 'End Date' should be approximately 2 months after the lodgement date of the completion report.*

**BACKGROUND**

**Explains why a TEP is required, as a result of an incident, breach, emergency. i.e. what went wrong**

*NOTE: Include relevant reporting requirements, monitoring locations and discharge limits from EA conditions, rainfall data, pits and water management structures affected, quantity of water proposed to be discharged, pumping/discharge rates and locations, creeks/streams to be discharged to, whether creeks/streams are still flowing naturally, water quality monitoring locations and downstream limits in creeks/streams during discharge, results of previous sampling, ongoing reporting requirements to the administering authority, downstream water uses and affected properties. Also include contingency plans for possibility of having to cease discharge due to poor water quality or significant flow path erosion etc. Include whether there are other permits involved and status of the applications.*

**SUPPORTING INFORMATION**

The *Environmental Protection Regulation 2008* commenced on 1 January 2009. The regulation consolidated considerations that must be made when making a range of decisions including TEPs into Chapter 4 of the regulation. This has resulted in making the range of matters to be considered clearer to decision makers. These include, but are not limited to:

- s51(1) (a) requires the consideration of the management hierarchy, environmental values, quality objectives and management intent specified in an EPP. The *Environmental Protection (Water) Policy 2009* lists a range of values that includes the biological integrity, the agricultural value, the drinking water value, the recreation value and the value for industrial purposes. If these values are correctly identified, the 'beneficial uses' of the waterway will be identified.
- s51(1) (d) requires consideration of the impact of the release of contaminants on the environment including the cumulative impact
- s51(1) (f) the order of occupancy between the person carrying out the activity and the affected person
- s51(1) (g) the remaining capacity of the receiving environment to accept contaminants while protecting the environmental values.
- s52(1) (a) requires consideration of imposing a condition requiring the implementation of a system for managing risks to the environment
- S52(1) (g) requires consideration of imposing a condition on the way in which contaminants are released for example a condition restricting the release of a contaminant at a particular temperature, velocity or rate or during particular meteorological conditions or water flows.
- s53(1) requires consideration of whether to impose monitoring conditions about the release
- s56 (2) requires consideration of any available toxicity data relevant to the release and the receiving environment.

**Note: Section 330 of the EP Act defines a TEP as:**

A transitional environmental program is a specific program that, when approved, achieves compliance with this Act for the matters dealt with by the program by:

- (a) reducing environmental harm; or
- (b) detailing the transition to an environmental standard.

**OBJECTIVES**

NOTE: As required under section 331 the transitional environmental program must state the objectives to be achieved and maintained under the program.

The objectives of the TEP must relate to the time frames for mines returning to operation in accordance with / compliance with the EA conditions, and must also include the prevention or re-occurrence in the short, medium and long term of the situation that gave rise to the approval of an TEP

**HOW OBJECTIVES ARE TO BE ACHIEVED**

NOTE: As required under section 331 the TEP must state how the objectives are to be achieved, and provide a timetable to achieve the objectives, taking into account the application of best practice environmental management and the risks of environmental harm being caused by the activity. The timetable must state appropriate performance indicators that can be measured at various intervals.

As an approved TEP can protect the holder from enforcement action for non-compliances with the Act, the commitments or terms of the TEP made by *the client* need to be clearly drafted, unambiguous and easily auditable. Please note that a failure to comply with the terms of a TEP is an offence so the terms outlined within the document act in a similar way to conditions contained within an EA.

**Table 1 – achieving TEP objectives**

OBJECTIVE	ACTION	RESPONSIBILITY	TIME FRAME	PERFORMANCE INDICATOR
XXXXX		Nominate officer/person responsible for fulfilling objective.		
XXXXX				
XXXXX				
XXXXX				

If the table above is not sufficient in size please use in the landscape format. If the table is insufficient due to the quantity of detail required utilise subheadings e.g. objective, action, responsibility, timeframe and performance indicator with detailed information included below each heading. This information can then be modified in the reporting for successes, issues, incidents and failures.

**MONITORING**

NOTE: As required under section 331 – Also include specific upstream and downstream monitoring locations and detailed supporting aerial photographs and maps defining discharge points and monitoring locations.

The following tables are provided as an example on providing the required data and how to apply varying limits to different monitoring points. If you are proposing to meet a specific water quality downstream (i.e. as a compliance point, approximately 500m is acceptable – receiving water monitoring locations should not be utilised), compliance will need to be monitored at both the ‘end of pipe’ location and the ‘compliance point’. Justification of the discharge actions proposed need to be provided in the documentation, considering Chapter 4 of the Environmental Protection Regulation 2008.

**Table 2 - Contaminant release points, sources and receiving waters**

Release point (TEP RP)	Easting (GDA94)	Northing (GDA94)	Contaminant source and location	Monitoring point	Receiving waters
TEP RP 1	xxxx	xxxx	xxxx	TEP MP 1	xxxx
TEP RP 2	xxxx	xxxx	xxxx	TEP MP 2	xxxx
				TEP MP 3	

**Table 3 - Contaminant release monitoring points**

Monitoring point (TEP MP)	Easting (GDA94)	Northing (GDA94)	Contaminant source and location	Monitoring point location	Receiving waters
TEP MP 1	xxxx	xxxx	xxxx	xxx dam spillway	xxxx
TEP MP 2	xxxx	xxxx	xxxx	xxx dam spillway	xxxx
TEP MP 3	xxxx	xxxx	xxxx	500m downstream of junction of xxx dam spillway on the xxx receiving waters	xxxx

**Table 4 - Contaminant release limits**

Quality characteristic	Release Limit	Monitoring Frequency	Sample Type	Monitoring Point
Electrical conductivity (uS/cm)	xxxx (e.g. 1500)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	<i>In situ</i> <sup>1</sup>	TEP MP 1
				TEP MP 3
			Samples require laboratory analysis <sup>2</sup>	TEP MP 1
				TEP MP 3
	xxxx (e.g. 3000)	Daily during release (the first sample must be taken within 2 hours of commencement of release)	<i>In situ</i> <sup>1</sup>	TEP MP 2
				Samples require laboratory analysis <sup>2</sup>
pH (pH Unit)	6.5 (minimum) 9.0 (maximum)	Daily during release (the first sample must be taken within 2	<i>In situ</i> <sup>1</sup>	TEP MP 1
				TEP MP 2

		hours of commencement of release)		TEP MP 3
			Samples require laboratory analysis <sup>2</sup>	TEP MP 1
				TEP MP 2
				TEP MP 3
Turbidity (NTU)	xxxxx	Daily during release (the first sample must be taken within 2 hours of commencement of release)	<i>In situ</i> <sup>1</sup>	TEP MP 1
				TEP MP 2
				TEP MP 3
		Samples require laboratory analysis <sup>2</sup>	TEP MP 1	
			TEP MP 2	
			TEP MP 3	
Sulphate (SO <sub>4</sub> <sup>2-</sup> ) (mg/L)	xxxxxx	Daily during release (the first sample must be taken within 2 hours of commencement of release)	<i>In situ</i> <sup>1</sup>	TEP MP 1
				TEP MP 2
				TEP MP 3
		Samples require laboratory analysis <sup>2</sup>	TEP MP 1	
			TEP MP 2	
			TEP MP 3	

<sup>1</sup> In situ samples can be taken using electronic sampling equipment.

<sup>2</sup> Samples are required to be analysed at a NATA accredited facility in accordance with this Transitional Environmental Program.

Table 5 - Release contaminant trigger investigation levels

Quality characteristic	Trigger levels (µg/L)	Monitoring frequency	Monitoring Point
Aluminium	55	Commencement of release and thereafter weekly during release	TEP MP 1 TEP MP 2
Arsenic	13		
Cadmium	0.2		
Chromium	1.0

Monitoring points (TEP MP)	Receiving waters location description	Easting (GDA94)	Northing (GDA94)
TEP MP X	CX – XXXX Creek XXX metres downstream of RP X	XXXX	XXXX
TEP MP X	CX - XXXX Gully XXXX metres downstream of RP X	XXXX	XXXX

**REPORTING**

*NOTE: The department will require daily reporting of insitu water quality parameters.*

*Progress reports will be required to be submitted to the department (i.e. monthly) describing activities and issues from previous month and proposed activities for next month and a final report defining how the objectives of the TEP have been achieved.\*

*A final report is required to be submitted to the report upon completion of all actions, and at least 2 months prior to the end date of the TEP.*

## **CONDITIONS**

In carrying out this Transitional Environmental Program, 'Client Name (i.e. principal EA holder)' will undertake all activities in accordance with the following conditions.

### **Undertaking the release of mine effected water**

- 1 Contaminants that will, or have the potential to cause environmental harm must not be released directly or indirectly to any waters except as permitted under this Transitional Environmental Approval.
- 2 The release of contaminants to waters must only occur from the release points specified in Table 2 and depicted in Figure 1 attached to this Transitional Environmental Program.
- 3 The release of contaminants to waters must not exceed the release limits stated in Table 4 at the monitoring points specified in Table 2 and Table 3 of this Transitional Environmental Program.
- 4 The release of contaminants to waters from the release points must be monitored at the locations specified in Table 2 and Table 3 for each quality characteristic and at the frequency specified in Table 4 and Table 5 of this Transitional Environmental Program.
- 5 If quality characteristics of the release exceed any of the trigger levels specified in Table 5 during a release event, the Transitional Environmental Program holder must compare the downstream results in the receiving waters identified in Table 7 to the trigger values specified in Table 5 and:
  - a) where the trigger values are not exceeded then no action is to be taken
  - b) where the downstream results exceed the trigger values specified Table 5 for any quality characteristic, compare the results of the downstream site to the data from background monitoring sites and
    - i) if the result is less than the background monitoring site data, then no action is to be taken or
    - ii) if the result is greater than the background monitoring site data, complete an investigation in accordance with the ANZECC & ARM CANZ 2000 methodology, into the potential for environmental harm and provide a written report to the administering authority in the next annual return, outlining

- 1) details of the investigations carried out
  - 2) actions taken to prevent environmental harm.
- 6 If an exceedance in accordance with condition 5(a)(ii)(2) is identified, the holder of the Transitional Environmental Program must notify the administering authority within 24 hours of receiving the result. The notification must include written verification of the exceedance forwarded to the administering authority either via facsimile (INSERT LOCAL OFFICE NUMBER) or email to [Manager.MiningCWR@derm.qld.gov.au](mailto:Manager.MiningCWR@derm.qld.gov.au).

### **Contaminant Release Events**

- 7 The Transitional Environmental Program holder must install, operate and maintain a stream flow gauging station to determine and record stream flows at the locations upstream of each release point specified in Table 2 for any receiving waters into which a release occurs.
- 8 Notwithstanding any other condition of this Transitional Environmental Program, the release of contaminants to waters must only take place during periods of natural flow events specified as minimum flow in Table 6 for the contaminant release point(s) specified in Table 2.
- 9 Contaminant release flow rate must not exceed **XXX**% of receiving water flow rate.
- 10 The daily quantity of contaminants released from each release point must be measured and recorded at the monitoring points in Table 2.
- 11 Releases to waters must be undertaken so as not to cause erosion of the bed and banks of the receiving waters, or cause a material build up of sediment in such waters.

### **Notification of Release Events**

- 12 The Transitional Environmental Program holder must notify the administering authority within **XXX** hours of having commenced releasing mine affected water to the receiving environment. Notification must include the submission of written verification to the administering authority (either via facsimile (INSERT LOCAL OFFICE NUMBER) or email to [Manager.MiningCWR@derm.qld.gov.au](mailto:Manager.MiningCWR@derm.qld.gov.au)) of the following information:
  - a) release commencement date/time
  - b) expected release cessation date/time
  - c) release point/s
  - d) release volume (estimated)
  - e) receiving water/s including the natural flow rate
  - f) any details (including available data) regarding likely impacts on the receiving water(s).

- 13 The Transitional Environmental Program holder must provide the administering authority daily during the release of mine affected water, in writing (either via facsimile (INSERT LOCAL OFFICE NUMBER) or email to [Manager.MiningCWR@derm.qld.gov.au](mailto:Manager.MiningCWR@derm.qld.gov.au)) of the following information:
- all in situ monitoring data for that day
  - the receiving water flow rate
  - the release flow rate.
- 14 The Transitional Environmental Program holder must notify the administering authority as soon as practicable, (no later than within 24 hours after cessation of a release) of the cessation of a release notified under condition 12 and within 28 days provide the following information in writing:
- release cessation date/time
  - natural flow volume in receiving water
  - volume of water released
  - details regarding the compliance of the release with the conditions of this Transitional Environmental Program (i.e. contamination limits, natural flow, discharge volume)
  - all in-situ water quality monitoring results
  - any other matters pertinent to the water release event.

**Notification of release event exceedence**

- 15 If the release limits defined in Table 3 are exceeded, the holder of the Transitional Environmental Program must notify the administering authority within 24 hours of receiving the results.
- 16 The Transitional Environmental Program holder must, within 28 days of a release that exceeds the conditions of this Transitional Environmental Program, provide a report to the administering authority detailing:
- the reason for the release
  - the location of the release
  - all water quality monitoring results
  - any general observations
  - all calculations
  - any other matters pertinent to the water release event.

**Requirements to cease the release of mine affected water**

- The mine water discharge must cease immediately if any water quality limit as specified in Table 2 is exceeded.

2. The Department of Environment and Resource Management may require the mine to cease discharge if the department's water monitoring stations detect any water quality limit exceedance.
3. The release of mine effected waters must cease immediately if identified that the release of mine affected waters is causing erosion of the bed and banks of the receiving waters, or is causing a material build up of sediment in such waters.
4. The release of mine effected waters must cease immediately if holder of this Transitional Environmental Program is directed to do so by the administering authority.

### **Monitoring Requirements**

Where monitoring is a requirement of this Transitional Environmental Program, ensure that a competent person(s) conducts all monitoring.

All monitoring undertaken as a requirement of this Transitional Environmental Program must be undertaken in accordance with the administering authority's Water Sampling Manual.

### **Notification of emergencies, incidents and exceptions**

As soon as practicable after becoming aware of any emergency or incident which results in the release of contaminants not in accordance, or reasonably expected to be not in accordance with the conditions of this Transitional Environmental Program, the administering authority must be notified of the release by telephone, facsimile or email.

The notification of emergencies or incidents must include but not be limited to the following:

- a) the holder of the Transitional Environmental Program
- b) the location of the emergency or incident
- c) the number of the Transitional Environmental Program
- d) the name and telephone number of the designated contact person
- e) the time of the release
- f) the time the holder of the Transitional Environmental Program became aware of the release
- g) the suspected cause of the release
- h) the environmental harm caused, threatened, or suspected to be caused by the release, and
- i) actions taken to prevent any further release and mitigate any environmental harm caused by the release.

Not more than fourteen days following the initial notification of an emergency or incident, written advice must be provided of the information supplied to the administering authority in relation to:

- a) proposed actions to prevent a recurrence of the emergency or incident, and

- b) outcomes of actions taken at the time to prevent or minimise environmental harm.

*Any other conditions that require a response, contingency for matters under this TEP, i.e. if constructing a new regulated structure, design plans will be required to be submitted to the administering authority for approval prior to construction.*

#### **NOTES FOR THE CLIENT**

These regulatory requirements of Chapter 4 of the *Environmental Protection Regulation 2008*, the Standard Criteria and the requirements of EP Act.

In deciding to accept or refuse a TEP the administering authority is required to consider section 338 of the EP Act, which states:

#### **338 Criteria for deciding draft program**

***(1) In deciding whether to approve or refuse to approve the draft program or the conditions (if any) of the approval, the administering authority—***

***(a) must comply with any relevant regulatory requirement; and***

***(b) subject to paragraph (a), must also consider the following—***

***(i) the standard criteria;***

- *The principles of ecological sustainable development as set out in the 'National Strategy for Ecologically Sustainable Development'.*
- *Any applicable environmental protection policy.*
- *Any applicable Commonwealth, State or local government plans, standards, agreements or requirements.*
- *Any applicable environmental impact study, assessment or report.*
- *The character, resilience and values of the receiving environment.*
- *All submissions made by the applicant and submitters.*
- *The best practice environmental management for activities under any relevant instrument, or proposed instrument, as follows – a transitional environmental program.*
- *The financial implications of the requirements under an instrument, or proposed instrument, mentioned in paragraph (g) (above) as they would relate to the type of activity or industry carried out, or proposed to be carried out, under the instrument.*
- *The public interest.*
- *Any applicable site management plan.*
- *Any relevant integrated environmental management system or proposed integrated environmental management system.*
- *Any other matter prescribed under a regulation.*

***(ii) additional information given in relation to the draft program;***

***(iii) the views expressed at a conference held in relation to the draft program.***

As has been demonstrated a significant consideration for the draft TEP is for the standard criteria. Recommendations in relation to a submission of a draft TEP in line with section 338 and the standard criteria are:

- Provide all relevant stakeholders, which may included Local Government and potentially affected landholders, with a copy of the draft TEP, and allow sufficient time for relevant stakeholders to provide comment for consideration.
- The applicant is required to consider Environmental Protection Policies, the character, resilience and values of the receiving environment, any applicable plans and standards, such as ANECC (aquatic ecosystem guidelines), the Queensland Water Quality Guidelines and 'A study of the cumulative impacts on water quality of mining activities in the Fitzroy River Basin'.

In accordance with the legislation, the submitted TEP must adequately address methods to reduce environmental harm (Section 330) and must meet the content requirements detailed in section 331.

## 4. Science & Capacity Building

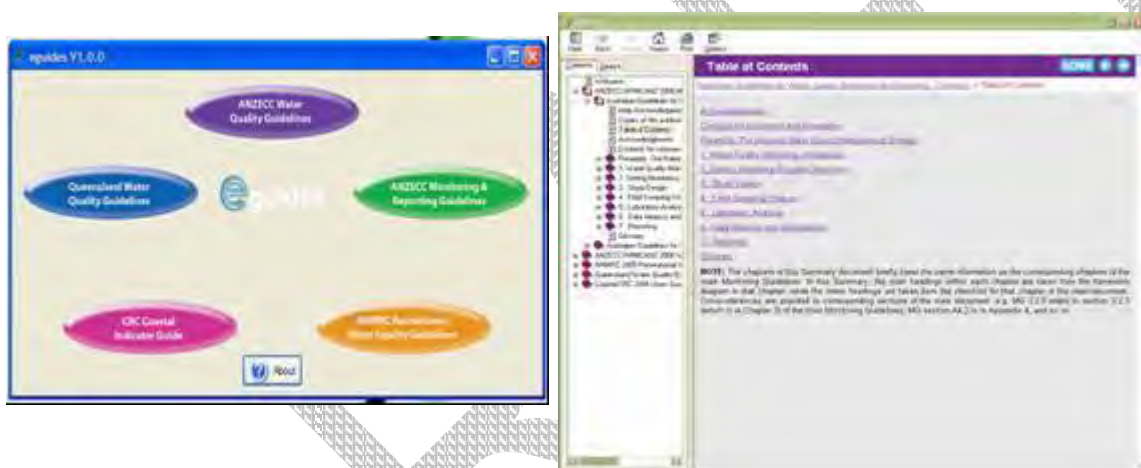

### 4.1 Decision Support Software

#### eGuides

eGuide is an electronic document which consists of a number of commonly referred to water quality guideline documents. The current version of eGuides contains the following documents.

- ANZECC/ARMCANZ 2000 Monitoring & Reporting Guidelines
- ANZECC/ARMCANZ 2000 Water Quality Guidelines
- NHMRC 2005 Recreational Guidelines
- Queensland Water Quality Guidelines
- Coastal CRC Users' Guide to Indicators for Monitoring

These documents have been compiled into a standard “HTML” version of Windows help systems (shown below) and can be installed in any personal computer for easy and quick access to information. Users can select the document that they would like to manually browse, or select the 'search' tab to search all the guides for some key words. The searched items can be viewed, copied to another document or printed out for later references. The beta version of this tool has been released and available on request from [water.tools@epa.qld.gov.au](mailto:water.tools@epa.qld.gov.au).

#### Modelling and Monitoring Assessment Decision Support System (MAMA DSS)

The Modelling and Monitoring Assessment Decision Support System (MAMA DSS) is a decision support tool to help choose and review modelling and monitoring undertaken as part of Environmental Impact Assessments (EIAs). Decision-making about activities in the coastal zone is generally underpinned by information from monitoring and modelling. The DSS is designed to provide a process for choosing and reviewing assessment techniques considering the management objective, the potential pollutants from point or diffuse sources, the features of the environment and the relevant indicators, stressors, and processes.

The DSS is supported by a help system containing information about water quality modelling approaches such as: biogeochemical modelling (also called process modelling), statistical modelling (also called non-process modelling), and monitoring and experimentation methods such as in-field monitoring, autosampling, remote sensing, and experimentation.

The MAMA DSS can be requested from [water.tools@epa.qld.gov](mailto:water.tools@epa.qld.gov). Further information on the tool can be obtained from <http://www.coastal.crc.org.au/3m/>.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

**Queensland Waterways Database**

The Queensland Waterways Database is a repository for all current and historical water quality monitoring data for Queensland waterways collected by the EPA. Approximately 350 sites across Queensland are monitored every month for a range of water quality indicators. Government agencies, research organisations and community groups use this information to assess the health of Queensland's waterways. Within the agency, water quality data is used in the production of reports, maps and models and to assist in compliance investigations, decision-making and planning.

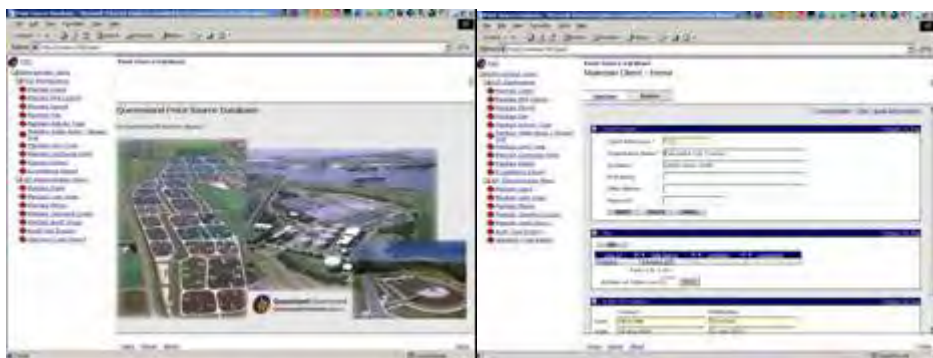

Further information can be obtained by emailing [water.data@epa.qld.gov.au](mailto:water.data@epa.qld.gov.au) or from [http://www.epa.qld.gov.au/environmental\\_management/water/water\\_quality\\_monitoring](http://www.epa.qld.gov.au/environmental_management/water/water_quality_monitoring)

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

### Point Source Database

Information on licensed discharges to water is monitored as part of licensees' permits issued by the EPA. The EPA's Point Source Database has been developed since 2003 and allows electronic submission, automated checking and storage of data. It is aimed to assist compliance and allow improved access to discharge information for a range of other uses. The database currently contains information on major sewage treatment plants in Queensland but will be extended in the future to all industries with licensed discharges. Further information on the database is provided in Appendix 1.

In addition to monitoring data, licence limits and discharge locations have been collated and are available to EPA staff via Ecomaps (<http://mudlark.env.qld.gov.au/website/index.htm>). Further information on how to access this layer of Ecomaps is provided in Attachment 2.

A further initiative is Point Source Data (PSD) Online which will provide access to up-to-date information on licensed discharges to waters in Queensland. The current application is a prototype and a beta version should be available EPA in mid 2008. PSD Online will provide access to raw data and graphed data contained in the EPA database. Other features include load estimation and links to discharge locations and licence limits in Ecomap. Instructions on how to use PSD Online will be provided.

Point source data is available to EPA staff, other organisations and the community on request from [water.data@epa.qld.gov.au](mailto:water.data@epa.qld.gov.au). Information on the database is available to the public from [http://www.epa.qld.gov.au/environmental\\_management/water/water\\_quality\\_monitoring/reporting\\_of\\_licensed\\_discharges\\_to\\_waterways/](http://www.epa.qld.gov.au/environmental_management/water/water_quality_monitoring/reporting_of_licensed_discharges_to_waterways/).

For further information, email [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au) or contact the Freshwater & Marine Sciences Group of the EPA.

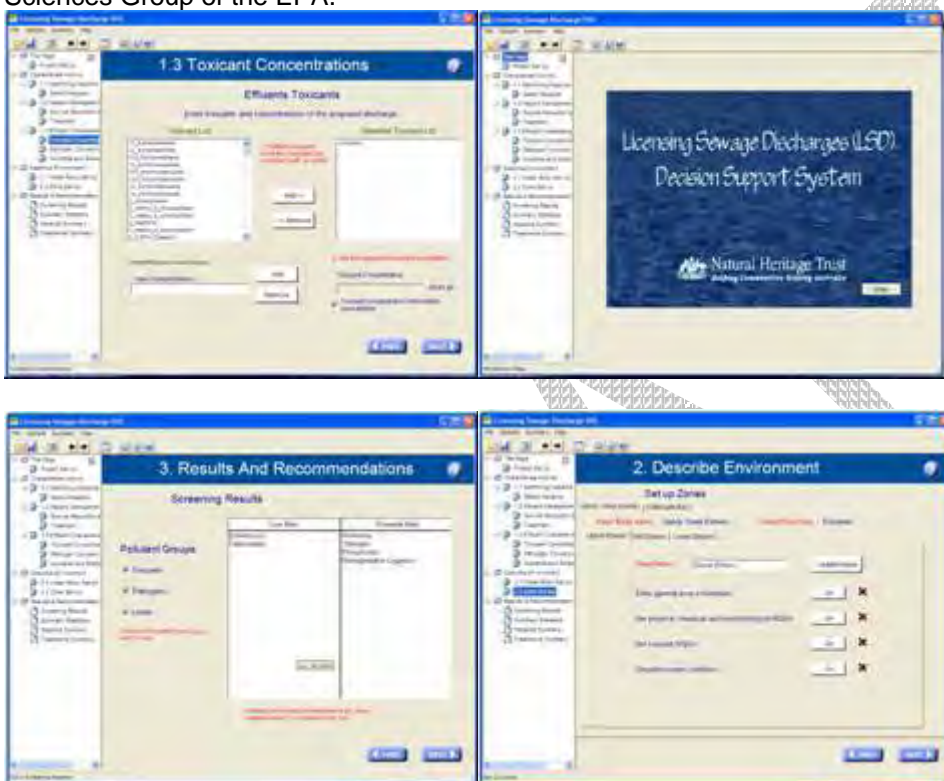

### Licensing Sewage Discharges Decision Support System (LSD DSS)

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

The Licensing Sewage Discharges Decision Support System (LSD DSS) is a support tool for the assessment of the aquatic aspects of proposed discharges from sewage treatment plants. It has been designed to be used by licensing officers in the early stages of screening a licensed application. There is an associated help system that is fully searchable. It includes screen explanations and the knowledge bases on typical sewer pollutants, waste water treatment, risk assessment protocols and relevant water quality guidelines.

The DSS was originally developed by the Queensland Environmental Protection Agency in collaboration with the Environment Protection Authority Victoria and the NSW Department of Environment and Conservation. The latest beta version was produced in collaboration with the e-Water Cooperative Research Centre.

For further information about the DSS please contact [water.tools@epa.qld.gov.au](mailto:water.tools@epa.qld.gov.au) or the Freshwater & Marine Sciences Group of the EPA.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### **Water Quality Online Website**

Water Quality Online is a website that contains information on water quality information and products developed as part of the National Action Plan for Salinity and Water Quality for regional managers in Queensland. It includes some of the tools discussed above in addition to a range of other tools that could assist water quality assessment. Water quality online is located at <http://www.wqonline.info>

### **OzCoasts/OzEstuaries Website**

The OzCoast and OzEstuaries provides comprehensive information about Australia's coast, including its estuaries and coastal waterways. This information helps to generate a better understanding of coastal environments, the complex processes that occur in them, the potential environmental health issues and how to recognise and deal with these issues. It includes a database on estuaries, information on coastal indicators, geomorphology and geology, conceptual models, the simple estuary response model (SERM) plus more. It can be accessed at <http://www.ozcoasts.org.au/>.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

**4.2 Relevant Water Quality Guidelines**

*ANZECC & ARMCANZ - Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000.* These guidelines provide substantial information on the nationally agreed approaches and trigger values for the protection of fresh and marine water. The guidelines are available with eGuides described above or can be downloaded from <http://www.environment.gov.au/water/publications/quality/index.html#nwqmsguidelines>

*ANZECC & ARMCANZ - Australian Guidelines for Water Quality Monitoring and Reporting 2000.* These national guidelines present useful information on water quality monitoring covering planning, designing, fieldsampling, laboratory analysis and reporting. The guidelines are available with eGuides described above or can be downloaded from <http://www.environment.gov.au/water/publications/quality/index.html#nwqmsguidelines>

*The Coastal CRC's User's Guide to Estuarine, Coastal and Marine Indicators for Regional NRM Monitoring, Coastal Zone CRC.* These guidelines were designed to assist regional natural resource managers choose indicators when dealing with estuarine and marine environment. It provides substantial information on the stressors and indicators that could be applicable to these environments. The guidelines are available with eGuides described above or can be downloaded from <http://www.coastal.crc.org.au/Publications/indicators.html>

*NHMRC Guidelines for Managing Risks in Recreational Waters, endorsed June 2005.* These guidelines are the most recently published in Australia for the management of recreational waters. It covers a range of hazards including microbial contamination. It includes a new risk assessment approach including sanitary surveys and new indicators/classifications to assess risks from pathogens. The guidelines are available with eGuides described above or can be downloaded from <http://www.nhmrc.gov.au/publications/synopses/eh38.htm>.

*NHMRC Australian Drinking Water Guidelines 2006.* The Australian Drinking Water Guidelines (the ADWG) are intended to provide a framework for good management of drinking water supplies. They are concerned with safety from a health point of view and with aesthetic quality. The guidelines are available from <http://www.nhmrc.gov.au/publications/synopses/eh19syn.htm>.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

*Queensland Water Quality Guidelines, Queensland EPA, March 2006.* These guidelines were developed to complement the ANZECC/ARMCANZ Freshwater and Marine Guidelines. It includes site specific trigger values for regions of Queensland based on monitoring data from relevant reference sites. The guidelines are available with eGuides described above or can be downloaded from [http://www.epa.qld.gov.au/environmental\\_management/water/queensland\\_water\\_quality\\_guidelines/#gen0](http://www.epa.qld.gov.au/environmental_management/water/queensland_water_quality_guidelines/#gen0)

*A guide to the application of the ANZECC/ARMCANZ Guidelines in the minerals industry, Australian Centre for Environmental Research (ACMER), September 2003.* These guidelines provide advice on the application of the national guidelines to mining industry and includes relevant case studies. More information on obtaining this document is available at <http://www.acmer.uq.edu.au/publications/handbooks.html>

*Review of Methods for Water Quality Assessment for Temporary Stream and Lakes Systems, Australian Centre for Environmental Research (ACMER), September 2004.* This document provides information on methods used to assess ephemeral streams. The document is available from <http://www.acmer.uq.edu.au/research/attachments/FinalReportTempWatersSep20042.pdf>

*Licensing Discharges from Sewage Treatment Plants, Case Study No.2, EPA.* This document provides an example of how EPA licensing officers may apply the agency's Procedural Guide for Licensing Discharges to Aquatic Environments. It involves a large sewage treatment plant which discharges to an estuary. It is available from the EPA's Ecostep system.

*Water Quality Sampling Manual, EPA, 1999.* This document is the third edition of the Queensland EPA's Water Quality Sampling Manual. It is for used in deciding 'protocols' under section 10 of the Queensland Environmental Protection (Water) Policy 1997 (subordinate legislation 1997 No. 136). It can be obtained from [http://www.epa.qld.gov.au/environmental\\_management/water/water\\_quality\\_monitoring/publications/](http://www.epa.qld.gov.au/environmental_management/water/water_quality_monitoring/publications/)

*National Chemical Reference Guide - Standards in the Australian Environment.* This is an Australian Government website that provides you with standards for chemicals such as in foods. It is found at [http:// hermes.erin.gov.au/pls/crg\\_public!/CRG\\_OWNER.CRGPPUBLIC.pStart](http://hermes.erin.gov.au/pls/crg_public!/CRG_OWNER.CRGPPUBLIC.pStart)

### 4.3 Water Quality Advice & Technical Services

The Freshwater & Marine Sciences Group of the EPA provides services to internal EPA clients on request (see electronic form on requesting services). These services include general advice, review of documents, modelling, field investigations and monitoring services and will typically cover only water quality aspects of a project. In requesting services, you need to clearly state the objective of the project or the problem to be solved staff. Additional documents should be sent via email or post.

The general turn-around time for reviews of EIS/IAS or similar major documents is 10 working days. However, the time required to complete any particular project will depend on the scope of the work and the available staff resources within the group at the time of the request. In general, the Freshwater & Marine Sciences Group will provide staff time on an in-kind basis, subject to director's approval. The requestor should cover any additional project costs, such as analysis costs and airfares.

Contacts for the Freshwater & Marine Sciences Group

Email: [water.workrequests@epa.qld.gov.au](mailto:water.workrequests@epa.qld.gov.au)

Phone: (3896 9250) or fax (38969277)

Postal: Indooroopilly Sciences Centre  
EPA (Botany Building)  
80 Meiers Road, Indooroopilly  
Brisbane, QLD, 4068

**Attachment1 to Section 4**

The Point Source Database Information Guide for EPA Staff  
October 2007  
Version 3.0

**Overview**

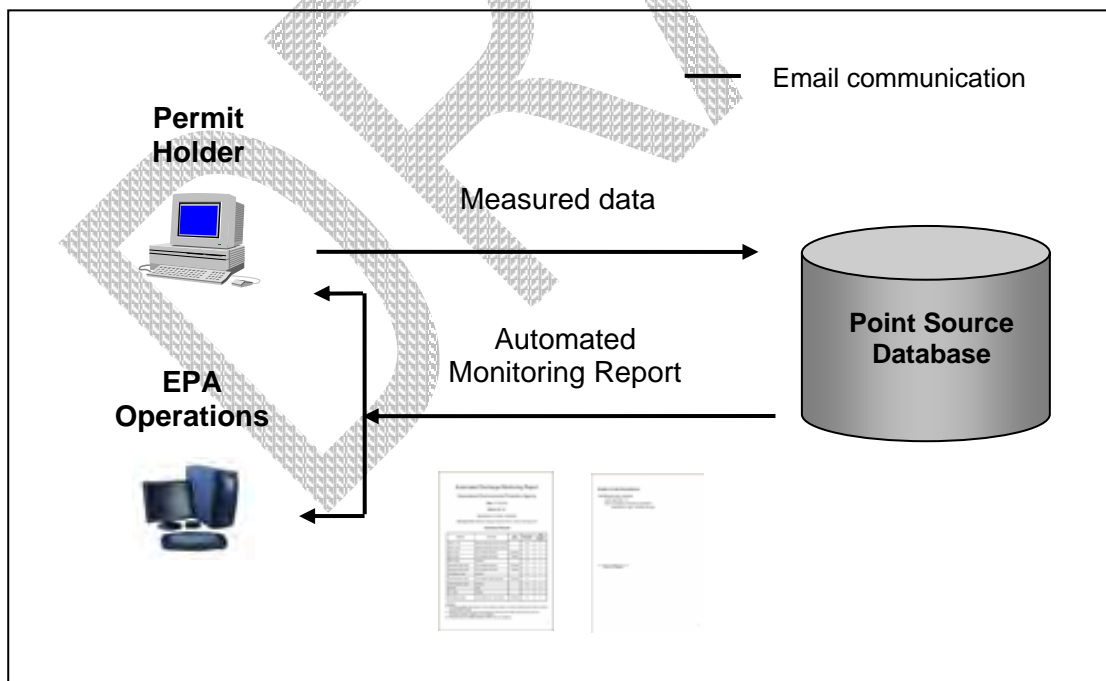

The Point Source Database (PSD) was designed and developed by the EPA to hold monitoring data for discharges to water required under EPA development permits for environmentally relevant activities (ERA's). It allows electronic submission of data and undertakes automated checks of the data against compliance limits. The submitted data can be viewed graphically by EPA staff while discharge locations and limits can be viewed using Ecomaps.

**Benefits**

The purpose of the PSD is to support compliance although it is not designed to replace notification requirements for non-compliance and incidents as prescribed in development permits. The database will also reduce the time taken by both EPA staff and registered operators in dealing with data requests and improve EPA decisions and projects through providing more complete and up-to-date information. Reporting of point source releases through mechanisms such as State of Environment Reporting, National Pollution Inventory and the Southeast Queensland's Ecosystem Health Report Card will be improved.

For registered operators submitting electronic data to the EPA, the requirement for this data and the related analysis to be submitted with the permit holder's annual return will be waived.

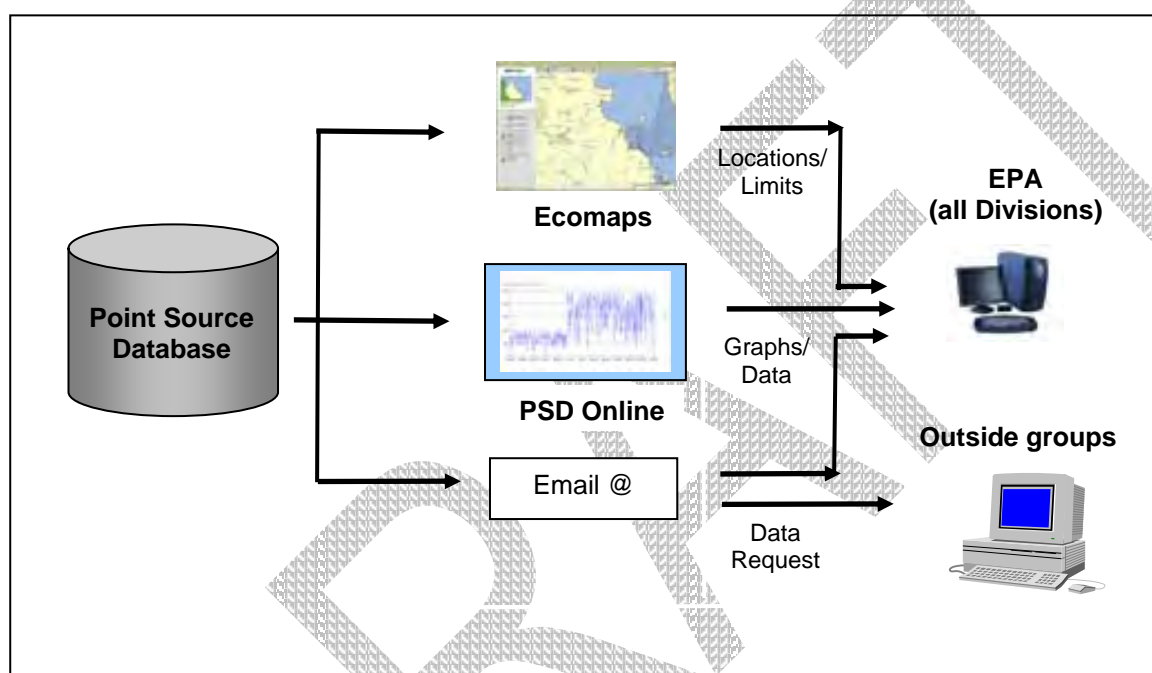

**Electronic Submission and Reporting**

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

The PSD requires registered operators to prepare a text file of measured data using a specific Excel template and attached this file to an email which is sent to the database. For registered operators of sewage treatment plants, this is currently at least every three months. The email is then received by the database and the file is firstly checked, and if in a correct format, imported into the database. The database then compares the submitted measured data to permits limits that are stored in the database and an automated monitoring report is produced. This provides a summary of results for each permit limit of the release as well as more detailed information on any exceedences – see Automated Monitoring Report for more information. The automated monitoring report is then sent, along with a copy of the submitted data, via email to the specified permit holder's email address and the relevant EPA district office email address.

### Getting Point Source Data and Information

Information will be available to EPA staff via Ecomaps, an internal website called Point Source Data Online or on request. The Ecomaps layers contain information on each the facilities, discharge locations and discharge limits. Point Source Data Online will provide direct access to most recent and historical data received by the database either as raw data or through viewing measured data via graphs. The data can be compared directly to permit limits and saved as an Excel file. Point Source Data Online also provides a facility to estimate pollutant loads for each facility based on submitted data. Guidance on accessing the ecomaps layer is provided in Appendix 2 (coming soon for Point Source Data Online). Requests for data or limits/locations can also be made to the Environmental Sciences Division – see contact details below.

External organisations do not have direct access to measured data, graphs, permit limits or discharge locations. However, the Environmental Sciences Division will respond to all reasonable data requests received in writing by an organisation or individual from government, universities, private industry or the general public. Data will generally be provided to partner organisations (those contributing to EPA monitoring programs) free of charge. The EPA will reserve the right to charge a nominal fee for services for any other data request.

Requests for data can also be made from Freshwater & Marine Sciences Group via email ([water.data@epa.qld.gov.au](mailto:water.data@epa.qld.gov.au)). The GIS layer of locations and limits can be requested from the Environmental information Systems Unit via email ([data.coordinator@epa.qld.gov.au](mailto:data.coordinator@epa.qld.gov.au)).

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### Implementation Overview

The PSD has currently been implemented for all sewage treatment plants greater than 10,000 equivalent persons (ERA 15 (e), (f) and (g) under Schedule 1 of the *Environmental Protection Regulation 1998*) that involve a direct discharge to waters. Historical data for these discharges has been collected, in most cases back to the year 2000. Electronic submission of quarterly data commenced for these discharges in 2007.

The PSD has been initially set up to collect information on direct releases to water. However, flow measurements of “recycled water” leaving the registered operators premises are also being collected for sewage treatment plants. At this stage, flows or quality of waters release to land covered under the permits are not collected or checked against permit limits, although this may be implemented in the future.

The next phase of the implementation will target major industry and the remaining sewage treatment plants, firstly in South East Queensland (SEQ) and then the remainder of Queensland. Some historical data for major industry in SEQ has already been collected.

### Guidance to Registered operators

Registered operators participating in electronic submission of data will generally have received a Point Source Database Implementation Manual and attended an information session run by the EPA. The following information is generally provided to the registered operator prior to submission.

The EPA will request participation from a registered operator in writing to submit their data electronically. The registered operator should notify the EPA in writing if they wish to participate. The EPA should also be notified in writing if the registered operator no longer wishes to submit electronic data to the EPA. In this case, reporting and data analysis is required as part of the licensees' annual return and data will need to be provided to the EPA on request. All correspondence with registered operators should be available on the relevant EPA files.

In preparing for electronic submission, the EPA will request the permit holder to provide historical data (preferably back to the year 2000) in an electronic format to the EPA. The data does not need to be in any specific format and existing Excel spreadsheets will suffice as long as they can be easily interpreted. The EPA will then import this data manually into the database. Automated checking of this data against permit limits is not usually undertaken. The data can then be used for data requests and to provide a previous history for assessment of long term limits that are usually up to 12 months when the first automatic submission is received.

Submission of electronic data to the EPA should be done using the templates provided by the EPA for the permit holder's specific plant or based on the EPA's electronic submission guide (available from [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au)). The completed templates should be attached to an email as a .CSV file (comma delimited text file) and sent to [psd.data@epa.qld.gov.au](mailto:psd.data@epa.qld.gov.au). For large point source emitters, data should be submitted to the EPA on no less than a quarterly basis and coincide with the end of the financial and calendar years. Data should be submitted for whole calendar months. Data submission will become due one calendar month after the end of the yearly quarter. The EPA will provide an email reminder to each licensee at this time. Data is to be submitted within thirty days of becoming due.

The provision of correct and accurate data is the sole responsibility of the permit holder and should be undertaken as set out in the development permit/s. The EPA will not be held responsible for submission of incorrect data. If incorrect data has been submitted, please contact the database manager on [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au).

The licensee should provide the EPA with a single generic email address so that all electronic correspondence in relation to the Point Source Database can be emailed to this address. It is the responsibility of the licensee to manage this email address and notify the EPA of any changes.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

Registered operators who submit monitoring data required under their development permit/s for the release to water are not required to submit this data or any related analysis with their annual return. However, submission of data to the Point Source Database does not remove an organization's obligation to report non-compliances and incidents as prescribed by their development permit/s.

### New Permits or Change to Permit Limits

The PSD contains permit limits for every licensed discharge to water contained in the database. It is essential that these permit limits are kept up-to-date as they are used for automated checking against submitted data. The permit limits are also displayed in Ecomaps, which is currently updated periodically.

Project Managers in the Environmental Operations Division are responsible for notifying the PSD administrators of any new development permits involving a discharge to waters and of any amendments to existing discharge quality limits on a development permit. This is required to be completed prior to submission to the Delegate and the process is included in the standard template "Assessment Report – Environmentally Relevant Activities". If a new permit involving a discharge to waters has been approved and is not currently in the PSD, please contact the Freshwater & Marine Science (email [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au)). If you become aware that the permit limits in the database, either from automated monitoring reports or from the layer in Ecomaps, also please contact Freshwater & Marine Sciences.

The PSD current holds information for all permits or amended permits but does not include details of Environmental Management Programs (EMPs). Please notify Freshwater & Marine Sciences if an EMP exists for a permit involved in electronic submission.

### Automated Monitoring Report

The EPA will produce an automated monitoring report (see attached sample) when new monitoring data is received from registered operators. A copy of the automated monitoring report and the data submitted will be sent to the relevant EPA Environmental Operations office and to the registered operator. Limit exceeded events are highlighted in the report and correspond to when the monitoring data provided exceeds permit limits. These are provided as a guide but should not be used as the primary basis for non-compliance.

The automated monitoring report is produced for each discharge plant/monitoring point. The report shows the date of submission, a unique return ID allocated by the database, the date period for which the new data have been submitted and the plant/discharge point name. A summary of results is provided in a tabular form with each line corresponding to a different indicator and limit type set out in the relevant permit. The indicators column shows the indicator name and units. The limit type column shows a range of limit types including maximum, range (maximum and minimum), loads, medians and a combination of short-term and long-term percentiles. For medians and percentiles, the limit period over which the limit is applied is shown in the next column and can include numbers of days, weeks or months. The frequency of sampling is not specifically tested by the database. However, the number of data points submitted to the database are counted and presented in the summary report. This allows the reader to scan the column and for those indicators taken at the sample frequency, the number of data points should be the same. Note there are typically more flow data points (typically measured daily) than water quality concentrations.

More detailed information on limit exceedences is provided in the automated monitoring report after the summary table. For each indicator/limit type combination, information is presented on the limit values and the date and values of any exceedences. The time period and samples required for the limit are also shown for medians and percentile limit types.

If the automated monitoring report contains exceedences, it is important to note that this may not be because of non-compliance. The limits in the monitoring report should be checked against current known limits. The limits may not be up-to-date or there may be an Environmental Management Program (EMP) in place allowing higher discharge levels. The data should also be checked. The raw data is provided with the automated monitoring report. Alternatively, data can be obtained or visualised using Point Source Data Online which allows direct

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

comparison against limits. It should be noted incorrect data can be submitted to the database and that the database and online tool may not correctly represent the limit calculations as set out in development permits. Therefore, even if the limits and exceedence appear correct, it is strongly recommended that the registered operator are contacted and provided an opportunity to confirm that the data and the limit exceeded events are correct. The limit exceeded events can also be checked against the non-compliances already notified to the EPA. If the limit exceeded events have not been reported, the registered operators should again be contacted. Based on the response from the registered operators, further actions may be required by the EPA.

### **Further Information**

The Point Source Database is a joint initiative Environmental Sciences and Environmental Operations Divisions. For further information, please contact Freshwater & Marine Sciences on (07) 3896 9250 or [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au).

### **Sample Automated Monitoring Report**

DRAFT

## Automated Discharge Monitoring Report

### Queensland Environmental Protection Agency

Date: 06/08/2007

Return Id: 845

Data Period: 01/04/2007 - 29/06/2007

Discharge Point: Coombabah / GCCCRP2

#### Summary Results

Indicator	Limit Type	Limit Period	Data Points in Period	Limit Exceeded Events
BOD 5 (mg/l)	80th percentile (short-term)	5 Weeks	13	0
BOD 5 (mg/l)	90th percentile (long-term)	12 Months	13	0
BOD 5 (mg/l)	maximum		13	0
D.O. (mg/l)	minimum		13	0
Suspended Solids (mg/l)	maximum		13	0
Suspended Solids (mg/l)	80th percentile (short-term)	5 Weeks	13	0
Suspended Solids (mg/l)	90th percentile (long-term)	12 Months	13	0
Faecal Coliforms (CFU/100ml)	80th percentile (1 day)	1 Days	13	0
Faecal Coliforms (CFU/100ml)	median (1 day)	1 Days	13	0
Free Residual Chlorine ( mg/L)	maximum		13	0
pH (Unit)	range		13	0
Total Phosphorus (mg/l)	maximum		13	2
Total Nitrogen (mg/l)	maximum		13	0
Total Nitrogen (mg/l)	50th percentile (long-term)	12 Months	13	0
N-NH3 (mg/l)	no limit		N/A	N/A
Total Nitrogen (mg/l)	Annual Load		13	0

#### Disclaimer

- It is the responsibility of the licensee to ensure samples are taken in accordance with their permit. Refer to permit for more information on limits.
- Although all care has been taken in the development of this report, the results may be incorrect and do not necessarily constitute compliance or non-compliance.
- This report does not constitute notification to EPA of any non-compliance.

1

Indicator	Limit Type	Limit Period	Data Points in Period	Limit Exceeded Events
Total Phosphorus (mg/l)	Annual Load		13	0
Flow (L)	maximum (dry day)		51	0
Flow (L)	maximum (wet day)		39	0

**Details of Limit Exceedence**

**BOD 5 (mg/l), 80th percentile (short-term)**

Lower/upper limit: < 15  
 Time period for limit application: 5 Weeks  
 Samples required in time period: 5  
 Date of exceedence (result):  
 Nil.

**BOD 5 (mg/l), 90th percentile (long-term)**

Lower/upper limit: < 10  
 Time period for limit application: 12 Months  
 Samples required in time period: 52  
 Date of exceedence (result):  
 Nil.

**BOD 5 (mg/l), maximum**

Lower/upper limit: < 30  
 Date of exceedence (result):  
 Nil.

**D.O. (mg/l), minimum**

Lower/upper limit: > 4  
 Date of exceedence (result):  
 Nil.

**Suspended Solids (mg/l), maximum**

Lower/upper limit: < 45  
 Date of exceedence (result):  
 Nil.

## Attachment 2 to Section 4

### Point Source Database – New Ecomaps Layers Version 1.0

#### Introduction

Two new layers relating to point source discharges have been added to Ecomaps. The two layers are (i) Point source discharge plants and (ii) Point source discharges. They currently contain similar metadata information but have been included as the locations of the plants and the discharges are usually different. The layers shows the location of point source discharges/plants and a description of each including the plant name, ecotrack number, permit reference, Environmentally Relevant Activity (ERA) type, licensee, location details. There is also a link to permit limit details that are the indicators and numerical limits placed on each of those limits in the relevant permit.

This document provides instruction on how to access these layers on Ecomaps that is located at:

<http://mudlark.env.qld.gov.au/website/index.htm>

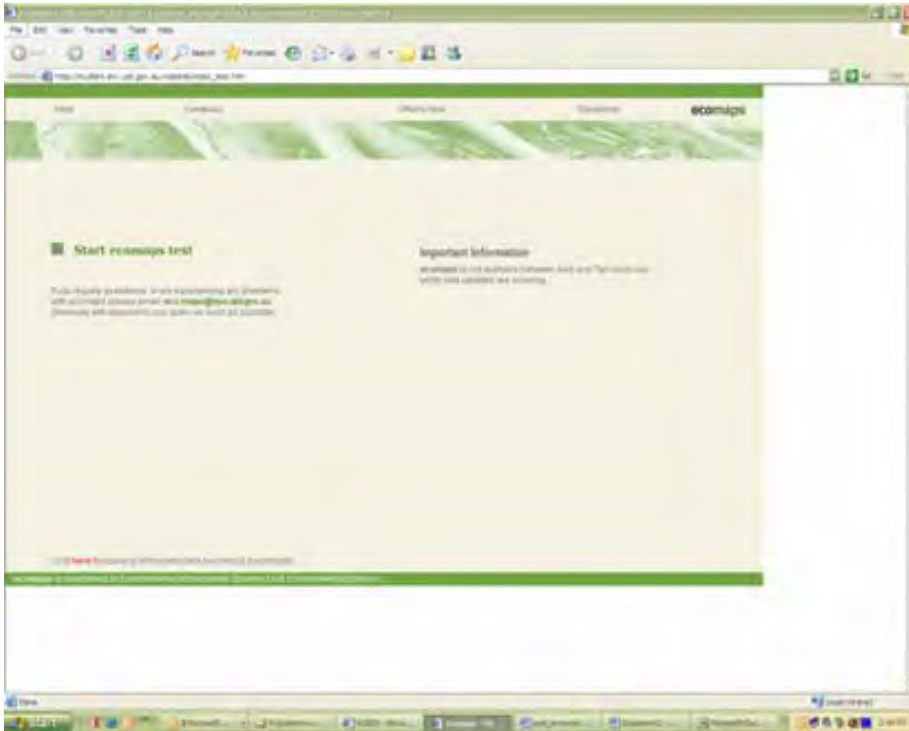

Although all care has been taken with the compilation of the data, please note that the information presented in this layer may contain errors or not be up-to-date. In terms of permit limits, Environmental Management Plans or other statutory mechanisms may be in place that are not recorded on these layers. Please contact the relevant Environmental Operations Office for the most recent information.

The Point Source Database is a joint initiative Environmental Sciences and Environmental Operations Divisions. For further information or feedback, please contact Freshwater & Marine Sciences on (07) 3896 9250 or [psd.help@epa.qld.gov.au](mailto:psd.help@epa.qld.gov.au).

**Instructions**

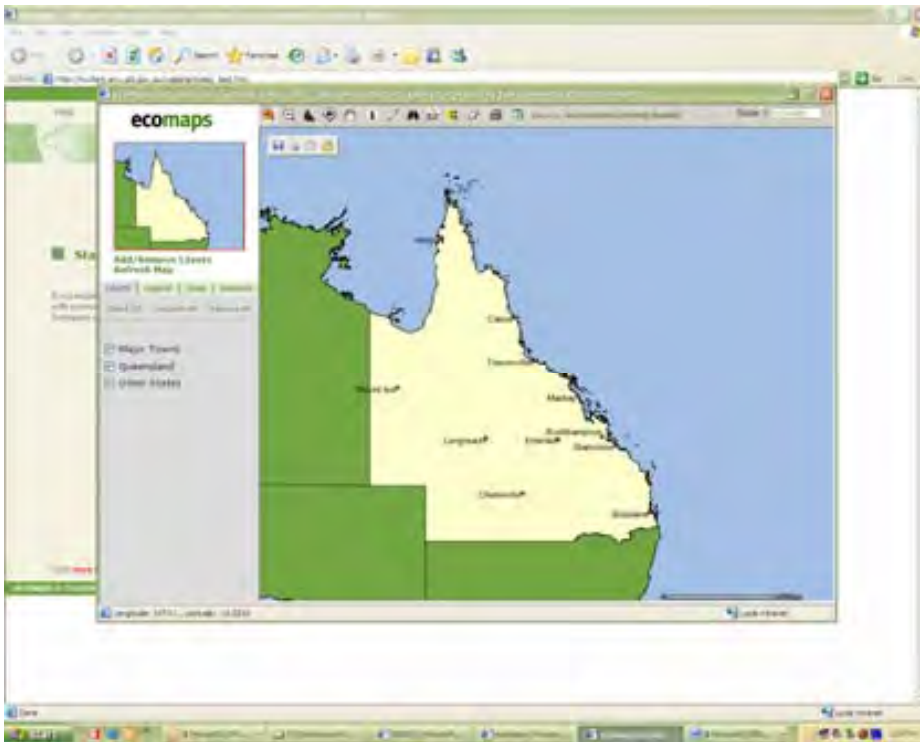

Step 1 – Start Ecomaps using the link and click on Start “ecomaps test”

<http://mudlark.env.qld.gov.au/website/index.htm>

DRAFT

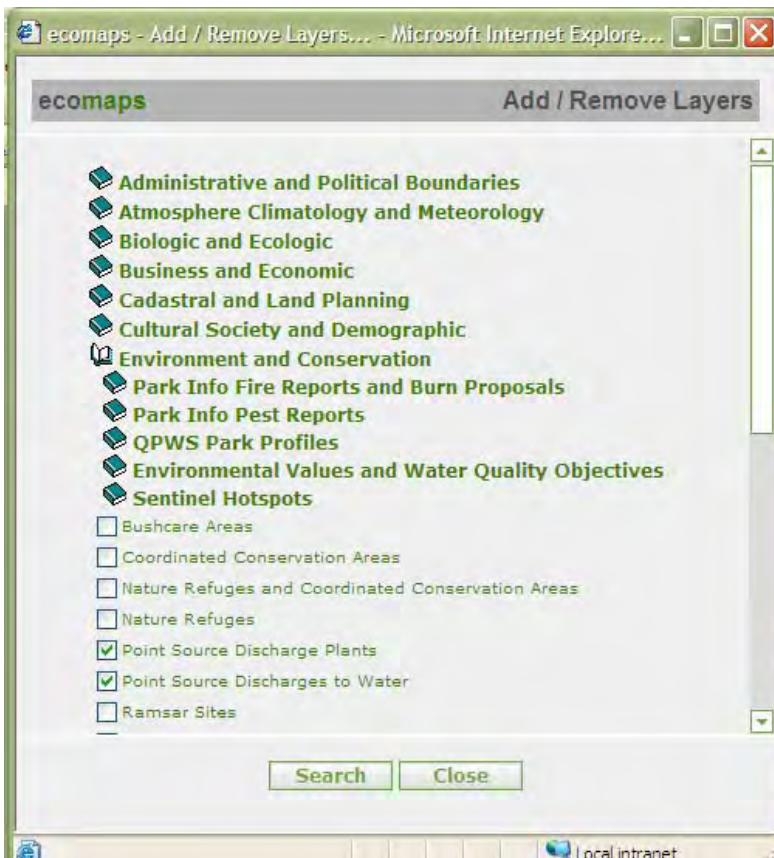

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

Step 2 – Click on Add/Remove Layers and choose Environment and Conservation. You can click the two boxes related to Point Sources and then Close

DRAFT

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

Step 3 – Check both boxes on the main screen and then Refresh Map

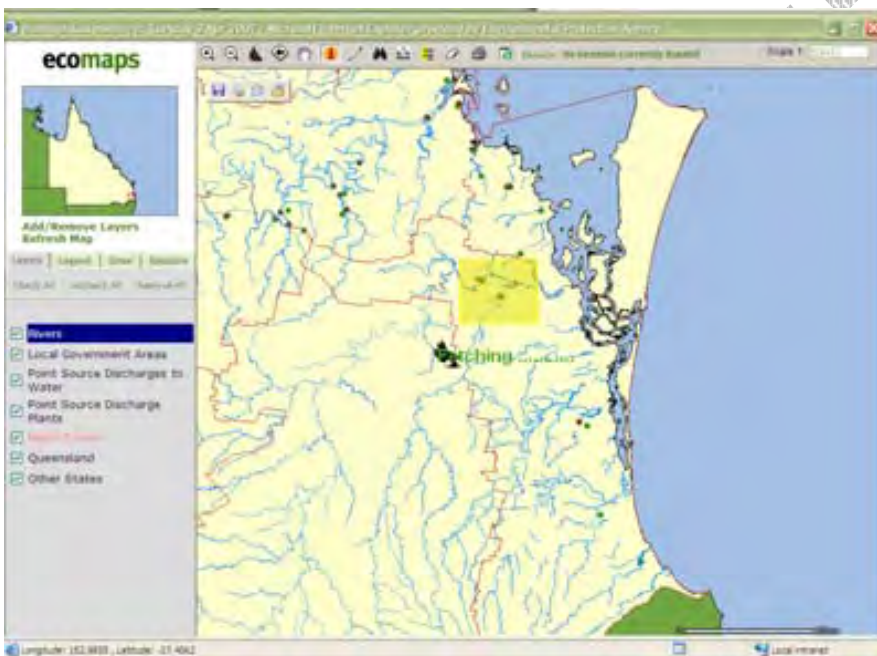

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

Step 4 – Add any other layers you want such as local government boundaries, rivers etc. and then Refresh Map

Step 5 – Zoom into some area of choice using the magnifying glass symbol

Step 6 – Click on i symbol and then choose Rectangle Select and select an area

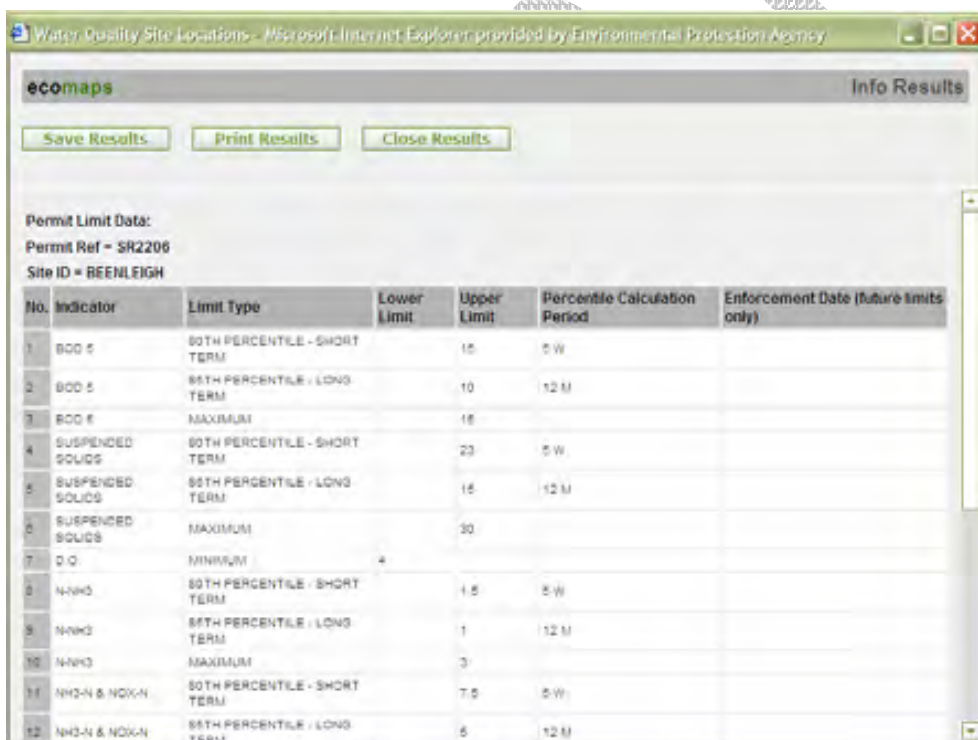

Scroll down till you see the point source information:

Step 7 – Click on View Permit Limit Data for your Plant/Discharge of choice:

## 5. Direct Toxicity Assessment

**This Section provides 'stand alone' information in considering a requirement for direct toxicity assessment. It also informs Section 2.3 of the Operational Policy.**

### 5.1 Introduction

This section of the *Procedural Guide* has been prepared by the Freshwater & Marine Sciences Unit (Environmental Sciences Division) for staff of the Environmental Protection Agency involved with regulating wastewater discharges to aquatic receiving environments.

The following subsections outline what assistance this document can provide for EPA staff contemplating the need to request or impose Direct Toxicity Assessment of an existing or proposed effluent discharge and what information would be required to make an informed decision. The following sections in the *Procedural Guide* will detail the specific effluent quality data required to determine whether or not there is a significant risk of toxic effects and therefore whether one-off, event-based or routine assessment for the toxic potential of the effluent is required. This assessment is referred to as a Direct Toxicity Assessment.

It should be noted that a Direct Toxicity Assessment (DTA) is also widely known as Whole Effluent Toxicity (WET) tests and both refer to an experimental procedure aimed at quantifying the potential toxicity of a sample of effluent through exposing a range of test specimens to that effluent. To remain consistent with the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC & ARMCANZ 2000), only the term DTA will be used hereafter.

#### **This Document (the Procedural Guide/Policy)**

This *Procedural Guide* will assist EPA officers who have reason to believe (or suspect) that:

- an effluent may have the potential of exhibiting toxic effects in aquatic biota, and consequently
- need to decide whether or not a DTA of the effluent is warranted.

A new Development Application (DA) or Amendment to an existing DA should contain detailed information that characterises the effluent and the receiving aquatic environment.

#### **Information Submitted by the Proponent**

The information provided in an Environmental Impact Assessment (EIA), Environmental Impact Statement (EIS), or other equivalent document, will form the basis of the assessment to determine whether or not there is a significant risk of toxic effects being caused by the effluent. If the required effluent quality data has not been presented in EIA/EIS then the priority would be to obtain it via a Request for Further Information (RFI).

In most cases however, the EIA/EIS should already contain detailed information that:

- identifies and quantifies the actual (or expected) effluent water quality characteristics;
- discusses whether or not the contaminants in the effluent comply with local Water Quality Objectives (WQOs) and preserve the Environmental Values (EVs) attributed to the specific receiving waters, and
- describes the effluent quality criteria in comparison to *Toxicity Trigger Values* (TTVs) presented in (ANZECC & ARMCANZ 2000) or alternate equivalent guideline.

### 5.2 Warranting Direct Toxicity Assessment

Performing a DTA usually involves initiating a series of laboratory-based toxicological bioassays that are designed to determine whether or not the effluent is toxic to any of a range of aquatic biota. The DTA of an effluent is both a time-consuming undertaking (at least several weeks) and expensive; hence for a DTA to be warranted there needs to be one or more issues of concern regarding some aspect of the:

- toxicant concentrations;
- discharge characteristics, and

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

- aquatic receiving environment.

Each of these aspects of an effluent is addressed below individually, however it must be pointed out that these are by no means separate issues; they are interrelated. An obvious example would be that a salinity concentration of 20 parts per thousand (ppt) would not be considered a toxicant in an estuarine or marine environment, but would be in a freshwater environment.

### Toxicant Concentrations

The primary reason for warranting a DTA of an effluent relates directly to the expected or observed concentrations of potential toxicants. There is a need for a DTA of the effluent to be performed when:

- one or more toxicant concentrations in the effluent are shown to exceed the TTVs at the appropriate *Percentage Level of Species Protection* (refer to Section 3.4).

Additionally, a requirement to have a DTA conducted should also be considered when there is a notable lack of measured effluent quality data, such as when the effluent quality data are:

- incomplete;
- based only on:
  - medians, means or 50<sup>th</sup> percentiles;
  - non-validated modelling outputs, or
  - best available estimations;
- relevant only for a short monitoring period and the quality of the effluent is:
  - likely to experience significant process-based fluctuations, or is
  - seasonally variable and the toxicant data is not representative of seasonality.

### Characterising the effluent

In order to determine whether the effluent poses a significant toxicological risk in the receiving environment, the first step is to review the quality characteristics of the effluent. Toxicity or environmental harm could be caused by one or more of the following characteristics:

- physicochemical variables;
- known toxicants, and
- unknown toxicants.

Each of these aspects of an effluent is addressed individually below.

#### ***Physicochemical Variables***

Although physicochemical variables are not toxicants per se, they may still cause harm to aquatic biota when they occur outside of a certain range or beyond certain limits. The main physicochemical variables that need to be considered when determining if a DTA is warranted are:

- pH (note that ammonia toxicity varies with pH; refer to ANZECC & ARMICANZ 2000);
- temperature;
- dissolved oxygen (DO) concentration/saturation, and
- conductivity/salinity/total dissolved salts
- hardness/total dissolved solids (TDS).

The acceptable ranges or limits for these water quality characteristics can be available for specific water bodies, climatic regions, aquatic environment types, or catchments, and can be available in either State or National publications, or by the private sector (i.e. generated by environmental consultants). Physicochemical variables are generally part of the WQOs and for Queensland, those can be found in the *Queensland Water Quality Guidelines* (QLD EPA 2006).

#### ***Known Toxicants***

Known toxicants are toxicants that are known to have the potential to harm the health of aquatic receiving environments and are therefore frequently analysed via chemical analysis. The following categories contain the

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

names of known toxicants that should be considered when characterising an effluent and where appropriate, example ANZECC & ARM CANZ (2000) TTVs are presented.

*Metals & Metalloids*

A more complete list of metals and metalloids with the potential to cause toxic effects in aquatic biota is presented in Table 3.4.1 of the ANZECC & ARM CANZ (2000). The most commonly encountered metals and metalloids of concern have been reproduced below (Table 1) for the reader's convenience.

**Table 1. Excerpt from Table 3.4.1 in ANZECC 2000 – Toxicity Trigger Values for most Metals & Metalloids at alternative levels of protection.**

Values in grey shading are the trigger values applying to typical *slightly-to-moderately* disturbed systems.

Chemical	Toxicity Trigger Values for Freshwater (µg/L)				Toxicity Trigger Values for Marine Water (µg/L)

\* These figures are provided in the errata for the ANZECC & ARM CANZ (2000) Guidelines ([http://www.mincos.gov.au/pdf/anz\\_water\\_quality/gfmwq-guidelines-vol1-errata.pdf](http://www.mincos.gov.au/pdf/anz_water_quality/gfmwq-guidelines-vol1-errata.pdf))

A Figure may not protect key test species from acute (and chronic) toxicity – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

B Chemicals for which possible bioaccumulation and secondary poisoning effects should be considered – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

C Figure may not protect key test species from chronic toxicity – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

H The figure has been calculated for a Hardness of 30 mg/L CaCO<sub>3</sub> and should be adjusted for site specific hardness – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

ID Insufficient data to derive a trigger value – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

*Non-metallic Inorganics*

Table 2 is a complete listing of non-metallic inorganic toxicants as per Table 3.4.1 of the ANZECC & ARM CANZ (2000).

**Table 2. Excerpt from Table 3.4.1 in ANZECC 2000 – Toxicity Trigger Values for Non-metallic Inorganics at alternative levels of protection.**

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

Values in grey shading are the trigger values applying to typical *slightly-to-moderately* disturbed systems.

Chemical	Toxicity Trigger Values for Freshwater (µg/L)				Toxicity Trigger Values for Marine Water (µg/L)			
	Level of Protection (% species)				Level of Protection (% species)			
	99%	95%	90%	80%	99%	95%	90%	80%
<b>Non-metallic Inorganics</b>								
Ammonia	320	900 <sup>C</sup>	1430 <sup>C</sup>	2300 <sup>A</sup>	500	910	1200	1700
Chlorine	0.4	3	6 <sup>A</sup>	13 <sup>A</sup>	ID	ID	ID	ID
Cyanide	4	7	11	18	2	4	7	14
Nitrate*	4900	7200	8700 <sup>C</sup>	12000 <sup>A</sup>	ID	ID	ID	ID
Hydrogen Sulfide	0.5	1.0	1.5	2.6	ID	ID	ID	ID

\* The TTVs for nitrate are officially under review (refer to ANZECC & ARM CANZ (2000) errata), however the values provided here have been recalculated by prominent Australian toxicologists involved in the writing of the Guideline and are therefore likely to be adopted.

A, B, C, H, ID – Refer to the footnotes to Table 1.

D Ammonia as total ammonia [NH<sub>3</sub>-H] at pH 8 – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

E Chlorine as total chlorine, as [Cl] – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

F Cyanide as un-ionised HCN, measured as [CN] – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

G Sulfide as un-ionised H<sub>2</sub>S, measured as [S] – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

J Figures protect against toxicity and do not relate to eutrophication issues – see Table 3.4.1 in ANZECC & ARM CANZ (2000) for more information.

\* Note that these figures differ from those in ANZECC & ARM CANZ (2000) due to a subsequent review of the values {{{XXXXXXXXXX}}}

*Aromatic Hydrocarbons, Phenols & Xylenols, Organic Sulfur Compounds*

If an effluent is shown to contain significant concentrations (i.e. as low as 1-10 µg/L or greater) of aromatic hydrocarbons, phenols, xylenols, organic sulphurous compounds or phthalates, then it may cause harm to an aquatic receiving environment. Table 3 provides some examples.

**Table 3. Excerpt from Table 3.4.1 in ANZECC 2000 – Toxicity Trigger Values for some Aromatic Hydrocarbons, Phenols & Xylenols, Organic Sulfurous Compounds and Phthalates.**

Values in grey shading are the trigger values applying to typical *slightly-to-moderately* disturbed systems.

*Endocrine Disrupting Chemicals*

Endocrine Disrupting Chemicals (EDCs) are comprised of many elements and different groups of compounds from a variety of sources, including industrial reagents, and domestic, health and personal care products. Although many are also be toxicants capable of causing lethal effects when they occur at sufficient concentration, at much lower concentrations they are referred to as *micropollutants*. EDCs are believed to cause detrimental effects in biota through disrupting the proper function of glands of the endocrine system. The glands and the hormones they release influence almost every cell, organ, and function in an organism. The endocrine system is instrumental in regulating mood (in humans), growth and development, tissue function, and metabolism, as well as sexual function and reproductive processes. For more information refer to CRC-WQT (2007).

A list of common known EDCs is provided in 0

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### *Pharmaceuticals*

Pharmaceuticals, including veterinary chemicals should be screened for in effluents derived from wastes where hospitals and large-scale livestock operations occur. Some of these compounds have been shown to pass through secondary treatment trains more readily than others. Some of these substances act as EDCs. Please refer to CRC-WQT (2007).

A list of common known pharmaceutical EDCs is provided in 0.

### **Unknown Toxicants**

Unknown toxicants can be of two types; *Known-Unknowns* and *Unknown-Unknowns*. These are explained below.

#### *Known-Unknown Toxicants*

Known-Unknown Toxicants are chemicals that are known to be in use and form a component of the effluent, but are unstable and degrade quickly to levels outside the detection capabilities of today's instruments, or there are no chemical analysis procedures or instruments capable of reliably detecting or quantifying them to-date.

Examples of Known-Unknown Toxicants would include undescribed disinfection by-products (making them undetectable in chemical analyses aimed at detecting specific compounds) and anti-scaling agents. Anti-scaling agents (such as orthonophosphates) are routinely used in Reverse Osmosis (RO) treatment of treated sewage effluent and sea water. At the present time there is no reliable method of detecting this group of compounds and their potential for toxicological effect have not yet been fully described; therefore, they are a potential Known-Unknown toxicant.

When Known-Unknown Toxicants are used in treatment processes and suspected to persist at significant concentrations in an effluent, and no readily available scientific literature exists that could be used to estimate the potential risk they pose to the aquatic receiving environment in question, then a DTA would be warranted.

#### *Unknown-Unknown Toxicants*

Unknown-Unknown Toxicants are chemicals suspected of being present in some effluent streams but cannot be quantified or detected. Unknown-Unknown Toxicants could be present due to:

- illegal or undeclared substances that either directly or indirectly enter the effluent stream;
- complex mixtures of organic compounds reacting with strong oxidising agents (e.g. chlorine) forming undescribed toxicants, and
- undescribed degradation products of pesticides and other complex substances.

When the effluent is likely to incorporate industrial and/or trade wastes that include chemicals of concern, and when the characteristics of the discharge are likely to match the scenarios presented under Section 0, it may be prudent to recommend that a DTA be performed.

### **Discharge Characteristics**

There may be good reason to order that a DTA of the effluent be performed whenever the proposed effluent is:

- being discharged to an aquatic environment attributed with High Ecological Value (HEV);
- voluminous, and being discharged into a relatively small receiving environment; or
- being discharged without a diffuser into:
  - a moderately to poorly-mixed (medium to low kinetic energy) environment, or
  - a receiving environment with a significantly different density.

Some general information on mixing zones is presented below that will be helpful in determining whether or not adequate mixing is taking place to manage acutely toxic concentrations of contaminants.

Mixing Zone characteristics

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

The mixing zone of an effluent discharge is typically defined as the area or zone at which the concentrations of contaminants may be above water quality objectives. This means that the mixing zone could be a different size for different contaminants, depending on the:

- Concentration of the contaminant in the effluent;
- Ambient or baseline concentration of the contaminant; and the
- Water quality objectives for the contaminant.

For instance, if Contaminant A

- is typically present in the effluent at 10 mg/L and
- the water quality objective for that contaminant is 1 mg/L, and background concentrations will be very low, then;
- 10 times dilution would be required for Contaminant A to meet water quality objectives, and that level of dilution would be achieved within;
- Distance X of the discharge point, based on dilution modelling.

For Contaminant B, it:

- is typically present in the effluent at 30 mg/L and;
- the water quality objective for that contaminant is 1 mg/L, and background concentrations will be very low, then;
- 60 times dilution would be required for Contaminant B to meet water quality objectives, and that level of dilution would be achieved within;
- Distance Y of the discharge point, based on dilution modelling.

Note that Distances X and Y should typically be determined using the average dilution scenario (e.g. mean current velocity and tide). A worst-case dilution scenario with low velocity (e.g. 0.05m/s) at low tide should also be determined to check no overlap with other mixing zones or contact with the shore line.

Therefore, Contaminant A and B will mostly likely possess mixing zones of differing dimension. This applies to all contaminants. There are a multitude of factors that will influence the size and extent of a mixing zone and the dilution rate of an effluent, and these should be presented as the input variables and assumptions used in the modelling for the discharge. The validity and applicability of those input variables should be assessed.

### **(i) Near-field Mixing Zone and Far-field Diffusion**

**Near-field Mixing Zone** occurs in the area within the mixing zone where the most rapid dilution takes place. This area is situated from the point of discharge to a certain distance away from that point, and the mixing is generally driven by the exit velocity of the effluent. Thereafter, where the effluent has lost its exit inertia and has become assimilated with the hydrodynamics of the aquatic receiving environment, a slower dilution-rate (a diffusion-based dilution rate) presides. The **Far-field Diffusion Zone** occurs from the extent of the near-field mixing to a distance where an elevation in the concentration of *any* contaminant from the effluent is no longer detectable from that in the ambient environment.

**Figure 1.** Example Diffusion Curve and related mixing characteristics

Hydrodynamic mixing models can provide estimates of the extent of these areas under differing conditions in the receiving environment, such as no-flow (worst-case), low-flow, and high-flow (best-case) conditions, and dilution curves (see Figure 1) can be produced for each scenario.

The dilution curves coupled with computer modelling of lateral diffusion dynamics are capable of producing a visual representation of the area likely to be affected by the discharge. This area is often described as the *plume* (see Figure 2). Both the near-field mixing zone and far-field diffusion occur within the boundary of the plume.

**Figure 2.** Representative diagram of a Near-field Mixing Zone and Far-field Diffusion.

Toxicity zone mapping can be performed by correlating the diffusion curve with the measured or estimated toxicant concentrations in the discharged effluent, or alternatively, DTA results. This approach can be taken in regards to identifying acute and chronic toxicity zones within the plume; see below (Section 00).

**Acute Toxicity and Chronic Toxicity Mixing Zone**

In regards to toxicity assessment, the typical mixing zone of an effluent discharge may possess up to two distinct areas relating to toxicity; the:

- acute toxicity zone, and
- chronic toxicity zone.

The ideal situation is where there is neither an acute nor a chronic toxicity zone however this is rarely the case. More typically, there will either be a Chronic Toxicity Zone within the plume (Figure 3 A), or both an Acute and a Chronic Toxicity Zone within the plume (Figure 3 B).

**Figure 3.** Acute and Chronic Toxicity Zones in a Mixing Zone

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

The EPA should always ensure, or negotiate toward, a no Acute Toxicity Zone scenario (see Figure 3 A.). It can be assumed that an acute toxicity zone is absent when all toxicant concentrations are below the acute toxicity criteria (i.e. ANZECC & ARMCANZ (2000) TTVs) at the end-of-pipe. In such a case, only a chronic toxicity zone may be present, and only long-term continuous exposure to these levels of toxicants would be likely to result in any observable adverse effects to the exposed biota.

Unfortunately however, having the effluent meet the (ANZECC & ARMCANZ 2000) TTVs at the end-of-pipe is not always achievable by the proponent. In such cases, the EPA needs to assess the risk posed to the receiving environment by the toxicants in the effluent.

### Aquatic Receiving Environment

Effluents are generally discharged to surface waters that can be classified into four categories:

- Freshwaters;
- Brackish waters;
- Estuarine waters, and
- Marine waters.

Considerations that relate to a discharge to each of these environments are discussed below.

#### Discharges to Freshwaters

Freshwaters are by definition very soft (i.e. water hardness is very low; salinity 0.05-1.0 ppt (ANZECC & ARMCANZ 2000)) and this condition promotes the solubility and consequently the bioavailability of toxicants, especially heavy metals and metalloids. Therefore the same 'total' metal concentrations in freshwater will tend toward being more toxic in freshwater than the same concentration in marine waters (refer to Table 1).

#### Discharges to Brackish or Estuarine waters

Brackish waters are slightly-to-moderately saline waters (salinity between 0.5 and 30 ppt (ANZECC & ARMCANZ 2000)), often resulting from saline ocean waters mixing with, and being diluted by, freshwater sources, as in estuaries. This variability in salinity normally excludes freshwater species being used as the test specimens in toxicity bioassays, although some freshwater biota can tolerate a certain degree of brackishness.

It is common however that marine species are selected for assessing effluent being discharged into brackish or estuarine waters. This is possible by simply elevating the effluents' salinity to a concentration preferred by the test specimen through the addition of pure salt. Naturally, this approach is not appropriate if it is the toxicity of the salinity itself what is being assessed.

#### Discharges to Marine waters

Marine waters are saline waters (salinity between 30-40 ppt ANZECC & ARMCANZ (2000)) and the presence of salt generally suppresses the bioavailability of metal and metalloid toxicants. This does not always translate to less toxic effects being observed in marine environments because some marine species can be more susceptible to toxic reactions to specific toxicants than freshwater species (e.g. copper; refer to Table 1).

Only marine species should be selected for DTA of discharges to marine environments.

## 5.3 Essential Components of the DTA Design

### Test-effluent Management

As mentioned in Section 0, the effluent needs to be characterised so that an appropriate DTA can be designed with applicable test specimens that can be used to determine the existence and magnitude of toxicological effects. Other important considerations that may affect the results of a DTA, such as the way the effluent is collected, stored and transported as well as the natural water used for dilutions are discussed in the following subsections.

### Effluent Dilution Series

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

In order to determine the level of dilution required for an effluent to no longer exhibit observable toxic effect in the test biota, the DTA incorporates a dilution series into the design. The dilution series typically takes the form of serial 1:1 dilutions that result in the following concentrations of effluent:

**Table 5. Effluent dilution series**

Dilution ratio (parts effluent: parts dilution water)	Resultant Percentage of the original effluent concentration
(undiluted)	100%
1:1	50%
1:3	25%
1:7	12.5%
1:15	6.25%
1:31	3.125%

The most appropriate water that can be utilised for the dilutions would be collected from the actual receiving environment for the proposed discharge (refer to Section 0), otherwise tap water, deionised or demineralised water, artificially manufactured sea water, or some other uncontaminated dilution water would be required.

### Normalising for Salinity

When the salinity of the effluent varies significant from the salinity of the receiving waters then there is the potential for an adverse impact on the environment to occur. This can be true for effluents more saline and for effluents less saline than receiving waters; however, the former is by far the more common case and of greater concern due to the potential of the denser brine solution sinking to engulf benthic biota.

In cases such as this, marine or estuarine test specimens should be selected (even for effluents proposed for a freshwater discharge) and the salinity of the effluent artificially increased to match that preferred by the test specimen (refer to {{58 Krassoi, R. 1995}}). In this way, any observable effects due to salinity are negated and the only effects from toxicants remain observable. Even though the test specimen is not representative of the receiving environment, the effects of elevated salinity are taken out of the toxicity equation.

### Collection and Use of Effluent and Bulk Natural Water

Certain complications can arise with the bulk collection of natural water for purpose of diluting effluent for DTA. These complications arise due to fluctuations in water quality variables that may occur between the times of collection to the commencement of the bioassays. Critical water quality parameters should be measured in the field (at the time of collection) wherever possible using portable probes and spectrometers; then again prior to the commencement of the bioassay so that any deviation from the field values is documented:

- pH
- Temperature
- Dissolved Oxygen (DO) concentration
- Conductivity (Salinity)
- Ammonia
- Suspended Solids

Where suspended solids (SS) are in high concentration in the receiving environment, it can interfere with observing the test specimens and can be a cause for toxic effects in some test specimens and therefore the bulk water should be allowed to settle or should be filtered. Bulk natural water should also be refrigerated to slow the activity of microbes consuming carbonaceous compounds and dissolved oxygen, and transport times should be kept to a minimum (i.e. use of local laboratories are preferable to interstate arrangements). In all other aspects, bulk natural water should be collected as per the *Water Quality Sampling Manual* (QLD EPA 2008) or the latest issue.

### Appropriate End Points

Ideally, a well designed DTA program that is in accordance with the guidelines stipulated in ANZECC & ARM CANZ (2000) must firstly incorporate five test specimens selected from four major taxonomical groups, but

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

should also aim to examine multiple toxicological end point types (i.e. acute, sub-lethal and chronic effects) over the varying selected periods of exposure. These concepts are discussed in more detail below.

### Acute Effects

Acute effects are observed when the substance(s) being tested causes death or severely incapacitates the organisms to the point where they are unable to maintain normal functions that will lead to certain death in the very near future (e.g. organisms become moribund through their inability to feed themselves, their nervous system has been irreparably damaged, etc.).

These are the most unlikely effects observable in the receiving environment, predominantly because the EPA will regulate the toxicant concentration levels in the discharge as to avoid acute toxicological effects from occurring, but also because biota are unlikely to remain in an inhospitable environment long enough for acute effect to manifest. On the contrary however, some biota are incapable of avoiding or vacating such inhospitable environments before permanent and lethal damage has occurred (e.g. slow-moving or sessile organisms).

### Sub-lethal Effects

Sub-lethal effects are observed when a substance being tested causes detrimental effects that will certainly compromise the individual organisms' ability to survive (e.g. through retarding growth and/or development) or the species' ability to persist (i.e. affecting fecundity, gestation or other reproductive success rates).

These effects can be exhibited in an organism later on in life after a larval or early development life stage was exposed to a short-term or pulse exposure to a toxicant, or can be the effect of long-term chronic exposure. This type of effect is more likely to occur in the receiving environment than are acute effects however they are rarely observed due to lack of in-depth monitoring.

### Chronic Effects

Chronic effects are observed when the substance causes the organism to be unable to maintain normal biological functions that will lead to certain death in the long-term (e.g. it compromises the organisms' ability to resist disease, causes biochemical changes that affect absorption rate of nutrient through the gut wall, etc.).

These effects are most likely to occur in the receiving environment but due to the lack of routine monitoring associated with effluent discharges, they are rarely observed. Even when the effects of chronic toxicity are observed, it is difficult to identify the specific effluent(s) or source(s) responsible for the observed effect because long-term chronic exposures are difficult to link back to specific point-source discharge(s).

### Exposure Times

Toxicological effects are dependant on the concentration of the toxicant versus the time of exposure. To examine the potential short-term and long-term effects that a substance may exhibit on test specimens, short-term exposures (1 hour) and medium-term exposures (96 hours) should be incorporated into the DTA design. Although longer-term exposures (e.g. weeks, months or even years) may exhibit adverse effects on biota in the receiving environment, it is unfeasible to explore these effects within the scope of most DTAs. It may be necessary that a long-term monitoring program be implemented if the circumstances of the discharge warrant continued vigilance (refer to Section 0).

### Appropriate Test Specimens

The best DTAs utilise test specimens that are directly relevant to the receiving environment for the discharge, however this may not always be possible for several reasons, including:

- Unavailability of the organism in sufficient numbers to perform the bioassays
- Inability to maintain the organism in the laboratory in a healthy state
- The organisms' relative sensitivity to a toxicant is unknown making its selection dubious
- State laws prohibited its use upon grounds of animal ethics (e.g. vertebrates)

In all other cases the best compromise should be sought. The most important considerations are:

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

- the test specimens should:
  - be sensitive to the main toxicant(s) of concern; this may be the case according to:
    - taxa versus toxicant type (e.g. use insect or crustacean macroinvertebrates for organophosphate pesticides),
    - life stage of the test organism (e.g. juveniles may be more sensitive than adults);
  - reasonably or closely relevant to the receiving environment, or
  - a standard test organism (see Section 0)

### *Acclimatised Species*

It may be appropriate to capture and rear local specimens that have acclimatised to local background toxicant concentrations. This may be particularly applicable where background toxicants exceed the ANZECC 2000 TTVs but locally captured organisms don't seem adversely affected.

This approach is more in the realms of scientific research and therefore normally out of the scope of a general DA however if the proponent is willing to wait for the research to be performed and invest the money required then this should be considered by EPA officers.

### Toxicity Identification Evaluation

Once the toxicological bioassays of a DTA are complete and toxic effects have been observed, there may be a need to determine which constituents in the effluent were responsible for those observed effects. The process for this determination is described by a series of procedures published by the USEPA but basically takes the following approach; the following Phase I TIE manipulations of the effluent are performed and then a repeat of the initial DTA is initiated, with subsequent Phase II and Phase III manipulations if required:

- Phase I TIE manipulations:
  - EDTA chelation – removes divalent metal ions (e.g. Cu, Zn, Ag, Hg) to reduce toxicity of the effluent;
  - pH adjustment – ammonia and aluminium toxicity can be reduced significantly by adjusting the effluent of pH;
  - Aeration – oxidisable or volatile toxicants are stripped or converted in the effluent to reduce overall effluent toxicity
  - Sodium thiosulphate – binds oxidative chemicals (such as Cl and Br) and some metals (e.g. Cu) making them unavailable as toxicants;
  - Solid Phase Extraction (SPE) – columns with C18 or C8 resin absorb non- or moderately polar organic chemicals from the effluent;
  - Filtration and centrifugation – removes particulate-bound toxicants;
  - Sublimation and Foam fractionation – removes sublimatable compounds such as surfactants;
  - Piperonyl Butoxide (PBO) addition – affects the action of some metabolically activated pesticides for that their toxicity is reduced or eliminated but may enhance the toxicity of pyrethroids.
- Phase II TIE manipulations:
  - SPE elution pattern – an enhanced version of Phase I SPE extraction;
  - HPLC elution pattern – similar to SPE elution pattern but with higher resolution;
- Phase III TIE manipulations:
  - Confirmation (spiking) study – suspect toxicants are spiked into the sample at double the concentration they exist at in the sample to observe enhanced toxic effect.

Identification of the compound(s) responsible for the observed toxicological effects on DTA test specimens may assist in developing strategies to reduce or remove the toxicants in question from the effluent (through the addition or modification of a treatment step), or be used to support or negate other management options.

### 5.4 Related Matters

This section deals with when, why and how DTAs should be conditioned into Discharge Licences and what needs to be considered in Receiving Environment Monitoring Programs (REMPs) so that the repercussions of the observations made in DTAs are adequately covered in the monitoring.

#### Routine DTAs

Where it is considered that there is continuing potential risk for an effluent to cause environmental harm then routine DTAs of the effluent may be required. Routine DTAs can be required:

- On an annual or bi-annual basis, or required at some other regular interval;
- whenever a treatment process change is implemented that is likely to significantly alter the effluent quality;
- whenever the influent quality into a sewage Treatment Plant (STP) for example, or Advanced Water Treatment Plant (AWTP), changes significantly, or
- when new information becomes available that puts into doubt the quality of the effluent so that the EPA can no longer confidently consider the effluent as being non-acutely toxic at the point of release.

An example of such a situation is where a ROC from a STP effluent that is being collected from a sewer catchment with a significant proportion of industrial effluents contributing to the bulk influent. Because of the

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

many parties involved with contributing to the STP influent and the high potential for unreported process changes and/or reagent changes to occur, it would be appropriate that there be a requirement that DTA be conducted on the effluent on a regular (routine) basis.

### **Requirement for Regular DTA**

NEGATIONS REGARDING THIS ISSUE ARE IN PROGRESS

### **Requirement for Irregular or Event-based DTA**

NEGATIONS REGARDING THIS ISSUE ARE IN PROGRESS

### **No Requirement for DTA**

NEGATIONS REGARDING THIS ISSUE ARE IN PROGRESS

### **Receiving Environment Monitoring Programs**

Where an existing or proposed discharge is considered to present unknown risk of acute, sub-lethal or chronic toxicological effects for reasons beyond the results of the DTA, then it may be appropriate to condition a biota monitoring component into a Receiving Environment Monitoring Program (REMP). Such reasons would include:

- Effluent diffusion is poor (poor mixing) during certain tidal or other variables (see Section 0);
- Receiving environment is of special significance (e.g. Ramsar wetlands, Wetlands of State Significance, HEV areas, etc.; see Section 0);
- The DTA test specimens:
  - were not directly relevant to the receiving environment (see Section 0), or
  - did not include the taxa that are most sensitive to the toxicant(s) in the effluent, or
- The effluent tested was not truly representative of the long-term discharge.

Biota monitoring can be for an interim period, or indefinite. Generally, an interim period would be a minimum of 2-3 years in duration so that seasonal changes and patterns of subsequent years can be analysed.

## 5.7 Glossary

<b>Acute Toxicity</b>	Acute toxicity is the ability of a substance or mixture of substances to cause lethal effects over a relatively short period of time, usually upon single or pulse exposures.
<b>Aquatic Ecosystem</b>	Any watery environment from small to large, from pond to ocean, in which plants and animals interact with the chemical and physical features of the environment.
<b>Biota</b>	The sum total of the living organisms in any designated area.
<b>Chronic</b>	Lingering or continuing for a long time; often for periods from several weeks to years. Can be used to define either the exposure of an aquatic species or its response to an exposure (effect). Chronic exposure typically includes a biological response of relatively slow progress and long continuance, often affecting a life stage.
<b>Chronic Toxicity</b>	Chronic toxicity is the ability of a substance or mixture of substances to cause harmful effects over an extended period, usually upon repeated or continuous exposure sometimes lasting for a significant proportion of the life of the exposed organism.
<b>Cladoceran</b>	Water flea; zooplankton belonging to the fourth Order of the Branchiopoda, the Cladocera.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

<b>Contaminant</b>	Biological (e.g. bacterial and viral pathogens) and chemical (see <b>Toxicants</b> ) introductions capable of producing an adverse response (effect) in a biological system, seriously injuring structure or function or producing death.
<b>Direct Toxicity Assessment</b>	The use of toxicity tests to determine the acute and/or chronic toxicity of waste water discharges or total pollutant loads in receiving waters. (Assesses the toxicity of mixtures of chemicals rather than individual chemicals).
<b>EC<sub>50</sub></b>	The concentration of material in water that is estimated to be effective in producing some response in 50% of the test organisms. The EC <sub>50</sub> is usually expressed as a time dependant value (e.g. 24 hour or 96 hour EC <sub>50</sub> ).
<b>Near-field mixing zone</b>	The Near-field Mixing Zone (or the <b>Initial Mixing Zone</b> ) is the area within the mixing zone where the most rapid dilution takes place. This area is situated from the point of discharge to a certain distance away from that point, and the mixing is generally driven by the exit velocity of the effluent.
<b>Far-field Mixing Zone</b>	The Far-field Mixing Zone (or the <b>Absolute Mixing Zone</b> ) extends from the end of the <b>Near-field mixing zone</b> to a distance where an elevation in the concentration of <i>any</i> contaminant from the effluent is no longer detectable from that in the ambient environment. It may also be described as where the effluent has lost its exit inertia and has become assimilated with the hydrodynamics of the aquatic receiving environment; therefore a slower dilution-rate (i.e. a diffusion-based dilution rate) prevails.
<b>LC<sub>50</sub></b>	The concentration of material in water that is estimated to be effective in producing some lethal response in 50% of the test organisms. The LC <sub>50</sub> is usually expressed as a time dependant value (e.g. 24 hour or 96 hour LC <sub>50</sub> ).
<b>TIE</b>	Toxicity characterisation procedures involving use of selective chemical manipulations or separations and analyses coupled with toxicity testing to identify specific classes of chemicals and ultimately individual chemicals that are responsible for the toxicity observed in a particular sample.
<b>Total Dissolved Salts</b>	A measure of the inorganic salts dissolved in water. The organic component of the water has been removed via some laboratory technique.
<b>Total Dissolved Solids</b>	A measure of the inorganic salts (and organic compounds) dissolved in water.
<b>Total Metal</b>	The concentration of a metal in an unfiltered sample that is digested in strong nitric acid.
<b>Toxicant</b>	A chemical capable of producing an adverse response (effect) in a biological system at concentrations that might be encountered in the environment, seriously injuring structure and function or producing death. Examples include pesticides, heavy metals and biotoxins (i.e. domoic acid, ciguatoxin and saxitoxins).
<b>Toxicity</b>	The inherent potential or capacity of a material to cause adverse effects in a living organism.
<b>Trigger Values</b>	These are the concentrations (or loads) of the key performance indicators measured for the ecosystem, below which there exists a low risk that adverse biological (ecological) effects will occur. They indicate the risk of impact if exceeded and should 'trigger' some action, either further ecosystem specific investigations or implementation of management/remedial actions.
<b>Water Quality Criteria</b>	Scientific data evaluated to derive the recommended quality of water for various uses.
<b>Whole Effluent Toxicity Testing</b>	The use of toxicity tests to determine the acute and/or chronic toxicity of effluents.

**5.8 Appendices**

Endocrine Disrupting Chemicals (Pesticides)

Table 9 lists some commonly used pesticides and industrial chemicals that are known or believed to possess endocrine disrupting qualities. Use this list as a guide to help ascertain which compounds should be included in chemical analyses of wastewater effluents from systems with these activities taking place within the sewage catchment.

**Table 9. Examples of known and suspected Agricultural and Industrial Endocrine Disrupting Chemicals**

Chemical	Common Uses
Amitrol	Defoliant, a herbicide, photography, plant growth regulation, non-selective weed control
Atrazine	herbicide for weed control in agriculture
Arsenite	Sodium arsenite: Dyes, soap, treating scale diseases; insecticide (termites); antiseptic, topical acaricide, hide preservative, herbicide. Copper Acetoarsenite: Insecticide, wood preservative, larvicide, pigment (particularly for ships and submarines), fungicide, bactericide and molluscicide.
Benzophenone	Fixative for heavy perfumes, manufacture of antihistamines, hypnotics; insecticides.
Benzo(a)pyrene	Petrochemicals combustion by-product.
Bisphenol A	Basic building block of polycarbonate plastic, an intermediate in the manufacture of polymers, epoxy resins, , fungicides, antioxidants, dyes, phenoxy, polysulfone and certain polyester resins, flame retardants and rubber chemicals.
Butylated hydroxyanisole (BHA)	Preservative and antioxidant in fat-containing foods, in edible fats and oils; and in cosmetic formulations.
Cadmium	Heavy metal with widespread use: electroplating, photoelectric cells, soft solder and solder for aluminium; deoxidizer in Ni plating, Ni-Cd storage batteries; process engraving, electrodes for cadmium vapour lamps, photometry of ultraviolet sun-rays. The powder is also used as an amalgam (1 Cd: 4 Hg) in dentistry. Cadmium chloride: photography, paints, pigments, glass, glazes, electronic components, nemotocide, pesticide and a fungicide, dyeing and calico printing, in the manufacture of cadmium yellow, galvanoplasty, manufacture of special mirrors, ice-nucleating agent, lubricant, in analysis of sulfides to absorb hydrogen sulfide, polymerization catalyst. Cadmium oxide: electroplating, storage battery electrodes, catalyst, semi-conductors, silver alloys, ceramic glazes, nematocide, anthelminic, phosphors, glass, cadmium electroplating, and an aracaricide in pigs.
Dithiocarbamate	Sodium Diethyldithiocarbamate: pesticide, fungicide, chelating agent. It is used in the evaluation of T-cell deficient diseases, in the inhibition of superoxide dismutase in mice and of cisplatin nephrotoxicity in rats, in AIDS-related complex, in immunopharmacology and in cancer immunotherapy. It has clinical use in acute nickel carbonyl, cadmium and thallium poisoning. It is used in colorimetric determination of small quantities of copper and for its separation from other metals. It is also used as a latex accelerator in rubber processing and as a chemical intermediate in the production of other diethyldithiocarbamate metal salts, such as zinc selenium and tellurium salts.  Sodium Dimethyldothiocarbamate: fungicide; corrosion inhibitor; rubber accelerator; intermediate; polymerization shortstop; nematocide and herbicide with a fumigant action.  Lead Dimethyldothiocarbamate: vulcanization accelerator.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

DDT	One of the 12 POPs listed by the Stockholm Convention on Persistent Organic Pollutants, DDT's allowed use is now restricted to disease vector control, specifically to kill mosquitoes spreading malaria in the developing world.
p, p'-DDE	One of the principal metabolites (breakdown products) of DDT
Dieldrin	Usage banned by the Stockholm Convention on Persistent Organic Pollutants. A non-systemic, persistent organic insecticide with contact and stomach action.
Endosulfan	Insecticide; pesticide. Very widespread modern use.
Ethylene thiourea	Polymer vulcanizing and curing agent, accelerator in curing polychloroprene (neoprene) and other elastomers. It is also used in electroplating baths, as an intermediate for anti-oxidants, in insecticides, dyes, pharmaceuticals and synthetic resins.
Furans	Usage banned by the Stockholm Convention on Persistent Organic Pollutants. Combustion by-products of combustion of organochlorine chemicals, furans have also been used as intermediates in the preparation of pharmaceuticals, insecticides, resins and in the formation of lacquers.
Heptachlor	Usage banned by the Stockholm Convention on Persistent Organic Pollutants. Heptachlor was used for control of the cotton boll weevil, termites, ants, grasshoppers, cutworms, maggots, thrips, wireworms, flies, mosquitoes, soil insects, household insects and field insects. It has some fumigant action, and was applied as a soil treatment, a seed treatment or directly to foliage.
Kepone	Used as an insecticide, fungicide, pesticide for control of the banana root borer and tobacco wireworm and bait for control of ants and cockroaches.
Lindane	Banned in many (but not all) countries; a pesticide to control lice and other ectoparasites, a foliar spray and soil application for insecticidal control of a broad spectrum of phytophagous and soil dwelling insects, animal ectoparasites and public health pests. It is used on ornamentals, fruit trees, nut trees, vegetables, tobacco and timber. This chemical is found in baits and seed treatments for rodent control. In pet shampoo it kill ticks, lice and sarcoptic mange mites.
Malathion	Insecticide on fruits, vegetables, ornamentals, household and livestock use, an acaricide, control of flies and other insect pests in animal and poultry houses, adult mosquitoes in public health programs, human body and head lice and in flea and tick dips. It is used in veterinary medicine as an ectoparasiticide.
Methoxychlor	Insecticide for a wide range of insect pests (particularly chewing insects) in field crops, forage crops, fruit, vines, flowers, vegetables, and in forestry, in animal houses and dairies, in household and industrial premises and in veterinary medicine as an ectoparasiticide.
Mirex	Usage banned by the Stockholm Convention on Persistent Organic Pollutants. Insecticide, pesticide, flame retardant for plastics, rubber, paint, paper and electrical goods; in antifouling paints, rodenticides and additives for antioxidant and flame retardant mixtures for stabilized polymer compositions, ablative compositions, anthelmintic compositions and lubricant compositions. Applied in paper, paint, rubber, electrical, adhesive and textile applications; also used in thermoplastic, thermosetting and elastomeric resin systems.
Nitrofen	Herbicide used on many vegetables, broad-leafed and grass weeds, cereals, rice, sugar beet, some ornamentals, broccoli, cauliflower, cabbage, brussel sprouts, onions, garlic, celery, roses and chrysanthemums.
Pentachlorophenol	Insecticide for termite control, pre-harvest defoliant, general herbicide, wood preservative, synthesis of pentachlorophenyl esters, molluscicide, fungicide, bactericide, anti-mildew agent, slimicide and algacide. The technical material finds extensive use in cooling towers of electric plants, as additives to adhesives based on starch and vegetable and animal protein, in shingles, roof tiles, brick walls, concrete blocks, insulation, pipe sealant compounds, photographic solutions, and textiles and in drilling mud in the petroleum industry.
Pentachloronitrobenzene	Fungicide for seed and soil treatment, herbicide, in slime prevention in industrial waters and to control damping off and other fungal infections.
Phenol, 4-tert-Butyl	Intermediate in the manufacture of varnish and lacquer resins, soap antioxidant;

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

	ingredient in de-emulsifiers for oil field use and motor oil.
Phthalates	<p>Butyl benzyl phthalate (BBP) resins: solvent and a fixative in perfume.</p> <p>Di-n-butyl phthalate (DBP): plasticisers, cosmetics, safety glass, insecticides, printing inks, paper coatings, adhesives, elastomers and explosives; as a solvent in polysulfide dental impression materials, solvent for perfume oils, perfume fixative, textile lubricating agent and solid rocket propellant.</p> <p>Di-ethylhexylphthalate (DEHP): vacuum pumps; as a plasticizer for polyvinyl chloride (PVC) for medical devices, resins and elastomers. Solvent in erasable ink and dielectric fluid. Acaricide in orchards, an inert ingredient in pesticides, a detector for leaks in respirators, testing of air filtration systems and component in cosmetic products.</p> <p>Di-n-pentyl phthalate (DPP): plasticizer for nitrocellulose and resin lacquers; anti-foaming agent in the manufacture of glue; in rubber cements.</p>
Thiram	Fungicide, bacteriostat, pesticide, rubber vulcanization accelerator, scarabicide, seed disinfectant, animal repellent, insecticide, lube oil additive, and wood preservative. Anti-septic sprays, lubricant oils. It is used against Botrytis, rusts and downy mildews and as a seed dressing against "damping off" and verticillium wilt. It is also used as an ethanol antagonist and deterrent in mixtures of the methyl, ethyl, propyl and butyl derivatives. Antioxidant in polyolefin plastics and a peptizing agent in polysulphide elastomers. Soaps and rodent repellents and as a nut, fruit and mushroom disinfectant.
Toxaphene	Usage banned by the Stockholm Convention on Persistent Organic Pollutants. Insecticide and pesticide. It was used on cotton crops, cattle, swine, soybeans, corn, wheat, peanuts, lettuce, tomatoes, grains, vegetables, fruit and other food crops; for control of animal ectoparasites, grasshoppers, army-worms, cutworms and all major cotton pests. It controls livestock pests such as flies, lice, ticks, scab mites and mange. It also controls mosquito larvae, leaf miners, bagworms, church bugs, yellow jackets and caterpillars.
Trifluralin	Pre-emergence herbicide, especially for cotton plants.
Zineb	Agricultural fungicide; insecticide.
Ziram	Fungicide and repellent to birds and rodents. Rubber vulcanization accelerator. Adhesives including those used in food packaging, paper coats for non-food contact, industrial cooling water, latex-coated articles, neoprene, paper and paperboard, plastics (polyethylene and polystyrene) and textiles.

Disclaimer

While this document has been prepared with care, it contains general information and does not profess to offer legal, professional or commercial advice. The Queensland Government accepts no liability for any external decisions or actions taken on the basis of this document. Persons external to the Environmental Protection Agency should satisfy themselves independently and by consulting their own professional advisors before embarking on any proposed course of action.

## Preamble

The purpose of the *Environmental Protection (Water) Policy 1997* (the EPP Water) is to achieve the protection of Queensland's water environment (surface tidal and non-tidal waters, groundwaters, lakes and wetlands) whilst allowing for development that is ecologically sustainable. The purpose is achieved by:

- a) identifying environmental values (EVs) for Queensland waters;
- b) deciding and stating water quality guidelines and objectives to enhance or protect the EVs – (ensuring healthy aquatic ecosystems and their ability to support human uses);
- c) making consistent and equitable decisions about Queensland waters that promote efficient use of resources and best practice environmental management; and
- d) involving the community through consultation and education, and promoting community responsibility.

The EVs for a water are protected if the measures for all indicators do not exceed the water quality objectives for the indicators.

## 1. Initial assessment of proposed activity

### **This Section informs Sections 2.1 and 2.4 of the Operational Policy**

The initial assessment of the proposed activity should consider the industry type, materials used in processing, content and fate of waste streams and disposal options, reuse, recycling and re-treatment proposals, mass balance and water budget information, likely contaminants discharged in waste water to land or waters (including contaminated stormwater) and likely receiving water ecological and human health indicators potentially impacted by the waste water discharge. The waste management hierarchy for prioritising waste management practices under the EPP Water is at the Attachment to Section 1. Information that characterises the proposed waste water release should be included in applications seeking to discharge waste water to waters or land. Summary information is also at the Attachment to Section 1.

Particular industries and Environmentally Relevant Activities (ERAs) are associated with classes of aquatic ecosystem contaminants, e.g. waste water treatment plants and nutrients. The [National Pollutant Inventory emission estimation technique manuals](#) list 90 priority substances on the basis of health and environmental risk, by industry sector, and the [USA EPA Toxic Release Inventory](#) lists 313 priority substances. These inventories may assist in determining the likely waste water contaminants that may be associated with specific industry sectors or ERAs, and any potential issues with release to the environment (land or water).

The Modelling and Monitoring Assessment Decision Support System, refer Section 4.1, may also assist in identifying potential contaminants resulting from point or diffuse source emissions from specific industry sectors. The decision support tool includes relevant indicators and stressors and can be requested from [water.tools@epa.qld.gov](mailto:water.tools@epa.qld.gov). Further information is at <http://www.coastal.crc.org.au/3m/>.

The e-Guides, refer Section 4.1, search facility includes links to all ANZECC Guidelines and may also assist in characterizing waste water toxicants that may be associated with specific industry sectors or ERAs. E-Guides are also available on request through [water.tools@epa.qld.gov](mailto:water.tools@epa.qld.gov).

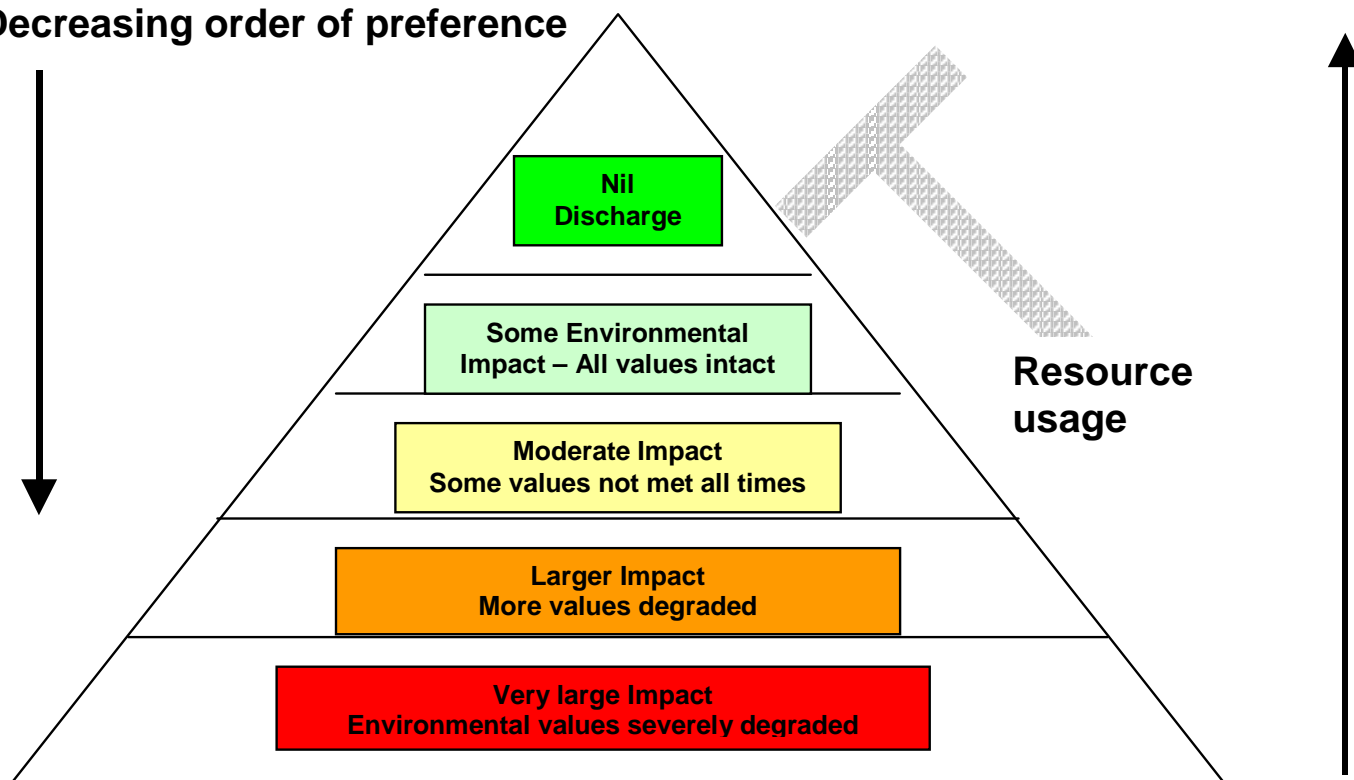

**Attachment to Section 1**

**A. Waste management evaluation procedure**

Figure 1 depicts the decision preference hierarchy in order to maximise the resource usage and minimise the impact on the EVs of the receiving waters under the EPP Water waste management evaluation procedure,

**Decreasing order of preference**

**Figure 1. Decision preference hierarchy**

**Steps under the waste management evaluation procedure include:**

**Waste avoidance** - Preventing the generation of waste water or reducing the amount of waste water generated.

Examples of practices for achieving avoidance include:

- input substitution;
- increased efficiency in the use of raw materials, energy, water or land;
- process redesign;
- product redesign;
- improved maintenance and operation of equipment; and
- closed-loop recycling.

**Waste water re-use**

Examples include:

- applying waste water to land in a way that gives agricultural and ecological benefits; and
- substituting waste water for potable water as input to a production process.

**Waste recycling** - Treating waste water that is no longer useable in its present form and using it to produce new products.

**Energy recovery from waste** - Recovering and using energy generated from waste.

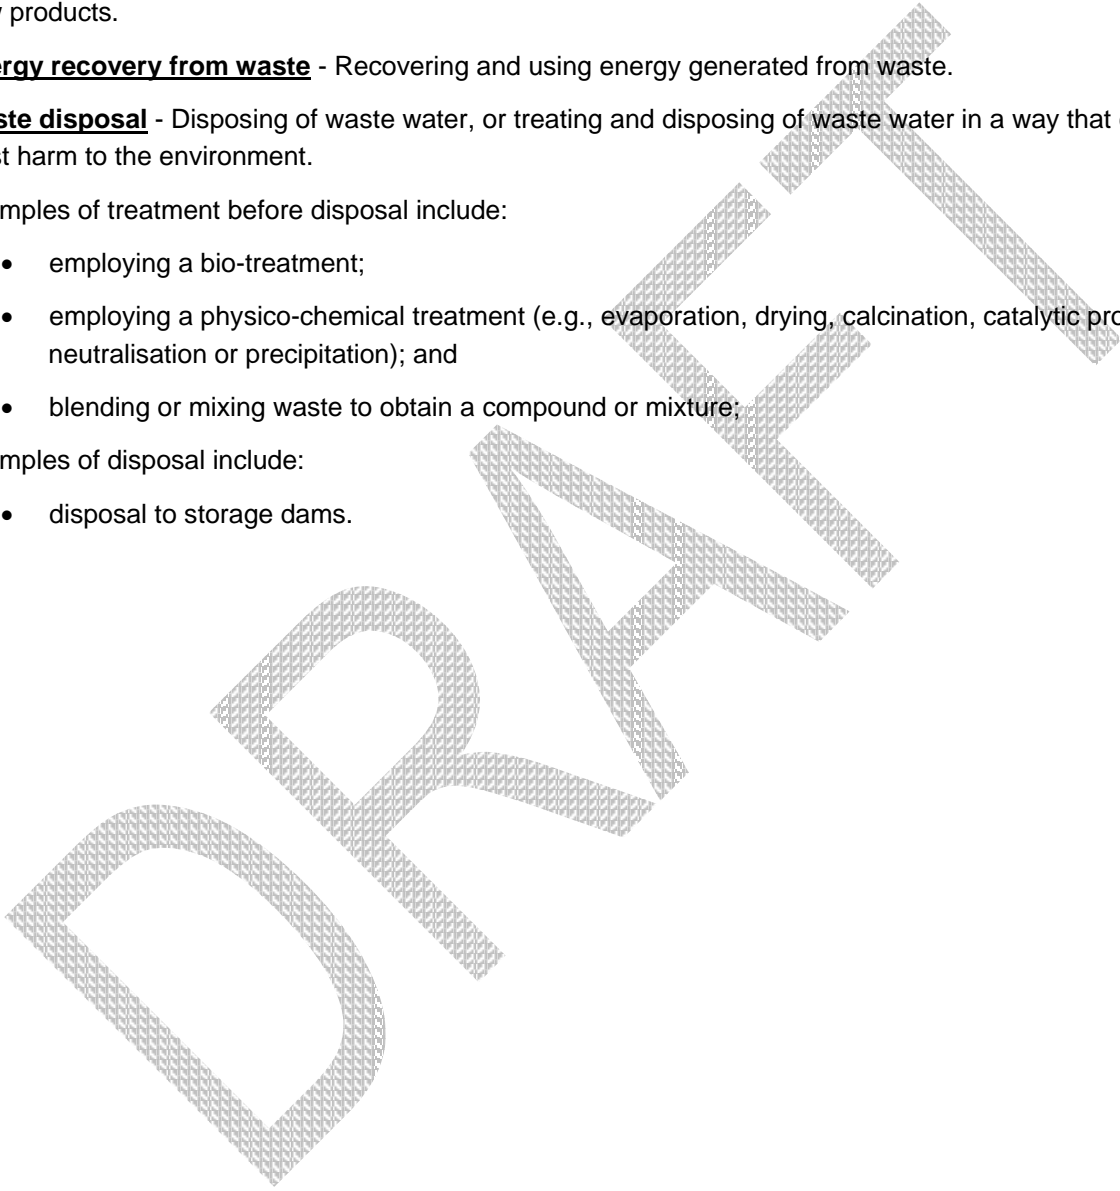

**Waste disposal** - Disposing of waste water, or treating and disposing of waste water in a way that causes the least harm to the environment.

Examples of treatment before disposal include:

- employing a bio-treatment;
- employing a physico-chemical treatment (e.g., evaporation, drying, calcination, catalytic processing, neutralisation or precipitation); and
- blending or mixing waste to obtain a compound or mixture;

Examples of disposal include:

- disposal to storage dams.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### **B. Waste water assessment - contaminants, re-use, recycling, treatment and release, monitoring information**

The following information should be included in applications involving waste water release to waters or land:

- source(s) of waste water;
- the key waste water contaminants released under steady state conditions, by concentration and load for key indicators. Identification of any toxicity concerns from the initial assessment and the inclusion of any screening results from direct toxicity assessment;
- the waste water avoidance measures incorporated in the process design and the waste water re-use, recycling and treatment proposals. The waste water disposal options considered prior to the final design should be included -- please attach diagram(s) of the treatment plant or process;
- quantitative comparisons of the above waste management measures with best practice environmental management for the activity;
- the proposed average, maximum and minimum daily and weekly volumes to be discharged, and maximum hourly discharge rate;
- the proposed times of discharge (and whether continuous or intermittent), wet weather and dry weather flow variation;
- the proposed diffuser details and the stated tidal or flow conditions of the waste water release;
- the facilities for measuring the volume or rate of discharge and for waste water discharge monitoring. List the proposed monitoring frequency and the indicators to be monitored;
- the name of the waters proposed to receive the waste water discharge and a plan or map showing the spatial location and latitude and longitude of the discharge outfall;
- the proposed impact monitoring program on the effect on the receiving environment (water or land) of the waste water release, specifying the proposed location of monitoring points (relative to the coordinates of the discharge outfall), the frequency of monitoring and the indicators to be monitored;
- the results of any investigations into the effects of waste waters discharged to land or receiving waters (please attach reports); and
- investigations assessing pre-development groundwater contamination should be in accordance with [http://www.ephc.gov.au/pdf/cs/cs\\_01\\_inv\\_levels.pdf](http://www.ephc.gov.au/pdf/cs/cs_01_inv_levels.pdf) and [http://www.ephc.gov.au/pdf/cs/cs\\_06\\_groundwater.pdf](http://www.ephc.gov.au/pdf/cs/cs_06_groundwater.pdf).

## 2. Receiving waters assessment – character, resilience and values of the receiving environment

**This Section informs Sections 2.2, 2.3 and Section 3 of the Operational Policy**

### 2.1 What EVs and WQOs and levels of aquatic ecosystems protection apply?

#### Environmental values (EVs) for waters

The EVs of waters to be enhanced or protected are listed in the documents in Schedule 1 of the EPP Water. For waters not listed in Schedule 1, the EVs are in the *Queensland Water Quality Guidelines 2006* (the QWQGs).

#### Water quality objectives (WQOs) - to protect or enhance the EVs for waters

The WQOs for a water are contained in the documents listed in Schedule 1. For waters not listed in Schedule 1, the WQOs are the set of water quality guidelines from the QWQGs and the Australian *Water Quality Guidelines for Fresh and Marine Waters 2001* for all indicators that will protect all EVs for the water.

#### Where do I find the information?

- For waters that are listed in Schedule 1 of the EPP Water the EVs and WQOs are available from the [EPA website](#). The Schedule 1 documents for the water include the EVs and WQOs for different water types (upland and lowland freshwaters, upper, mid and lower estuarine waters, enclosed and open coastal waters, wetlands, lakes and reservoirs), the levels of aquatic ecosystems protection (HEV, SMD or HD) and river basin/sub-basin plans in jpeg format. Alternatively CD copies are available on request by emailing [EPA.EV@epa.qld.gov.au](mailto:EPA.EV@epa.qld.gov.au), calling the free-call 1800 177 291 or contacting the local EPA office.
- For waters **that are not listed** in Schedule 1 of the EPP Water the [Queensland Water Quality Guidelines](#) provide EVs and WQOs for all other water types (see above) for Queensland regions/sub-regions. The default level of aquatic ecosystems protection is slightly to moderately disturbed. Both CD and printed copies are available on request as advised above. Note that the [ANZECC Water quality guidelines for fresh and marine water quality](#) provide concentration levels for indicators not included in the Queensland Water Quality Guidelines (for example, toxicants.). Other guidelines may also be relevant (for example food standards and recreation), see below and Section 4.1.
- **Water quality guidelines are also available on-line through e-Guides**, refer Section 4.1. The current version contains:
  - ANZECC 2000 Water Quality Guidelines;
  - ANZECC 2000 Monitoring & Reporting Guidelines;
  - NHMRC 2005 Recreational Guidelines;
  - Queensland Water Quality Guidelines; and
  - Coastal CRC Users' Guide to Indicators for Monitoring.

Users can select the document that they would like to manually browse, or select the 'search' tab to search all the guides for key words. The searched items can be viewed, copied to another document or printed out for later reference. E-Guides are available on request from [water.tools@epa.qld.gov.au](mailto:water.tools@epa.qld.gov.au).

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

**Spatial datasets and metadata** are available for:

- EPA staff through *Ecomaps* - Environment and Conservation category. Schedule 1 documents are available through the EPA Intranet system ROBIN (Fast find/EVs) or the QWQGs (link above);
- EPA GIS staff through Enterprise GIS ('O' drive). Schedule 1 documents as above;
- Other State Government Departments and Local Governments may access spatial data through the Queensland Government *Infolink*, accessible through the *GovNet* homepage at <http://wwwhost.env.qld.gov.au/HomePage/GovNet.htm>. Schedule 1 documents for the specific waters are available through the EPA website or the QWQGs (link above); and
- Consultants, stakeholders and members of the public, CD copies containing the spatial datasets, metadata and the EPP Water Schedule 1 documents are available on request through the EPA Environmental Information Systems Unit, by email from [data.coordinator@epa.qld.gov.au](mailto:data.coordinator@epa.qld.gov.au) or by telephone (07) 3227 6447.

### Notes

1. The EPA has developed Queensland water quality guidelines (QWQGs) based on the ANZECC scientific principles and management protocols. The QWQGs are:

- based on data collected from un-impacted Queensland reference sites, that are listed in Appendix F (by region, site name and location (latitude and longitude.) The QWQGs are derived from the 20<sup>th</sup> and 80<sup>th</sup> percentiles of the reference sites' data--the 80<sup>th</sup> percentiles are used where high values of an indicator cause problems (e.g. nutrients or chlorophyll-a), the 20<sup>th</sup> percentiles where low values cause problems (Secchi depth) and both the 20<sup>th</sup> and 80<sup>th</sup> percentiles where high or low values could cause problems (pH and DO);
- given for different water types, to the limit of Queensland waters (three nautical miles). Water types include open and enclosed coastal waters, lower, mid and upper estuarine waters, lowland and upland fresh or riverine waters, freshwater lakes and reservoirs, wetlands and groundwaters; and
- based on geographic regions and subregions (river basins, sub-basins and localised guidelines) for southern, central and northern Queensland watersheds east of the Great Dividing Range.

2. The level of protection (for aquatic ecosystems) means the level of aquatic ecosystem condition that the water quality objectives for that water are intended to achieve. The stated levels of aquatic ecosystem protection are:

- Level 1 - High ecological value (HEV)— effectively unmodified or highly valued aquatic ecosystems;
- Level 2 - Slightly to moderately disturbed (SMD) — aquatic ecosystems in which biological diversity has been adversely affected by human activity to a relatively small but measurable degree; and
- Level 3 - Highly disturbed (HD) — measurably degraded aquatic ecosystems of lower ecological value.

## 2.2 Receiving water quality information sources

### Water quality information:

- informs strategic planning and development assessment - assessing current condition and trends in water quality;
- provides raw data to a range of client groups and the general public;
- informs the spatial and temporal variability that provides a basis for assessing compliance with the EPP Water and the Queensland Water Quality Guidelines;
- informs the development of reference values for Queensland waters; and
- informs regional environmental monitoring programs e.g. the SEQ Ecological Health Monitoring Program, and State of Environment reporting.

### Water quality information sources include:

The **Queensland waterways database** contains current and historic water quality information from the EPA water quality monitoring program. The database includes monthly monitoring from more than 500 (mostly estuarine) sites across Queensland. View a [map of the sites monitored in Queensland](#) and click on the area or catchment of interest.

### What indicators of water quality are monitored?

Brief indicator descriptions, sampling and determination methods can be [viewed here](#). The range of water quality indicators include:

- physico-chemical indicators (temperature, [pH](#), [conductivity](#), [dissolved oxygen](#), [turbidity](#));
- [chlorophyll-a](#), [suspended solids](#), [nutrient concentrations](#); and
- [sediment metal](#) concentrations, plankton samples and [faecal coliform](#) (bacteriological) counts.

### How do I access water quality monitoring data and published information?

Download published water quality reports and brochures from the website [publications](#) page.

For access to the water quality monitoring data please contact the EPA Environmental Sciences Division, Freshwater and Marine Sciences, by emailing [water.data@epa.qld.gov.au](mailto:water.data@epa.qld.gov.au) or telephone 3896 9250. Further information can be obtained at

[http://www.epa.qld.gov.au/environmental\\_management/water/water\\_quality\\_monitoring](http://www.epa.qld.gov.au/environmental_management/water/water_quality_monitoring)

**Other sources of water quality information** include State and Commonwealth agencies, Local Governments, Queensland Port Authorities, Regional NRM Bodies and industry. Additionally Universities (particularly the University of Queensland, Griffith University, Central Queensland University and James Cook University of North Queensland), the Australian Institute of Marine Science, the CSIRO Division of Land and Water and the SEQ Healthywaterways Partnership conduct research projects that may inform water quality assessment.

Specific information sources include:

- [Department of Natural Resources and Water](#) (NRW) which collects, manages and delivers data on the quantity and quality of fresh water in the State's rivers and aquifers. NRW operates and maintains networks across the State to monitor:
  - quantity and [quality of surface water](#);

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

- [groundwater quantity](#) and [groundwater quality](#); and
- sediment transport and aquatic ecology.

Data access is via NRW website the Stream Gauging Stations Index using [stream name](#), or [gauging station number](#). The water monitoring program operates under a certified quality management system at [Water monitoring data collection standards](#). The validated field data is entered into easy access databases using formats specified in the [Water monitoring data reporting standards](#).

- [NRW State of Rivers](#) projects provide 'snapshots' of the ecological and physical condition of Queensland riverine systems. Survey information for specific rivers is at [State of the Rivers report](#). Condition ratings include riparian vegetation condition, aquatic vegetation and habitat condition, recreational and conservation value.
- [Local Governments](#) throughout Queensland which conduct water quality monitoring programs, including recreational (biological) monitoring.
- [Great Barrier Reef Marine Park Authority](#) which conducts lower estuarine and coastal water quality monitoring.
- Regional Environment Monitoring Programs (REMPs) that are supported collaboratively by State and local government and industry in parts of the State; including Trinity Inlet, SEQ/Moreton Bay, Cleveland Bay, the Great Barrier Reef and Port Curtis. In some cases development conditions related to receiving waters monitoring may be addressed by applicants by contributing to such REMPs.
- OzCoast website which includes an estuary database and information on coastal indicators that can be accessed at <http://www.ozcoasts.org.au/>.
- Water Quality Online website which includes products developed as part of the *National Action Plan for Salinity and Water Quality*. It includes water quality assessment tools that can be accessed at <http://www.wqonline.info>.
- Ports Corporation Queensland undertakes water quality monitoring at each of its ports to assess trends in water quality parameters over time. The current program of water quality monitoring commenced in mid-2004 and the links below provide a summary of the results obtained to date. Each file contains a map of the sampling area and locations, as well as the sampling results from; [Abbot Point/Bowen](#). [Lucinda](#). [Mourilyan](#). [Thursday Island](#). [Weipa](#).
- Other information sources include the Department of Primary Industries and Fisheries (declared fish habitat areas under the *Fisheries Act 1994*, mangroves and seagrass mapping), Sunwater, SEQ Water and other water authorities throughout the State.

**For further information please search the respective websites or contact the organisations.**

## 2.3 Assessing water quality – for DA and strategic planning

Comparison of ambient or receiving water quality data from site monitoring programs or test data should be made with the WQOs for the waters under the EPP Water, either listed under Schedule 1 or from the QWQGs/ANZECC.

Compliance with the WQOs for all indicators from the Schedule 1 documents for the specific waters (and water types) is assessed by comparing the annual median value for each indicator and site with the WQOs for the water - at the stated level of aquatic ecosystems protection.

In the second case compliance is assessed by comparison with the water quality objectives from the QWQGs/ANZECC for relevant regions/subregions/catchment level information. Compliance is assessed for all indicators by comparing the annual median value for each indicator, by site and water type against the QWQGs/ANZECC guideline values.

In both assessment cases the level of level of aquatic ecosystem condition that the water quality objectives for that water are intended to achieve should be determined from either the Schedule 1 document for the waters, or from the QWQGs in conjunction with planning designations for impacted or downstream waters (e.g. marine park/national park, fish habitat areas, significant wetlands (Ramsar/Directory of Important Wetlands etc.))

### **Assessment of sample or test data against the WQOs for the waters**

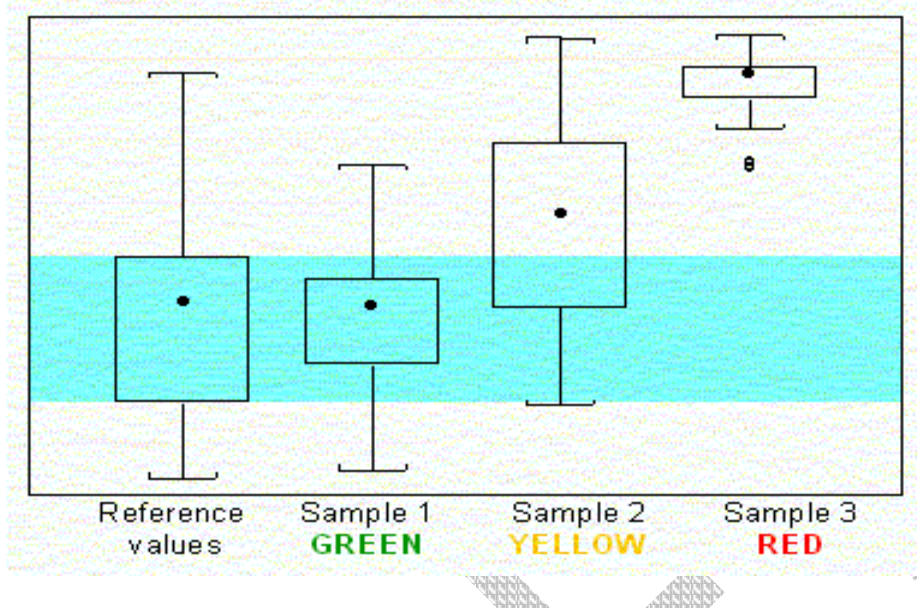

Median, 20<sup>th</sup> and 80<sup>th</sup> percentile values for each indicator at each sample site, or test data from model predictions, are compared with the WQOs as follows:

- If the median value of the sample or test data falls within the water quality objectives (less than the WQOs for nutrients, suspended solids, turbidity or chlorophyll-a; greater than the WQO for Secchi depth; less than the maximum and greater than the minimum for pH and dissolved oxygen), the water quality objectives are met and the waters are ecologically healthy; or
- If the median value of the sample or test data is not within the water quality objectives, but the 20<sup>th</sup> or 80<sup>th</sup> percentile is within the water quality objectives (20th percentile less than the WQO for nutrients, suspended solids, turbidity or chlorophyll-a; 80th percentile greater than the guideline for Secchi depth; 20th percentile less than the maximum guideline or 80th percentile greater than the minimum guideline for pH and dissolved oxygen), the waters are slightly/moderately impacted (SMD waters) with some signs of poor ecological health; or
- If both the median value of the sample or test data and 20<sup>th</sup> or 80<sup>th</sup> percentile values fall outside the water quality objectives (20th percentile greater than the WQO for nutrients, suspended solids, turbidity or chlorophyll-a; 80th percentile less than the guideline for Secchi depth; 20th percentile greater than maximum or 80th percentile less than minimum for pH/dissolved oxygen), the water quality objectives are not met and the waters are moderately/heavily impacted (HD waters).

Compliance can be assessed by producing box plots of the sample or test data (using the median values, the 20<sup>th</sup> and 80<sup>th</sup> percentiles and the highest and lowest values (not outliers) for comparison with the WQOs for the waters. Refer to Figure 2 below.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

**Figure 2. Box plot presentation of sample or test data against WQOs**

**Green:** WQOs are met. Median value of sample or test data is within WQOs – sample/test site is ecologically healthy/slightly impacted.

**Yellow:** Median exceeds WQOs, but 20<sup>th</sup> or 80<sup>th</sup> percentile is within the WQOs – sample/test site is slightly/moderately impacted with some signs of poor ecological health.

**Red:** WQOs not met. Median and 20<sup>th</sup> or 80<sup>th</sup> percentile exceeds WQOs – sample /test site is moderately/heavily impacted.

**Integrated assessments of sample or test sites against the WQOs for the waters**

Integrated assessment combines the results from the individual indicator/site assessments as follows:

Criteria		Result
All sample or test sites green?	Yes	Green
	No	Yellow
More sample/test sites yellow than green?	Yes	Yellow
	No	Red
Any sample/test sites red?	Yes	Red
		Red

**Notes**

1. The S-PLUS statistical software package, or equivalent, to produce box plots for water quality assessment is the preferred method for sample/test data presentation and comparison with WQOs. S-PLUS software is available for EPA staff - contact the EPA Water Policy and Partnerships Unit by email at [EPA.EV@epa.qld.gov.au](mailto:EPA.EV@epa.qld.gov.au), or telephone 1800 177 291.

2. The above assessment, based on annual medians, is not relevant for assessing the likely impact of toxicants, short term releases or pulse events on aquatic ecosystem values - refer to the ANZECC guidelines (via e-Guides) for approaches to these issues.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### 2.4 Assessing the contribution of multiple discharges to receiving waters

In assessing receiving water quality, the current condition reflects discharges from the whole catchment - including point source emissions, urban diffuse source emissions and rural diffuse source emissions. The relative contributions from the various emission sources should be understood in the assessment of applications for further waste water discharge or in strategic planning; particularly for slightly to moderately disturbed (SMD) waters without assimilative capacity or highly disturbed (HD) waters (that have no assimilative capacity.)

Possible information sources on existing waste water discharges to waters within a given catchment include:

- the EPA point source database and licensing database that provide information on existing point source discharges (quality/quantity/location);
- the results of compliance inspections conducted in specific areas of the State that may provide additional information on point source emissions and particular waterways/catchment issues;
- Local Government may have catchment level information on urban diffuse emissions;
- Healthy waterways strategies (including water quality improvement plans) and Regional NRM Plans may provide whole of catchment information, including rural and urban diffuse emissions; and
- EPA internal reports (via ROBIN) and external research publications via the Internet; also refer to Section 2.2.

### 2.5 Waste water discharge to ephemeral streams – ecological and hydrological impacts

Discharge of waste water to temporary streams requires special consideration due to their unique hydrological and ecological characteristics. The importance of maintaining water quality in the small number of permanent pools in ephemeral streams during naturally dry stages includes the protection of these habitats as refugia for aquatic species during the dry season. Waste water emissions during naturally dry stages are likely to disrupt the natural ecology and impact the aquatic ecosystem, and continuous or semi-continuous discharges of waste water should be avoided. Wet weather discharges of waste water should occur when receiving water flows are sufficient, from a risk based assessment, to maintain the water quality objectives of the receiving waters. (Data from any adjacent upstream gauging station may assist in determining the release period.) Feasible disposal alternatives should be investigated; including minimising the production of waste water, reuse opportunities and retention for discharge during wet conditions. Specific mine water disposal issues of a 'one-off' nature would be considered on a case-by-case basis with the administering authority.

Receiving water quality objectives should be based on the most appropriate local reference data collected from same stream above the discharge, or in an adjacent stream not affected by waste water discharges. Monitoring data should ideally cover the wetting stage as well as recession or pool stages. In the absence of suitable reference data, default values from the Queensland and ANZECC Water Quality Guidelines should be adopted.

Information on methods to assess ephemeral stream water quality is available from [http://www.acmer.uq.edu.au/research/attachments/FinalReport\\_TempWatersSep20042.pdf](http://www.acmer.uq.edu.au/research/attachments/FinalReport_TempWatersSep20042.pdf)

The discharge of waste water may also have adverse impacts on the hydrology of temporary and permanent surface receiving waters. The impacts relate to the volume and velocity of discharge relative to natural flows and may include bed and bank erosion and changes to the particle size distribution of sediments. Other effects may occur on biota where there is insufficient time to complete life cycles due to changed flow regimes. As a guide,

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

modelling of flow characteristics should be considered where the waste water flow exceeds 10% of the natural flow of the waterway.

### 2.6 EPA guidelines - sampling / experimental design / sample analysis / data analysis and pre-development water quality monitoring

The EPA Water Quality Sampling Manual, at [http://www.epa.qld.gov.au/environmental\\_management/water/water\\_quality\\_monitoring/publications/](http://www.epa.qld.gov.au/environmental_management/water/water_quality_monitoring/publications/), is to be used by relevant parties in deciding sampling, sample analysis and statistical analysis requirements under the EPP Water, including when:

- taking samples, or making tests and measurements; or
- preserving and storing samples, or performing analyses on samples; or
- performing statistical analyses on the results of sample analyses.

Manual methods or the S-PLUS statistical software package, or equivalent, should be used to produce box plots for water quality assessment of sample or test data against water quality objectives.

Where pre-development water quality monitoring is required:

- the QWQGs recommend the taking 18 samples to provide estimates of median, 20<sup>th</sup> and 80<sup>th</sup> percentiles at a reference site, refer to section 3.4.3.1 and Figure 3.4.1. As a minimum samples should be collected over a period of at least 12 months and cover seasonal variations, on the understanding that further samples would be collected to meet the recommended number of 18. Note the [ANZECC Water Quality Guidelines](#) recommend the taking of 24 samples to estimate the above percentiles at a reference site; and
- [The Australian Guidelines for water quality monitoring and reporting 2000](#) informs baseline studies that measure change, including the *Multiple Before After Control Impact* (MBACI) experimental design. MBACI examples detecting environmental impacts of marine aquaculture are at [http://www.bio.usyd.edu.au/SOBS/TEACHING/ecol\\_04/marine/CAS%202004%20marine%20ecology%20lecture%2011.pdf](http://www.bio.usyd.edu.au/SOBS/TEACHING/ecol_04/marine/CAS%202004%20marine%20ecology%20lecture%2011.pdf).

The above protocols also inform the baseline studies required under the EPA Operational Policy *Waste water discharge to Queensland waters* in demonstrating ‘an equivalent outcome of no, or negligible, change to the physico-chemical, biological, habitat and flow attributes beyond natural variation of HEV waters, excepting, in limited circumstances, within a defined initial mixing zone measured near the waste water release outfall location. The intent is that beyond the mixing zone boundaries, current environmental quality is maintained and the aquatic ecosystem is conservatively protected over time, taking into account the precautionary principle.’ Appendix 6.4 of the Operational Policy, Application of MBACI design for HEV water assessment, provides further information.

#### Note

The method of assessing ‘no change’ to the physico-chemical, biological, habitat and flow ecosystem attributes of high ecological waters is given in the Queensland Water Quality Guidelines 2006 (Appendix D Compliance assessment protocols.)

## 2.7 Predicting the impacts of the proposed waste water discharge on the receiving waters

***This Section informs Section 2.3 and Section 3 of the Operational Policy***

### **When is predictive water quality modelling required to ascertain the impact from the proposed waste water discharge?**

All development applications or environmental authority applications proposing waste water discharge to waters must quantitatively assess the impacts on the receiving waters.

- Where the assessed environmental risk of the proposed discharge is low (on the basis of toxicity assessment and contaminant load), the scale is small and spreadsheet calculations or simple box modelling indicates the increase in contaminant concentration does not exceed of the WQOs for the receiving waters, then more detailed predictive water quality modelling is not likely to be required. This circumstance may include a proposed discharge involving a small volume of waste water containing one or two well-studied contaminants at concentrations only several times greater than the well mixed mid/lower estuarine receiving waters. Refer to Attachment 2 to Section 2. Assimilative capacity must exist for the contaminant (that is the WQOs are not exceeded.)
- Commensurate with increased scale and risk, and including where the receiving waters are of high ecological value, the use of more complex predictive water quality modelling will be required to evaluate receiving waters impacts. Predictive modelling outputs would include the assessments over a range of input conditions or scenarios. Test data output should be analysed and compared with the existing receiving water quality and the WQOs of the receiving waters using box plots, refer Section 2.3.

### **What models / techniques should be used?**

- **Mixing zone models** are used to assess water quality impacts from point source discharges. The most commonly used mixing zone model is [Cormix](#) available through the USEPA website is a water quality modeling and decision support system designed for environmental impact assessment of mixing zones resulting from waste water discharge from point sources. Although US focused, the [compilation of mixing zone documents](#) provides good background information.

*Mixing zone guidance includes:*

- to protect EVs, outfall diffusers would normally be required to ensure a minimum initial dilution level under the stated tidal or flow conditions (i.e. release during stated parts of the tide or above stated freshwater flows);
- the maximum lateral dimension of the mixing zone should be the lesser of 50m diameter or 30 percent of the waterway width for riverine and estuarine waters; and a radius not exceeding 100m from the diffuser port for coastal waters;
- boundaries of adjacent mixing zones be at least 200m apart, cumulative impacts should be assessed;
- compliance with receiving water quality objectives should be met within 3 stream widths or 300m from the diffuser port, whichever is the smaller; and
- application is primarily to toxicants. Nutrients should be assessed in terms of equilibrium concentrations at a certain distance (for example 300m) from the discharge port.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

- **Catchment models** typically simulate the flows and loads of suspended sediment, total phosphorus and total nitrogen from freshwater catchments with consideration of land use, rainfall, soil characteristics, vegetation cover etc. Flows and loads are routed through stream networks, typically to the tidal limits of estuaries. Catchment models are available from a number of sources including CSIRO Land and Water, eWATER CRC and Regional NRM Groups.
- **Receiving water quality models** for estuaries and embayments are specific and complex models that simulate the hydrodynamic and water quality variations in the water body subject to external inputs. Receiving water quality models enable scenario modelling of water quality to be undertaken to predict the likely impacts of contaminants. Receiving water quality models are available through major consultant organisations for specific parts of the State, and are required to be used for significant projects.
- **Box models for estuarine water quality modelling** provide a simple computational framework that may be used to determine contaminant load estimates (e.g. N and P). Box models are relatively straightforward, available through most consultant organisations or may be developed for the estuarine waters of interest. A simple box model of steady state increase of contaminant concentration is at Attachment 1 to Section 2.

### 2.8 Considering the results of water quality assessments in accordance with the Operational Policy

Development applications and environmental authority applications proposing to discharge waste water to receiving waters should provide information to characterise the receiving environment and predicted impacts of the proposed discharge of waste water; in accordance with sections 2.1 to 2.7 above, and in summary as follows.

- Environmental values, water quality objectives, water types and levels of aquatic ecosystem protection for the receiving waters should be provided, preferably with spatial datasets including application details and relevant overlays (e.g. protected estate and constraints mapping).
- Waste water contaminant assessment, discharge and monitoring information – refer Attachment to Section 1.
- Existing receiving water quality and ecological health information should be sourced and collated to include riverine, estuarine and coastal waters and the broadest range of indicators and indicator values.
- Future planning intent for the catchment and associated waters should be determined.
- Conduct baseline water quality monitoring for HEV waters, and as required for SMD/HD waters. Use agreed experimental design to establish pre-development water quality at control sites and proposed impact sites:
  - The QWQGs provide guidance on the number of site samples and time period to establish baseline development water quality, refer also to Section 2.6; and
  - The EPA Sampling Manual informs sampling techniques and sample analysis requirements. Sample data statistical analysis should include the calculation of median values, 20<sup>th</sup> and 80<sup>th</sup> percentiles and data outliers, by indicators, by sample sites for a given water type. Box plot presentation is preferred.

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

- All applications must quantitatively assess the impact of the proposed waste water discharge on receiving water quality. Information on the proposed waste water discharge contaminants (indicators concentrations and loads) should be provided. Depending on the degree of risk, scale and initial estimates of contaminant concentration increases above background, predictive modelling may be required.
- Collate test data or site sample data on existing water quality. Use S-PLUS statistical analysis software or equivalent, comparing site sample data or site test data with the WQOs for the water type for key indicators.
- Use box plots to present data and develop integrated water quality assessments (**GREEN**, **YELLOW** and **RED** ZONES) to provide an evidence base that informs the subsequent analysis in accordance with the EPP Water:
  - **Green:** Median of site sample data and test data is within WQOs – sample or test sites are ecologically healthy/slightly impacted, WQOs are met prior to, and post the proposed discharge of the waste water;
  - **Yellow:** Median values of site sample data or test data exceeds WQOs, but 20<sup>th</sup> or 80<sup>th</sup> percentile is within the WQOs – sample /test site is slightly/moderately impacted site; and
  - **Red:** Median of site sample data or test data and 20<sup>th</sup> or 80<sup>th</sup> percentile exceeds WQOs – sample or test site is moderately/heavily impacted. WQOs are not met by the existing water quality. Further decline in water quality would be expected with additional discharge.

### Assessment and decision making guidance

In assessing and deciding applications for development approval and environmental authority, the administering authority must comply with any relevant EPP requirement; consider the standard criteria and other prescribed matters. **That is, the assessment and decision making processes are determined by consideration of multiple criteria – not single criterion.** Refer to Endnotes 1, 2 and 3 for further detail.

The current EPP Water includes statements of policy about assessment and decision making that resulted from consultation on the [Regulatory Impact Statement](#) for the [Environmental Protection \(Water\) Amendment Policy No 1 2006](#) (the EPP (Water) AP). These are described in the corresponding [Explanatory notes](#) and summarized in the EPA Operational Policy.

- For proposed waste water discharge to **HEV waters** there should be no impact beyond the mixing zone (minimized to the greatest extent) and where practicable environmental offsets used to provide a net environmental gain to the receiving waters (refer Section 3 Environmental Offsets). Some assimilative capacity is preserved for future ESD.

Note that mixing zone considerations apply to all environmental management decisions involving waste water discharge to surface water in accordance with s18 of the EPP Water; considerations include the use of diffusers, limiting the size of the mixing zone and releasing waste water under stated tidal or flow conditions.

- For **GREEN ZONE** assessment - proposed discharge of waste water to SMD waters with assimilative capacity (WQOs met prior to and post the discharge):

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

- seek to maintain current water quality, through innovative and proactive discussions working in close partnership with the applicant to investigate on feasible alternatives to waste water discharge - refer to the waste management hierarchy for guidance at the Attachment to Section 1);
- retain some assimilative capacity for future ESD; and
- limit non-compliance to the mixing zone, minimised to the greatest extent.
- For **RED ZONE** assessment - proposed discharge of waste water to SMD and HD waters that do not meet the WQOs (prior to or post the waste water discharge – i.e. the waters have no assimilative capacity for the discharge):
  - in constructive partnership with the applicant, seek innovative and proactive alternatives to waste water discharge (refer to the waste management hierarchy); and
  - consider the use of environmental offsets if there are no feasible alternatives to discharge.
  - Analyse key contributors discharging to catchment waters to understand the existing major emission sources. (Unrelated to the application being assessed, discussion with the Regional Manager may consider initiating a *strategic compliance management plan* involving area and industry sector inspection programs towards longer term improvements in receiving water quality).
- For **YELLOW ZONE** assessment - Median values of site sample data or test data exceeds WQOs, but 20<sup>th</sup> or 80<sup>th</sup> percentile is within the WQOs.
  - **Assess as above** - recognising there is no assimilative capacity in respect of the non-compliant water quality indicators and considering the use of environmental offsets where there is no feasible alternative to discharge. If the discharge will not affect a non-compliant indicator e.g. discharge of sediment where water clarity and any relevant biological indicators are met, assess as per green zone.

### Endnotes

1. The *Environmental Protection Act 1994* (EP Act) s73A, AA, B and C informs the assessment of development applications for chapter 4 activities (other than for mining or petroleum activities), wherein the administering authority must comply with any relevant Environmental Protection Policy requirement and must consider the standard criteria of schedule 3 of the EP Act and additional information given in relation to the application. (This section does not limit the Integrated Planning Act (IPA), section 3.3.15 or chapter 3, part 5 (Decision stage) or division 2 (Assessment process) of that Act.)

Section 73B of the EP Act specifies the conditions of any development approval that may and must be imposed; including s73B (1) subject to the Integrated Planning Act s3.5.30 (conditions must be relevant or reasonable), the administering authority may impose the conditions on the development approval it considers are necessary or desirable and (2) the conditions must include any condition the authority is required to impose under an EPP requirement.

2. In assessing and deciding applications for environmental authority (mining activity) for level 1 mining projects, under s 193 the administering authority may in granting the application impose the conditions on the draft environmental authority it considers necessary or desirable.

In deciding whether to grant or refuse the application or to impose a condition the authority must:

(a) comply with any relevant Environmental Protection Policy requirement; and

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

(b) subject to paragraph (a), consider the application documents for the application, the standard criteria, the wild river declaration for the area—to the extent the application relates to mining activities in a wild river area, any suitability report obtained for the application and the status of any application under the Mineral Resources Act for each relevant mining tenement.

3. The standard criteria under Schedule 3 Environmental Protection Act 1994 means:

(a) the principles of ecologically sustainable development as set out in the 'National Strategy for Ecologically Sustainable Development'; and

(b) any applicable environmental protection policy; and

(c) any applicable Commonwealth, State or local government plans, standards, agreements or requirements; and

(d) any applicable environmental impact study, assessment or report; and

(e) the character, resilience and values of the receiving environment; and

(f) all submissions made by the applicant and submitters; and

(g) the best practice environmental management for activities under any relevant instrument, or proposed instrument, as follows—

(i) an environmental authority;

(ii) an environmental management program;

(iii) an environmental protection order;

(iv) a disposal permit;

(v) a development approval; and

(h) the financial implications of the requirements under an instrument, or proposed instrument, mentioned in paragraph (g) as they would relate to the type of activity or industry carried out, or proposed to be carried out, under the instrument; and

(i) the public interest; and

(j) any applicable site management plan; and

(k) any relevant integrated environmental management system or proposed integrated environmental management system; and

(l) any other matter prescribed under a regulation.

## Attachment 1 to Section 2

### Box Model estimation of steady state increase in total nitrogen concentration

**Question** – What is the steady state increase in total nitrogen concentration in a “box” of water given a constant daily load and a first order decay due to denitrification?

Conservative assumptions include:

- No advection
- No dispersion
- Tidal prism based on neap tidal range

Other assumptions include

- Losses due to denitrification – first order decay with a rate constant  $K_T$  of  $0.05 \text{ day}^{-1}$  (derived by John Bennett from modelling work on Southeast Queensland estuaries.)

The basic relationship is

$$\frac{d \text{ Total N}}{dt} = \text{Load TN} - K_T \text{ Total N}$$

i.e. the change in total nitrogen (TN) (kg) wrt. time is the load of TN (kg/day) minus losses of TN due to denitrification

#### Calculating tidal prism in ML

Determine areal extent ( $\text{m}^2$ ) of waters upstream from discharge point.

Obtain data from site inspection/map/field visit. Distance upstream is limit of tidal influence for small streams. For large streams, use mean tidal velocity for an average tide (m/s) multiplied by time of tidal cycle e.g. 6hrs X 60min X 60secs for 2 tides/day

Calculate the tidal range under neap tides (m) from local tide data.

Tidal prism ML = areal extent ( $\text{m}^2$ ) X depth (m) /1000

In this case, 40m wide X 3000 m long X 1.0m mean neap tide difference/1000

→ **Tidal prism = 120 ML**

#### Calculating aquaculture daily load of total nitrogen (TN)

$$\begin{aligned} \text{Daily Discharge in m}^3 &= 5\% \text{ of growout pond volume} \\ &= 0.05 \times 6 \times 5000\text{m}^2 \times 1\text{m} \\ &= 1500 \text{ m}^3 \end{aligned}$$

$$\begin{aligned} \text{Daily Discharge in ML} &= \text{discharge in m}^3 / 1000 \\ &= 1.5 \text{ ML} \end{aligned}$$

$$\begin{aligned} \text{Max Daily Load TN (kg/day)} &= \text{daily discharge (ML/day)} \times \text{concentration TN (mg/L)} \\ &= 1.5 \times 0.6 \\ &= \mathbf{0.9 \text{ kg/day (Scenario 1)}} \end{aligned}$$

#### Calculating the change in total N ( $\Delta$ TN)

The Basic Relationship again is

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

$$\frac{d \text{ Total N}}{dt} = \text{Load} - K_T \text{ Total N}$$

Under steady state, change in Total N wrt. time is zero, therefore:

$$\frac{d \text{ Total N}}{dt} = \text{Load} - K_T \text{ Total N} = 0$$

transforming the equation gives:

$$\begin{aligned} \text{Total N (kg)} &= \frac{\text{Load (kg day}^{-1}\text{)}}{K_T \text{ (day}^{-1}\text{)}} && \text{(Note from above, } K_T \text{ (day}^{-1}\text{) value is a given factor)} \\ &= 0.9/0.05 \\ &= \mathbf{18 \text{ kg}} \end{aligned}$$

This is the steady state additional mass of TN in the tidal prism (i.e. the box) caused by the discharge

Calculating the change in total N concentration ( $\Delta$ TN)

$$\begin{aligned} \Delta \text{TN mg/l} &= \text{mass TN (kg) /volume (ML) of the tidal prism} \\ &= 18/120 \\ &= \mathbf{0.15 \text{ mg/L}} \end{aligned}$$

Assessing Impact

Add predicted increase in TN mg/L (i.e. 0.15mg/L) to ambient median TN

Scenario A: ambient median TN = 0.36mg/L

Scenario B: ambient median TN = 0.205 mg/L

Compare result to water quality objective for TN: 0.300mg/L

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

### Alternate Scenario

Let's say that the discharge is instead to larger estuary with the following characteristics.

- Average width: 70 m for at least 12 km upstream
- Neap tidal range: same, 1.2 m
- Distance to extremity of tidal influence upstream from farm 20 km
- Average tidal current velocity during neap tides 0.5 metres per second.
- 2 tidal cycles per day i.e. approx. a 6 hour tidal cycle

To recalculate tidal prism:

1. Distance of tidal flow upstream = 0.5 m/sec X 6 hours  
= 0.5 m/sec X 60 X 60 X 6 sec  
= 10800 metres

2. Tidal prism

**Tidal prism ML = areal extent (m<sup>2</sup>) X depth (m) /1000**

In this case, 70m wide X 10800 m long X 1.2 mean neap tide difference/1000  
**= 907.2 ML**

### Calculating the change in total N concentration ( $\Delta$ TN)

$\Delta$ TN mg/l = mass TN (kg) /volume (ML) of the tidal prism  
= 18/907.2  
**= 0.02 mg/L**

### Assessing Impact

Add predicted increase in TN mg/L (i.e. 0.03mg/L) to ambient median TN

Scenario A: ambient median TN = 0.36mg/L

Scenario B: ambient median TN = 0.205mg/L

Compare result to water quality objective for TN: 0.300mg/L

## Attachment 2 to Section 2

### Steady state calculations – estimation of activity impact

#### A. Dilution Ratio in Creek Method

Assumptions:

- Constant flow in creek
- Constant flow of discharge
- Calculates ratio of flow in creek to flow in discharge
- Gives a guide to potential dilution available.

[Note: This does not take account of mixing zone impacts]

#### Assumed flows

- Turtle Creek North – 12.77 cumecs = 12.77 cubic metres per second
- Turtle Creek South – 25.3 cumecs = 25.3 cubic metres per second

#### Maximum waste water discharge

= 5 ML/day  
= 5000 cubic metres per day  
= 0.058 cubic metres per sec

#### Dilution Ratios

Turtle Creek North – 12.77/0.058 = 220:1

Turtle Creek South – 25.30.058 = 436:1

#### B. Estimated concentration in creek method

To calculate the resultant water concentration the following formula can be used:

$$C_{res} = \frac{(Q_{creek} * C_{creek}) + (Q_{dis} * C_{dis})}{(Q_{creek} + Q_{dis})}$$

With:

$C_{res}$  = Resultant concentration in the creek in  $\mu\text{g/L}$   
 $Q_{creek}$  = Flow in the creek in ( $\text{m}^3/\text{s}$ ) upstream of discharge  
 $C_{creek}$  = Concentration in Creek upstream of discharge ( $\mu\text{g/L}$ )  
 $Q_{dis}$  = Discharge volume of activity ( $\text{m}^3/\text{s}$ )  
 $C_{dis}$  = Concentration in discharge ( $\mu\text{g/L}$ )

Assumptions:

- Constant flow in creek in one direction
- Constant flow of discharge into the creek
- Assumes all mix together
- Note this ignores a mixing zone effect and hence any mixing zone impacts.

#### Example

Data

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

Q creek - 12.77 cumecs = 12.77 cubic meters per second  
 Ccreek from data = 0.4 µg/L maximum dissolved copper  
 Q dis = 0.058 m<sup>3</sup>/s  
 Cdis = 30 µg/L maximum (assume all dissolved copper)

$$C_{resulting} = \frac{(12.77 * 0.4) + (0.058 * 30)}{(12.77 + 0.058)} = 0.5 \mu\text{g/L}$$

**C. Estimated minimum dilution in creek method**

Question: What if we want to know what minimum dilution is necessary to meet ANZECC trigger values?

**Data**

Cresulting = 1.4 (ANZECC criteria for copper)  
 Q creek - x cumecs = x cubic meters per second  
 Ccreek from data = 0.4 µg/L maximum dissolved copper  
 Q dis = 0.058 m<sup>3</sup>/s  
 Cdis = 30 µg/L maximum (assume all dissolved copper)

Substituting from equation above gives:

$$C_{resulting} = \frac{(x * C_{creek}) + (Q_{dis} * C_{dis})}{(x + Q_{dis})}$$

$$\rightarrow 1.4 = \frac{(x * 0.4) + (0.058 * 30)}{(x + 0.058)}$$

$$\rightarrow Q_{creek} = 1.6588$$

Flow in the creek (Q creek) must equal at least 1.6588 cumecs i.e. 1.6588 cubic meters per second if the resultant concentration is not to exceed 1.4 micrograms Cu per litre.

Minimum dilution ratio therefore is:

1.6588 cubic meters per second flow in creek to achieve criteria

Maximum daily discharge = 0.058 cubic meters per second

= 28.6 (rounded off say 29-30 times)

### 3. Environmental offsets

**This Section informs Section 2.4 of the Operational Policy**

#### 3.1 What is an environmental offset in the context of waste water discharge?

**Environmental offsets** (offsets) means the measures taken to counterbalance the negative environmental impacts resulting from a residual waste water discharge that must first be avoided, then minimised before considering the use of offsets for any residual impacts. An offset is to be of a like-kind (i.e. the same contaminant and chemical form) and seeking to deliver a net environmental gain to the receiving waters. Offsets may be located within or outside a development site and should be legally secured.

Offsets will not replace or diminish existing environmental standards or regulatory requirements that must still be met; e.g. a discharge of poorly treated waste water or an activity that failed to incorporate best practice measures could not implement an offset to avoid adopting best practice environmental management. Offsets will not be used to allow development in areas where they could not otherwise occur or be used for purposes not otherwise allowed. They are simply intended to provide another tool that can be used during project design, environmental assessment and implementation to achieve the principles of ecologically sustainable development—the object of the EP Act.

Offsets counterbalance those impacts that still exist despite reduction through best practice waste avoidance, recycling and re-treatment, and adoption of environmentally sound discharge location and release circumstances in accordance with the EPP Water. Offsets should be distinguished from ‘abatement measures’ which refer to the range of actions that can be undertaken to reduce the level of impacts of a discharge (typically undertaken on-site and by adopting discharge strategies sensitive to environmental conditions).

#### 3.2 When may an environmental offset be required?

The administering authority may require an offset or may approve an offset incorporated in a development proposal in making a decision about an application under the EP Act for a development approval for an environmentally relevant activity or environmental authority for a level 1 mining or petroleum activity. Refer to section 2.0 and 2.1 of the EPA Operational Policy. The policy intent is that for:

- HEV waters, where practicable the application includes a like kind environmental offset proposal - counterbalancing the discharge of residual waste water (the discharge) from the proposed ERA; and
- SMD and HD waters with no assimilative capacity, environmental offsets (offsets) may be considered by the administering authority where there are no feasible alternatives to residual waste water discharge.

For the purposes of the EPA Operational Policy, environmental offsets will not apply to SMD waters where assimilative capacity exists. Refer to the Operational Policy Section 2.3.4 Assimilative capacity and sustainable load. By definition HD waters have no assimilative capacity.

In all cases an environmental offset condition must only be imposed where it is considered to be either necessary or desirable in the context of the activity (see EP Act s 73B, 114 and 210). This means there must be a nexus between the offset and environmental protection of the subject waters, and the offset is either a necessary or desirable additional measure that assists in achieving the object of the EP Act.

#### Note

The Australian Government Department of Environment and Water Resources is addressing the use of environmental offsets in approval conditions under the EPBC Act, when a proposed development impacts on a matter of national environmental significance that is protected by that Act. When finalised, EPBC Act requirements should be considered in conjunction with this Operational Policy.

### 3.3 Queensland Government Environmental Offsets Discussion Paper

The consideration of environmental offsets is in accordance with the principles in the discussion paper on a proposed Queensland Government Environmental Offsets Policy, that are listed below.

- *Environmental impacts must first be avoided, then minimised before considering the use of offsets for any residual impacts.*
- *Offsets will not be used to allow development in areas where they could not otherwise occur, or for purposes not otherwise allowed.*
- *Offsets must achieve an equivalent or better environmental outcome.*
- *Offsets must provide environmental values as similar as possible to those being lost.*
- *Offsets must be provided with a minimal time-lag between the impact and delivery of the offset.*
- *Offsets must provide additional protection to values at risk or additional management actions to improve environmental values.*

### 3.4 Information on the development of an acceptable offsets proposal

In developing an offsets proposal under the EPA Operational Policy, offsets must be:

**Enduring**—they must offset the impact of the development for the period that the impact occurs. Where there is an approved increase in residual waste water discharge over time, a commensurate increase in offset quantity is required. Where the onset time is delayed, the offset will need to generate a larger amount of contaminant reduction in later years to balance any shortfall in the early establishment period. Development conditions or environmental authority conditions will specify the maintenance and monitoring requirements for the offset to ensure the achievement of the net environmental gain to the receiving waters over the life of the project.

**Quantifiable and Monitored**—the proposed environmentally relevant activity (ERA) discharge load increase and the counterbalancing offset load reduction must both be able to be measured or estimated with a reasonable level of confidence. Where the offset involves land-use change impacting on diffuse source contaminants, it is likely to be difficult to determine precisely the actual amount of pollution abated. In this case, measurement using a protocol agreed beforehand with the administering authority would be required. Measurement of baseline loads before implementation of the offset in accordance with the protocol would typically be included. Sound estimation tools should be based on the best available science and an acceptable level of understanding of how the offset measures work.

To measure the success of environmental offsets in delivering the desired environmental outcome, it is necessary that offset performance is monitored and audited, and the results included in reporting to the administering authority.

**Targeted and located appropriately**—they must offset the impacts on a 'like-for-like' basis (like kind offsets) of the same chemical type and form and be located appropriately. Offsets must impact on the same (receiving) waters and use offset ratios to achieve environmental equivalence between the proposed ERA discharge and offset sources. The administering authority will advise priority catchment locations for rural diffuse offsets.

Potential offset sources should discharge the same type and chemical form of contaminant and to the same waters as the proposed ERA discharge. In some cases a contaminant will be present in more than one form. For example, phosphorus is comprised of both soluble and non-soluble forms and most sources discharge a

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

combination of these forms. As offset opportunities are considered, the form of the contaminant being discharged should be identified to ensure that offsets represent an equivalent impact on water quality.

The fate of a contaminant is also an important consideration in evaluating impacts. For example although an activity may discharge non-soluble phosphorus, if the environmental conditions result in indirect impacts these must also be considered (e.g. discharge to stratified receiving waters that solubilise phosphorus.) The applicant should establish:

- the type and form of the major contaminant proposed in the residual waste water discharge;
- catchment offset sources that discharge the same type and form of the contaminant;
- the impacts of concern for the contaminant and any variation based on different chemical forms; and
- the potential for differential impacts from the various forms of the contaminant.

**Suitable**—discharge contaminants that may be suitable for management by offsets include nutrients (nitrogen and phosphorus), sediment (TSS and TDS), organic carbon or other contaminants where the scientific basis can be demonstrated and the contaminants do not have human health impacts, irreversible environmental impacts or unacceptable biota impacts.

Criteria to determine if a particular contaminant is suitable for management by offsets include:

- the contaminant contributes to a chronic, cumulative environmental impact (load effect), not an acute, localized impact (concentration effect)—toxicants are not appropriate;
- practical off-site pollution abatement measures are available to remove the contaminant elsewhere in the catchment; and
- practical tools are available to measure or estimate diffuse and point source loads of the offset contaminant, including existing baseline loads before ERA discharge and the offset measures commence.

Contaminants such as pathogens, most heavy metals and other contaminants that are toxic, at very low levels, to humans and the environment cannot be addressed using offsets.

The Attachment to Section 3 informs phosphorus, nitrogen and sediment suitability for management by offsets.

**Enforceable**—the applicant is responsible for ensuring that the offset is implemented diligently and maintained in a proper and effective manner. The applicant must identify how offsite elements will be implemented. Where the applicant is not the owner of the land subject to the offset, evidence of owner consent should be included in the application and ongoing use of the land for offset activities. The location of the offset (lot and plan numbers) must be included in the Offset Agreement.

**Supplementary**—offsets must have been specifically proposed for the offset purpose and be beyond current regulatory requirements.

The offsets proposal must also consider financial assurance—the administering authority has discretion under Chapter 7 Part 6 of the EP Act, and applicants should discuss the possible requirement during pre-design conferencing with the administering authority. It is reasonable that any financial assurance be drawn down as offsets are progressively implemented.

### 3.5 Determining environmental equivalence of offsets at different discharge points - offset ratios

The application of an equivalence (or offset) ratio seeks to account for contaminant reductions (offsets) made at different points within a catchment and to ensure that the impact of the offsets from designated locations or areas are equivalent to the proposed ERA residual waste water discharge.

#### Offset ratios must be greater than 1:1

An offset ratio determines the quantity of contaminant that a proposed offset must reduce for each kilogram of contaminant emitted in the residual waste water discharge. The offset ratio 3:1 means that 3 kilograms of contaminant are offset for every 1 kilogram of contaminant discharged. Offset ratios account for:

- the policy intent for the management of HEV, SMD and HD waters (refer section 2.0 of the EPA Operational Policy);
- the scientific uncertainty in estimating the loads of contaminant emitted by the ERA proposal (the load being offset) and the load reduced by the offset actions; and
- the spatial, temporal, chemical and bioavailability differences between the contaminants released and offset.

Table 1 provides default offset ratios that may be used to provide a reasonable level of confidence that the contaminant discharge is offset. The default ratios are consistent with offset / trading ratios used nationally and internationally for a range of contaminants, refer <http://www.environment.nsw.gov.au/resources/framework05260.pdf> and <http://www.epa.gov/owow/watershed/trading/traenvrn.pdf>. Different default ratios may be needed to address the project contaminants and locality issues, and should be discussed at pre-design conferencing.

**Table 1: Default offset ratios**

Emission source of ERA contaminant	Emission source of offset contaminant	Ratio (offset : impact)	Basis of ratio (Offsets are in the same waters or different water types upstream of the ERA contaminant discharge.)
Point	Point	1.5:1	A 1:1 ratio is the minimum needed to achieve a nil net discharge. The ratio also reflects the risk and uncertainties of achieving the offset measure and to achieve a net environmental gain to HEV waters or SMD/HD waters not meeting WQOs.
Point	Diffuse (rural)	3:1	As above. In addition, the ratio has been increased to account for the greater uncertainty in achieving and quantifying rural diffuse offsets, in-stream processing effects and spatial, time and bioavailability differences.
Point	Diffuse (urban)	3:1	As above.

### Notes to Table 1

1. Table 1 provides **minimum default offset ratios** that may be used for point and diffuse offsets to waters in the same catchment. The ratios assume knowledge of the proposed ERA residual waste water discharge, over time, and the conduct of monitoring programs to inform offset compliance.
2. Applicants may choose to develop project specific offset ratios, based on catchment and offset modelling, for consideration by the administering authority. Where offsets are proposed to be implemented in waters of **adjacent catchments with common receiving waters**, this must be agreed with the administering authority at pre-design conferencing and the offset ratios determined from catchment and offset modelling.
3. Proposals to include **rural diffuse offsets** assumes the restoration or re-establishment of degraded riparian or wetland habitats, or other land management actions, according to priorities advised by the administering authority at pre-design conferencing.
4. Proposals to include **urban diffuse offsets** from either new or existing urban development should also be according to the priorities advised by the administering authority. (The use of modelling techniques to demonstrate treatment train effectiveness in reducing contaminant emissions from both existing and new urban development will be required by the administering authority. Note that with respect to new urban development, offset proposals would be required to address contaminants remaining after the application of best practice environmental management for urban stormwater.)
5. **Downstream offsets.** SMD and HD waters that have no assimilative capacity for the proposed ERA residual waste water discharge contaminants will show further deterioration in current condition and for HEV waters the natural values of HEV waters will not be maintained. Localized contaminant impacts post the ERA discharge may be exacerbated in riverine waters with low flows and/or a high capacity for contaminant retentiveness or in extended estuaries with limited tidal flushing. The adoption of downstream offsets in different water types (i.e. the offset is located in a different water type that is downstream of the proposed ERA discharge) has limited ability to address the policy intent of preventing further degradation and reversing the declining trend in water quality or maintaining natural values. Accordingly, the adoption of downstream offsets in different water types does not contribute to achieving the policy intent and is not considered suitable.

Offsets for proposed ERA residual discharge in riverine waters should be in the same water type, using the minimum default offset ratios as in Table 1.

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

**3.6 Determining riparian and wetland buffer widths**

The Department of Natural Resources and Water’s *Regional Vegetation Management Codes* under the *Vegetation Management Act 1999* for the relevant Queensland bioregions (available through the website at [www.nrm.qld.gov.au](http://www.nrm.qld.gov.au)) should be used as **default buffer widths to re-establish degraded watercourse riparian or wetland function** — providing the offsetting contaminant load reduction to receiving waters by preventing bank erosion and filtering sediments, nutrients and other contaminants from stormwater run-off.

In the context of this Operational Policy the codes are used to provide default buffer widths — equivalent to the buffer widths under the codes to be retained in the clearing of vegetation to prevent loss of riparian function. Extracts in Table 2 below are for information only and reference must be made to the appropriate Queensland bioregion code for case-by-case assessment. Examples of degraded and functioning riparian buffers are at Figure 3.

**Table 2 Default riparian and wetland buffer widths**

Performance requirement	Buffer width
<p>To re-establish degraded watercourse riparian or wetland function.</p> <p><b>Watercourses</b> To regulate the clearing of vegetation in a way that prevents the loss of biodiversity and maintains ecological processes — remnant vegetation associated with any <b>watercourse</b> is protected to maintain —</p> <ul style="list-style-type: none"> <li>a) <b><u>bank stability by protecting against bank erosion;</u></b></li> <li>b) <b><u>water quality by filtering sediments, nutrients and other pollutants;</u></b></li> <li>c) <b><u>aquatic habitat; and</u></b></li> <li>d) <b><u>wildlife habitat.</u></b></li> </ul> <p><b>Wetlands</b> To regulate the clearing of vegetation in a way that prevents the loss of biodiversity and maintains ecological processes — remnant vegetation associated with any <b>significant wetland</b> and/or <b>wetland</b> is protected to maintain —</p> <ul style="list-style-type: none"> <li>a) <b><u>water quality by filtering sediments, nutrients and other pollutants;</u></b></li> <li>b) <b><u>aquatic habitat; and</u></b></li> <li>c) <b><u>wildlife habitat.</u></b></li> </ul>	<p>Guideline buffer widths to re-establish degraded watercourse riparian and wetlands function — shown below as <b><i>bold/italics/underlined text</i></b>.</p> <p><b><u>Buffer width</u></b> Clearing does not occur —</p> <ul style="list-style-type: none"> <li>a) in any <u>watercourse</u>;</li> <li>b) within <b><u>200 metres from each high bank of each watercourse with a stream order 5 or greater.</u></b></li> <li>c) within <b><u>100 metres from each high bank of each watercourse with a stream order 3 or 4;</u></b> and</li> <li>d) within <b><u>50 metres from each high bank of each watercourse with a stream order 1 or 2.</u></b></li> </ul> <p><b><u>Buffer Width</u></b> Clearing does not occur —</p> <ul style="list-style-type: none"> <li>a) in any <u>wetland</u>;</li> <li>b) in any <u>significant wetland</u>;</li> <li>c) within <b><u>100 metres from any wetland;</u></b> and</li> <li>d) within <b><u>200 metres from any significant wetland.</u></b></li> </ul>

Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

**Alternatively**, applicants may conduct site based modelling studies acceptable to the administering authority to determine **riparian and wetland buffer widths** for Queensland bio-regions; e.g. the CSIRO Land and Water at <http://www.clw.csiro.au/publications/technical99/tr32-99.pdf>. In either case (i.e. default or site specific study) the riparian vegetation structure design must restore full ecological function; e.g. according to CSIRO Land and Water management objectives at [http://downloads.lwa2.com/downloads/publications\\_pdf/PN061234\\_34-36.pdf](http://downloads.lwa2.com/downloads/publications_pdf/PN061234_34-36.pdf).

Best practice environmental management includes fencing to exclude stock at least 5m upslope from the top of the bank, ensuring the bank is fully vegetated, incorporating a grass strip filter of the design width (but at least 15m) between the stream and the land use, adding an additional width equal to the height of the bank where this is greater than 15m, and including 30m or three widths of native trees/scrubs along the top of the bank.

**Note** that determining the **buffer length** to satisfy offset load requirements will require case by case land use and locality assessment, as prioritised by the administering authority. Site based modelling will be required.

Figure 3 Examples of degraded and effectively managed riparian ZONES © Photographs CSIRO Land and Water

## Attachment to Section 3

### A. Offset suitability for phosphorus

Sources of phosphorus include point sources such as waste water sewage treatment plants and diffuse sources such as agricultural activities. Phosphorus discharges and in-stream concentrations can be readily measured and the contaminant is relatively stable as it travels through waterways. As a result, water quality equivalence can be established between offset load reductions and ERA load increases.

**Contaminant forms.** Phosphorus forms include:

- Soluble phosphorus, as dissolved ortho-phosphates, that is more bioavailable than nonsoluble forms.
- Non-soluble sediment-bound or particulate-bound phosphorus, that is not as likely to promote rapid algal growth but has the potential to become biologically available over time.

The concentration of total phosphorus is based on the sum of the soluble and non-soluble phosphorus. Due to phosphorus cycling in a waterbody (conversion between forms), offsets should consider total phosphorus expressed in terms of annual loads as a common metric with ERA discharge loads.

Actual forms of phosphorus being discharged should be identified to establish an equivalent impact on water quality. E.g., if offset reductions have substantially divergent chemical form to ERA discharges (e.g., one primarily discharges soluble phosphorus while another primarily discharges non-soluble phosphorus) then the two may not be environmentally equivalent. Most diffuse phosphorus from grazing/rural lands is sediment-bound, non-soluble phosphorus and from irrigation/horticulture in soluble form.

**Impact.** Excessive phosphorus concentrations have both direct and indirect effects on water quality. Direct effects include nuisance algae growth. Indirect effects include low dissolved oxygen, elevated pH, cyanotoxins from blue-green algae production and trihalomethane in drinking water systems.

Phosphorus **fate and transport** in waterways are well understood. The phosphorus “retentiveness” of a waterway describes the rates that nutrients are used relative to their rate of downstream transport. Areas of high retentiveness are usually associated with low flows, impoundments, dense aquatic plant beds and heavy sedimentation. Offsets that involve phosphorus discharges through these areas will likely require higher offsets to achieve water quality equivalence. In areas with swift flowing water and low biological activity, phosphorus is transported downstream faster than it is used by the biota, resulting in low levels of retentiveness and minimal aquatic growth. In reaches where phosphorus is transported rapidly through the system, lower offsets may be required.

**Timing.** The key consideration for phosphorus offsets is the seasonal load variability amongst emission sources. Agricultural diffuse source loadings will vary seasonally, with greater loadings likely during the growing season and during storm events associated with soil runoff. Point sources generally discharge continuously.

Refer *Water Quality Trading Assessment Handbook, US EPA, November 2004* available at [http://www.epa.gov/owow/watershed/trading/handbook/docs/NationalWQTHandbook\\_FINAL.pdf](http://www.epa.gov/owow/watershed/trading/handbook/docs/NationalWQTHandbook_FINAL.pdf).

## Procedural information for the Operational Policy *Waste water discharge to Queensland waters*

---

### B. Offset suitability for nitrogen

Anthropogenic sources of nitrogen discharging to receiving waters include point sources, such as waste water treatment plants and industrial discharge, and diffuse sources from agricultural activities and rural lands. Human activity has had an important influence on nitrogen cycles causing an increase of mobilized nitrogen. In particular nitrogenous fertilizer use has increased nitrogen input to receiving waters since widespread use began in the 1950's. In addition, both natural and human disturbances of natural ecosystems (e.g., forest fires, forest clearing) can contribute significant quantities of biologically available nitrogen to receiving waters.

Nitrogen discharges can be measured or calculated and tracked along a waterway.

**Contaminant forms.** Nitrogen forms include:

- Organic nitrogen that refers to nitrogen contained in organic matter and organic compounds, and may include both dissolved and particulate forms. Sources of organic nitrogen include decomposition of biological material, animal manure, soil erosion, waste water treatment plants and some industries. Organic nitrogen is not available for aquatic plant uptake, but over time organic forms may convert to inorganic, bioavailable forms.
- Inorganic nitrogen that includes nitrate ( $\text{NO}_3^-$ ), nitrite ( $\text{NO}_2^-$ ), ammonia ( $\text{NH}_3$ ) and ammonium ( $\text{NH}_4^+$ ). The primary sources of inorganic nitrogen are mineralized organic matter, nitrogenous fertilizers, point source discharges and atmospheric deposition. Inorganic nitrogen is bioavailable.

Total nitrogen is typically calculated based on the total load - it is assumed that all of the organic nitrogen will become bioavailable within a relevant time period. Offsets are based on total nitrogen load.

**Impact.** The effects of excessive nitrogen include those related to eutrophication—such as habitat degradation, algal blooms, hypoxia, anoxia and direct toxicity effects. While nutrient and eutrophication impacts associated with excess phosphorus may be more commonly of concern in freshwater systems, nitrogen is generally the limiting nutrient in marine environments and thus has a greater impact in estuarine systems. Some forms of nitrogen may pose particular problems; including ammonia that can cause localized toxicity problems and high concentrations of nitrate in drinking water may raise human health concerns.

A key consideration in determining offset requirements is to understand the nitrogen loss from the waterway. In addition to nitrogen exiting the waterway via irrigation diversions is nitrogen attenuation in the waterway, e.g. vegetation can draw dissolved inorganic nitrogen ( $\text{NO}_3^-$  and  $\text{NH}_4^+$ ) from the system. Another form of attenuation involves the process of “denitrification” whereby nitrate is reduced to gaseous nitrogen mainly by microbiological activity. Waterway reaches associated with high denitrification are usually associated with low, shallow flows. If offset nitrogen is mainly in the form of nitrate a (potentially large) portion of nitrogen may not reach the receiving waters and hence higher offset requirements. Conversely, nitrogen loads discharged to swiftly flowing, deep waters will have less opportunity for denitrification and have lower offset requirements.

Another factor important to water quality impacts in estuarine environments is the degree of flushing activity, particularly from tides. For example some estuarine waters may have a low level of tidal activity, mixing, and flushing. It is likely that these zones will retain the nitrogen for long periods of time and may have significant water quality concerns from discharge to such waters.

**Timing.** Nitrogen offsets are expressed in terms of annual loads as a common metric to ERA discharge loads. While point sources such as WWTPs are likely to have relatively consistent discharge timing, rural diffuse sources will have variable loadings that change seasonally based on land management activities and increased nitrogen levels during periods of high rainfall.

### C. Offset Suitability for sediments

Sediment from erosion or unconsolidated deposits is transported by, suspended in, or deposited by water. The erosion, transport and deposition of sediment become a problem when increases in sediment supply exceed the water body assimilation capacity. Sediment problems involve the presence of excess fine sediment such as silt and clay particles that increase turbidity when suspended, and form muddy bottom deposits when they settle. Excessive fine suspended and bedload sediments cause aquatic ecosystem impairments.

**Sources.** Major sources include soil erosion carried by surface runoff and within-channel erosion of banks and bedload sediments.

In catchments where human activity has markedly increased overland flow and run-off, and in-channel erosion and sediment load, excess sediment may be a common event with resulting impairment. Diffuse sediment sources include streambank destabilization due to riparian vegetation removal, agricultural activities without adequate buffer zones, urban sources during stormwater runoff from construction and permanent land development activities, sand and gravel extraction and road construction and maintenance.

**Impacts.** Excessive amounts of sediment can directly impact aquatic life and fisheries. Deposition can choke spawning gravels, impair fish food sources and reduce habitat complexity in stream channels. Stream scour can lead to destruction of habitat structure. Sediments can cause taste and odour problems for drinking water, block water supply intakes, foul treatment systems, and fill reservoirs. High levels of sediment can impair swimming and boating by altering channel form, creating hazards due to reduced water clarity, and adversely affecting aesthetics.

Indirect effects include low dissolved oxygen levels due to the decomposition of organic sediment materials and water column enrichment of attached nutrients loads. Elevated stream bank erosion rates also lead to wider channels that can contribute to increased water temperatures.

**Contaminant forms.** Sediment sources discharge a range of particle sizes and loads based on:

- Suspended or “water column” sediments are particles that are small and light enough to remain suspended in the water column, generally less than 1 mm. Sources discharge two types of these suspended sediments: geological particles, which are derived from rock and soil, and biological particles such as planktons and other microscopic organisms.
- Bedload sediments are generally larger particles that are too heavy to be suspended in the water column. They are discharged by diffuse sources and are transported along the bed of the stream and range in size from fine clay particles to coarse material.

**Timing.** Sediment delivery to streams from diffuse sources is episodic and rainfall related. Metrics for sediment offsets are expressed as average load per year.

### Waste water discharge to Queensland waters

*Operational policies provide a framework for consistent application and interpretation of legislation by the Environmental Protection Agency, which incorporates the Queensland Parks and Wildlife Service. Operational policies will not be applied inflexibly to all circumstances. Individual circumstances may require an alternative application of policy.*

*This operational policy<sup>1</sup> provides both policy advice and technical information for officers assessing development applications or environmental authority applications under the Environmental Protection Act 1994, Environmental Protection (Water) Policy 1997, Integrated Planning Act 1997 and State Development and Public Works Organisation Act 1971 for environmentally relevant activities discharging residual waste water to Queensland waters, including to waters of high ecological value. The operational policy includes the consideration of mixing zones, assimilative capacity, environmental offsets and environmental values and water quality objectives in assessing and deciding applications. It also informs applicants in preparing applications.*

## 1. Operational policy overview

### 1.0 Policy subject

This document summarises and explains the policies that apply when assessing applications under the [Environmental Protection Act 1994](#) (the EP Act) that may involve discharge of waste water<sup>2</sup> to Queensland waters<sup>3</sup>, including to waters of high ecological value (HEV). It also applies when assessing applications under other Acts that involve environmental values (EVs) of water or water quality objectives (WQOs), decisions made under the *State Coastal Management Plan 2001* and Regional Coastal Management Plans.

### 1.1 Key legislation and policy frameworks

The operational policy is based primarily on the EP Act and the [Environmental Protection \(Water\) Policy 1997](#) (the EPP Water). The object of the EP Act is “to protect Queensland’s environment while allowing for development that improves the total quality of life, both now and in the future, in a way that maintains the ecological processes on which life depends (ecologically sustainable development)” (from Section 3 of the EP Act). The explanatory notes to Section 5 of the EP Act (Obligations of persons to achieve object of Act) require “all people who are given power under this Act, to use that power to protect the Queensland environment and do so consistent with the principles of ESD”.

The current EPP Water includes statements of policy about assessment and decision making that resulted from consultation on the [Regulatory Impact Statement](#) for the [Environmental Protection \(Water\) Amendment Policy No 1 2006](#) (the EPP (Water) AP). These are described in the corresponding [explanatory notes](#). This operational policy provides further information on the implications of ‘scheduling’ EVs and WQOs under the EPP Water for residual waste water discharge. Refer also to the [EPA information sheet Scheduling environmental values and water quality objectives](#).

The operational policy also informs officers and applicants on key provisions of the EPP Water, the [Queensland Water Quality Guidelines 2006](#) and the [ANZECC Water Quality Guidelines](#).

The environmental offsets policy at Section 2.5 is to be used in conjunction with the Queensland Government Environmental Offsets Policy.

Relevant legislation, intergovernmental agreements and other EPA Operational policies are listed at [Section 4](#).

### 1.2 Application of policy

This operational policy applies when assessing or deciding applications (hereinafter referred to as development applications) relating to activities that are proposing to discharge residual waste water to waters, such as:

- development approvals under the [Integrated Planning Act 1997](#) (IPA) for EP Act chapter 4 activities (non-mining and non-petroleum environmentally relevant activities (ERAs)) prescribed under the [Environmental Protection Regulation 1998](#);
- environmental authorities under the EP Act for mining and petroleum activities;
- the assessment of *Environmental Impact Statements* prepared under the EP Act chapter 3 or the [Environmental Protection and Biodiversity Conservation Act 1999](#) (the EPBC Act);
- projects declared to be significant projects by the Coordinator General under the [State Development and Public Works Organisation Act 1971](#) (the SDPWO Act);

---

<sup>2</sup> Under the EPP Water, waste water means liquid waste and includes contaminated stormwater.

<sup>3</sup> Queensland waters means all waters that are within the limits of the State and includes all tidal (coastal and estuarine) and non-tidal (riverine) waters, groundwaters and wetlands (see the definition in the *Acts Interpretation Act 1954*).

- development that is the subject of designation of land for community infrastructure under the [Integrated Planning Act 1997](#);
- when assessing transitional environmental programs or environmental evaluations under the EP Act; and
- when making environmental management decisions under the EPP Water involving waste water release on land, waste water recycling and the release of contaminated stormwater that may impact on surface waters or groundwaters.

**In assessing development applications for EP Act chapter 4 activities** the administering authority must comply with any relevant Environmental Protection Policy requirement and must consider the standard criteria of schedule 3 of the EP Act ([see Glossary of Terms](#)) and additional information given in relation to the application.

If the application seeks an increase in the scale or intensity, the administering authority must assess the application having regard to the proposed activity, the existing activity and the potential environmental harm the proposed activity and the existing activity may cause. Refer to section 73AA of the EP Act for applications in a wild rivers area.

Subject to IPA, the administering authority may impose **conditions on the development approval** it considers are necessary or desirable, and must include any condition the authority is required to impose under an Environmental Protection Policy requirement. For other conditions that may be imposed, refer to section 73B (3) and (4) of the EP Act.

**In assessing and deciding applications for environmental authority (mining activity) for level 1 mining projects** the administering authority may in granting the application impose the conditions on the environmental authority it considers necessary or desirable.

In deciding whether to grant or refuse the application or to impose a condition the authority must:

- (a) comply with any relevant Environmental Protection Policy requirement; and
- (b) subject to paragraph (a), consider - application documents for the application, the standard criteria, the wild river declaration for the area—to the extent the application relates to mining activities in a wild river area, any suitability report obtained for the application and the status of any application under the *Mineral Resources Act 1989* for each relevant mining tenement.

**The operational policy also informs the application of EVs and WQOs in the assessment of non-ERA development applications**, including under the *State Coastal Management Plan 2001* and Regional Coastal Management Plans (State Planning Policies under IPA). Information on [Implementing the State Coastal Management Plan](#) includes the Planning Scheme Guideline and Development Assessment Guideline. These guidelines provide advice on reflecting the relevant policies of the State and Regional Coastal Management Plans into Local Government planning schemes and for development assessment. Relevant policies include 2.4.1 Water quality management, 2.4.4 Stormwater management and 2.4.5 Groundwater.

**A glossary of terms is at Appendix 6.1.**

## 2. Policy/technical issues determination

### 2.0 Policy statements

The statements of policy informing assessment and decision making on applications for ERAs discharging residual waste water to Queensland waters are at [Explanatory notes for EPP \(Water\) AP](#) and summarized as follows. The policy context is considered with respect to receiving waters that have the biological integrity of:

#### a. Effectively unmodified (high ecological value) aquatic ecosystems

*“The management intent for high ecological value aquatic ecosystems is to maintain the natural values; including the physico-chemical, biological, habitat and flow attributes. For any new ERA a decision to release waste water to high ecological value surface waters, or groundwater, is the least preferred option. Under the waste management evaluation procedure of section 15 of the Environmental Protection (Water) Policy 1997 (the waste management evaluation procedure), the management hierarchy requires the sequential evaluation of waste water prevention and waste water treatment and recycling before the evaluation of the release of waste water to land, sewer or surface water.*

*In addition, the activity must be carried out in accordance with best practice environmental management for the activity.*

*However if some release of waste water from the activity to high ecological value surface water is environmentally acceptable after consideration of the waste evaluation procedure, and there are no practicable alternative surface water discharge locations, the ERA would need to demonstrate:*

- *an equivalent outcome of no, or negligible, change<sup>4</sup> to the physico-chemical, biological, habitat and flow attributes beyond natural variation of the waters, excepting, in limited circumstances, within a defined initial mixing zone measured near the waste water release outfall location. The intent is that beyond the mixing zone boundaries, current environmental quality is maintained and the aquatic ecosystem is conservatively protected over time, taking into account the precautionary principle;*
- *some environmental assimilative capacity<sup>5</sup> is preserved for future ecologically sustainable development;*
- *the proposal is in the public interest<sup>6</sup> and provides outstanding net benefits to the region, or State as a whole<sup>7</sup>;*
- *where practicable, the proposal includes a like kind environmental offset<sup>8</sup>; and*
- *compliance with State Government obligations under intergovernmental agreements which include the management and protection of world heritage areas under the UNESCO Convention<sup>9</sup>; the management and conservation of wetlands under the [Ramsar Convention on Wetlands](#)<sup>10</sup>; and the management and protection of migratory birds and their environment under JAMBA and CAMBA<sup>11</sup>”; or*

<sup>4</sup> The method of assessing ‘no change’ to the physico-chemical, biological, habitat and flow ecosystem attributes of high ecological waters is given in the Queensland Water Quality Guidelines 2006 (Appendix D Compliance assessment protocols.)

<sup>5</sup> The environmental assimilative capacity is broadly the capacity of the environment to receive some human induced input of contaminants or alteration, without causing unacceptable change.

<sup>6</sup> Refer to the standard criteria listed under Section 3 of the *Environmental Protection Act 1994*.

<sup>7</sup> Refer to the Terms and abbreviations section of the *State Coastal Management Plan 2001*.

<sup>8</sup> To be of a ‘like-kind’ the environmental offset would need to be based on the same contaminant and preferably in the same water. However the environmental offset proposal would be considered by the administering authority on a case-by-case basis; seeking to deliver a net environmental gain to the water as a whole.

<sup>9</sup> The *Convention Concerning the Protection of the World Cultural and Natural Heritage (UNESCO) 1972*.

<sup>10</sup> *RAMSAR Convention on Wetlands, Iran 1971*.

<sup>11</sup> Japan Australia Migratory Bird Agreement and China Australia Migratory Bird Agreement. Australian Treaty Series, respectively 1981 No.6 and 1988 No.22. Department of Foreign Affairs and Trade. Canberra.

**b. Slightly to moderately disturbed aquatic ecosystems**

*“The management intent for the release of waste water to surface waters having the biological integrity of slightly to moderately disturbed aquatic ecosystems is considered with respect to the existing water quality.*

*For any new ERA, if after consideration of the waste evaluation procedure the release of contaminants to surface water is environmentally acceptable, the management intent is summarised below:*

- *where the existing water quality is better than the scheduled water quality objectives, the management intent is to maintain the current water quality; while allowing in some circumstances the use of some of the remaining assimilative capacity for future development and population growth; and*
- *where the existing water quality corresponds to the scheduled water quality objectives, the management intent is to maintain the water quality; and*
- *where the existing water quality is of a lower quality than the scheduled water quality objectives, the management intent is to improve the water quality and prevent further degradation. Attainment of the scheduled water quality objectives will be sought through continual improvement over time and, depending on existing water quality, may be a long-term goal. Environmental offsets of a ‘like kind’ may be considered by the administering authority where there are no feasible alternatives to the release of waste water.*

*In addition, the activity must be carried out in accordance with best practice environmental management for the activity. For existing ERAs the continuous improvement requirement of development conditions applies...’; or*

**c. Highly disturbed aquatic ecosystems**

*“The management intent for the release of waste water to surface waters having the biological integrity of highly disturbed aquatic ecosystems is to halt the decline and reverse the trend in water quality.*

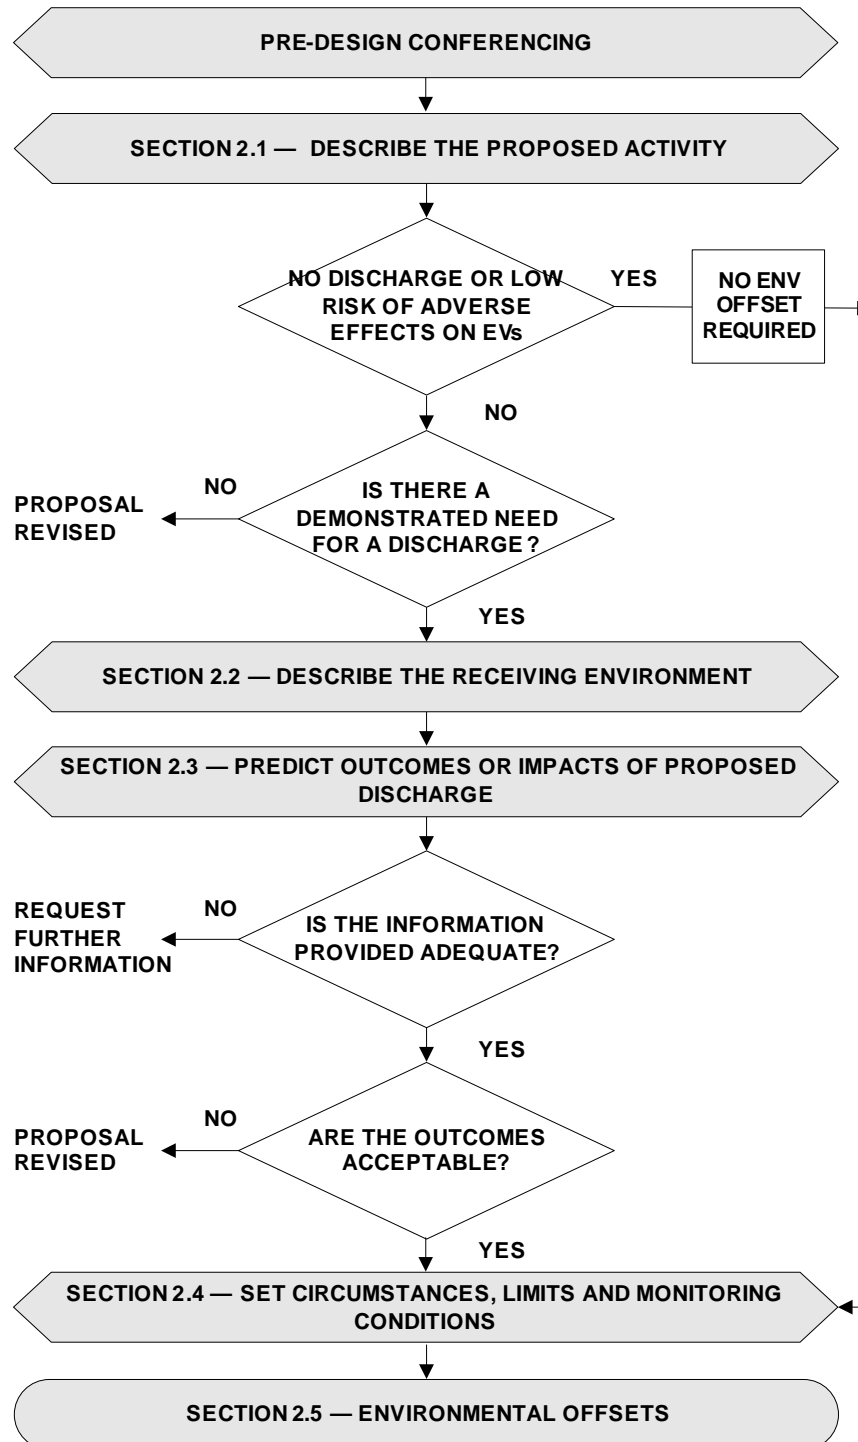

*For any new ERA, if after consideration of the waste evaluation procedure the release of contaminants to surface water is environmentally acceptable, the management intent is to halt the decline and reverse the trend in existing water quality. However it is recognised that attainment of scheduled water quality objectives is a long-term goal.*

*In addition, the activity must be carried out in accordance with best practice environmental management for the activity. For existing environmentally relevant activities the continuous improvement requirement of development conditions also applies.*

*Environmental offsets of a ‘like kind’ may be considered by the administering authority where there are no feasible alternatives to the release of waste water.”*

**The above statements of policy** are considered in the following sections 2.1 to 2.5, in conjunction with the Queensland and ANZECC Water Quality Guidelines and the role of EVs and WQOs in water quality assessment. An overall assessment flowchart is at Figure 1, the corresponding task list for assessing the discharge of residual waste water is at Table 1. A glossary of terms is at [Appendix 6.1](#).

Figure 1 — Assessment flowchart

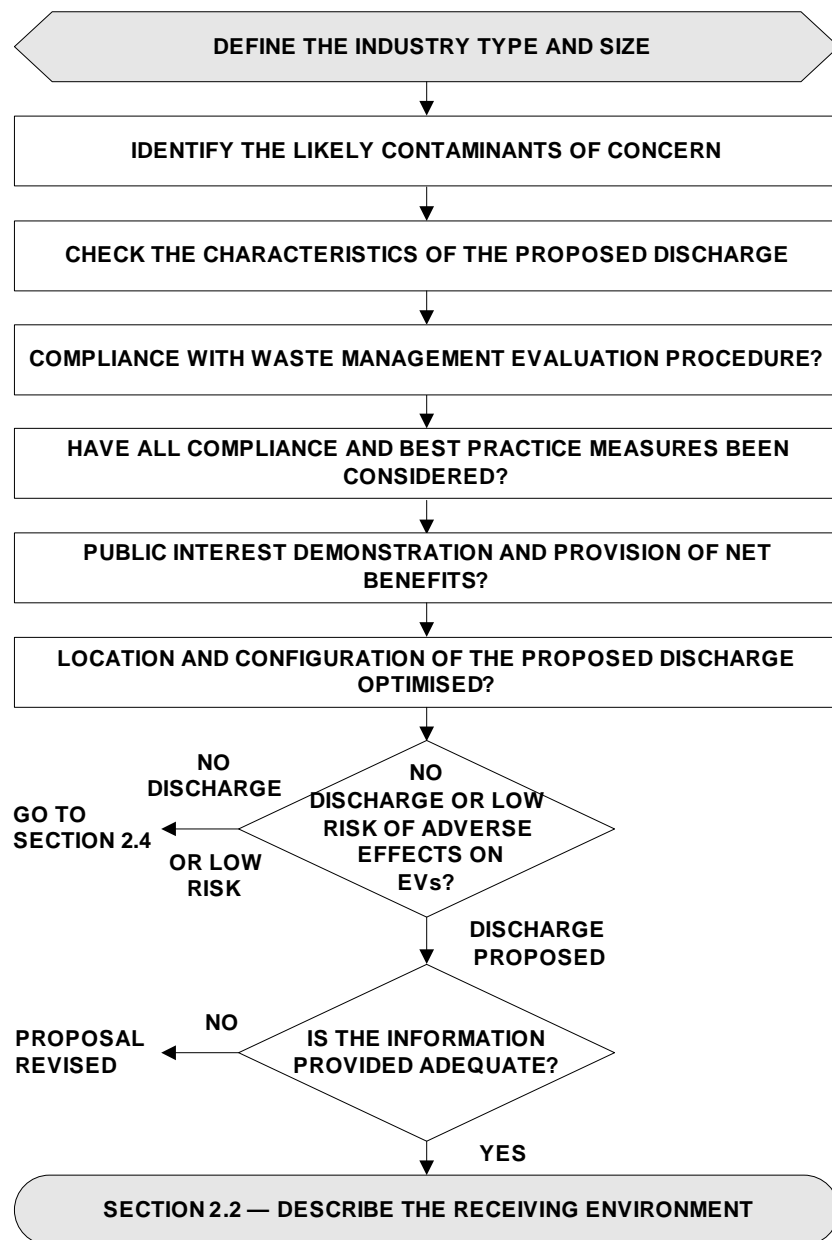

**Table 1 — Task list for assessing the discharge of residual waste water**

Section	Activity	Tasks list
2.1	Describe the proposed activity	<p>Define the industry type and size (proposed production).</p> <p>Is a residual waste water discharge proposed, or is the discharge assessed as low risk of having an adverse effect on an environmental value?</p> <p>Identify the potential contaminants of concern in the proposed discharge.</p> <p>Check the characteristics of the proposed discharge (quality/quantity/variability).</p> <p>Check the location and configuration of the proposed discharge.</p> <p>Have all reasonable and practicable measures been used to avoid or minimise the discharge (for example best practice, source reduction, recycling)?</p>
2.2	Describe the receiving environment	<p>Identify water bodies potentially affected by the proposed discharge. For each water body, what are the sustainable loads for key contaminants? What proportion of the sustainable load is used by this proposal?</p> <p>Check government planning requirements that apply to these water bodies (e.g. Ramsar, EPA Referable Wetlands, National Parks and Fish Habitat Areas).</p> <p>Has relevant information on the receiving environment been provided? Is it adequately described given the contaminants and risks associated with the proposed discharge?</p> <p>Are the EVs and WQOs for these waters listed in the EPP Water Schedule 1? (If not EVs and WQOs from the <i>Queensland Water Quality Guidelines 2006</i> and ANZECC Water Quality Guidelines apply).</p> <p>Have other sources and loads of contaminants in the catchment, including future loads, and previous history, been considered?</p>
2.3	Predict outcomes of the proposed activity	<p>Identify the need for predicting outcomes of the proposed activity (i.e. is modelling required?) and what predictive methods/models were used.</p> <p>Were the predictive methods used appropriately?</p> <p>If a mixing zone is proposed; check the EPP Water (Section 18) and ANZECC Water Quality Guidelines.</p> <p>For receiving water bodies, are WQOs met and EVs protected? If not, does the activity contribute to achieving them in the future?</p> <p>Determine the need for consideration of environmental offsets.</p>
2.4	Set limits, circumstances and monitoring conditions	<p>Specify any circumstances (for example limitations or timing issues) related to the approved discharge.</p> <p>Derive end-of-pipe limits from approved discharge loads/characteristics.</p> <p>Include compliance monitoring for the end-of-pipe/receiving environment</p> <p>Include reporting requirements for the approved activity.</p> <p>As required, condition the execution of an environmental offset agreement.</p>

**2.1 Describe the proposed activity and discharge**

This section involves the assessment of information provided by the applicant on the description of the proposed activity, as shown in Figure 2 below and summarised in the following text.

**Figure 2 — Activity description and assessment**

**2.1.1 Define the industry type and size (estimated production)**

The industry type and scale will help to classify the potential environmental risk from the proposed activity and discharge of residual waste water. The scale of the activity can be specified in production quantities such as area of production for aquaculture farms, tonnes of throughput for processing industries or equivalent persons in the case of sewage treatment.

**2.1.2 Identify the potential contaminants of concern in the discharge from the proposed activity**

The first step in assessing the discharge of residual waste water from the proposed activity is identifying the source waste streams and potential contaminants of concern. Contaminants can be a gas, liquid or solid, an odour, an organism, energy (as in a thermal discharge) or a combination of contaminants. Common industry point source discharges and their likely effects are summarised in Table 2.

**Note** that some industries/ERAs are commonly associated with particular classes of aquatic contamination; for example Waste Water Treatment Plants and nutrients. The [National Pollutant Inventory emission estimation technique manuals](#) list 90 priority substances on the basis of health and environmental risk, by industry sector, and the [USA EPA Toxic Release Inventory](#) lists 313 priority substances.

These inventories may assist in identifying other key contaminants by industry/ERA. The information can be used as a guide to check information in the application. A search of the academic literature and the internet would be undertaken for more information on specific activities not mentioned. Contaminants are related to process inputs and outputs and can transfer from media other than water (for example leach from solids, scrubber effluent, etc). Contaminants in residual waste water may also occur as unintended by-products of processes (for example dioxins and metal compounds).

Depending on the character and resilience of the receiving environment, and the degree of risk, direct toxicity assessment may be required on any available laboratory or pilot plant samples to complement literature evaluation of the additive toxicity of contaminants in the proposed discharge. Such analysis more closely resembles the situation in the natural environment than single chemical testing approach. Refer to the [ANZECC Water Quality Guidelines — volume 2, Section 8.3.6](#).

**Table 2 — Potential issues of concern and water quality contaminants**

Point source discharges	Potential issues	Water quality contaminants
Sewage effluent	Asphyxiation of aquatic animal life (e.g. low dissolved oxygen levels leading to fish kills), algal blooms, smothering of flora and fauna, impairment of ecosystem structure and function, and public health risks.	Carbonaceous material, nutrients, pathogens, suspended solids, toxicants (metals/metalloids, pesticides, residual disinfectants and pharmaceuticals).
Abattoir effluent	Asphyxiation of aquatic animal life (e.g. low dissolved oxygen levels leading to fish kills), algal blooms, smothering of flora and fauna, impairment of ecosystem structure and function, and public health risks.	Carbonaceous material, suspended solids, nutrients, pathogens, residual disinfectants and toxicants.
Mine discharges	Toxicity of sulphate, acid/alkaline solutions and metals/metalloids. Increased availability of metals due to pH changes, smothering of flora and fauna impairment of ecosystem structure and function, and salinisation. May affect stock and irrigation water.	pH, sulphate, temperature, suspended solids, turbidity, salinity, toxicants (metals/metalloids and other chemicals, including fluoride).
Aquaculture discharges	Asphyxiation of aquatic animal life (e.g. low dissolved oxygen levels leading to fish kills), algal blooms, smothering of flora and fauna, impairment of ecosystem structure and function, diseases and introduced species.	Carbonaceous material, suspended solids, nutrients and toxicants.  Diseased organisms and antibiotics may be an issue in some operations.

Point source discharges	Potential issues	Water quality contaminants
Sugar mill cooling waters	Low dissolved oxygen levels leading to fish kills, elevated temperatures may lead to fish kills and other effects on fauna and flora.	Carbonaceous material, temperature and antifouling agents.
Chemical processing plants	Toxicity of acids, alkalis, metals or industrial chemicals. Increased availability of metals from pH changes, smothering of flora and fauna, algal blooms and low dissolved oxygen levels leading to fish kills.	pH, sulphate, toxicants (ammonia, metals/metal compounds (including sulphides)/metalloids, pesticides, and other chemicals), suspended solids, carbonaceous material, temperature, nutrients and by-products.
Power stations - blowdown water	Toxicity of metals and metalloids. Smothering of flora and fauna. Elevated temperatures and salinisation.	Suspended solids, toxicants (metals, metalloids and chemicals), temperature and dissolved salts.

### 2.1.3 Check the characteristics of the discharge from the proposed activity

The quality and quantity of the discharge from the proposed activity should be clearly characterised. This must include concentrations, typically averages and worst-case values of all potential contaminants of concern, assuming the treatment technology is working effectively. The quantity of the discharge must be similarly expressed for volumes and resulting contaminant loads. The expected variability with time is a further important consideration and percentiles may be used to express this. Wet weather influences must be considered and separate wet weather discharge characteristics defined where applicable.

The method used to estimate these characteristics must be clearly defined and realistically achievable from practical and economic viewpoints. This may be demonstrated with reference to guidelines, pilot plant results or previous applications of the adopted waste water treatment technology. Alternatively, process models may be used to predict these characteristics.

### 2.1.4 Have all best practice measures been used to avoid or minimise the discharge? Have all compliance matters been addressed?

The mandatory waste management evaluation assessment consideration is required under the EPP Water and the [Environmental Protection \(Waste Management\) Policy 2000](#) (EPP Waste). Assessment usually involves benchmarking against waste management principles, relevant best practice environmental management (BPEM) and evaluation of discharge alternatives. A range of processing options for the proposed activity are usually available to the applicant to prevent, abate or mitigate the waste water discharge and its impacts. These measures include segregating waste streams, source reduction, substitution of chemicals used, cleaning and processing with minimal water, recycling, reuse and best practice treatment and disposal alternatives.

#### a. Best practice environmental management for the proposed activity

The application should demonstrate that the management of the proposed activity will achieve an on-going minimisation of the activity's environmental harm through cost effective measures assessed against the measures currently used nationally and internationally for the activity. Best practice environmental management technology standards are industry and contaminant specific. Guidance is available from sources including environmental guidelines, research organisations, equipment manufacturers and performance records of industry sector leaders. A technology based standard using best practice environmental management would comprise a benchmark to satisfy the EPP Water waste minimisation provisions.

**b. Compliance with the Environmental Protection Policies — waste management evaluation**

The application must demonstrate that the proposed activity complies with the [EPP Water](#) provisions, including Sections 14 to 24, the EPP Waste provisions, including Sections 10 to 13 and 15 to 17 (as relevant) and consider the [Queensland Water Recycling Guidelines 2005](#) and the National Water Quality Management Strategy's [Australian Guidelines for Water Recycling: Managing Health and Environmental Risks 2006](#).

The latter guidelines provide the framework to encourage the adoption of sustainable water recycling to better manage water resources, and to support economic growth while protecting the environment and safeguarding public health. For industrial waste streams it should also be demonstrated that a release of effluent to sewer, subject to Local Government conditions, is not an acceptable option. A letter from the relevant Local Government advising that discharge to sewer would not be permitted is the common way that this may be demonstrated.

**c. Some discharge of residual waste water shown to be unavoidable and environmentally acceptable**

Waste water discharge to receiving waters is the least preferred option. The application must demonstrate that waste management evaluation procedures have been addressed and best practice environmental management measures have been used to avoid or minimise the residual discharge to water, and there are no alternate discharge locations or other residual waste water treatment, reuse or disposal options that cause less harm to the environment.

Environmentally acceptable in the context of this paragraph means incorporating all best practice and practicable waste minimization measures.

**d. Compliance with State Government obligations under Intergovernmental Agreements and other statutory instruments**

The application must comply with, and assessment and approval processes must address matters of State interest, including relevant State Government obligations under inter-government agreements including:

- [Intergovernmental Agreement on the Environment](#);
- [Agreement under the Council of Australian Governments \(COAG\) Water Reform Framework](#);
- [Convention on Wetlands \(Ramsar, Iran, 1971\)](#);
- [UNESCO World Heritage Convention 1972](#); and
- International Agreements Relating to Migratory Birds and Wetlands (the Japan-Australia Migratory Bird Agreement ([JAMBA](#)), the China-Australia Migratory Bird Agreement ([CAMBA](#)) and the [Directory of Important Wetlands Australia](#)).

Inter-government agreements contain a range of State obligations. Examples include the promotion the sustainable use and conservation of Ramsar wetlands, protecting world heritage areas and adopting ecologically sustainable development in natural resource decision-making and approval processes. State obligations under COAG include the implementation of the [National Water Quality Management Strategy](#).

Matters the subject of the agreements may be of national environmental significance under the EPBC Act and trigger Commonwealth assessment and approval processes. The applicant is responsible for self-assessment and referral to the Australian Government for impact assessment on a matter of national environmental significance. For further information refer to the Department of Environment and Heritage website, EPBC Act Policy Statements — [Significant Impact Guidelines/Matters of National Environmental Significance](#).

**Relevant statutory instruments** having the effect of State planning policies include the *State Coastal Management Plan 2001*, Regional Coastal Management Plans (Wet Tropical Coast, Cardwell - Hinchinbrook,

Curtis Coast, South-east Queensland) and the *South East Queensland Regional Plan 2005 – 2026*. **State planning policies** include [SPP 2/02 \(Planning and Managing Development Involving Acid Sulphate Soils\)](#) and [SPP 2/07 \(Protection of Extractive Resources\)](#) that identifies those extractive resources of State or regional significance where extractive industry development is appropriate in principle, and aims to protect those resources from developments that might prevent or severely constrain current or future extraction when the need for use of the resource arises.

EPA Referable Wetlands datasets are available to State and Local Government through the Queensland Government *Infolink* and development triggers for land in or near are at [Assessable development under Integrated Planning Regulation 1998](#).

**e. For HEV waters — is the proposal in the public interest and does it provide outstanding net benefits to the region, or State as a whole?**

Public interest under the standard criteria of Schedule 3 of the EP Act may be ascribed as meaning the interest of the public as distinct from the interest of the individual(s).

Net benefits to the region, or the State as a whole, has the meaning under the [State Coastal Management Plan 2001](#).

These matters may be addressed if, for example:

- the proposal provides a public service such as municipal sewage disposal or provides goods or services to the Queensland community to meet an identified demand and there is no alternative option that is capable of meeting that demand; and
- the potential environmental, economic and social impacts of the project (whether beneficial and adverse) have been assessed at a regional or State level, depending on the project scale; and strongly supports the proposal.

**Note the public interest and applicable environmental impact studies, assessments or reports are a part of the standard criteria under Schedule 3 of the EP Act that must be considered in assessing all applications.**

### **2.1.5 Check the location and configuration of the discharge from the proposed activity**

The location of the proposed discharge is important as it determines the receiving waters potentially affected. Further, the potential impacts of the proposed discharge are influenced by the configuration under which it is operated (for example some discharges may only occur in the wet season or under slack water, or flood or ebb-tide conditions). A further consideration is the diffuser or outfall configuration. A diffuser may be used to provide better mixing in the initial zone. Outfalls may be submerged to promote mixing or achieve aesthetic goals. The application should explain the rationale behind the proposed discharge location and configuration. Similarly, the rationale for rejecting alternatives to discharge should be explained.

It would typically be necessary and desirable for a discharge pipe to be submerged below low water spring datum, except in cases of denser than ambient waste waters where submergence may exacerbate adverse environmental effects.

### **2.1.6 ERAs with low assessed risk or no discharge of residual waste water**

If the proposed ERA does not involve a direct or indirect discharge of residual waste water to waters, then conditions prohibiting waste water discharge would be included. If the ERA includes a discharge, but represents a low risk of having an adverse effect on an environmental value, then further detailed steps may not be required. Subject to addressing the matters in [Section 2.1](#), and checking for any matters in [Section 2.2](#) that would preclude the discharge, the assessment should proceed to [Section 2.4](#).

A low risk of having an adverse effect on an environmental value would generally occur when pollutant loads are decreasing and are a relatively minor contribution to the receiving water, and when toxicant concentrations in the discharge are below trigger values listed in Section 3.4 of the ANZECC Water Quality Guidelines.

Another case may be a relatively infrequent discharge such as overtopping of waste water storage during flood conditions.

Where no toxicant trigger values are available but published information suggests a chemical may be of concern, direct toxicity assessment may be required on any available laboratory or pilot plant samples to ensure risks are low. Refer to the [ANZECC Water Quality Guidelines — volume 2, Section 8.3.6](#) and [Appendix 6.2](#) of this operational policy.

Development applications involving contaminants found to be low risk or involving no discharge of waste water require no further receiving water quality assessment.

Development conditions would require monitoring and reporting to annually confirm the absence of adverse effects on environmental values or would prohibit waste water discharge (in development applications where no discharge was proposed). Development conditions would also typically specify the nature of the permitted discharge and require monitoring of discharge volume and quality to ensure the activity was carried out as described in the application. In most cases, conditions also typically prohibit discharge of contaminated stormwater. For some activities, stormwater treated to render it less hazardous may comprise a waste water stream that is permitted to be discharged subject to conditions.

## Summary

### ***Is there a demonstrated need for a discharge of residual waste water? Are relevant EPP and other compliance issues addressed?***

Note that in deciding whether to grant or refuse an application the administering authority must comply with any relevant EPP requirement and must consider the standard criteria of Schedule 3 of the EP Act.

Applications must demonstrate that the discharge of residual waste water from the proposed activity is unavoidable and environmentally acceptable, and other EPP requirements and other compliance requirements are addressed.

If not demonstrated the application should be revised following an information request.

### ***Applicants are encouraged to discuss the above requirements at pre-design conferencing.***

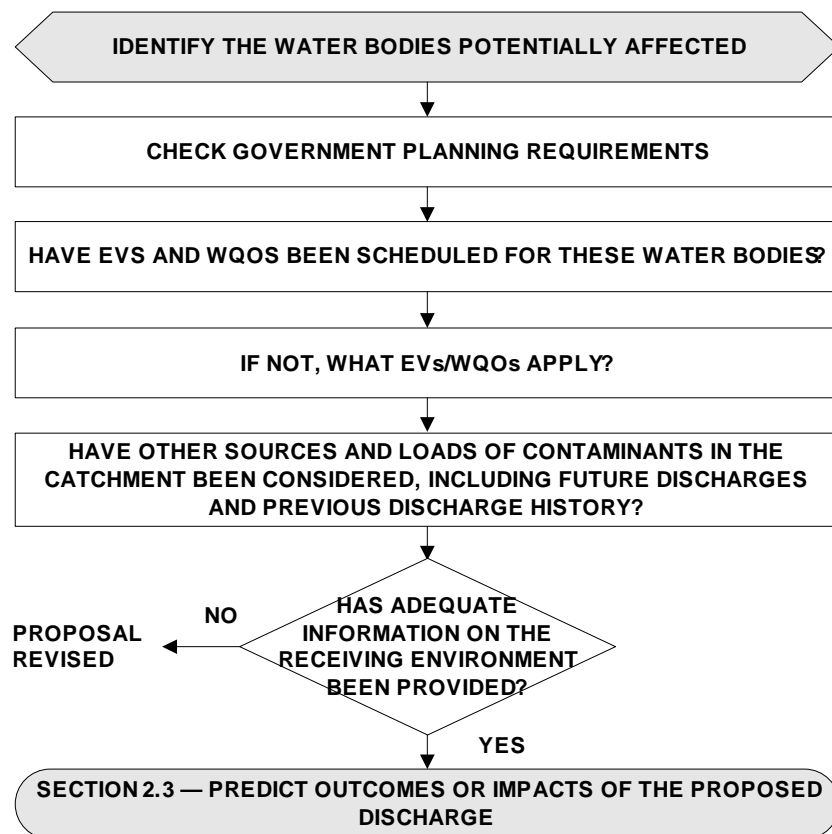

Pre-design conferencing is offered by the EPA to all prospective applicants seeking direction and advice on development applications; including on the preparation of development applications and the necessary documentation to ensure that lodged applications are supported by the requisite information to enable the administering authority to make a decision. Applicants are encouraged to compile information for pre-design conferencing of concepts and plans.

**2.2 Describe the receiving environment**

This section involves the assessment of information provided by the applicant on the description of the receiving environment, as shown in Figure 3 below and summarised in the following text.

For the receiving waters potentially affected by the proposed discharge, the applicant should identify the EVs and WQOs and provide a description of the existing character, resilience and environmental values of the receiving environment. Refer Appendix 6.1 for the glossary of terms.

**Figure 3 — Description of receiving environment**

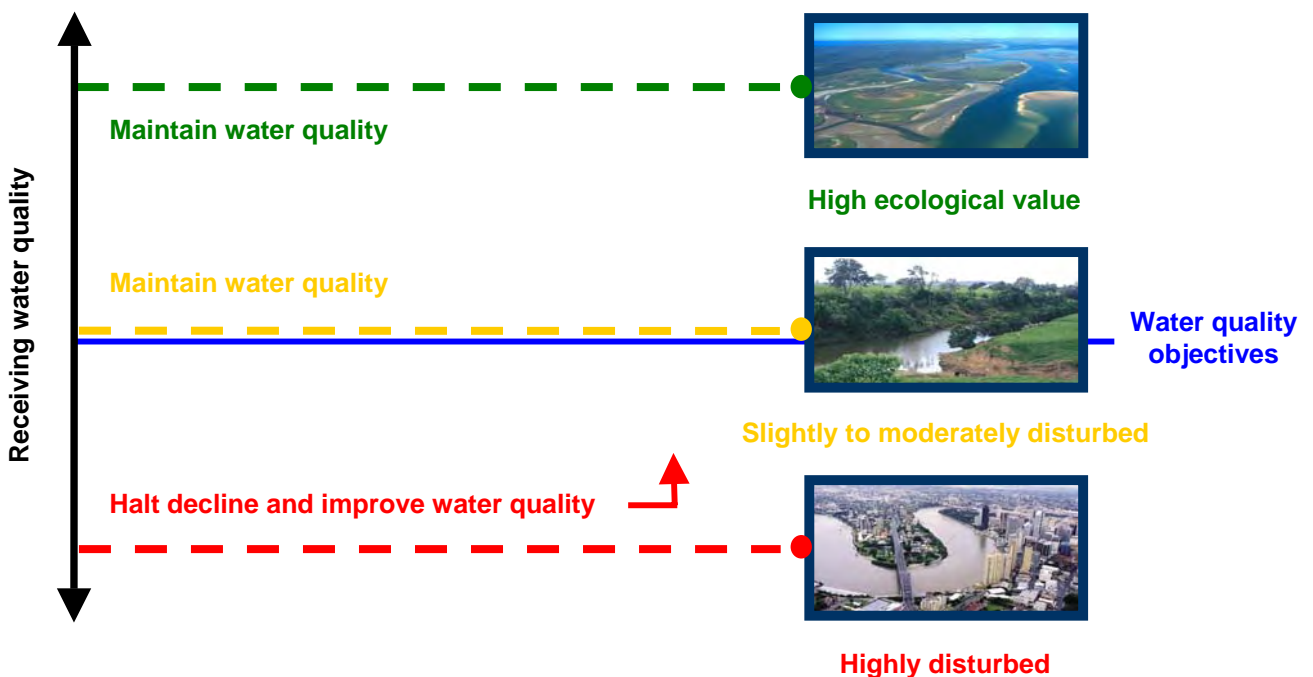

**2.2.1 Identify the water bodies potentially affected by the proposed discharge**

The intent is to characterize the receiving waters including EVs, WQOs and levels of ecosystem protection. Key information sources are the EPP Water (Schedule 1) and the *Queensland Water Quality Guidelines 2006*, for waters not listed under Schedule 1. As in Section 2.2.2, other State and regional planning documents may also be relevant.

It is important to determine what receiving water ecological health monitoring data is available and how it compares with the relevant water quality objectives and the policy intent (refer Figure 4 below, [Section 2.2.3](#) and [Section 2.3](#)).

**Figure 4 — Receiving water quality, water quality objectives and management intent**

EVs relevant to the receiving waters should be used for the assessment of development applications. For example the affected water body might be a bay, an estuary or riverine waters, and different EVs and WQOs will apply to different parts of the water body. This information is either contained in the documents referenced in Schedule 1 of the [EPP Water](#) (accessible via the [EPA website](#)) or from the *Queensland Water Quality Guidelines 2006*. Local information may need to be obtained if the latter does not adequately characterise the receiving waters, refer [Section 2.2.5](#).

Further, the levels of aquatic ecosystem protection need to be determined as either high ecological value (HEV) or slightly-to-moderately disturbed (SMD) or highly disturbed (HD). Levels of aquatic ecosystems protection may be available from a number of sources including the EPP Water, State and Regional Coastal Management Plans (Areas of State Significance (Natural Resources)), the [Directory of Important Wetlands Australia](#) and Marine Parks and National Parks designations for waters in areas of protected estate. Further guidance in assigning the level of aquatic ecosystem protection is given in Table 3, Section 2.2.2 and the ANZECC Water Quality Guidelines (Section 3.1.3).

### 2.2.2 Check applicable government plans or requirements

Environmental management objectives, levels of aquatic ecosystem protection and other relevant matters are often specified in applicable planning designations. These matters are a part of the standard criteria of Schedule 3 of the EP Act that must be considered by the administering authority in deciding the application. Examples of Commonwealth requirements include matters of national environmental significance, such as Ramsar listed wetlands and World Heritage Areas, threatened species, as well as Great Barrier Reef Marine Park requirements. Examples of State requirements include the State and Regional Coastal Management Plans, Marine Park zoning plans, Water Resource Plans, Fisheries Habitat Areas, National Parks, EPA Referable Wetlands (refer Section 2.1.4 d) and the Great Barrier Reef Water Quality Protection Plan. Local Government information may also include relevant designations in Local Government planning schemes.

### 2.2.3 Check applicable environmental impact studies, assessments or reports

Relevant information may be available through Commonwealth and State Government Agencies and Authorities, Non-Government Agencies and Local Government web sites, and internet and library searches; or required by the applicant.

### 2.2.4 Has relevant information on the receiving environment been provided? Is it adequately described given the contaminants and risks associated with the proposed discharge?

It is essential that ecosystem health and catchment information is obtained to assess the outcomes of the proposed activity. Information must be provided on both the character and resilience of the receiving environment to address the standard criteria of Schedule 3 of the EP Act and would include current local ecosystem health and water quality information, potential catchment pollutant sources and local catchment issues. This information may already exist; however it must be current and adequately address temporal and spatial variations to be representative of current conditions. The information may need to be established as part of special investigations prior to lodging the development application. **Pre-design conferencing to address these issues is strongly encouraged.**

Local or regional ecological health monitoring data may be available for the receiving waters (for example from EPA, Department of Natural Resources and Water (DRNW), regional natural resource management bodies or Local Government). The information will be required for comparing the existing water quality of the receiving waters with the WQOs, and must relate to the specific contaminants and assessed risks associated with the proposed residual discharge of waste water to the receiving waters. Current ecological health information may also be required for calibration of predictive models, refer [Section 2.3](#) and Appendix 6.3.

In considering the proposed discharge of residual waste water, the policy intent relates to the level of ecosystem protection and the existing receiving water quality, as shown in Figure 4 and summarised in Table 3.

There may be reports, environmental studies or monitoring results that assist in characterising the receiving environment from sources such as the EPA, the DNRW, the Department of Primary Industries and Fisheries (DPIF), other State Government departments, Local Government, universities, external research organisations and industry groups. This information is a valid consideration under the standard criteria of Schedule 3 of the EP Act.

Note that the precautionary principle must be considered where EVs for waters are threatened and information on the resilience of the system is unknown or limited.

**Table 3 — Levels of aquatic ecosystem protection, policy intent and environmental management decisions**

High ecological value
<p>The policy intent for high ecological value waters is to afford a high degree of protection of the EVs by ensuring no measurable change to water quality, biological diversity or flow condition. Applications proposing residual waste water discharge to HEV waters should be accompanied by local reference data and local biological effects data. Where practicable the proposal should include a 'like kind' environmental offset, seeking to deliver a net environmental gain to the water.</p> <p>For toxicants listed in Section 3.4 of the ANZECC Water Quality Guidelines, environmental management decisions would include trigger values for toxicants<sup>12</sup> to protect 99 percent of species in the affected water. HEV waters may include fish habitat areas, dugong protection areas, Marine Parks, National Parks and Areas of State Significance (Natural Resources) under State and Regional Coastal Management Plans. Additional HEV waters may be identified through State or regional strategies, ecological studies or stakeholder consultation.</p>
Slightly to moderately disturbed
<p>The policy intent for slightly to moderately disturbed waters is dependent upon current water quality. If the current water quality is better than the WQOs, the intent is to maintain current water quality — using some assimilative capacity. If the current water quality is worse than the WQOs, the intent is to prevent further degradation and improve water quality over time.</p> <p>Environmental offsets of a 'like kind' may be considered by the administering authority where there are no feasible alternatives to discharge of residual waste water.</p> <p>For toxicants listed in Section 3.4 of the ANZECC Water Quality Guidelines, environmental management decisions would include trigger values for toxicants<sup>13</sup> to protect 95 or 99 percent of species in the affected water. The applicant may also use risk analysis techniques, including direct toxicity assessment; all supporting documentation should be supplied with the development application. EPA officers should request assistance from the Environmental Sciences Division in assessing the validity of the data.</p>
Highly disturbed
<p>The policy intent for highly disturbed waters is that receiving water quality should:</p> <ul style="list-style-type: none"> <li>a) improve towards achieving the WQOs to protect the EVs, over time; and</li> <li>b) not measurably deteriorate as a result of the proposed discharge.</li> </ul> <p>For toxicants listed in Section 3.4 of the ANZECC Water Quality Guidelines, environmental management decisions would include trigger values for toxicants for slightly to moderately ecosystems would be adopted first, although lower levels of protection (for example 90 percent of species) may apply in some cases. An application for a discharge into HD waters should be supported by reference to local monitoring data.</p> <p>Environmental offsets of a 'like kind' may be considered by the administering authority where there are no feasible alternatives to the discharge of residual waste water.</p>

<sup>12</sup> See Table 3.4.2 of the ANZECC Water Quality Guidelines.

<sup>13</sup> Refer above.

**2.2.5 Have EVs and WQOs for the waters been listed in Schedule 1 of the EPP Water?**

EVs and WQOs for waters listed under Schedule 1 of the EPP Water must be adopted and considered in assessing development applications.

**2.2.6 If EVs and WQOs are not listed under Schedule 1 of the EPP Water, what EVs/WQOs apply?**

Where EVs and WQOs for the waters have not been specifically set in Schedule 1 of the EPP Water then, under Section 11(2) of the EPP Water, the WQOs are the set of water quality guidelines that will protect all EVs for the waters, including the Queensland and ANZECC Water Quality Guidelines.

Where the default guideline values are inappropriate for the receiving environment, for example due to non-anthropogenic reasons such as high organic carbon, WQOs would be based on water quality guidelines derived from data collected at appropriate local reference sites — refer [Section 3.1](#).

Table 4 lists EVs for waters, refer also to Appendix 6.1. The EPA guideline [Establishing draft environmental values and water quality objectives](#) sets out the process for establishing EVs and WQOs under the EPP Water.

**Table 4 — Environmental values for waters**

EVs of water	Examples of suitability for use
<p><b>Aquatic ecosystems EVs</b> The level of aquatic ecosystems protection that the WQOs are intended to protect includes:</p> <ul style="list-style-type: none"> <li>• High ecological value ecosystems</li> <li>• Slightly to moderately ecosystems</li> <li>• Highly disturbed ecosystems</li> </ul>	<p>Maintain or improve the biological integrity of the respective aquatic ecosystems condition (HEV, SMD, HD).</p> <p>Total to partial complement of aquatic and adjacent terrestrial habitat and biota diversity and abundance (depending on the level of protection), including water associated wildlife.</p>
<p><b>Human use EVs include:</b></p> <ul style="list-style-type: none"> <li>• Recreation and aesthetics</li> </ul>	<p>Primary contact recreation (e.g. swimming).</p> <p>Secondary contact recreation (e.g. boating).</p> <p>Visual recreation (e.g. natural landscape).</p>
<ul style="list-style-type: none"> <li>• Drinking water</li> </ul>	<p>Water sources used for drinking water.</p>
<ul style="list-style-type: none"> <li>• Primary industries</li> </ul>	<p>Irrigation, general agricultural use and stock watering.</p> <p>Stock watering.</p> <p>Human consumption of aquatic foods (fish, crustacean and mollusks) — commercial and recreational sources.</p> <p>Aquaculture.</p>
<ul style="list-style-type: none"> <li>• Industrial</li> </ul>	<p>Generic processes (heating and cooling).</p> <p>Specific industries (textile, chemical, paper and pulp).</p> <p>Power generation (hydro-electric).</p>
<ul style="list-style-type: none"> <li>• Cultural and spiritual</li> </ul>	<p>Protection of cultural resources — places or objects of historic or indigenous significance or value.</p>

### **2.2.7 Have other sources and loads of contaminants in the catchment been considered, including future discharges and previous discharge history?**

For some contaminants such as nutrients and sediment it is necessary to consider other catchment sources and loads, and if the activity will be contributing to these loads. Considering catchments loads is particularly important where WQOs are not currently being achieved in receiving waters potentially affected by the discharge and multiple discharge sources exist.

It should be noted that the EPP Water also requires discharge of waste water from future developments to be considered in the decision making process. Possible sources of information include development applications, Local Government sewerage planning strategies, the [EPA Point Source Database](#) and the Department of Infrastructure and Planning. This aspect is important because the administering authority would not allocate all available assimilative capacity to a single application, and an application should not seek the discharge of a contaminant where the proposed load was a significant proportion of the sustainable load; i.e. the contaminant load consistent with the maintenance of the WQOs for the receiving waters. The concept of sustainable load including consideration of assimilative capacity is addressed further under [Section 2.3.4](#).

The sustainable load can be determined by studies of aquatic ecosystem health and modelling to predict the effect of natural catchment and anthropogenic loads (diffuse and point source) on the water quality objectives of the receiving water. This process is generally undertaken in collaboration with regional natural resource management bodies and other relevant stakeholders.

For some receiving waters, previous management actions have resulted in the reduction of contaminant loads in order to achieve water quality objectives. The administering authority would consider it important that improved environmental outcomes be maintained, rather than re-establish discharge loads. Load history may also give insight into the likely effect of certain levels of discharge on water quality. Environmental offsets may be considered by the administering authority for SMD and HD waters with no assimilative capacity for the contaminant, and where there are no feasible alternatives to the discharge of residual waste water.

#### **Summary**

***Has adequate information been provided to describe the character, resilience and environmental values of the receiving environment? Have applicable government plans, requirements, environmental impact studies, assessments or reports been considered?***

Note that the above relates only to part of the standard criteria of Schedule 3 of the EP Act. All the standard criteria and other prescribed matters must be considered by the administering authority in deciding whether to grant or refuse the application.

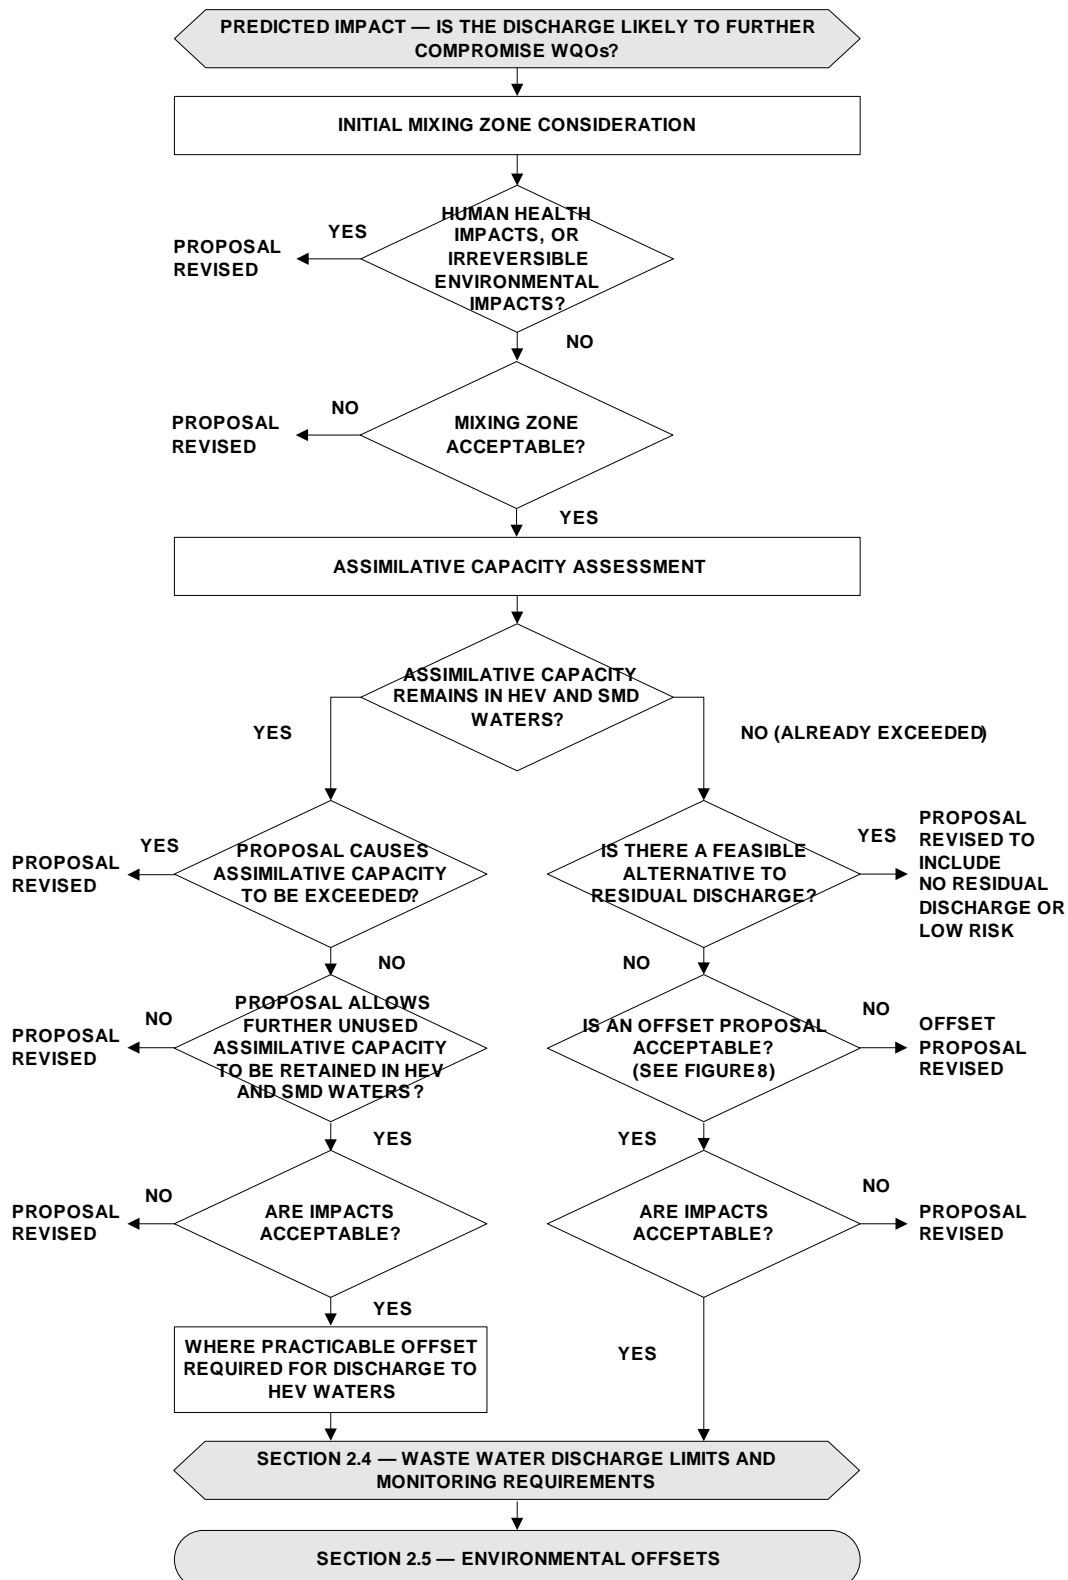

If not demonstrated, the application should be revised following an information request.

***Applicants are encouraged to discuss the above requirements at pre-design conferencing.***

### 2.3 Predict outcomes or impacts of the proposed discharge

This section involves the assessment of information provided by the applicant on the predicted outcomes or impacts of the proposed discharge, as summarised in the following text and shown in Figure 5 below.

**Figure 5 – Prediction of impacts of proposed discharge**

### 2.3.1 Predicted impact of the proposed discharge of residual waste water on the EVs and WQOs of the receiving waters

Prediction of the environmental outcomes or impacts that would result from the proposed ERA requires the completion of quantitative assessments which may involve numerical modelling procedures to estimate contaminant loads, changes to receiving waters contaminant concentrations and the effects of mitigation actions. Refer to Appendix 6.3 — *Numerical modelling of environmental impacts and mitigation actions*.

Prediction of the impact of the proposed discharge of residual waste water on receiving water quality should be compared to the WQOs — in the context of the policy intent at Section 2.0, which is summarised below and shown at [Figure 4](#). Existing receiving water quality should be the baseline comparison for impact assessment.

#### **a. For the discharge of residual waste water to high ecological value (HEV) receiving waters**

The policy intent in considering an application to discharge residual waste water into high ecological value receiving waters is to maintain the natural values; including the physico-chemical, biological, habitat and flow attributes.

#### **b. For the discharge of residual waste water to slightly to moderately disturbed (SMD) receiving waters**

The policy intent in considering an application to discharge residual waste water into slightly to moderately disturbed receiving waters is considered with respect to the existing water quality — either maintain (use some assimilative capacity) or improve (over time).

#### **c. For the discharge of residual waste water to highly disturbed (HD) receiving waters**

The policy intent in considering an application to discharge residual waste water into highly disturbed receiving waters is to halt the decline and reverse the adverse trend in water quality. Highly disturbed receiving waters do not have any assimilative capacity. It is recognised that attainment of WQOs for highly disturbed receiving waters is a long-term goal.

### 2.3.2 Where WQOs are not currently being achieved, is the discharge likely to further reduce receiving water quality?

If the WQOs of the receiving waters that are potentially affected by the proposed discharge are not currently being achieved, a significant environment risk is associated with the proposed discharge as further environmental harm is likely to occur. In this case the EVs will not be protected and pre-design conferencing with the applicant should consider alternatives. Where the discharge of residual waste water from the proposed ERA may not otherwise be avoided, reused, recycled or other disposal alternatives adopted; further considerations by the administering authority should include environmental offsets where there are no feasible alternatives to the discharge of residual waste water — refer to [Section 2.5](#).

### 2.3.3 Initial mixing zone

Mixing zones are a mandatory consideration under the EPP Water and applications must:

- comply with Section 18 of the EPP Water (waste water releases to surface water);
- consider the [ANZECC Water Quality Guidelines](#) for mixing zones;
- include the results of the baseline water quality monitoring in the area of the proposed mixing zone; and
- for HEV waters — provide predictive modelling results that demonstrate no or negligible change to the ecological attributes beyond the mixing zone, refer to [Appendix 6.2](#).

A mixing zone is a permitted zone of non-compliance with the receiving WQOs and is primarily for managing soluble toxicants where concentrations in the discharge are above toxicant trigger values in Section 3.4 of the

ANZECC Water Quality Guidelines. Where this is the case, further risk assessment including direct toxicity assessment (DTA) for biological effects, should be considered prior to mixing zone assessment.

Refer to the [ANZECC Water Quality Guidelines — volume 2, Section 8.3.6](#). Where the toxicant concentrations in the discharge are found to not cause toxicity, mixing zone assessment may not be required. Results of DTA will also be used to assess the actual dimensions of the mixing zone.

Various predictive models are available for estimating initial mixing zones, evaluating outfall diffuser designs and defining areas around the outfall where concentrations may exceed WQOs; refer Appendices [6.2](#) and [6.3](#).

The administering authority would not approve a mixing zone if inclusion would be likely to result in human health impacts, irreversible environmental impacts, unacceptable impacts to biota or where the discharge of residual waste water was characterised by a lack of effluent plume dispersion.

Mixing zone considerations include:

- only one mixing zone, minimised to the greatest practicable extent in accordance with the waste management hierarchy, is permitted for an ERA;
- spatially defining the mixing zone based on compliance with estimated receiving environment concentrations using mean flows and maximum expected toxicant concentrations for the discharge against chronic toxicant concentration (refer Appendix 6.2). The diameter (as depicted in Figure 6) should be measured from the diffuser port and should be defined by considering the maximum extent from a range of tidal conditions in tidal areas covering at least slack tides and mid-tide conditions for all toxicants present in the discharge. In non-tidal streams, the minimum consecutive seven day average flow with a 10-year recurrence interval is recommended as a guide to minimum dilution conditions;
- ensuring the mixing zone would not provide a barrier to the migration of aquatic fauna in riverine and estuarine waters, i.e. not take up the width of the stream. As a general rule, the maximum lateral dimension should be the lesser of 50m diameter or 30 percent of the waterway width for riverine and estuarine waters and a radius not exceeding 100m from the diffuser port for coastal/marine waters;
- avoiding overlap of mixing zones from neighboring discharges. It is recommended that the edges of the mixing zones be at least 200m apart. The combined affect should be assessed;
- not impinging on the shore line; for example, based on the mean on the low water spring tide (Mean Low Spring Tide);
- the use of mixing zones is not appropriate for managing the discharge of nutrients, bio-accumulatory or particulate substances. For nutrients, see discussion below for management using reference based assessment;
- mixing zones are typically not applicable to waters with significant and regular use for primary contact recreation, existing aquaculture development approvals, areas allocated to aquaculture under planning frameworks, waters of high ecological value, conservation significance or scientific importance or near potable water intakes;
- the discharge limits should be set such that within the mixing zone the residual waste water discharge does not cause odours, surface discolouration, visible floating foam, oils, grease, scum, litter or other objectionable matter;
- contaminant concentrations in the mixing zone must not be acutely toxic to fish, other aquatic vertebrates, commercial species or endangered wildlife, cause significant irreversible harm including objectionable bottom deposits, the growth of undesirable aquatic life or the dominance of nuisance species (such as algal blooms). The use of toxicity-based guidelines or site-specific biological effects

data is usually required to define the boundary of the mixing zone (refer Figure 6 and Appendix 6.3); and

- for large flowing freshwater streams where effluent discharges are unlikely to have significant density difference to the receiving waters, the effluent plume may extend a considerable distance downstream. The applicant would need to confirm the proposed discharge did not violate the WQOs of the receiving waters after full lateral mixing.

When assessing thermal discharges and oxygen demanding substances, acute effects should not occur anywhere in the receiving waters, for example no harmful dissolved oxygen sags are caused. In these cases, maximum concentrations and loads should be modeled and assessed to assess potential impacts. Predicted environmental concentrations and levels should be compared to known acute effect levels.

**Figure 6 — Spatially defining an initial mixing zone.**

**A. Low risk configuration where acute toxicity levels are met end-of-pipe.**

**B. Configuration that involves a small zone within the mixing zone where acute toxicity criteria may not be met but have a low risk of causing acute toxicity.**

When assessing effects of contaminants that are based primarily on a reference condition rather than direct effects, for example nitrogen and phosphorus concentrations, assessment typically requires water quality objectives to be met on a percentile basis (for example median concentration). It is not necessary that such concentrations are met directly at the discharge point as effects of dilution, assimilation and average receiving environment conditions should be considered. Prediction of effects of these discharges is typically a far-field issue and needs to consider the assimilative capacity of the waters (see Section 2.3.4).

Monitoring of effects of discharges in these cases is typically undertaken in the centre of waterway channel at various distances from the discharge point. Compliance with reference criteria should be met within 3 stream widths or 300m, whichever is the smaller as a general guide. Approval of zones with exceeded water ambient quality objectives greater than this size may be granted in specific cases where social and economic considerations support the discharge of residual waste water and there are no other feasible alternatives. Regardless, localised environmental harm should not occur, for example smothering of corals with benthic algae from nutrients.

For discharges involving contaminants that are not directly toxic, diffusers are still desirable and may also be required to achieve good initial dilution and avoid undesirable effects such as visible plumes or slicks and biological effects such as avoidance behavior. Modeling may be required to design the diffusers to optimize dilution and location. For example, it would generally be desirable to achieve at least a 1:50 dilution within 100m in any direction from the discharge point of the release. Discharges from pipes should also be located so that they are submerged under all tidal conditions, unless the discharge is denser than ambient. Discharges to poorly mixed waterways should be discouraged, for example upper estuaries, below barrages and small waterways with limited tidal exchange.

In cases where a mixing zone was permitted, development conditions would require the applicant to install measures such as diffusers on which the predictions were based and require a compliance monitoring program to verify that the minimum dilution ratios and concentrations predicted for mixing zone were achieved at the modelled or DTA determined mixing zone boundary.

Specific considerations include:

- Loss of aesthetic enjoyment or generation of an objectionable odour;
- **Public notification.** As the environmental values for waters may be prejudiced by the inclusion of a mixing zone, impact assessable development applications proposing a mixing zone should become public knowledge through the public notification stage of the application. Development conditions may require signage to identify the location of the adjacent mixing zone;
- **The precautionary principle** must be applied where environmental values are threatened and information on the resilience of the system is limited. Consequently the administering authority must, in considering the application and assessing risks to the ecological health of waters outside the mixing zone, adopt the precautionary principle to ensure that the current environmental quality is maintained beyond the mixing zone boundaries and that human health and aquatic ecosystems are conservatively protected within the mixing zone; and
- For HEV waters **peer review assessment** of the mixing zone proposal is required, including the demonstration of the lack of impacts beyond the mixing zone boundaries, and must be submitted with the development application. The EPA can advise of potential peer reviewers.

### 2.3 4 Assimilative capacity and sustainable load

#### **a. Policy issues**

Refer to Section 2.0.

Assimilative capacity is the capacity of the receiving waters to receive some human induced input of contaminants, or alteration, while still achieving the water quality objectives.

#### **b. Release of assimilative capacity in HEV and SMD waters for discharge of residual waste water**

Decisions about the use of assimilative capacity in HEV and SMD receiving waters for the discharge of residual waste water must be considered after all options to manage the waste water have been assessed and managed by the administering authority in the context of sustainable and efficient use of scarce resources — see also sub-section *d* below, *Assimilative capacity of HEV water not to be exceeded by discharge of residual waste water*.

A development application should demonstrate that the assimilative capacity of the receiving waters is not exceeded and that some assimilative capacity is preserved for future ecologically sustainable development - the proportion proposed to be consumed should be determined.

As a guide, the majority proportion of the assimilative capacity should be retained for future ecologically sustainable development.

The administering authority may consider the role of market-based instruments in managing these issues (for example flexible or incentives based mechanisms). For HEV waters the policy intent is that, where practicable, the application includes an environmental offset proposal seeking to deliver a net environmental gain to the water as a whole, see Section 2.5.

**c. What are the sustainable loads for key contaminants?**

The sustainable load of a particular contaminant is the maximum amount that a water body can receive without failing to meet the WQOs and therefore adversely affecting EVs. The concept of sustainable load is particularly important for oxygen demanding substances, nutrients, sediments and toxicants. It should be noted that toxicants are generally a near-field issue<sup>14</sup> and that suspended sediments can have an adsorbed toxicant load which can adversely affect pelagic species and benthic fauna and flora directly, as well as indirectly through contamination of food sources (for example, seagrass and organic detritus)..

**d. Assimilative capacity of HEV water not to be exceeded by discharge of residual waste water**

The demonstration of 'no or negligible change' to the ecological indicators beyond the mixing zone boundaries also demonstrates that the HEV water assimilative capacity is not exceeded. Refer to [Appendix 6.2](#).

**e. Where assimilative capacity is exceeded — prior to assessment**

In some SMD waters the assimilative capacity for specific contaminants may already be exceeded. This may be evident from ecological health monitoring and remedial programs may be underway to restore ecological health by reducing loads of specific contaminants.

Where the current receiving water quality does not meet the WQOs, the policy intent for slightly-to-moderately disturbed (SMD) waters is to prevent further degradation and improve water quality over time.

Highly disturbed (HD) waters do not have any assimilative capacity. The policy intent is to halt the decline and reverse the trend in water quality, recognising the attainment of receiving WQOs is a long term goal.

For ERAs seeking to discharge residual waste water to receiving waters without assimilative capacity, alternatives to the discharge and alternate discharge locations should be re-evaluated before undertaking an assessment of how worse water quality will become. If there are no feasible alternatives to prevent, control or abate the discharge of residual waste water or to mitigate the impacts through alternative discharge strategies, then environmental offsets may be considered by the administering authority — see Section 2.5.

For waters with no assimilative capacity, achieving the receiving WQOs would be sought on a catchment wide basis involving all ERAs discharging waste water to the receiving waters through continual improvement over time, and additionally considering diffuse source (urban and rural) emissions. Depending on the existing receiving water quality, achievement of the WQOs may be a long-term goal. The [EPA Strategic compliance management program](#) typically includes area/sub-catchment, industry sector and licensed activity inspections that seek, amongst other things, to improve receiving water quality on a catchment basis. The program may involve all activities discharging to a particular water body.

In the case of an existing industry that is a key contributor to the impaired water quality in SMD or HD waters, reductions in discharge loads would be considered for any application to increase scale or intensity, or as part of the above EPA program to restore waterway health.

---

<sup>14</sup> Sustainable loads should relate to an area of influence based on the issues of concern. For example, effects from sediment bound toxicants on benthic communities may be a localised issue.

The public interest consideration and other considerations under the standard criteria of Schedule 3 of the EP Act may be important in the assessment of applications proposing the discharge of residual waste water to SMD or HD receiving waters, where assimilative capacity is exceeded.

Relevant considerations may include:

- the proposal provides a public service such as municipal sewage disposal or provides goods or services to the Queensland community to meet an identified demand and there is no alternative option that is capable of meeting that demand; and
- applicable environmental impact studies, assessments or reports.

## Summary

### ***Is the information provided adequate?***

Is sufficient information provided about the proposed activity that addresses the above matters? If necessary, further information should be requested.

### ***Are the outcomes/impacts acceptable?***

Further information may also be required to address deficiencies or achieve better environmental outcomes, for example using alternative technologies, management practices, discharge locations. Pre-design conferencing is important in raising issues and exploring options at the earliest possible time, and in seeking advice and direction on documentation, plans and information requirements.

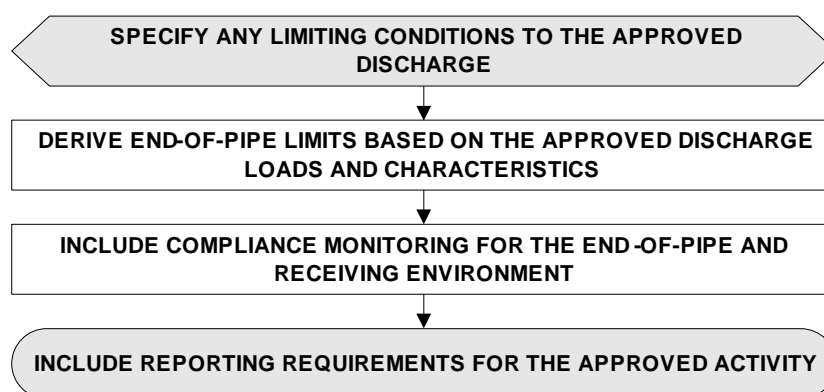

***Pre-design conferencing is encouraged to address the prediction of impacts of the discharge on receiving waters, mixing zone and assimilative capacity requirements.***

## 2.4 Set residual waste water discharge limits, discharge and impact monitoring requirements

Once the outcomes of the proposed activity are deemed acceptable, it is necessary to determine the appropriate residual waste water discharge limits and monitoring requirements, the latter in compliance with Sections 26 and 27 of the EPP Water, for inclusion in the development conditions. The derived development conditions, including discharge characteristics, limits, release (discharge) and impact monitoring requirements should reflect the inputs used in predictions.

Other factors for consideration include the environmental risk of the industry type and the use of best practice environmental management for the activity. Appropriate discharge limits and performance monitoring can be decided upon by undertaking the following steps that are summarised at Figure 7.

**Figure 7 — Consideration of specific development conditions**

### 2.4.1 Specify any circumstances related to the approved discharge

Approval to discharge must be constrained to the residual waste water, after waste minimisation measures have been implemented. The conditions must state that only approved waste water may be discharged. The location of the discharge, including any need for submergence or a diffuser, should be specified. Certain limitations or timing issues may also be conditional to the approval. For example, the discharge may only be permitted at outgoing tides (ebb-tide release), certain months of the year or only during wet weather flows exceeding a stated level. Outfall submergence below local low water to avoid visual impacts and enhance mixing is generally required, unless the discharge is not buoyant. Other precautions such as signage may be desirable depending upon the nature and the location of the discharge.

The protocols for monitoring must comply with Section 10 of the EPP Water and be in accordance with the [EPA Water Quality Sampling Manual](#) and the ANZECC Water Quality Guidelines. Compliance assessment protocols for different levels of aquatic ecosystems protection (HEV, SMD and HD waters) are at the Queensland Water Quality Guidelines.

### 2.4.2 Derive discharge limits based on the approved discharge loads and characteristics

WQOs would not normally be used directly for regulatory purposes and therefore discharge limits for the end-of-pipe need to be derived that will achieve these WQOs. The process of deriving the limits can be divided into selecting the indicator (for example dissolved oxygen concentration), determining the relevant limit type (for example minimum) and choosing the limit and units (for example 6mg/L). General guidance for setting limits is shown in Table 5. Derived information would be used in conditioning development approvals, environmental authorities, transitional environmental programs and environment protection orders.

**a. Indicators**

Limits should be placed on any indicators that can be practically measured at the end-of-pipe and are relevant to the discharge quality. These might include toxicants, nutrients, oxygen-consuming substances, suspended solids, dissolved oxygen, pH and pathogen indicators such as *Enterococcus spp.* The discharge loads proposed for the activity and assessed in the above processes would be used as a basis for setting these limits. For waste streams that may vary over time, for example municipal sewage may receive varied trade waste inputs, an additional qualitative condition that requires that the release must not have any other properties nor contain any other organisms or other contaminants which are capable of causing environmental harm is recommended to address this issue.

**b. Discharge volume limits**

Maximum volumes permitted for discharge on any one day would be considered, including wet weather flows for waste water treatment plants (WWTPs),

**c. Percentiles and frequency**

Development conditions may include limits combining percentiles (for example the 80<sup>th</sup> percentile) and must include maximum values (or minimum values in cases such as dissolved oxygen discharge of very cold water where adverse effects are related to low values rather than high values). Maximum values are particularly important for toxicants that have an acute impact on the environment (refer [Table 3](#) and Table 3.4.2 ANZECC Water Quality Guidelines for trigger values for toxicants to protect 99, 95 and 90 percent of species). In addition, maximum values can be applied for compliance monitoring to a single sampling event whereas percentiles can only be applied over a number of sampling events. Maximum values also ensure a proper standard of treatment applies at all times. Percentiles may be employed when relevant to treatment technology and when percentile performance is used in impact assessment studies to evaluate medium to long term environmental outcomes, for example nutrient loads and risks of nutrient enrichment.

**Table 5 — Guidance for setting limits for indicator types**

Contaminant type	Limit type/s	Guidance for limits
Toxicants	Maximum No observed effect level (NOEL)	No acute toxicity in initial mixing zone (i.e. end-of-pipe). No chronic effects outside initial mixing zone. Additional multiplying factors may be used in the case of bio-accumulating and bio-concentrating contaminants. No build-up in sediments, exceeding relevant trigger levels. No build-up in seafood species (Food Standards Code). Irrigation, stockwater and drinking water protected where these are relevant values.
Nutrients	50 <sup>th</sup> percentile Maximum Mass loads	50 <sup>th</sup> percentile to achieve mass load (and prevent local impacts). Maximums to prevent local impacts (generally three times limit for 50 <sup>th</sup> percentile). Mass loads based on systems sustainable load or capacity.
Sediments	Maximum	Use levels achievable by BPEM (e.g. 50 mg/L)
Salinity	Maximum	Maximum to prevent local impacts.
Pathogenic indicators	Maximum Median 4 out of 5	Limits based on 2005 National Health and Medical Research Council (NHMRC) Water Guidelines (e.g. for faecal coliforms, <i>Enterococcus spp.</i> and pathogenic protozoa).

Contaminant type	Limit type/s	Guidance for limits
Temperature	Maximum Minimum	Maximum temperature elevation based on receiving waters.
Residual disinfectant	Maximum Minimum	Maximum based on likely decay time and effects on biota.
Dissolved oxygen concentration	Minimum	Best practice environmental management.
Oxygen demand and suspended solids	Mass loads 80 <sup>th</sup> percentile Maximum	Mass loads based on systems sustainable load or capacity. 80 <sup>th</sup> percentile to achieve mass load (and prevent local impacts). Maximums to prevent local impacts (generally three times limit for 80 <sup>th</sup> percentile).

Minimum values are necessary for dissolved oxygen concentration levels and pH in discharges. Percentiles are important as they encompass ongoing high quality treatment in the longer term, whilst allowing reasonable fluctuation in the treatment process. Note that percentiles are not suitable for some characteristics (for example residual chlorine) and should not be applied without relevant maxima or minima.

Activities with substantial discharges such as large WWTPs would typically be required to meet a long-term percentile (annual), short-term percentile (six week) and maximum limits. As this involves significant sampling effort (for example weekly), this may not be appropriate for a small-scale discharge such as that from a small caravan park's WWTP. In this case, monthly monitoring against maximum limits and annual percentile would be more reasonable. The method of determining maximums and percentiles should incorporate expected and acceptable fluctuations in concentrations and loads consistent with best practice.

Typically loads are implicitly conditioned through a combination of both concentration and volume limits. In some cases, load-based limits may be set (for example daily, weekly or annually).

This is done by setting a limit on the mass of a particular contaminant discharged per day, calculated by multiplying the volume released that day by the most recent monitoring result for the contaminant. Percentile load limits are expressed as the proportion of a number of consecutive daily loads that must meet the relevant limit (for example five out of 10 consecutive daily loads must not exceed a stated mass).

Where loads are used to quantify discharge limits, concentrations should also be included. This prevents the discharge of a smaller volume of very poorly treated effluent that would meet a load limit.

**d. Limits and units**

Limits need to be set for each quality characteristic in appropriate units based on potential effects and available analytical methods (refer Table 5). Analytical methods are given in the [EPA Water Quality Sampling Manual](#). Scientific experts should be consulted where required.

**2.4.3 Include requirements for discharge monitoring and receiving environment impact monitoring**

The administering authority must consider requiring the applicant to monitor waste water releases and to carry out impact monitoring of the effect of the waste water releases. Compliance monitoring decisions, monitoring frequency and indicators must be in accordance with the provisions of sections 26 and 27 of the EPP Water. Compliance monitoring may be applied to a combination of end-of-pipe, the local receiving environment and the regional receiving environment.

Further information on setting up monitoring programs can be obtained from the [Australian Guidelines for Water Quality Monitoring and Reporting \(2000\)](#) Australian and New Zealand Environment and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ). Refer also to Appendix 6.4 for the application of Multiple Before-After Control-Impact monitoring program for HEV water assessment.

Discharge or end-of-pipe monitoring should relate to the criteria and limits decided above. This type of monitoring is a direct measure of the performance of the activity and is necessary to assess compliance with a condition of a development approval, environmental authority, or transitional environmental program or environment protection order. It may also be required to determine whether a system is working true to its design specifications to avoid environmental harm. End-of-pipe monitoring does not provide direct information on the impact of the discharge on the receiving environment.

Impact or ambient monitoring within the local receiving environment should focus on protecting the EVs of the receiving waters through comparison of monitoring data with the WQOs. The ambient monitoring program may also be designed to monitor those locations near known discharges or other inputs into the waterway, where water quality objectives are most likely not be met (for example mixing zones). Ambient monitoring data may be used for performance assessment and for calibrating water quality models.

As the WQOs for the receiving waters may be affected by other activities in the catchment, non-compliance with WQOs may not be solely attributed to the performance of a particular point source discharge. This is particularly the case where impacts occur over time in tidal estuaries. An example of where ambient monitoring may more immediately relate to effects of an activity is measurement of sediment plumes downstream of a dredging operation and comparing it to up-current conditions. Other reasons for requiring ambient monitoring may be to monitor mixing zone characteristics, verify conclusions of an environmental impact assessment, study or report, to decide future disposal strategies or if there is concern about the levels of a particular contaminant in waters.

Ambient monitoring can provide information on regional ecosystem health and other relevant water quality information required to assess EVs. Such programs may be coordinated through regional partnerships comprising groups of stakeholders involved in the catchment. A contribution by the applicant to existing regional ecological health monitoring programs may be an alternate to applicant monitoring.

Compliance monitoring of residual waste water discharge and the receiving environment would normally commence when the approved activity commences, however baseline ecological health monitoring of receiving waters may be required by the applicant to characterise the receiving environment in the preparation of the development application. For further details refer to the Queensland Water Quality Guidelines Appendix C, Table C3 — Data for stand alone use in developing local guidelines (a minimum of 18 data values, over 12 months at two reference sites.)

#### **2.4.4 Include reporting requirements for discharge and impact monitoring**

The provision of monitoring data and reports to the administering authority should be set out as development conditions. Requirements should include reporting performance against development approval, environmental authority, transitional environmental program or environment protection order conditions, prompt notification of breaches of development conditions and other incidents likely to cause environmental harm; and the assessment of impact monitoring of the effect of waste water releases. The EPA has a database to receive electronic data from licensees. This is currently available for WWTPs.

#### **Summary**

***The administering authority must consider requiring the applicant to monitor the discharge of residual waste water against approval conditions and to carry out impact monitoring of the effect of the residual waste water releases.***

***Pre-design conferencing is encouraged, including addressing any requirement for baseline ecological health monitoring of the receiving waters prior to lodging an application.***

**2.5 Environmental offsets**

**a. Policy issues**

Refer to Section 2.0 for detail. The policy intent is that for:

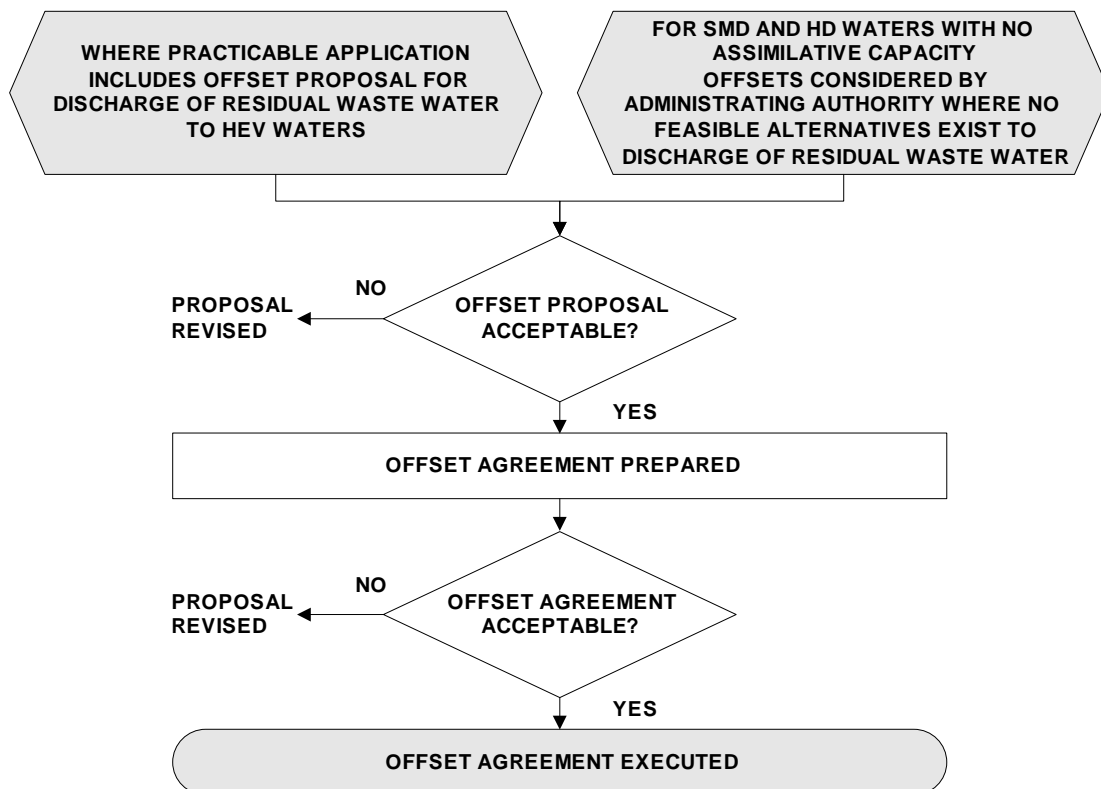

- HEV waters, where practicable the application includes a like kind environmental offset proposal - counterbalancing the discharge of residual waste water (the discharge) from the proposed ERA<sup>15</sup>; and
- SMD and HD waters with no assimilative capacity, environmental offsets (offsets) may be considered by the administering authority where there are no feasible alternatives to residual waste water discharge.

For the purposes of the EPA operational policy, environmental offsets will not apply to SMD waters where assimilative capacity exists. Refer to Section 2.3.4. By definition HD waters have no assimilative capacity.

In accordance with the above, and consistent with the overarching principles of the discussion paper<sup>16</sup> on the proposed Queensland Government Environmental Offsets Policy, the aim of providing environmental offsets is:

- to maintain the biological integrity of HEV waters, by counterbalancing the discharge of residual waste water (the discharge) from the proposed ERA with a like kind environmental offset; and
- to improve the water quality of SMD and HD waters by providing an offset that both counterbalances the proposed residual waste water discharge and provides additional assimilative capacity.

**Figure 8 — Environmental offsets**

Further to the above policy intent, where it is practicable and the discharge is suitable for management via offsets the application should include a like kind environmental offset proposal (offset proposal) that would be

<sup>15</sup> The Australian Government is considering environmental offsets as approval conditions under the EPBC Act when a proposed development impacts on a matter of national environmental significance. When finalised, EPBC Act requirements should be considered in conjunction with this operational policy.

<sup>16</sup> Subject to the finalisation of the proposed Queensland Government Environmental Offsets Policy in 2008, any inconsistencies will be addressed by further review of this operational policy.

considered by the administering authority on a case-by-case basis seeking to deliver a net environmental gain to the receiving waters as a whole.

The consideration of offsets must only occur after all options to avoid, reuse, recycle or adopt other disposal alternatives have been addressed in accordance with the waste management evaluation procedure under the EPP Water, and the discharge is demonstrated to be unavoidable and environmentally acceptable.

Figure 8 above depicts the matters that are detailed in the following sections.

**b. Like kind offsets**

To be of a 'like kind' offsets must be of the same contaminant and chemical form and preferably a point source emission impacting on the same waters as the proposed ERA discharge. To avoid further impairment of waters that have no assimilative capacity for the proposed ERA contaminants, offsets should impact on the same waters as the proposed ERA discharge. Where this is not practicable, offsets to waters in the same catchment would be considered by the administering authority.

Where it is not practicable to secure point source offsets, then diffuse urban offsets (from new and existing urban development) or diffuse rural offsets would be considered by the administering authority. The priority and spatial location of diffuse offsets would be advised by the administering authority during pre-design conferencing, reflecting catchment priorities established under planning processes completed by recognised entities under the EPP Water. Offset proposals must reduce contaminant discharges to a level below individual load limits for point sources and beyond minimum performance standards for diffuse sources.

**c. Net environmental gain**

The offset quantity should seek to deliver a net environmental gain to the water as a whole. Net environmental gain for a water, the subject of discharge from the proposed ERA, is based on a 'nil net discharge' and additionally takes account of the environmental risk and uncertainty and the policy intent for the waters (maintaining natural values or the lack of assimilative capacity and water quality objectives not being met-respectively for HEV and SMD/HD waters.)

**d. Equivalence ratios**

Offset sources are assigned a quantity equivalence (or offset) ratio accounting for:

- environmental risk and uncertainty resulting from the effects of separation distance, attenuation, the nature of the offset (point or diffuse source), performance variation over time, delayed onset time, different chemical forms and bioavailability; and
- the maintenance of the biological integrity of HEV waters and to prevent further degradation and reverse the trend in water quality of SMD and HD waters. The latter aspect would be considered by the administering authority in the context of the whole catchment assessment and the contribution from point source discharges.

For like kind point source offsets emitting to the same water type and effective from the time of the proposed ERA discharge, an equivalence ratio greater than 1 is required.

Equivalence is less likely:

- with increased distance from the proposed ERA discharge location;
- where the offset load reduction is effected in different water types in the same catchment;
- where urban or rural diffuse source offsets are involved; or
- where the timing of offset reductions is delayed from the project commencement date.

Consequently higher quantity offset ratios would be assigned in these circumstances reflecting the increased risk of delivering a net environmental gain, quantified over the project life.

If diffuse rural offsets are included in the offset proposal, the offset should rehabilitate or restore degraded riparian or wetland habitats according to priority locations advised by the administering authority. Other land use management actions that reduce rural diffuse emissions may be considered by the administering authority. Proposals to include urban diffuse offsets from either new or existing urban development should also be according the priorities advised by the administering authority.

The EPA procedural guide *Procedural information for the operational policy waste water discharge to Queensland waters*, provides guidance in determining environmental equivalence through minimum default offset ratios and determining riparian and wetland buffer widths.

**e. Discharge contaminants must be suitable for management by offsets**

Discharge contaminants that are potentially suitable for management by offsets include nutrients (nitrogen and phosphorus), sediment (TSS and TDS), organic carbon, contaminated stormwater or other contaminants where the scientific basis can be demonstrated and the contaminants do not have human health impacts, irreversible environmental impacts or unacceptable biota impacts.

**f. Development application to include an offset proposal**

Where required the development application must include an offsets proposal that meets the acceptability requirements listed below. The onus is on the applicant to provide sufficient information to allow the administering authority to consider whether the offset proposal is acceptable.

**g. Acceptability of offset proposal**

At pre-design conferencing the administering authority would advise on the requirements for an acceptable offset proposal, that must:

- meet statutory, regulatory and planning requirements and be enforceable—through development conditions, covenants or contracts;
- be additional to the consideration of EPP and EP Act provisions, as summarised in Sections 2.1 to 2.4;
- be enduring--offset the impact of the development from commencement and for the period that the impact occurs. Where onset is delayed, offsets must balance any initial shortfall over the project life;
- be suitable and targeted--contaminants must be suitable for management by offsets, be of the same contaminant and chemical form;
- be capable of being supplied and secured by the applicant or authorised agent;
- be appropriately located--apply to the same waters impacted by the proposed residual waste water discharge, or to other water types in the same catchment;
- initially consider point source offsets and then diffuse urban offsets or diffuse rural offsets (involving the restoration of degraded riparian or wetlands buffers) in accordance with catchment priorities as advised by the administering authority;
- seek to achieve a net environmental gain to the receiving waters;
- demonstrate compliance through emissions monitoring and reporting to the administering authority;
- be compatible with any flexible or incentive based mechanisms such as nutrient trading; and,
- address other elements, pending case by case assessment by the administering authority.

***h. Offset agreement***

If the offset proposal is acceptable to the administering authority and the application is approved, the administering authority must include development conditions that require the applicant:

- to secure the offsets proposal through an agreement between the applicant and the administering authority; and
- to execute the agreement before the commencement of site works, that:
  - includes a memorandum of agreement if the offset proposal involves either the State or a Local Government;
  - includes a deed of agreement for private developers; and generally use a financial guarantee, refundable on demonstrated offset establishment;
  - requires rural diffuse offsets to be legally secured with covenants or conservation agreements and addresses the on-going management and maintenance of offset sites, where relevant; and
  - requires the offset to be recorded on the appropriate register.

Other elements may need to be considered, pending case by case assessment by the administering authority.

***i. Financial contribution***

The discussion paper on a proposed Queensland Government Environmental Offsets Policy (QGEOP) provides for financial contributions to be made to meet offset requirements in certain circumstances. The discussion paper outlines several principles that must be complied with for a financial contribution to be acceptable. The use of financial contributions under the operational policy will be considered further upon the implementation of the QGEOP.

**Summary**

***Pre-design conferencing is encouraged to address environmental offset requirements***

### 3. Additional information

#### 3.0 Process for using default EVs and WQOs

Where EVs for the waters have not been specifically set in Schedule 1 of the EPP Water, then, under Section 11(2) of the EPP Water, the WQOs are the set of water quality guidelines (the *Queensland Water Quality Guidelines 2006* and the ANZECC Water Quality Guidelines) that will protect all EVs for the waters.

Where the above guideline values are considered inappropriate for the receiving environment the following provides information on default EVs and WQOs based on water quality guidelines derived from data collected at appropriate local reference sites.

##### a. **Define default EVs**

Information on existing and possible future EVs should be obtained from maps, site inspections, surveys, local knowledge, water abstraction licences, planning documents, scientific studies and monitoring data. It is recommended that any changes to default EVs be agreed upon through consultation with key stakeholders, such as representatives of government, community, and industry groups.

EVs may be discounted if sufficient information can be obtained to justify that this value does not currently exist and is unlikely to exist in the future. It should be noted that the protection of the aquatic ecosystems and visual aesthetics should always be included as an environmental value of any water body. However, the level of aquatic ecosystem protection can vary between water bodies or zones of water bodies.

##### b. **Define default environmental goals**

Locally specific information on EVs can be used to propose environmental goals. These goals define in more detail what needs to be protected and represent major subdivisions of EVs. Examples of typical environmental goals for EVs include protection of specific habitats (such as seagrass beds), protection of specific aquatic species (such as wallum frogs), minimisation of algal blooms, and maintenance of biodiversity or protection of the public during swimming activities.

##### c. **Define default water quality indicators**

The next step involves determining the water quality indicators and concentrations required to protect the identified EVs. This is a technical process to be conducted by the applicant and involves reference to water quality data and guidelines. The indicators and concentrations determined in this step will become the WQOs for the next step of the process.

Water quality indicators may include physical-chemical, biological or toxicant measures applying to a combination of water, sediment and biota. Some sources of information to determine suitable indicators for protection of EVs are included in Table 6 below.

##### d. **Define default WQOs**

To determine default WQOs, trigger values can be taken from published guidelines (for all values) or from local reference data (for aquatic ecosystem protection only). Once the numerical criteria are determined, they should be listed in a matrix of water quality indicators versus EVs for each geographical zone that has different EVs. For some indicators in a particular zone, different guideline numbers may be quoted to protect more than one EV or goal. In these cases, the more stringent guideline should be adopted as the default water quality objective for that indicator.

Reference data for Queensland waterways can be obtained from the EPA, or as listed in Table 6. Guidelines for biological, toxicants and sediment indicators and for primary industry, recreational water quality and drinking water values can be obtained from the ANZECC Water Quality Guidelines. Local reference information may be particularly important in determining the water quality characteristics required to protect local aquatic

ecosystems. This would be the case if there are known unique species, such as acid frogs that require low pH conditions.

Determining default WQOs to protect aquatic ecosystems often requires significant technical input and should be considered as trigger values, below which a very low risk to the environment from that pollutant may be assumed. Default WQOs may depend on the levels of aquatic protection assigned for each zone. Further information on how to determine levels of aquatic ecosystem protection is provided in [Table 3](#).

The *Queensland Water Quality Guidelines 2006* will become a repository for such sub-regional and local information for Queensland waters as it becomes available, and should be referenced for the default WQOs. The ANZECC Water Quality Guidelines will remain important for a range of indicators (for example toxicants and pathogens).

### 3.1 Use of local reference data

The *Queensland Water Quality Guidelines 2006* and ANZECC Water Quality Guidelines recommend using data from local reference sites to derive WQOs. The three main steps in the process are to establish a suitable reference site, collect sufficient data and calculate typical reference ranges and objectives. For further detail refer to Section 7.4.4 of the [ANZECC Water Quality Guidelines](#) (Volume 1.)

**Table 6 — Guideline and reference information for determining WQOs**

EVs of Water	Sources of guideline and reference information
Aquatic ecosystem	EPA website for the Queensland Water Quality Guidelines and physical-chemical reference data.  <a href="#">National water targets online</a> for nutrients, turbidity and salinity.  <a href="#">National Water Quality Management Strategy</a> website for biological, toxicant and sediment guidelines. Fact sheets on biological indicators and groundwater are at the above site.
Recreation and aesthetics	<a href="#">National Water Quality Management Strategy</a> website.  <a href="#">National water targets online</a> for nutrients, turbidity and salinity.  <a href="#">World Health Organisation Guidelines</a> .
Drinking water	<a href="#">Australian Drinking Water Guidelines</a> (NHMRC 2004).
Primary industries	<a href="#">National Water Quality Management Strategy</a> website.
Industrial	<a href="#">National Water Quality Management Strategy</a> website.
Cultural and spiritual	EIS assessments and other site specific information where relevant. Refer also the <a href="#">State Coastal Management Plan</a> .

Reference sites are used to define the condition of a stream without impacts from discharges. They should ideally be in the same stream, a short distance upstream of the proposed discharge being assessed. If monitoring is possible before the discharge commences, a site downstream of the proposed discharge may be appropriate (note that it is not appropriate to use the same waterway to develop water quality criteria if it receives waste discharges or its quality is materially affected by non-point source runoff). If no suitable sites are identified in the stream, sites may be chosen in another local stream with similar hydrological, geological and ecological characteristics.

A list of reference sites for riverine, estuarine and coastal waters is included in the *Queensland Water Quality Guidelines 2006*.

For physical and chemical indicators and toxicants, the ANZECC Water Quality Guidelines recommend a minimum of two years of monthly data to define reference conditions. If objectives are derived from less data, they may be unreliable. Established Queensland or ANZECC Water Quality Guidelines reference conditions are preferred in this case. It is also crucial in researching reference conditions that appropriate quality assurance measures are applied to sample collection, preservation and analysis (refer to the [EPA Water Quality Sampling Manual](#)).

Once sufficient data have been collected, WQOs can be determined from the reference range of the data. This is the range from the 20<sup>th</sup> percentile to the 80<sup>th</sup> percentile of data and represents the typical range that would be expected for that indicator in the absence of the discharge. Most physical, chemical and toxicant indicators only require an upper water quality objective derived from the 80<sup>th</sup> percentile. For pH and dissolved oxygen where low values are also undesirable, lower WQOs are also derived from the 20<sup>th</sup> percentile.

### 3.2 Temporary streams

Temporary streams are defined as streams that do not flow continuously all year round. They include ephemeral streams, which only flow after significant rainfall, as well as intermittent streams, which only stop flowing during extended dry periods. Temporary streams go through a series of hydrological stages, from a wetting stage following rain (including the first flush), through a recessional stage, to a pooled stage or completely dry stage.

Discharge of waste water to temporary streams requires special consideration due to their unique hydrological and ecological characteristics. Such emissions are likely to disrupt the natural ecology and impact the aquatic ecosystem. Continuous or semi-continuous discharges during naturally dry stages should be avoided, and wet weather discharges occur when receiving water flows are sufficient, from a risk based assessment, to achieve the receiving water quality objectives. The nearest upstream gauging station should be used to determine the release period. Feasible alternatives should be investigated such as minimizing the production of waste water, reuse and retention to discharge during wet conditions. Specific mine water disposal issues of a 'one-off' nature would be considered on a case-by-case basis with the administering authority.

Receiving water quality objectives should be based on the most appropriate local reference data collected in the same stream above the discharge or in a similar stream in the area that is not affected by the discharge. Monitoring data should ideally cover the wetting stage as well as recessional or pool stages. In the absence of suitable reference data, default values from the Queensland and ANZECC Water Quality Guidelines should be adopted.

### 3.3 Hydrological impacts

The discharge of waste water may have adverse impacts on the hydrology of temporary and permanent surface receiving waters. The impacts relate to the volume and velocity of discharge relative to natural flows, and may include bed and bank erosion and changes to the particle size distribution of sediments. Other effects may occur on biota where there is insufficient time to complete life cycles due to changed flow regime. As a general guide, modelling of flow characteristics should be considered where the waste water flow would exceed 10 percent of the natural minimum flow of the waterway.

### 3.4 Riparian habitat impacts

Discharge of waste water may adversely affect riparian vegetation. For example, nutrient rich discharges may lead to weed infestation of habitats where vegetation is adapted to a low nutrient regime. Visual recreation is a declared environmental value of a water that likely to be adversely affected if a water way becomes weed infested. Similarly saline groundwater discharged into a freshwater stream or clearing may adversely affect riparian vegetation.

### 3.5 Public health impacts

Protection of public health usually requires that multiple barriers between effluent and drinking water or contact water be in place. The monitoring for typical water quality indicators such as *Enterococcus spp.* is not for pathogenic organisms, but indicators of possible contamination and hence does not necessarily guarantee safe levels. Apart from effluent treatment trains, barriers usually include dilution and significant distances between outfalls and places where potential exposure and water use occurs.

In some cases these barriers may not be present, for example where:

- the effluent is not substantially diluted by a watercourse/ocean prior to public access; and
- persons may come in contact with the effluent (for example, a beach or recreational area); or
- the waters are essentially fresh, which may encourage children to ingest the waters;

then alternative discharge locations should be evaluated, or more specialised public health assessment approaches adopted. Refer to the [Guidelines for Managing Risk in Recreational Waters \(NHMRC 2006\)](#) for further information on assessing suitability of recreational water quality.

### 3.6 Groundwater impacts

Additional considerations exist when applying the guidelines to groundwater, or to water bodies directly or indirectly affected by groundwater. An example of a direct impact is where the groundwater is suitable for drinking. In this case, the guideline values should be applied directly to the groundwater. An example of an indirect impact is where the groundwater is not directly used but the movement of the groundwater impacts on a secondary water body with defined values. In this case it is necessary to consider the values to be protected, as well as the effects of the attenuation zone, the flux rate of the groundwater and any dilution achieved.

## 4. Relevant legislation, intergovernmental agreements and EPA operational policies

Relevant legislation, intergovernmental agreements and EPA operational policies include:

- *Environmental Protection Act 1994*;
- *Environmental Protection (Water) Amendment Policy No 1 2006* — Subordinate Legislation No. 30 of 2006 and its explanatory notes;
- *Environmental Protection (Water) Policy 1997* — Subordinate Legislation No. 136 of 1997, including Sections 15–19 and Schedule 1, and the explanatory notes;
- *Environmental Protection (Waste Management) Policy 2000*, including Part 3 Waste management hierarchy and Part 4 Environmental management decisions concerning waste;
- *Queensland Water Quality Guidelines 2006*;
- *Queensland Water Recycling Guidelines 2005*;
- *State Coastal Management Plan — Queensland's Coastal Plan 2001*;
- *Integrated Planning Act 1997*;
- *State Development and Public Works Organisation Act 1971*;
- *Environment Protection and Biodiversity Conservation Act 2000*;
- *National Water Quality Management Strategy*, including the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000* (the ANZECC Water Quality Guidelines) and the *Australian Guidelines for Water Recycling: Managing Health and Environmental Risks (Phase 1) 2006*;
- Intergovernmental Agreement on the Environment;

- Guidelines for Managing Risks in Recreational Water Quality (NHMRC 2005);
- Agreement under the Council of Australian of Australian Governments Water Reform Agenda;
- International agreements relating to migratory birds and wetlands (Japan-Australia Migratory Bird Agreement (JAMBA) and the China-Australia Migratory Bird Agreement (CAMBA));
- Directory of Important Wetlands Australia;
- *Australian and New Zealand Guidelines for Fresh and Marine Waters 2000* (Volume 2. Appendix 1 Mixing zones adjacent to effluent outfalls);
- EPA operational policy [Licensing waste water releases from existing marine prawn farms in Queensland](#);
- EPA operational policy [Approval of sewage treatment plants including options for use of reclaimed water](#);
- EPA Information sheet [Case study 1 — Licensing discharges from sewage treatment plants](#); and
- EPA Information sheet [Case study 2 — Licensing discharges from sewage treatment plants](#).

## 6. Appendices

### Appendix 6.1: Glossary of terms

**Administering authority** means the administering authority under the EP Act, and will be the chief executive of the Environmental Protection Agency or the Local Government's chief executive officer.

The chief executive of the DPIF has delegated authority for ERAs 3 and 4 (i.e. cattle feedlotting and pig farming). These ERAs have been delegated to the DPIF.

**Applicant** means the applicant for a development approval or environmental authority application. In the context of this operational policy it may also mean employees of organisations contracted by the applicant to assist in the preparation of the application.

**Aquatic ecosystems** is defined in the ANZECC Water Quality Guidelines as the animals, plants and micro-organisms that live in water, and the physical and chemical environment and climatic regime in which they interact. It is predominantly the physical components (for example light, temperature, mixing, flow, and habitat) and chemical components (for example organic and inorganic carbon, oxygen, nutrients) of an ecosystem that determine what lives and breeds in it, and therefore the structure of the food web. Biological interactions (for example grazing and predation) can also play a part in structuring many aquatic ecosystems.

**Assessable development** means development specified under Part 1, Schedule 8 of IPA and includes the carrying out of a chapter 4 activity, other than an activity (or part of an activity) for which a code of environmental compliance has been approved.

**Assessment manager** for an application for a development approval means the Local Government or the entity prescribed under the [Integrated Planning Regulation 1998](#).

**Assimilative capacity** means the capacity of the receiving waters to receive some human induced input of contaminants, or alteration, without causing the water quality to deteriorate so the water quality objectives are no longer met.

**Basin** means the major hydrological drainage basins in the national spatial database provided by Geoscience Australia. Australia is divided into drainage divisions which are sub-divided into water regions which are in-turn sub-divided into river basins. The data, which includes the name and number of each Queensland drainage division, region and river basin, is available at the [Australian Government Geoscience Australia](#) website.

**Best practice environmental management** is defined in the EP Act as the management of the activity to achieve an on-going minimisation of the activity's environmental harm through cost effective measures assessed against the measures currently used nationally and internationally for the activity. Section 21(2) lists measures to be regarded in deciding best practice environmental management of an activity. These measures include, but are not limited to, strategic planning, systems and training, product and process design, public consultation, waste prevention/treatment and disposal.

**Biological integrity** of a water is defined in the EPP Water as the water's ability to support and maintain a balanced, integrative, adaptive community of organisms having a species composition, diversity and functional organisation comparable to the natural habitat of the locality in which the water is situated.

**Catchment** means the total watershed draining into a river, creek, reservoir or other body of water. The limits of a given catchment are the heights of land (such as hills or mountains) separating it from neighbouring catchments. Catchments can be made up of smaller sub-catchments.

**Character**, resilience and environmental values of the receiving environment – see **Resilience**.

**Code of environmental compliance** is a document that contains standard environmental conditions for an ERA, or part of an ERA.

**Complete mixing** means, with reference to mixing zone considerations, the effluent is completely dispersed through the receiving waters.

**Compliance monitoring** means the activity of monitoring the approved discharge and comparing against the specified development conditions. This will generally occur at the discharge pipe. Monitoring can also be required for the receiving environment. Compliance should not be based on the receiving environment monitoring results alone, particularly where other factors in the catchment may contribute to non-compliance.

**Concurrence agency** for an application for a development approval under IPA means an entity prescribed under a regulation as a concurrence agency for the application.

**Contaminant** is defined in Section 11 of the EP Act as a liquid, gas, solid or other forms, that is released into the environment.

**Cultural resources** is defined in the *State Coastal Management Plan 2001* as places or objects that have anthropological, archaeological, historic, scientific, spiritual, visual or ecological significance or value.

**Development application** means an application for a development approval or environmental authority under the EP Act and subordinate EPP Water, IPA or the SDPWO Act for ERAs proposing to discharge of residual waste water to Queensland waters.

**Decision notice** means the written notice issued under IPA by the assessment manager to notify an applicant of the decision for their application in relation to a development approval.

**Development condition** means a condition of a development approval imposed by the assessment manager or concurrence agency under IPA.

**Direct toxicity assessment (DTA)** means the assessment of the combined effects of a number of compounds of unknown identity and concentration in an effluent. DTA provides an integrated measure of the aggregate/additive toxicity of chemicals and accounts for interactions between compounds. The DTA approach has been adapted from conventional toxicity testing approaches using the same methods, species selection and extrapolation to receiving waters (refer to ANZECC Water Quality Guidelines Volume 2, Section 8.3.6).

**Ecological health** is defined in the ANZECC Water Quality Guidelines as the health or condition of an ecosystem. It is the ability of an ecosystem to support and maintain key ecological processes and organisms so that their species compositions, diversity and functional organisations are as comparable as possible to those occurring in natural habitats within a region (also termed ecological integrity). The concept of ecological health is applicable to all complex ecosystems and sustainability is a key element of the concept.

**Ecologically sustainable development (ESD)** is defined in the EP Act as the protection of Queensland's environment while allowing for development that improves the total quality of life, both now and in the future, in a way that maintains the ecological processes on which life depends. The principles for ESD as published in the [National Strategy for Ecologically Sustainable Development 1992](#) are a part of the standard criteria of Schedule 3 of the EP Act and include the precautionary principle. They must be considered when making decisions to grant or refuse an application.

**Environmental authority application** means an application under the EP Act for an environmental authority.

**Environmental offsets** in the context of this operational policy means the positive measures taken to counterbalance the adverse environmental impacts of the development resulting from the residual waste water discharge that cannot be avoided, reused, recycled or otherwise disposed in accordance with the waste management evaluation procedure under the EPP Water. An offset is to be of a like-kind (i.e. the same

contaminant and chemical form), is located outside the development site and seek to deliver a net environmental gain to the waters.

**Environmentally relevant activity (ERA)** means a mining activity or an activity prescribed under a regulation as an ERA (where a contaminant will or may be released into the environment when the activity is carried out and the release will or may cause environmental harm). Schedule 1 of the *Environmental Protection Regulation 1998* lists the non-mining ERAs and section 39 (1) lists the ERAs devolved to Local Government.

**Environmental values (EVs)** is defined in the EPP Water as the qualities of a water that make it suitable for supporting aquatic ecosystems and human water uses (refer also Section 9 of the EP Act). EVs need to be protected from the effects of pollution, waste discharges and deposits to ensure healthy aquatic ecosystems and waterways that are safe for community use. Particular waters may have different EVs. The list of EVs and the waters they can potentially apply to, are tabulated below.

Environmental value	Potentially applicable to:	
	Tidal waters	Fresh (non-tidal) waters
<p><b>Protection of aquatic ecosystems (Aquatic ecosystem EV)</b></p> <p>Protection of aquatic ecosystems, under three possible levels of protection relating to the following three ecosystem conditions:</p> <ul style="list-style-type: none"> <li>• High ecological value waters;</li> <li>• Slightly to moderately disturbed waters; and</li> <li>• Highly disturbed waters.</li> </ul> <p>(suitability for seagrass has also been specifically identified for some waters as a component of this EV)</p>	✓	✓
<p><b>EVs other than aquatic ecosystem EV (called human use EVs)</b></p> <p>Suitability for human consumers of wild or stocked fish, shellfish or crustaceans (suitability for oystering has also been specifically identified for some waters)</p> <p>Suitability for primary contact recreation (for example swimming)</p> <p>Suitability for secondary contact recreation (for example boating)</p> <p>Suitability for visual (no contact) recreation</p> <p>Protection of cultural and spiritual values</p> <p>Suitability for industrial use (including manufacturing plants, power generation)</p> <p>Suitability for aquaculture (for example red claw, barramundi)</p> <p>Suitability for drinking water supplies</p> <p>Suitability for crop irrigation</p> <p>Suitability for stock watering</p> <p>Suitability for farm use</p>	<p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p>	<p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p> <p>✓</p>

**Far-field waters** means, in the context of an initial mixing zone, the waters beyond the specified boundaries of the mixing zone.

**General environmental duty** means the duty that applies to all persons in Queensland to take all reasonable and practicable measures to prevent or minimise environmental harm when carrying out an activity that causes, or is likely to cause, environmental harm. It is defined in Section 319 of the EP Act.

**High ecological value (HEV) waters** is defined in the *Queensland Water Quality Guidelines 2006*, as amended, as waters that have the biological integrity of effectively unmodified (intact) ecosystems or waters that are highly valued.

**Information request** means the additional information given about an application that is supplied by the applicant, at the request of the assessment manager or concurrence agency under IPA. It includes an EIS supplement.

**Intergovernmental Agreement on the Environment** means the agreement made on 1 May 1992 between the Commonwealth, the States, the Australian Capital Territory, the Northern Territory and the Australian Local Government Association.

**Level of protection (for aquatic ecosystems)** is defined in the *Queensland Water Quality Guidelines 2006*, as amended, as the level of aquatic ecosystem condition that the water quality objectives for that water are intended to achieve. The levels of aquatic ecosystem protection are:

- Level 1 High ecological/conservation value aquatic ecosystems — effectively unmodified or other highly valued systems;
- Level 2 Slightly to moderately disturbed aquatic ecosystems — ecosystems in which aquatic biological diversity may have been adversely affected to a relatively small but measurable degree by human activity; and
- Level 3 Highly disturbed aquatic ecosystems — measurably degraded ecosystems of lower ecological value.

**Like kind** environmental offsets means the offsetting load reductions from other point source and diffuse source emissions of the same contaminant (and chemical form).

**Mixing zone (or initial mixing zone)** is defined in the EPP Water as an area where residual waste water mixes rapidly with surface water because of the momentum or buoyancy of the waste water and turbulence of the surface water. Within the initial mixing zone dilution of the effluent contaminants takes place, water quality degradation occurs and certain water quality objectives may be exceeded.

**Multiple Before-After, Control-Impact (MBACI)** means water quality assessment studies that are designed to assess change to the water body from a particular input or disturbance. Such water quality assessments give the greatest confidence that any observed differences between control and impacted sites are not simply a result of natural variation between places or times.

**Near-field waters** means, in the context of an initial mixing zone, the waters immediately adjacent to the specified boundaries of the mixing zone.

**Net environmental gain** for a water the subject of residual waste water discharge from the proposed ERA, means the counterbalancing environmental offsets produce a net environmental outcome -- based on a 'nil net discharge' and additionally accounting for the environmental risk/uncertainty and the lack of assimilative capacity and water quality objectives not being met.

**Offsets agreement** means the agreement between an applicant and the EPA, Local Government or other party that secures the offsets proposal.

**Offsets proposal** means the proposal acceptable to the administering authority that quantitatively offsets, for the life of the proposed development, the discharge of residual waste water from the ERA to achieve a net environmental gain to the receiving waters.

**Peer review** or expert peer review means the commissioning, by the applicant, of a nationally or internationally recognised expert in the relevant discipline, to provide independent expert written assessment of the technical/scientific work of either the applicant, or the applicant's consultant for inclusion in the application.

**Precautionary principle** is defined in the [National Strategy for Ecologically Sustainable Development 1992](#) as where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation. In application of the precautionary principle, public and private decisions should be guided by careful evaluation to avoid, wherever practicable, serious or irreversible damage to the environment and an assessment of the risk-weighted consequences of various options. Decisions to grant or refuse an application must consider the precautionary principle as part of the standard criteria of Schedule 3 of the EP Act.

**Public interest** may be ascribed as meaning the interest of the public as distinct from the interest of the individual(s).

**Queensland Water Quality Guidelines** means the *Queensland Water Quality Guidelines 2006*, as amended, prepared by the EPA.

**Queensland waters** is defined in the [Acts Interpretation Act 1954](#) as all waters that are within the limits of the State or coastal waters of the State.

**Resilience** of the receiving environment means the ability of an ecosystem to adjust or respond to progressive impacts **and** the ability to recover following cessation of the natural or anthropogenic disturbance. Information on both the recovery and response phases is required to **characterise resilience and the sensitivity of the receiving environment**. In particular, information on the recovery phase is crucial because it is the indicator of reversibility or irreversibility of the impact.

**Standard criteria** is defined in Schedule 3 of the EP Act as:

- (a) the principles of ecologically sustainable development as set out in the 'National Strategy for Ecologically Sustainable Development'; and
- (b) any applicable environmental protection policy; and
- (c) any applicable Commonwealth, State or Local Government plans, standards, agreements or requirements; and
- (d) any applicable environmental impact study, assessment or report; and
- (e) the character, resilience and values of the receiving environment; and
- (f) all submissions made by the applicant and submitters; and
- (g) the best practice environmental management for activities under any relevant instrument, or proposed instrument, as follows—
  - (i) an environmental authority;
  - (ii) a transitional environmental program;
  - (iii) an environmental protection order;
  - (iv) a disposal permit; and
  - (v) a development approval; and
- (h) the financial implications of the requirements under an instrument, or proposed instrument, mentioned in paragraph (g) as they would relate to the type of activity or industry carried out, or proposed to be carried out, under the instrument; and

- (i) the public interest; and
- (j) any applicable site management plan; and
- (k) any relevant integrated environmental management system or proposed integrated environmental management system; and
- (l) any other matter prescribed under a regulation.

**Stream order** is a standard means of describing streams. The smallest streams in a drainage network have no tributary streams. These are called first order streams. Two first order streams unite to form a second order stream. Second order streams only have first-order streams as tributaries. Third order streams only have second and first order streams as tributaries, etc. As the order of the stream increases, the discharge increases, the gradient decreases, the velocity increases, and the channel dimensions (width and depth) increase to accommodate the increased discharge.

**Sustainable load** of a particular contaminant means the maximum amount of the contaminant that a water body can receive without exceeding the related WQOs, and therefore adversely affecting EVs.

**Trigger values** means the numerical criteria that if exceeded require further investigation for the pollutant of concern. If not exceeded, a low risk of environmental harm can be assumed.

**Waste management evaluation procedure** in making environmental management decisions about the release of residual waste water from an ERA means, under the EPP Water, the assessment processes for prioritising waste management practices (waste management hierarchy) to achieve the best environmental outcome.

**Waste water treatment plants (WWTPs)** means sewage treatment plants, advanced waste water treatment plants, water reclamation plants and all other synonyms for treatment plants whose primary function is to treat a water based waste stream.

**Waste water** means, under Schedule 2 of the EPP Water, a liquid waste and includes contaminated stormwater.

**Water** means the whole or any part of surface water or groundwater, tidal or non-tidal, and including any river, stream, lake, lagoon, swamp, wetland, unconfined surface water, natural or artificial watercourse, dam, tidal waters (estuarine, coastal and marine waters to the limit of Queensland waters) and underground or artesian water.

**Water quality indicator (for an EV)** is defined in the EPP Water as a property that can be measured or decided in a quantitative way. Examples of water quality indicators include physical indicators (for example temperature), chemical indicators (for example nitrogen, phosphorus, metals) and biological indicators (for example macroinvertebrates, seagrass and fish).

**Water quality objectives (WQOs)** are, the WQOs specified in Schedule 1 of the EPP Water to protect the EVs for waters. WQOs are long term goals for water quality management. They are numerical concentration limits or narrative statements established for receiving waters to support and protect the designated EVs for those waters. They are based on scientific criteria or water quality guidelines, but may be modified by other inputs (for example social, cultural, and economic).

**Water types** means waters with similar characteristics. The water types covered by this document are based on water types established in the *Queensland Water Quality Guidelines 2006*. Water types include coastal waters (open and enclosed), estuarine waters (lower, middle and upper), tidal canals, constructed estuaries, marinas and boat harbours, freshwaters (lowland, upland and dams/reservoirs), wetlands and ground waters. WQOs applying to different water types are outlined in the documents under Schedule 1 of the EPP Water.

## Appendix 6.2: Mixing zone determination

### Matters to be addressed in the development application must include:

#### a. Use of Direct Toxicity Assessment

The development application must demonstrate that the contaminants in the proposed residual waste water discharge are not acutely toxic to aquatic organisms inside the mixing zone or exceed the No Observed Effect Level, or equivalent (for example, the No Observed Adverse Effect Concentration) outside the mixing zone.

Where the proposed residual waste water discharge includes a contaminant(s) for which there is a lack of environmental effects data the development application must include the results of Direct Toxicity Assessment (DTA). Testing may be based on samples from demonstration plant, pilot plant or laboratory scale to complement a literature review.

This information is relevant to DTA of discharged effluent, whether required prior to licensing approval or as part of post-approval monitoring. DTA of effluent is also referred to as Whole of Effluent Toxicity testing.

DTA of an effluent is applicable to discharges that pose a potentially acute toxic exposure risk to aquatic fauna in the receiving environment. Typically, this involves cases where the concentrations of multiple chemical and/or elemental substances in the effluent exceed, or are likely to exceed, the known Toxicant Trigger Values presented in the ANZECC Water Quality Guidelines. The potential for synergistic toxicological effect can also be demonstrated through the use of DTAs. DTA of effluent would generally apply to residual waste water treatment plants that have the potential to receive commercial or industrial effluent as part of the trade waste system, or Advanced Waste water Treatment Plants (AWTPs) that produce a Reverse Osmosis Concentrate (ROC), or other similarly concentrated waste streams.

Specific requirements may include:

- The proponent should submit a DTA program and Toxicity Identification Evaluation (TIE) program for review and approval by the QLD EPA prior to commencement of the DTA program;
- DTA should be conducted on the effluent as it would be delivered to the end-of-pipe;
- The use of toxicity testing for licensing requirements should preferably employ cellular-based (mode of action) methods over whole organism tests where a QLD EPA and [National Association of Testing Authorities](#) (NATA) approved method for those tests exist<sup>17</sup>. This would negate any requirement for animal ethics approval (in most cases), standardises tests for marine and freshwater discharges, and provides more defined information on the form of toxicity;
- DTAs should be conducted on samples that are *representative of the discharge*;
- The frequency of licensed DTAs should initially be on at least an annual basis and in cases where there is seasonal variability in the quality of the effluent, on the effluent that represents the worst-case. Case-specific factors, such as the frequency and volume of the discharge, changing influent or effluent quality characteristics, and the Environmental Values (EVs) of the receiving environment should be taken into consideration when determining the frequency of the licensed DTA requirements for the discharge;
- The test organisms to be used for DTAs are to be chosen in accordance with Section 8.3.6.8 of the ANZECC Water Quality Guidelines, taking into consideration locally occurring species, the location of the discharge and nature of the receiving environment;

---

<sup>17</sup> There are very few validated cellular based/methods currently available. Consequently the great majority of DTA-related bioassays will be Whole of Organisms tests.

- The toxicity tests chosen for the DTA should demonstrate that the effluent is neither acutely toxic within the initial mixing zone, nor exhibit observable chronic (or alternatively sub-lethal) toxicity in the test specimens outside of the mixing zone;
- The toxicity limits derived from the DTA should be reported to the EPA as No Observed Effect Level or No Observed Adverse Effect Concentration (for example NOAEC at 10% effluent concentration);

Applicable TIE procedures, as provided in the approved DTA program, must be undertaken if, following the QLD EPA review of the reported DTA results, the QLD EPA requests in writing that TIEs are required to be performed.

**b. Spatial definition**

The development application must specify the proposed mixing zone; including the location, boundary and area. In cases where the proposed residual waste water discharge is to a river, the percentage of the width occluded or blocked by the mixing zone must also be specified.

The mixing zone boundary may be determined by indicator concentrations in the residual waste water. Where indicator concentrations are predicted to be statistically indistinguishable from the receiving water concentrations, complete mixing has occurred and the mixing zone is presumed to have ended. Only one mixing zone, minimised to the greatest practicable extent may be included in the development application.

Where the assessed environmental risk is low, spreadsheet calculations may be used to establish plume geometry and the dilution of contaminants. This circumstance may include, for example, a proposed discharge involving a small volume of residual waste water containing one or two well-studied contaminants at concentrations only several times greater than the receiving waters.

Commensurate with increased scale and risk, the use of predictive numerical modelling may be required to evaluate mixing processes and impacts in the near-field. Model outputs would include the prediction of the size and behavior of the effluent plume and mixing zone impacts, in both the water column and sediments, over a range of input conditions. The development application must include both the results of numerical modelling and any experimental work for the assessment of impacts.

Predictive numerical modelling may incorporate relevant functional relationships between the contaminant discharge and environmental quality indicators likely to be affected. Where functional relationships are unknown, consistent with assessed environmental risk, additional laboratory or field experiments may be required to understand the likely effects of a discharge (for example to understand the impact of effluent contaminants on benthic communities in marine sediments).

General information on predictive numerical modelling is at [Appendix 6.3](#).

**c. Assessment of no or negligible change to HEV receiving waters**

The development application must address both baseline monitoring of relevant indicators in the near-field, beyond the mixing zone boundary, and predictive impact modelling of the effects of the proposed waste water discharge to demonstrate no or negligible change to the physico-chemical, biological, habitat and flow attributes, above natural variation, in the near-field beyond the mixing zone boundaries. These matters and post operational water quality monitoring requirements are addressed below.

**1. Establishment of baseline condition**

The development application must establish the baseline water quality against which the no or negligible change requirement may be assessed for the natural range of values of physico-chemical, biological, habitat and flow indicators relevant to the proposed ERA.

To characterise the natural condition the baseline water quality monitoring program design should be consistent with the requirements of the *Before* component of a *Multiple Before-After Control-Impact* (MBACI) water quality assessment program (or equivalent assessment program). Refer [Appendix 6.4](#) for MBACI water monitoring experimental design.

The adoption of MBACI water monitoring experimental design would allow the baseline data to be used in the predictive impact modelling of the effects of the proposed discharge to demonstrate no or negligible change in the near-field, beyond the mixing zone boundaries. The data may also be used for post operational compliance monitoring of impacts.

The baseline monitoring design must include at least two near-field monitoring sites adjacent to the proposed boundary of the mixing zone at the impact site. These near-field sites may comprise monitoring sites for the *Impact* location of the MBACI water quality monitoring design. A comparable number of indicators must be monitored at two control sites. Refer [Appendix 6.4](#) for MBACI water monitoring experimental design.

The *Queensland Water Quality Guidelines 2006* recommend collection of a minimum of 24 samples over two years. However, this requirement may need to be adjusted for some biological and habitat indicators (for example indicators that represent an environmental response integrated over a longer timeframe). The two year time period is recommended to allow some measure of inter-annual variation. While two years will not capture the entire range of such variation it must provide some indication of its likely magnitude.

Notwithstanding, the aim is to properly characterise the whole natural range of the selected indicators and maximize the chance of detecting changes in environmental indicators beyond the effect sizes stipulated in the *Queensland Water Quality Guidelines 2006*.

## **2. Prediction of impacts of the proposed ERA—demonstration of no or negligible change**

Having established the natural baseline, the development application must determine the effects of the proposed residual waste water discharge within the initial mixing zone and the near-field immediately beyond the mixing zone boundaries. The no or negligible change test would be satisfied if no significant difference was predicted between the impact site and the two control sites. Operational risks must be addressed.

For technical detail refer to Sections 8.4.2, 8.4.3 and 8.4.4 of the *Queensland Water Quality Guidelines 2006* and Section 3.2.2.1 of the [Australian Guidelines for Water Quality Monitoring and Reporting \(2000\)](#).

Peer review assessment must be submitted with the development application.

## **3. Post operational monitoring**

Development conditions must include the requirement for the applicant to initiate the *After* component of the *Multiple Before-After Control-Impact* (MBACI) monitoring program (or equivalent monitoring program) when the operation is at design capacity, or within 12 months of commissioning, to demonstrate actual compliance with the no or negligible change requirements.

As a guide, 24 sample sets over a 12-month period would be required.

Post operational non-compliance would require the implementation of expedited compliance actions under a *transitional environmental program* or other instruments under the EP Act.

After compliance is demonstrated, on-going water quality monitoring would be required. For some waters and contaminants there is the possibility of achieving this requirement through a contribution to a joint agency/stakeholder ecological health monitoring program.

In the context of continuous improvement the development conditions may also require the preparation and implementation of a *transitional environmental program* to reduce the size of the mixing zone, over time.

## Appendix 6.3: Numerical modelling of environmental impacts and mitigation actions

### ***Choice of model***

The models used should be “fit for purpose” and any work based upon sound science and the best available information. The size and potential risk of the proposed activity will determine the scope and extent of the modelling required.

Predictive tools such as mathematical models are often required when assessing the benefits of various management options (or scenarios). Different types of computer models exist, including hydrodynamic (mixing and flow), water quality (biogeochemical), catchment (export) and groundwater models. The type of model used will depend on the application but generally a combination hydrodynamic and water quality models would be required to simulate receiving waters for decisions involving continuous point source discharges. Catchment models may be used to provide inputs into receiving water models. Hydrodynamic and water quality models are discussed further below.

The choice of hydrodynamic models needs to account for the properties of the discharge, bathymetry, as well as the local mixing conditions in the receiving waters. Some discharges such as brine concentrates from reverse osmosis plants have elevated salt concentrations or mineral processing effluents may have elevated temperatures. Receiving waters may also not be well mixed in all dimensions. For example some estuaries periodically stratify due to salt wedge formation. The model needs to be able to simulate the appropriate density effects or thermodynamic processes for the specific application.

Mixing models used to assess mixing zones are generally hydrodynamic models that simulate the initial dilution of the discharge with the receiving environment. To obtain concentration predictions in the mixing zone, background levels need to be added to the dilution predictions. These may be sourced from far-field models or estimates from monitoring.

Water quality models simulate the water quality processes occurring within waterways. The model of choice needs to include the relevant biogeochemical processes relevant to the contaminants in the discharge and the characteristics of the receiving environment. For example, for carbonaceous matter, the model will need to simulate the heterogenic bacterial activity that breaks down the carbonaceous matter. This process also consumes oxygen and therefore the models need to simulate surface re-aeration and solubility etc. For nutrients, the model will usually need to simulate the growth of algae and primary production.

A technical description of the model should be provided to the EPA covering the history of the model, development history, published articles and details of the conversion of the model into a software package. Details of the experience and training of the model users should be provided. Other requirements include a statement of objective to explain clearly the situation being modelled and the objectives of the modelling study and outputs required from the model. The choice of model should be justified to demonstrate that the model used is suitable for this study including examples of previous applications in similar situations and a conceptual diagram of how the model represents environmental processes.

### ***Data inputs to the model***

The quality of inputs to the model will greatly affect the predicted outcomes. All modelling assumptions should be stated. Initial assessment should include a review of the flows and contaminant concentrations for the proposed activity and other activities to be modelled. These usually form the basis of the scenarios used for the model runs. How well do they represent the likely release in terms of quantity and variability? For constant concentrations and flows, do they represent average or worst-case condition? For what period of time do the worst-case conditions exist, and how frequently? Further data inputs will include initial conditions (particularly for water quality variables) and boundary conditions (tidal flow and elevations at the seaward or upper catchment boundary of the model) of the model and these should be checked. The choice of environmental data such as

rainfall will often be determined by the choice of baseline conditions. It is generally recommended that a statistical dry year is used to assess point source scenarios.

Data used for the modelling study and its source should be clearly defined, including the source, quality assurance and expected errors. Any data manipulation and related assumptions should be detailed. Raw data in electronic form should be made available to the EPA, on request.

***Uncertainty of predictions (calibration)***

The ability of the model to make reliable predictions will strongly depend on the above issues and should ideally be tested through both calibration (adjustment of model parameters to reproduce measured data) and validation (a comparison of predicted values against measured data). Validation is used to demonstrate the model accuracy. Without calibration or validation, model prediction should only be used for qualitative comparisons, rather than quantitative comparisons against water quality objectives. Sensitivity analysis can be used to demonstrate the effect of varying input data or parameters on key output variables. The uncertainty of model predictions should be stated and incorporated into any conclusions made by the applicant.

## **Appendix 6.4: Application of Multiple Before-After Control-Impact design to HEV water assessment**

### ***Introduction***

The purpose of Multiple Before-After Control-Impact (MBACI) sampling designs is to allow a logically and statistically valid assessment of impact in the context of overall environmental variability. A discussion of these designs is available in Underwood (1992). Its application to HEV areas is aimed at determining whether or not the no change criterion has been met following commencement of an activity.

As its name implies, MBACI designs involve collecting samples before and after (BA) an impact may potentially occur to determine the significance of any change. It also involves collecting before and after samples at both control and impact (CI) sites. Inclusion of control sites makes it possible to infer whether changes detected at an impact site are due to the activity under investigation or are simply the result of broader scale natural variations that exist in the environment and are unrelated to the activity. The use of Multiple (M) control sites is to protect against the possibility of drawing erroneous conclusions from results at a single site, where an observed change may also be due the natural cycles occurring at different times in different places.

In scientific methodology, an experimental treatment is applied to some instances (for example fertiliser applied to a field or a new drug given to patients) and the results in these instances compared to those from testing instances where the treatment is absent (for example no fertiliser or a placebo given). An MBACI sampling program is essentially just a scientific experiment in which the experimental treatment is commencement of the subject activity, this being introduced at the project site and but not control sites.

The use of MBACI to assess change within HEV areas is essentially no different to its application elsewhere. It involves identification of adequate control and impact sites and collection of sufficient samples to allow a reasonable chance of detecting a predefined quantum of change. More detailed guidance on these issues with respect to HEV areas is provided below.

### ***Indicators***

The selection of indicators will of course be related and sensitive to the type of activity proposed. As a general guide, indicators must include:

- Indicators that reflect the potential direct physico-chemical impact of the activity in the water column;
- Where applicable, indicators that measure the potential impact on sediments; and
- Indicators that measure the biological response to the activity.

### ***Control sites***

Under the MBACI design, the smallest number of control sites is two. Additional sites will increase the strength of any inferences drawn from the program. The control sites must have similar hydrological, environmental and biological characteristics to the impact sites (in the before period). This may need to be verified through a pilot survey or existing information. In streams, control sites can be sited upstream of impact sites and/or in nearby similar (un-impacted) waterways. In embayments and estuaries, control sites must be located in physically and biologically similar locations but far enough away from the impact area to be unaffected once the activity commences. For small estuaries, use of similar nearby estuaries is preferable if this is practicable. Control sites must not be in a location in which material human activities take place (for example another waste water discharge or channel dredging).

### ***Impact sites***

It is undesirable to replicate the potential impact and thus there will typically be only one impact site. This will be located adjacent to the proposed mixing zone (if any) for the discharge or activity. For water quality assessment,

at least two water quality monitoring sites must be located in the near-field adjacent to the mixing zone at the impact site. In smaller streams, the mixing zone must not be more than one third of the stream width. The near-field may be in the mid point of the stream adjacent and downstream of the mixing zone. In large estuaries or embayments, the near-field zone may be an area within 50m of the boundary of the mixing zone.

### **Number of samples**

Where pre-existing data is unavailable or only available for some indicators, the data from the before phase of the MBACI program will be used establish both the environmental goals for environmental impact assessment and collect the before condition data for the requisite environmental monitoring program. The number of samples required is predicated on the need to achieve a relatively precise definition of existing condition (for the selected indicators) and also to have a reasonable chance of detecting an environmental change occurring at the requisite environmental effect size.

For HEV waters, the management aim is to have no change, but this is not logically or statistically testable. Instead, testing is carried out on the hypothesis that implementing the activity will significantly change monitored environmental variables. If the data do not support this, the null hypothesis that no significant change occurs is accepted.

As the testing is to determine if a change occurs, some minimum detectable environmental change needs to be defined. For physico-chemical water quality indicators, this issue is prescribed through a default method of assessing no change. This method is detailed in the Queensland Water Quality Guidelines in Section 8.4.2.1.1. In brief, during the before period, a minimum of 24 samples must be collected over a period of two years. The two-year time period is recommended to allow some measure of inter-annual variation. While two years will not capture the entire range of such variation it must provide some indication of its likely magnitude. These samples are taken as reasonably practicable at the same time for impact and control sites.

In the after period, an initial collection of 24 samples at each site is required. For continuous discharges or activities, this may need to be undertaken in a period of not less than 12 months. However, for intermittent discharges, the collection of samples must be tailored to the periods of discharge and potential impact.

For biological indicators the default approach described above may not be appropriate. Due to the wide range of possible biological indicators and differing time frames over which biological variables integrate impacts, it is not practicable to provide a prescriptive approach. However, the overriding aim remains the same i.e. to establish the natural range and to be able to detect any change to the natural range of values. The following general guidance is provided.

The before distribution of population values needs to be established with reasonable precision. This means that sufficient numbers of samples must be collected such that reasonably tight confidence intervals<sup>18</sup> (CI) around the estimated population 20/50/80 percentiles are established (CI ranges for the three percentiles must be clearly separated). What constitutes a sufficient number will vary depending on the indicator. The number of samples taken will depend upon natural variability of the chosen indicator(s). The number of samples is a compromise between degree of information gain with increasing replication and time, cost and practicality of increasing sampling effort. However, if the selected indicator is so variable that impractically high numbers of samples are required to achieve the desired outcome, then an alternative indicator must be considered.

The overall objective is to obtain a reasonable estimate of the sample population. A useful technique is to determine the coefficient of variation for increasing degrees of sample replication and sampling effort (for example plot size to estimate which techniques will give a reasonable estimate of variability).

---

<sup>18</sup> *In the default method for physico-chemical indicators, use of the 75<sup>th</sup> rather than 95<sup>th</sup> percentile CIs is recommended. This is similarly recommended for biological indicators. While this leads to an increase in the chance of making Type 1 errors, it considerably tightens up the CI ranges and decreases chance of Type II errors. This is considered a reasonable trade off for these HEV waters*

Sampling in the post-activity period must similarly aim to collect sufficient samples to be able to develop tight confidence intervals around the estimated population 20/50/80 percentiles. The before and after percentiles (with their associated confidence intervals) can then be compared for evidence of change. These percentiles are used so that monitoring may detect changes, which result in shifts in median levels as well as changes in variability.

### ***Use of existing data***

Where there is sufficient existing data from relevant sites for a particular indicator, the proponents may make use of this. The existing data could be used to characterise the environment and establish environmental goals for that indicator(s). If an environmental monitoring program is currently being conducted in relevant places, this data may be used for *before conditions* at control sites and/or the impact site as required.

Where long term data sets are available, information gained from assessment of spatial and temporal variation of an indicator could potentially be used to modify the program. For example, if spatial variation in an embayment was found to be very small for a particular indicator, this might justify a reduction in the number of control sites required to the minimum level.

In numerous waterways in Queensland, stakeholders jointly contribute to and carry out monitoring programs, a practice EPA encourages. A proponent proposing to use such data may need to contact stakeholders to discuss mutually acceptable arrangements for use of data and participation in the program.

An important caveat on the use of existing data is that it must be of proven high quality (i.e. it must have documented Quality Assurance information).

# Conditions for Coal Mines in the Fitzroy Basin

## Approach to Discharge Licensing

### 1. Introduction

This document describes the proposed approach for deriving consistent and appropriate limits and conditions for Coal mine discharges and supports the draft Conditions for Coal Mines in the Fitzroy Basin. The proposed approach aims to minimise the risk of discharges on downstream environmental values of receiving waters and be consistent with current legislation, departmental policy and State/National water quality guidelines. This includes the department's Policy for wastewater discharges to Queensland waters (<http://www.epa.qld.gov.au/publications?id=2272>), the Queensland Water Quality Guidelines (2006) and the ANZECC/ARMCANZ Fresh and Marine Water Guidelines 2000.

### 2. Managing and Characterising Discharges

The first step in assessing a licence proposing a wastewater discharges is to demonstrate the unavoidable need for that discharge. Water is a resource and most mines require substantial amounts of water even if for coal washing and/or dust suppression. A well planned and effective water management system is essential for having sufficient water for the mine during dry times but also having sufficient available storage/free-board to ensure discharges are infrequent and only associated with major storm events. Effective water management requires separate storage of water with varying water quality (such as storage of process water/groundwater, surface water runoff), appropriate infrastructure to accommodate sufficient water storage and appropriate flood design and control.

Where the need for a discharge is demonstrated, the next step is to characterise the wastewater and identify the potential contaminants or associated hazards that may exist. This may require an understanding of historical wastewater quality and/or information on local groundwater quality, geology types, the process/treatment systems involved and the broader water management strategies to be adopted. Currently, salinity (measured as electrical conductivity) and suspended sediment (and pH to a lesser extent) are known to be major water quality issues that require regulation. However, for other characteristics such as metals/metalloids, a legitimate need for regulation it is likely to vary from case to case. However, in the majority of cases there is currently a lack of data. Further information needs to be collected on both wastewater and natural waters. An interim approach is required for setting discharge conditions where water quality data insufficient or not currently available.

### 3. Environmental Values and Ephemeral Streams

After characterising the discharge, the next step requires environmental values and water quality objectives for waterways potentially affected by the discharge to be assessed. Depending on the risks from the discharge (based on its volume, contaminant concentrations, duration and location), this step will need to be done to a lesser or greater spatial extent. With greater risk, environmental values and potential impacts will need to be considered further a field. Environmental values and water quality objectives specified in the Environmental Protection (Water) Policy 1997 must be considered for assessment of all waterways including ephemeral streams. Environmental values for drinking water, stock watering, irrigation, recreation, industrial use and aquaculture may exist downstream of the discharge depending on the discharge location. The guidelines for these environmental values will form the basis of default water quality objectives and will typically not differ between permanent and temporary flowing streams. Various published guideline values are shown in Tables 1 to 6.

Many coal mines are situated in areas of ephemeral/intermittent streams. Current reference-based water quality guidelines for aquatic ecosystem protection (for example, in the Queensland Water Quality Guidelines, 2006) are available only for permanent flowing streams. Nonetheless, it is proposed that these guidelines be used for impact assessment and licensing discharges to ephemeral streams until local reference information becomes available. In addition, in mining areas it is common that background concentrations may be elevated as a result of historical anthropogenic activities and/or natural causes (certainly the case for some metals). Deriving local guidelines and background data is ideally needed but requires sufficient reliable data from monitoring of appropriate sites. Monitoring of ephemeral streams can be challenging given the infrequent and unpredictable nature of flow and the logistical issues involved with accessing and taking event related sampling. There is currently insufficient information for some contaminants as to how levels change with rainfall and flow. For electrical conductivity (EC) it is unlikely that high EC is associated with high flows in contrast to suspended sediment solids or turbidity which is typically elevated during rainfall-associated events.

For many sites there will be an absence of suitable monitoring data. In this case, reference-based guidelines from permanent flowing streams can be used for deriving end-of-pipe limits or trigger values in a precautionary sense, although consideration needs to be given to the above points. Where good local referenced data has been collected, this could be used to derive local reference-based guidelines (typically 75<sup>th</sup> percentiles for median EC, 80<sup>th</sup> percentiles for other reference-based water quality indicators such as pH, turbidity and suspended sediment). Typically at least 18 data points would be required and collected over at least 3 rain events. This may require 2 years of data but is dependant on rainfall frequency. Data from multiple reference sites could be amalgamated in most situations. The Queensland Water Quality Guidelines propose that this approach also be used for metals/metalloids where local reference conditions may be elevated.

## 4. Potential Water Quality Impacts

### *Effects of Salinity on Aquatic Organisms*

Salinity has the potential to cause both acute and chronic toxicological effects in aquatic organisms. There is currently no nationally published toxicity trigger for salinity effects in freshwater environments although there is published information on the effects of salinity on fish, macroinvertebrates and other biota. Thus the recommended approach is to consider the ambient reference-based guidelines as discussed in Section 7. Generally, setting EC limits based on reference-based conditions will address potential concerns with toxicity given that discharge levels will typically be below toxicity thresholds. However, for situations where the stream has assimilative capacity for salinity, it may be possible to have discharge levels at or above toxicity thresholds and through dilution, still meet reference-based guidelines in-stream within a short distance downstream. The general policy position in this case is that the discharge should not result in any toxicity within the initial mixing zone.

Based on the comments by Hart (2008) in a recent review of water quality in the Fitzroy Basin, EC values of less than 1500  $\mu\text{S}/\text{cm}$  are unlikely to affect adult fish although salinity around 1000-1500  $\mu\text{S}/\text{cm}$  may effect early life stages of fish. Macroinvertebrates are unlikely to be affected at below around 1000 $\mu\text{S}/\text{cm}$ . However, for those species adapted to quite low salinity (200-300 $\mu\text{S}/\text{cm}$ ) such as in the south of the Fitzroy Basin, permitting ambient EC concentrations to reach 1000-1500  $\mu\text{S}/\text{cm}$  would adversely affect the community structure, especially at a species level. A conservative trigger used in the ANZECC guidelines (1992) was Total Dissolved Solids (TDS) of 1000 mg/L (this converts to an EC of approximately 1500 $\mu\text{S}/\text{cm}$ ) which receiving waters should not exceed.

## 5. Monitoring of Metals/Metalloids

Metals/metalloids have the potential to cause both acute and chronic toxic effects in the short-term and bioaccumulate to have similar effects in the long-term. The comments on measuring EC in receiving waters are also relevant to applying limits to metals/metalloids in receiving waters. There are few examples of where metals/metalloid limits have been applied end-of-pipe at this stage for coal mines and in most cases, further review of data is required for this to be done. Ascertaining end-of-pipe total and dissolved metal concentrations is recommended. Trigger values for receiving environment monitoring can be applied. Trigger values should be based on relevant environmental values. Conservative trigger values are shown in Tables 5 and 6. For aquatic ecosystem protection (Table 5), the default trigger values are for slightly-to-moderately disturbed (SMD) systems protecting 95% of species. For highly disturbed systems (HDS), ANZECC/ARMCANZ (2000) guidelines recommend adopting SMD levels in the first instance but if there are known high levels naturally occurring, lower lesser level of species protection (such as 90% or even 80%) can be adopted. In some situations such as may occur in highly mineralised mining catchments, natural or historical effects have resulted in even higher background levels for some specific metals/metalloids. Guideline adjustment for metals such as aluminium, copper, iron and zinc is sometimes required. If this is the case, relevant reference data should be assessed to develop locally-relevant guidelines. Where reference data is not available, the use of upstream background could be negotiated as a surrogate where it can be demonstrated that the site has not been influenced by upstream mine or other industry-

related activities that are likely to affect metal/metalloid concentrations. Guideline values for long-term medians can be developed from 80<sup>th</sup> percentiles of relevant reference data.

For aquatic ecosystems, the metals/metalloid limits could be applied to total (i.e. unfiltered) concentrations. If this is the case and the total concentration exceeds the trigger value, a hardness correction can be applied for some metals (cadmium, chromium III, copper, lead and nickel) up to a salinity of 2500 mg/L. See Table 3.4.3 of ANZECC/ARMCANZ (2000) Guidelines as to how to modify the trigger values for hardness for these metals. However, if exceedances still occur or are likely to occur then dissolved (i.e. filtered) metals/metalloid concentrations should also be measured and compared to the limits. Also note that speciation of some metals/metalloids is usually required for aquatic ecosystem protection (e.g. arsenic and chromium). For event-based sampling, measurement of dissolved metals/metalloids will be more problematic and logistically difficult. Samples need to be filtered, refrigerated and analysed within short time frames and this may not always be possible. However, at this stage it is proposed that for protection of aquatic ecosystem, metals are measured for dissolved metals/metalloids given the likelihood for exceedance of the guidelines. On the other hand, given the potential addition costs of speciated metals, it is proposed that all samples be analysed for dissolved total species (i.e. all species of the metal/metalloid, or 'total' species) for licensing. Where risks are identified, further assessment of speciated components may be required. For other environmental values, assessment of total metals/metalloids is needed to compare to guidelines but only for those that are specified in the guidelines. Where there is an absence of other information on potential sources or levels of metals/metalloids, a standard set of metals/metalloids is recommended until such information is made available. This might include characterising of the wastewater in dams or potential sources of wastewater (such as groundwater, waste characterisation or geological analysis).

## 6. Monitoring Receiving Waters

### *Water Quality Monitoring*

Where data is available, background receiving water quality typically does not meet reference-based guidelines for all indicators. This may be due to both differences in natural conditions and from anthropogenic pressures. For this reason, application of guidelines to receiving waters as regulatory limits is likely to result in frequent non-compliance, regardless of whether the mine is discharging or not.

Therefore, receiving water assessments using water quality guidelines should only be used for triggering reporting (or investigation purposes) and not as a primary mechanism for regulation. This could include reporting of long-term medians of data (reference-based guidelines) or reporting against 95<sup>th</sup> percentiles (biological effect data). Maximum trigger values for certain indicators such as EC and pH may be adopted for some near-field monitoring sites as an additional trigger limit.

Reporting against guidelines for environmental values other than aquatic ecosystem protection should also be done where present. Monitoring should be done when the stream is flowing (this flow trigger would preferably be below the discharge flow trigger) and should ideally be done both when the discharge is and is not occurring. Reporting of the receiving environment monitoring program (REMP) could be done.

Water quality measurements of permanent water holes or other specific downstream environmental values are also appropriate where risks of potential impact are identified. For ephemeral streams, the current science suggests that the permanent and semi-permanent water holes need to be protected as a high priority. The concentrations of some water quality characteristics can increase significantly in water holes with time due to evaporation and no flow conditions whilst others decrease in concentration due to changes in water chemistry. Recent mine discharges have resulted in significant changes to salinity profiles within some downstream drinking water reservoirs and therefore impoundments, storages, weirs, dams, etc. should also be monitored given the potential for impacts.

### ***Biological Monitoring***

Biological monitoring (e.g. macroinvertebrate sampling) will generally only be required when the discharge quality and circumstances are such that they are considered to pose a significant risk to the affected receiving waters and associated habitat(s). For instance, this situation might arise when end-of-pipe EC levels are above 1000  $\mu\text{S}/\text{cm}$  and there is a potential for discharge during times of low flow when limited dilution will be occurring. Having said that, biological monitoring should generally be limited to permanent and semi-permanent water bodies that could be potentially impacted by the discharge (for example, within 50km of the discharge), although this will depend on the quantity and duration of discharge. Note that specific ecosystem-type considerations must be taken into account, for example, in some areas of the catchment even short-term wetting of stream beds can play an extremely important role in the ecological cycle of the system and therefore may warrant biological monitoring.

Monitoring of macroinvertebrates must be carefully designed and interpreted in accordance with (i) the Queensland Australian River Assessment System (AusRivAS) Sampling and Processing Manual (August, 2001) and (ii) Chessman (2003), SIGNAL 2 – A Scoring System for Macro-invertebrate ('Water Bugs') in Australian Rivers, Monitoring River Health Initiative Technical Report no. 31, Commonwealth of Australia, Canberra. Monitoring should be undertaken at both impact and control sites. (For further advice on this issue, contact Neil Tripodi on 3896 9241)

### ***Sediment Sampling***

Sediment sampling for toxicants such as metals and metalloids will generally only be required when the discharge quality and circumstances are such that they pose a significant risk to the receiving waters. This may be the case where end-of-pipe metals/metalloid concentrations are significantly above both background/guideline concentrations, discharge has occurred for extended periods of low flow and ANZECC/ARMCANZ (2000) water quality guideline values and background water quality concentrations are exceeded.

Sediment monitoring should be limited to permanent water bodies (such as weirs, water holes etc) that could be potentially impacted by the discharge and that possess the environment where muds (sediment) can accumulate. Sediment monitoring locations may be of similar nature to macroinvertebrate sampling sites (where required).

## 8. Setting End-of-pipe Limits and Links to Natural Flow

Discharging linked to natural flow in ephemeral streams is an essential mechanism for ensuring any discharge has reduced risk of impact on downstream environmental values. The specification of upstream monitoring sites and start/stop discharge triggers based in the environmental flow is also needed to ensure that this occurs. Large dilutions factors (e.g. 1 to 10 or 1 to 20) would generally result in reduced risk of both water quality and flow impacts, assuming the monitoring of the stream and discharge flow are closely linked and controlled.

The proponent should provide adequate data and modelling of the flow in their part of the catchment to determine the most suitable environmental flow trigger under which a discharge of certain maximum volume and flow rate should occur. The frequency or percentage of wet weather days that this will be possible should be assessed under a range of rainfall scenarios.

As part of the approval, the following will be required:

- A minimum natural receiving environment flow ( $\text{m}^3/\text{s}$ ) should be defined at which wastewater discharge can take place – both commencement and cessation. It should be based on historical measurements of upstream natural flow and be designed to avoid times of poor mixing and permit significant post-discharge flushing (such as <20<sup>th</sup> percentile flow). Ongoing access to data from a suitably situated gauging station will be required.
- The maximum discharge rate should be set so that it does not exceed 20% of the minimum natural receiving environment flow rate (i.e. 1:4 – 1 part discharge wastewater : 4 parts natural flow).
- Daily discharge in cumecs ( $\text{m}^3/\text{s}$ ) should be reliably measured and recorded.

An interim approach is required when no background receiving environment monitoring data is available. In this case, the dilution factors are not considered in setting limits as background water quality may exceed guidelines (i.e. there would be no assimilative capacity for any contaminant), although a 20 percent dilution with receiving waters will still be required.

Where discharge cannot be linked to sufficient natural flow, more detailed risk assessment should be undertaken for the waterways potentially affected by the discharge as the likelihood of impact is significantly increased. Any permanent water bodies (e.g. weirs or water holes) or locations of other environmental values potentially affected by the discharge should be identified. For such situations, more stringent water quality limits would typically be required such that it meets ambient or background water quality levels. Long-term continuous discharges in ephemeral streams should be generally discouraged. In the case of some mines in upper catchment areas, an interim approach may be adopted where discharge is permitted with flow measurements downstream. This will ensure that potential impacts are limited to near-field. Such an approach may be suitable for a transitional environmental program (TEP) or where the potential effects are considered low risk.

Monitoring of relevant physical chemical and toxicant indicators in Tables 1 to 6 should be undertaken end-of-pipe when a discharge is occurring, ideally coinciding with receiving environment monitoring. The limits/triggers are derived from ambient water quality data of permanent flowing streams in the Fitzroy and from drinking water guidelines. It is proposed that the EC discharge limit should vary depending on geographical location and whether a drinking water reservoir is located downstream of the discharge. Other issues that should be considered in setting end-of-pipe indicators and limits/triggers include laboratory detection limits and the relevance of the indicators to the activity and the risks involved.

End-of-pipe limits are required for EC and pH. The information is not currently available to set maximum values based on acute toxicity. A conservative approach would be to ensure discharge limits for EC end-of-pipe do not exceed 1500  $\mu\text{S}/\text{cm}$ . Under certain circumstances, a higher end-of-pipe limit may be applicable where large mixing ratios are achieved and discharge is only for smaller durations/volumes. In these cases, the end-of-pipe limit may be increase up to 2250  $\mu\text{S}/\text{cm}$ . The need for this would need to be demonstrated. The pH limits would ideally be between 6.5 and 8.5 when linked to 1:4 dilutions. Higher pH limits (say  $\leq 9.0$ ) end-of-pipe may be negotiated where appropriate dilution will be achieved. Limits for suspended solids concentrations can be negotiated with mines for sediment based on expected sediment removal from settling. Turbidity levels should be measured with the view of setting a relevant limit when sufficient background data is obtained.

In terms of metals/metalloid measurements end-of-pipe, it is recommended that no compliance limit be applied to this end-of-pipe monitoring unless adequate receiving environment data is collected and reviewed. However, trigger limits can be proposed for those metals/metalloids that currently have ANZECC/ARMCANZ (2000) trigger values for freshwater. Such trigger limits, if triggered, would firstly require a comparison of down stream water quality to trigger values, if exceeded, and then a comparison should be made to reference site data. If values are within local reference levels, no further action should be required.

There is a range of other indicators that may be monitored and regulated end-of-pipe (and in receiving waters). These include nutrients (ammonia, nitrate, total nitrogen, total phosphorus, filterable reactive phosphorus, phosphate, chlorophyll-a), sulphate, total hydrocarbons, fluoride and pathogens to mention only a few. Nutrients should be monitored where these are likely to be high in the discharge as a result of the activity, for example, where a sewage treatment plant is adopted or where there is a source of nutrients in the process. Ammonia and nitrate are potential toxicants (with toxicant trigger values) while total nitrogen, total phosphorus, ammonia, organic nitrogen, oxidised nitrogen, and filterable reactive phosphorus are indicators relating to potential eutrophication effects (and have related ambient water quality guidelines). Sulphate is currently regulated as a result of potential effects on drinking water (human and stock). Sulphate has no aquatic ecosystem trigger value although can change the interactions of other water quality contaminants. There are also no aquatic ecosystem guidelines for total petroleum hydrocarbons (TPHs) or polycyclic aromatic hydrocarbons (PAHs) other than naphthalene but this may be required to be monitored where mechanical workshops or petroleum-based chemicals/fuels are used on site.

## 9. Receiving Environment (RE) Monitoring and Triggers

Monitoring of all indicators listed for relevant environmental values in Tables 1 to 6 should be undertaken in the receiving waters at upstream and receiving environment monitoring points. Metals/metalloids as shown in Table 5 (and Table 6 if relevant) should also be monitored at upstream and downstream receiving environment monitoring points, at least until time where sufficient data is available to revise suitable monitoring indicators. Ideally, both total and dissolved metals should be monitored in the receiving environment relevant to the environmental value that the indicator relates to, e.g. total arsenic is required for assessment against drinking water guidelines.

Ideally, any associated local receiving environment monitoring program should include at least one far-field monitoring point situated much further downstream to represent post-mixing water quality. Note that the far-field monitoring point may be off the mining lease but should remain located within the nearest major flowing stream – this monitoring point should not be assessed for compliance purposes (or maximum triggers). A reference site un-impacted by mining activities (e.g. no mines within 20km upstream) should be identified and monitored for the sub-catchment. In situations where this is not possible, the least affected site, or unaffected site from another nearby sub-catchment should be identified for the purpose of collecting reference or “background” data. Collaborative monitoring programs involving more than one mining company may be applicable for monitoring such sites for local creek catchments.

Upstream and downstream receiving environment monitoring should occur during all flow events, not just during periods when discharges are taking place. This requirement is necessary for a number of reasons:

- To allow for condition assessment of these waterways
- To allow for potential assessing of impacts before and after discharge
- To allow assessment of background to assist with limit setting

Where end of pipe compliance limits apply for physical chemical indicators and are considered low risk, receiving environment monitoring and reporting should be based on long term assessment of consecutive measurements over a twelve month period and compared to ambient water quality objectives in the Queensland Water Quality Guidelines (2006) and background water quality.

Where end-of-pipe limits are considered to pose some potential risk to receiving waters, trigger values can be applied to sites immediately downstream from the discharge. The trigger values would generally be more stringent than end-of-pipe conditions but be achievable. For example, based on available information a receiving environment maximum trigger of 1000  $\mu\text{S/cm}$  EC is proposed for near-field monitoring sites. Trigger values for metals/metalloids would typically be ANZECC/ARMCANZ (2000) toxicant trigger values for slightly moderately disturbed systems until sufficient reference data becomes available to review these limits.

Exceedance of these trigger values during discharge should require an in accordance with the ANZECC and ARMCANZ 2000 methodology. Where downstream water quality is within reference data, no further action should be required.

## 10. Modifying Limits and Triggers

Changes to compliance limits and trigger values may be appropriate where adequate and relevant reference monitoring data is made available and assessed as per the allowance in ANZECC/ARMCANZ (2000) and additional information. A reference site can be defined as a site without mine impacts (e.g. no mines within 20km upstream) for the sub-catchment with other requirements as per Appendix C in the QWQG (2006). In some cases it may be the least impacted site, or an unaffected site from another adjacent sub-catchment. An adequate number of valid data points are required to provide a reasonable confidence limit around the percentile based trigger values/guidelines. For example to develop an 80<sup>th</sup> percentile guideline, a minimum of 18 samples is required to provide a 95% confidence level. Ideally,

samples should be taken from multiple (minimum 3) flow events over at least a one to two year period.

The objective of water sampling for meta/metalloid concentrations discussed above is to help form an acceptable data set to allow site specific license limits or trigger values to be set for end-of-pipe and receiving waters. Elevated background levels of some metals such as aluminium, zinc, iron and chromium have been observed in the Fitzroy Basin.

Where assimilative capacity has been identified as part of monitoring, additional allowance may be incorporated into discharge limits.

## Definitions

**Background** – In terms of water quality, background would typically be obtained by sampling upstream of the mining activity in times of natural flow. Background should not include times of discharges from other mines upstream or times of no flow.

**Reference** - A reference site is a site whose condition is considered to be a suitable baseline or benchmark for assessment and management of sites in similar waterbodies. The condition of the site is reference condition and values of individual indicators at that site are the reference values. Most commonly, reference condition refers to sites that are subject to minimal/limited disturbance. The key criteria quoted in the Queensland Water Quality that is applicable for most mining areas in the Fitzroy is that there is no major extractive industry (current or historical) within 20km upstream. Monitoring must occur when the stream is flowing.

**Adequate Data** – The Queensland Guidelines recommend a minimum of 18 samples collected over at least 12 months for estimates of 20th or 80th percentiles at a site. For 50th percentiles a smaller minimum number of samples (~ 10–12) would generally be adequate. For ephemeral streams, more than one sample should be taken for each flow event and all flow events in the period should be sampled.

**Table 1. Reference-based EC guidelines for the protection of aquatic ecosystems in the Fitzroy Catchment (Qld Guidelines 2007). Units in  $\mu\text{S}/\text{cm}$ .**

Sub catchment	95 <sup>th</sup> Percentile Guideline	90 <sup>th</sup> Percentile Guideline	75 <sup>th</sup> Percentile Guideline*
Fitzroy North	1400	1250	720
Fitzroy South	650	510	340

\* guideline should be compared to median of long term data set.

**Table 2. Guideline Values for EC for other values**

	<b>TDS (mg/L)</b>	<b>EC* (µS/cm)</b>
Drinking Water	500	750
Irrigation**		1100
Stockwater***	2400	3600

\* using theoretical conversion  $\text{mg/L TDS} = 0.67 \times \mu\text{S/cm EC}$ ;

\*\* most stringent field/grass croop trigger - for corn in clay (depends on crop and soil types);

\*\*\* for dairy cattle, poultry trigger of 2000mg/L TDS

## 1. Purpose

The purpose of this document is to provide guidance to decision makers and information on the existing legislative framework to ensure that the disposal of Coal Seam Gas (CSG) water to Queensland waters, including surface and ground waters, is managed to avoid or minimise environmental harm. This includes the scenarios where CSG water is:

- Considered as waste water and disposed of to Queensland waters (including surface waters, and groundwaters via aquifer re-injection or re-charge); or
- Approved for re-use and is being transported and/or stored in waters or returned to waters via overland flow or aquifer recharge.

CSG water under the EP Act s310D (7) means underground water brought to the surface of the earth or moved underground in connection with exploring for or producing coal seam gas. The 'Coal Seam Gas Water Management Policy' provides information on the activity and the department's position with regard to the preferred options for the management of CSG water. The options for disposal of CSG water currently include injection into natural underground reservoirs or aquifers of equal or lesser water quality, direct use of treated CSG water and/or discharge of CSG water to surface waters. The disposal of CSG water directly to surface waters is not a preferred management option. Where injection is technically and economically feasible, operators should inject treated water into aquifers that are under developmental stress and/or are at risk of adverse impact from CSG activity, as a first priority for the use of treated CSG water.

## 2. Scope

This document is a guideline which outlines, and provides some interpretation of the broad statutory requirements, guidelines and supporting documents as they are relevant to the management of CSG water to protect environmental values. Future versions of this guideline document will include additional reference to the following areas:

- Monitoring and reporting standards;
- Approach to cumulative impacts; and
- Mapping the Department of Environment and Resource Management's roles and responsibilities.

## 3. Statutory Requirements and Supporting Documents

The statutory bases for managing CSG water discharged to Queensland waters along with supporting documents linked to these statutes are primarily as follows:

### State Legislation

- *Environmental Protection Act 1994* (EP Act). The object of the EP Act is to 'protect Queensland's environment while allowing for development that improves the total quality of life, both now and in the future, in a way that maintains the ecological processes on which life depends (*ecologically sustainable development- ESD*)'. Chapter 5A of the EP Act provides for environmental authorities for petroleum activities which includes CSG activities. The supporting documents include:
  - Coal Seam Gas Water Management Policy

- Guideline: Preparing an Environmental Management Plan for Coal Seam Gas activities
  - Guideline: Model conditions for level 1 environmental authorities for coal seam gas activities
  - Operational Policy: Waste water discharge to Queensland Waters
- *Environmental Protection Regulation 2008* (EP Reg). This is subordinate legislation made under the EP Act to regulate the protection of the environment.
  - *Environmental Protection (Water) Policy 2009* (EPP Water). The purpose of the EPP Water is to 'achieve the object of the EP Act in relation to Queensland waters'. Environmental values and water quality objectives are scheduled in this policy. The supporting documents include:
    - Monitoring and Sampling Manual 2009
    - Queensland Water Quality Guidelines 2009
  - *Environmental Protection (Waste Management) Policy 2000*. The object of this policy is to achieve the object of the EP Act in relation to waste management. The policy provides a waste management hierarchy to be applied to the management of CSG water, and principle for identifying environmental protection commitments, objectives and control strategies. The supporting documents include:
    - Guideline: Approval of coal seam gas water for beneficial use
  - *Water Act 2000*. To advance sustainable management and efficient use of water and other resources by establishing a system for the planning, allocation and use of water. Water Resource Plans (WRPs) and Resource Operation Plans (ROPs) are developed under the Act.

#### Commonwealth Legislation

- *Environmental Protection and Biodiversity Conservation Act 1999* (Cth). This Commonwealth Act provides a legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places - matters of national environmental significance. DERM is not the administering authority for this legislation.
- Murray Darling Basin Agreement - Schedule 1 of the *Water Act 2007* (Cth). The purpose of the agreement is to 'promote and co-ordinate effective planning and management for the equitable, efficient and sustainable use of the water and other natural resources of the Murray-Darling Basin, including by implementing arrangements agreed between the Contracting Governments to give effect to the Basin Plan, the *Water Act* and State water entitlements.' DERM is not the administering authority for this legislation.

#### **4. DERM as an Administering Authority**

Proponents will be required to meet all relevant statutory requirements as identified in the State and Commonwealth legislation. However, DERM is the administering authority when assessing and conditioning an environmental authority (EA) under the EP Act for discharging CSG water to Queensland waters. The administering authority must comply with any relevant regulatory requirement; consider standard criteria; and any additional information. The EP Reg s5 establishes a range of matters to be considered for environmental management decisions. S51 (1) (a) states that:

- (1) *The administering authority must, for making an environmental management decision relating to an activity, consider the following matters—*
- (a) *each of the following under any relevant environmental protection policies—*
    - (i) *the management hierarchy;*
    - (ii) *environmental values;*
    - (iii) *quality objectives;*
    - (iv) *the management intent;*

Section 13 of the *Environmental Protection (Water) Policy 2009* (EPP Water 2009) states the management hierarchy for an activity that may affect a water. The release of waste water or contaminants must be dealt with according to the stated hierarchy of preferred procedures under section 13 (2) (a) to (d).

Environmental values and water quality objectives for waters are addressed under Part 5 of this Guideline.

Section 14 of the EPP Water 2009 states the management intent for waters subject to an activity that involves the release of waste water or contaminants to the waters. The management intent depends on the level of aquatic ecosystem protection for the waters.

In order to protect the environment it is necessary to define any related impact. Under the EP Act, environmental harm is defined as any adverse effect, or potential adverse effect (whether temporary or permanent and of whatever magnitude, duration or frequency) on an environmental value, and includes environmental nuisance (s14). CSG activities are classified as either Level 1 or 2 activities (defined in Schedule 5 of the EP Reg) based on the risk of environmental harm being caused by the activities. Assessment processes for Level 1 activities are more comprehensive and may require the completion of an environmental impact statement (EIS).

An EA application for a Level 1 CSG activity must be accompanied by an environmental management plan (EM Plan) to demonstrate that the applicant has considered all potential impacts of the proposed petroleum activities. EM Plans must be prepared in accordance with s310D of the EP Act. The department has developed the guideline 'Preparing an environmental management plan for coal seam gas activities' to provide information to proponents on EM Plan preparation. The EM Plan as it refers to environmental values must among other things:

- (b) *describe each of the following—*
  - (iv) *the environmental values likely to be affected by the activities;*
  - (v) *the potential adverse and beneficial impacts of the activities on the environmental values; and*
- (c) *state the environmental protection commitments the applicant proposes for the activities to protect or enhance the environmental values under best practice environmental management; and*
- (d) *contain enough other information to allow the administering authority to decide the application and conditions to be imposed on*

*the environmental authority (chapter 5A activities); and*

The guideline document 'Model conditions for level 1 environmental authorities for coal seam gas activities' provides a set of model conditions that can form the basis of environmental protection commitments given in the EM Plan and EA.

## **5. Environmental Values**

Environmental values are defined in EP Act s9. For Queensland waters they are the aquatic ecosystem and human use values in s6 (2) of the EPP Water—

- (a) for high ecological value waters—the biological integrity of an aquatic ecosystem that is effectively unmodified or highly valued;*
- (b) for slightly disturbed waters—the biological integrity of an aquatic ecosystem that has effectively unmodified biological indicators, but slightly modified physical, chemical or other indicators;*
- (c) for moderately disturbed waters—the biological integrity of an aquatic ecosystem that is adversely affected by human activity to a relatively small but measurable degree;*
- (d) for highly disturbed waters—the biological integrity of an aquatic ecosystem that is measurably degraded and of lower ecological value than waters mentioned in paragraphs (a) to (c);*
- (e) for waters that may be used in primary industry or for agricultural purposes, the suitability of the water for—*
  - (i) agricultural use; or*
  - (ii) aquacultural use; or*
  - (iii) producing aquatic foods for human consumption;*
- (f) for waters that may be used for recreation or aesthetic purposes, the suitability of the water for—*
  - (i) primary recreational use; or*
  - (ii) secondary recreational use;*
- (g) for waters that may be used for drinking water—the suitability of the water for supply as drinking water;*
- (h) for waters that may be used for industrial purposes—the suitability of the water for industrial use;*
  - (i) the cultural and spiritual values of the water.*

If an environmental value for particular water has not been scheduled in Schedule 1 of the EPP Water then s7 states the following:

- (3) For particular water, the indicators and water quality guidelines for an environmental value are—*
  - (a) decided using the following documents—*
    - (i) site specific documents for the water;*
    - (ii) the Queensland Water Quality guidelines;*

- (iii) *the Australian Water Quality guidelines;*
- (iv) *other relevant documents published by a recognised entity;*

For the management of ground waters, documents that would be identified under s(3) (iv) above include the National Water Quality Management Strategy (NWQMS) Australian Guidelines for Water Recycling: Managing Health and Environmental Risks (Phase 2): Managed Aquifer Recharge. While it is recognised that this guideline does not specifically deal with injection of CSG water, there are a number of elements that may apply to injection of brine and treated and untreated CSG water. Therefore wherever applicable, this NWQMS guideline may be considered the basis for assessment of injection proposals.

In establishing and scheduling environmental values (EVs) for waters in the EPP Water, and the subsequent derivation of water quality objectives (WQOs) to protect the values, the process is independent of any release to receiving waters. In other words the environmental values are determined before any release to waters is considered, and is a completely independent process. Under s 8 of the EPP Water, the environmental values for a particular water are protected if the measures for all indicators do not exceed the water quality guidelines stated for the indicators. This encompasses a commonly used range of some 20 water quality guidelines but also extends to all measures for all indicators to protect the environmental values. The EPP Water defines water quality guidelines as 'quantitative measures or statements for indicators, including contaminant concentration or sustainable load measures of water, that protect a stated environmental value'. If the environmental values for an area have not been scheduled the ecological assets included in WRPs, which are developed under the Water Act, may also provide information. WRPs are recognised as other relevant documents as per s7 (3) (iv) of the EP Act.

## **6. Environmental Authorities**

There are two key areas of risk to aquatic ecosystem and human use environmental values from the discharge of CSG water to Queensland waters that require management to ensure their protection:

1. Changes to water quality (including physical, chemical and biological characteristics); and
2. Changes to in-stream and groundwater hydrology (including associated ecosystem impacts due to the volume and timing of discharges).

A precautionary and adaptive management approach is advocated to address these areas of risk, which is consistent with the objectives of the EP Act and the EPP Water.

EAs are required under chapter 5A of the EP Act for environmentally relevant activities, including for petroleum activities. The administering authority may impose the conditions on the environmental authority (chapter 5A activities) it considers are necessary or desirable (s309z). For an EA to discharge CSG water to waters conditions to meet specified water quality and hydrological requirements to protect environmental values would be included.

### **6.1 Water Quality**

#### Background

CSG water at all stages of the process should be fully characterised, this includes the quantity and quality of the water before and after production and treatment and at the point of discharge. This is consistent with the risk-based approach adopted in the National Water Quality Management Strategy (NWQMS). The NWQMS Guidelines for Fresh and Marine Water Quality, EPP Water and the Qld Water Quality Guidelines 2009 state that locally applicable guidelines for indicators should be used in preference to less specific regional and national guidelines. This requires a detailed risk assessment to be undertaken, and indicators of concern to be identified. The indicator for an environmental value is a 'physical, chemical, biological or other property that can be measured or decided in a quantitative way' (EPP Water s7(1)). Indicators are then conditioned in the EA (EP Act Ch 5) for the activity. If detailed characterisation is not undertaken, conditioning in the EA will be necessarily more stringent. This is consistent with the precautionary approach.

The general characterisation of CSG water quality as reported in the literature has identified a range of possible risks to environmental values. These values for aquatic ecosystems and human use (including suitability of the waters used for primary industry or agricultural purposes, primary and secondary recreation, drinking water, industrial purposes and cultural and spiritual values) are enhanced or protected by maintaining the water quality objectives (WQOs) for the receiving waters. To provide for appropriate environmental management, WQOs are identified to protect environmental values and are then scheduled in the EPP Water. In the absence of scheduled WQOs, water quality guidelines for all indicators that will protect environmental values for the water are used. To achieve this legislative requirement, any release of CSG water to receiving waters must be conditioned in accordance with s51 (1) (a) of the EP Reg.

### Implementation

The required water quality for CSG water discharged to Queensland waters will be conditioned through an EA issued under the EP Act and in accordance with section 51 of the EP Reg (see Attachment 1).

As previously stated, under the EPP Water, the environmental values (values for aquatic ecosystem and human use) for particular water are protected if the measures for all indicators do not exceed the water quality guidelines stated for the indicators. To achieve this outcome, any proposed release is required to be assessed, in part with s51 of the EP Reg. Monitoring, reporting and incident management requirements will also be identified in the EA. A detailed risk assessment is to be undertaken using appropriate CSG water characterisation data. This will allow for parameters of concern to be identified and then included in the EA conditions for the activity.

To protect environmental values the quality of CSG water discharged to waters will need to be within an acceptable upper and/or lower bounds to ensure the WQOs required to protect the aquatic ecosystem health and relevant human use environmental values are achieved. This is of particular importance in the likely scenario of CSG water being treated with reverse osmosis and then discharged to ephemeral systems where at times CSG water is likely to flush and / or fill natural waterholes and make-up 100% of the flow. Attachment 2 discusses potential issues associated with discharging large quantities of CSG water to waters.

If CSG water is to be reinjected to an aquifer there are some key components of the injection proposal risk assessment to protect the environmental values and the groundwater resource values associated with the water quality impact zone and hydraulic impact zone where fluid is proposed to be injected. These components include:

- a) the establishment of baseline data and hydrogeological conceptualisation of the aquifer;
- b) the identification of potential hazards of re-injection and related activities and their inherent risk; and
- c) the identification of injection standards (including proposed limits for contaminants of concern), requirements, preventative measures and residual risk.

Risk assessments of proposed discharges of CSG water to waters must be sufficient to demonstrate that the regulatory requirements of section 63(2) of the *Environmental Protection Regulation 2008* will be met. A guiding framework for risk assessments is provided in relevant NWQMS guidelines.

The requirements for monitoring programs and reporting should be included in the conditions of the EA for the activity. The monitoring programs and reporting should be designed to ensure EA conditions are being met and that strategic data collection to enhance the understanding of cumulative impacts is undertaken. The collection of this data will ensure that adaptive management to protect environmental values occurs. Specific monitoring programs include:

- Baseline conditions of the receiving environment: For surface waters ambient monitoring in accordance with the *Queensland Water Quality Guidelines (2009)*;
- Quality of the CSG water discharged; and
- Receiving environment impacts: This should include assessment of the impact of the release on the receiving waters with a requirement to implement a multiple before-after control impact design to assess changes as per the Australia New Zealand Guidelines for Fresh and Marine Water Quality (2000).

These requirements are further outlined in Schedule I of the guideline 'Model conditions for coal seam gas activities'. Specific requirements of the Receiving Environment Monitoring Program (REMP) are found in Appendix 1 (BA15-BA18) of the same document. Monitoring should be undertaken in line with the EPP Sampling Manual.

#### Implementation to align with Water Safety (Supply and Reliability) Act 2008 requirements

Legislative reforms to the *Water Safety (Supply and Reliability) Act 2008* (WS (S&R) Act) are proposed to provide purpose built rigorous requirements for CSG water which has a material impact on town drinking water supply sources, in order to protect public health. In the scenario where CSG water directly or in-directly augments a town drinking water supply source and there is a material impact on the supply source, the proposed reforms in the WS (S&R) Act will require the development of a Recycled Water Management Plan (RWMP). The regulated entity will be required to prove that the treatment process and supporting management arrangements will consistently deliver water of the quality required. Where there is direct supply of treated CSG water to a drinking water service provider for the use in a town drinking water supply source, then the drinking water service provider will also require a Drinking Water Quality Management Plan.

CSG water quality standards will be prescribed by Queensland Health (QH) under the *Public Health Regulation 2005*. This is currently being developed and in the interim, the regulator will set the water quality standard as part of the RWMP consistent with the standard prepared by QH.

If there is no material impact on a town's drinking water supply source, then there may be an exclusion from the requirement for a RWMP (for defined circumstances in a regulation for

discharges into an aquifer or if these are not applicable, then through a regulator's exclusion decision and attached conditions).

The process under the EP Act, EP Reg and EPP Water to protect environmental values (including the suitability of the water for supply as drinking water) through conditions in the EA for the activity will also apply. This means that there will be co-regulation of the activity – both under the EP Act and the WS (S&R) Act. Consequently standards may be imposed under the EP Act as well as under the WS (S&R) Act. If there are different values for a particular indicator, then the holder of the EA/RWMP will need to meet the most stringent of the requirements. To make certain that there are no inadvertent conflicts in the EA conditions and RWMP conditions, DERM Project Managers will ensure that a detailed risk assessment and adaptive management process is undertaken, and that through feedback processes any inconsistencies are identified early and addressed. See Attachment 2. for a discussion on these issues. Conditions in the EA and RWMP will require notification to the relevant administrator of each Act, if the particular values in the EA or RWMP are triggered.

Until the new regulatory framework under the *Water Supply (Safety and Reliability) Act 2008* commences, the regulatory requirements under the EP Act, will be used to regulate CSG water which impacts on town drinking water supply sources.

## 6.2 Hydrology

### *Background*

Discharge of water to a watercourse is not by default an environmental benefit, as ephemeral streams naturally have periods of dryness as well as periods of wetness. WRPs, under the *Water Act 2000*, are fundamentally designed for sustainable allocation and management of the water resources in the catchment. The management rules in the plan are tailored to minimise the impact of water extraction on the flow patterns that are of most importance to a WRP's ecological assets.

The environmental flow indicators of the WRP are primarily designed to determine how much water could be extracted from the watercourse. In assessing for the protection of the environmental value for aquatic ecosystems, it is not enough to assess if Environmental Flow Objectives (EFO) in Water Resource Plans (WRP) are met. This is because the EFOs are designed as a reference check when allocating water for extraction (which is a 'drying' action) and are not designed as a reference check when approving a discharge (which is a 'wetting' action).

Releases to receiving surface waters need to be regulated to protect environmental values. A water's flow supplemented with CSG water may be at most equivalent to but not in excess of a DERM approved pre-development flow regime. An example of this would be that wetting of the flow regime beyond 'naturalness' for an ephemeral stream would not be acceptable. It is critical that key ecological assets and aquatic ecosystem values are protected from artificial discharges to waters.

The underlying intent of maintaining or moving towards the natural flow regime in surface waters is to:

- Avoid localised erosion of bed and banks (including re-suspension of sediments and riparian zone erosion) and impacts on riparian ecosystems;
- Maintain natural variability in the flow regime. A single release rate will reduce the small scale variability patterns which contribute to maintaining the biological integrity

- of a system such as stream habitat, wetting on macrophyte beds, inducing fish movement, entraining organic matter, scouring and primary production;
- Mimic natural seasonality (timing), frequency and duration of events of different magnitudes that support and trigger natural ecosystem processes (eg. nutrient cycling, migration and spawning cues, etc.); and
  - Follow natural attenuation patterns, avoid bank slumping, maintain macroinvertebrate communities and minimise fish stranding, etc.

### Implementation

The discharge strategy for CSG water discharged to waterways will be conditioned through the EA issued under the EP Act.

If the CSG discharge proposal is part of a beneficial re-use (as defined in *Environmental Protection (Waste Management) Policy 2000*) scheme, an amendment to the applicable resource operations plan may be required (e.g. water sharing rules, dam operating rules) to ensure there are no impacts on other entitlements.

CSG water discharges need to be managed to mimic seasonal flow volumes and allow for periods of low and no flow. A simplified example of this would see the discharge of larger volumes of CSG water during periods of higher natural flow and lower or nil discharges during naturally low and no flow periods. CSG water discharges should meet these variable flow requirements with the conditions incorporated in the environmental authority. These conditions may include volumetric release limits over time periods including per day or season, with modelling of pre-development flows using the Integrated Quality and Quantity Model as a guide in their calculation, and including the key ecological assets identified in the WRP process for the waters.

When CSG water is discharged to waters as part of a Water Supply Scheme or beneficial use approval, it is still necessary that the environmental values are protected.

## **7.0 Adaptive Management and Cumulative Impacts**

To ensure that the conditions included in the EA are appropriate to protect the environmental values of the receiving waters, proponents will be required to undertake adequate monitoring of the implementation and effectiveness of the EA conditions. This includes assessing the effectiveness and reliability of any water treatment process (i.e. reverse osmosis), monitoring for changes in receiving water quality and aquatic ecosystem health, and for any other impacts to environmental values. If new impacts to environmental values are identified, future EAs will include conditions to adequately manage them.

To effectively protect waters from the as-yet unquantified cumulative impacts of CSG water discharged to waters, an adaptive approach will be used. Through this process, information collected through both monitoring and research, can be used to inform both new EAs and future management frameworks.

## **8.0 Definitions**

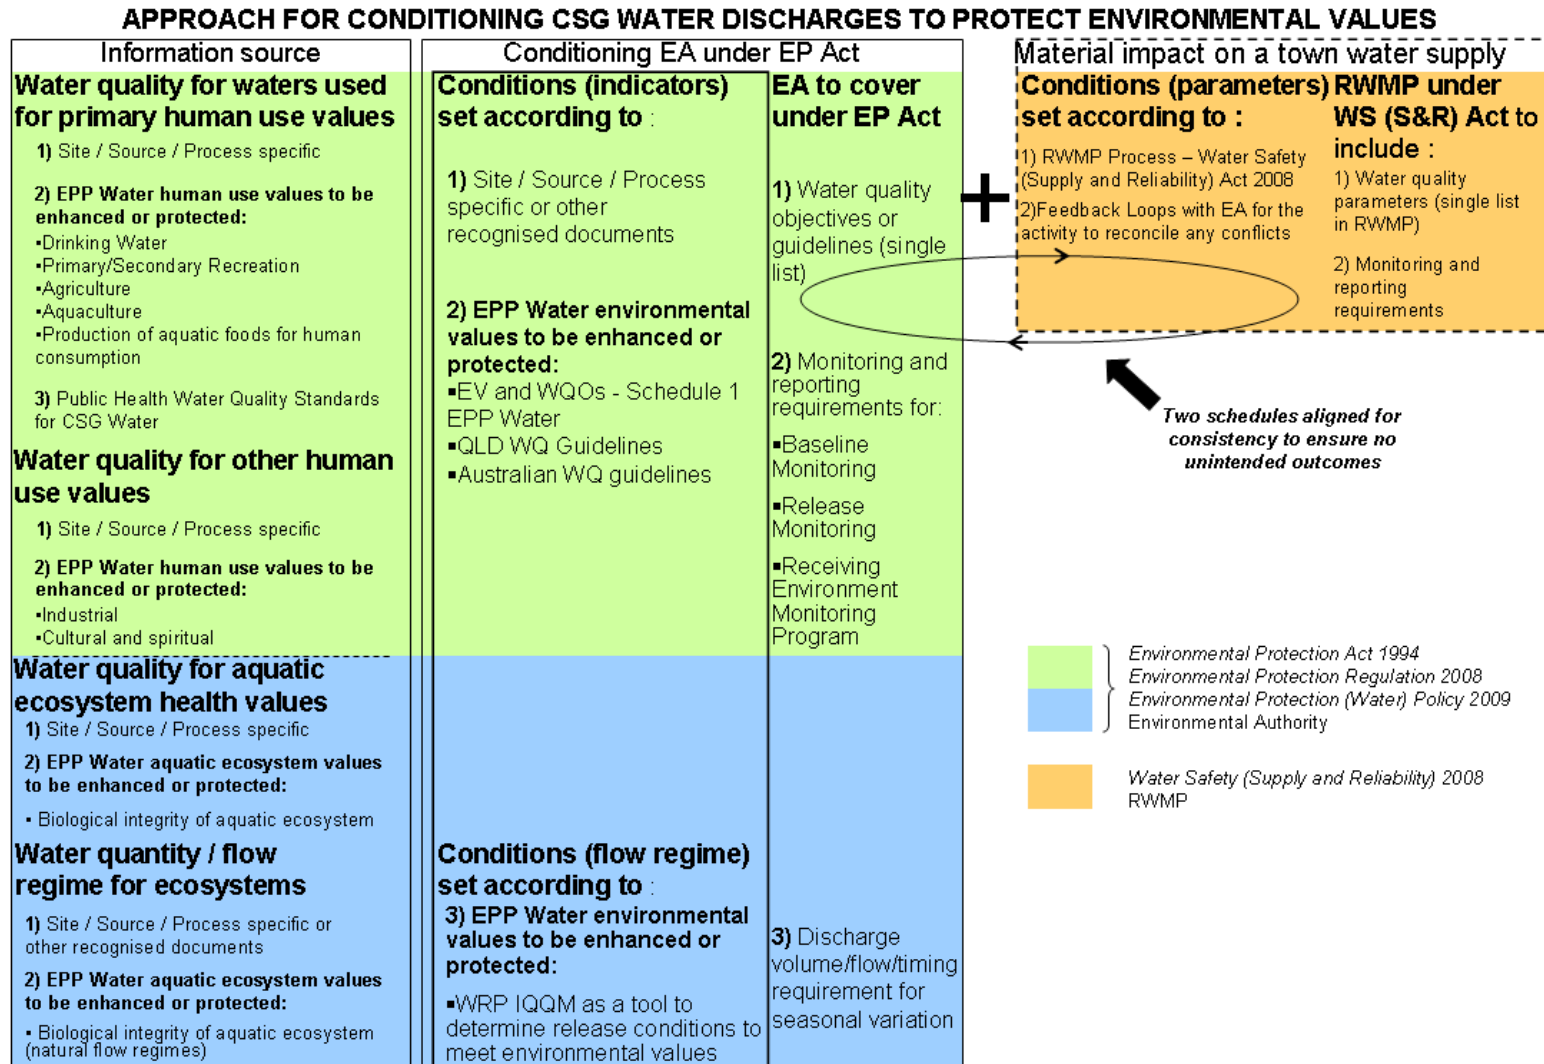

Note: Where a term is not defined in this guideline, the definition in the *Environmental Protection Act 1994*, its regulations and Environmental Protection Policies must be used.

#### Background

Under the *Environmental Protection Act 1994* (EP Act), and its subordinate legislation, there is a process for identifying the environmental values of waters. In the scenario where a proponent is proposing to undertake an environmentally relevant activity in Queensland, including discharge of CSG water to waters, an environmental authority (EA) must be issued by the administrative authority - the Department of Environment and Resource Management (DERM). If an EA is issued, it must include conditions to manage any impacts to the identified environmental values of the waters from the activity. These conditions may include indicators for water quality with a set of guidelines / release limits for the discharge. The proposed regulatory reforms to the *Water Supply (Safety and Reliability) Act 2008* and the associated RWMP process will apply along with the process under the EP Act, EP Reg and EPP Water to protect environmental values (including the suitability of the water for supply as drinking water) through conditions in the EA for the activity. This means that there will be co-regulation of the activity – both under the EP Act and the WS (S&R) Act. Consequently standards may be imposed under the EP Act as well as under the WS (S&R) Act. If there are different values for a particular indicator, then the holder of the EA/RWMP will need to meet the most stringent of the requirements. To make certain that there are no inadvertent conflicts in the EA conditions and RWMP conditions, DERM Project Managers will ensure that a detailed risk assessment and adaptive management process is undertaken, and that through feedback processes any inconsistencies are identified early and addressed. This document aims to reconcile any potential conflicts. It also considers other issues for aquatic ecosystem health related to the discharge of CSG water to waters.

#### Interim Public Health Water Quality Standards under the WS (S&R) Act

Interim Public Health Water Quality Standards have been developed by Queensland Health for use where CSG water will impact on an urban community's drinking water supply source. These standards will be included in the Recycled Water Management Plan (RWMP) that will be required under the WS (S&R) Act. These standards will be prescribed under the *Public Health Regulation 2005*. The levels are set to allow for ingestion by humans of two litres per day for a lifetime. Existing water quality data for CSG water was examined, including Australian and overseas data, to inform the development of these standards. The standards are focused on coal associated compounds of health concern, or any hazards that may be added during treatment, storage or transport of the CSG water. The standards will be amended as more specific information on CSG source water quality in Queensland and associated treatment, storage and transport processes becomes available. It should be noted that this proposed schedule of standards is not intended to represent the ongoing monitoring program for CSG companies, it simply prescribes the health related standard if a particular compound is detected during monitoring.

#### Scientific Assessment

The following provides a comparison between the Interim Public Health Water Quality Standards (WQS) proposed for CSG and the toxicant trigger guidelines for protection of

aquatic ecosystems. The purpose of this review is to determine potential conflicts between the Interim Public Health WQS and other guidelines. Note that the aquatic ecosystem guidelines are based on biological effects data and are meant to be trigger values. Where exceeded in the environment, background levels should be assessed and the triggers modified to reflect the risk involved.

In general, the review indicates the following:

- There are no obvious conflicts between the list of Public Health WQS and other guidelines for CSG;
- The list of indicators is substantial and it is likely that it could be reduced through source characterisation and associated risk assessment processes;
- For Reverse Osmosis (RO) treated CSG water, many of the indicators are unlikely to be relevant, even in the source water – see the table below;
- Areas of potential conflict where Public Health WQS are listed in an approval (or required to be monitored) and the limit listed is significantly higher than guidelines for aquatic ecosystem health protection. This is shown for 17 indicators in the table below. The major problem here is that a false impression may be given to proponents in terms of satisfactory standard for discharge if the standards in the RWMP are less stringent than those required to meet environmental values. Where these contaminants are of concern, they should be listed with appropriate limits in the EA, with the proponent meeting the most stringent ; and
- Note that such a review could also be done for primary industry guidelines such as irrigation. Similar conclusions from the comparison with aquatic ecosystem guidelines are expected.

For the discharge of 'good quality' RO treated CSG water, the potential risks to receiving water should be relatively small. The major issues that should be assessed on a case by case basis include:

1. The potential deficiency of cations/anions such as calcium that could have a detrimental effect on aquatic ecosystem biota. The proposed management action would be to dose the water to achieve appropriate cation/anion concentrations. Release limits for Sodium Adsorption Ratio, calcium, magnesium etc would generally be applied.
2. The potential change to flow regimes. This risk is potentially greatest for significant continuous releases to ephemeral streams. In most cases, this requires an assessment of key aquatic habitats and the potential extent of effect from the release. In many cases, sandy substrates may mean the water may have a limited extent of effect on surface waters. Alternative discharge locations may need to be considered and ongoing monitoring may be required during operation where potential risks exist.
3. Boron is not generally removed from the RO process and is often elevated in the discharge water. An assessment should be carried out on the potential effect on all downstream environmental values including aquatic ecosystem and irrigation. The levels are not typically high enough to be of major concern and there are limited management actions available to address this issue.
4. Given the water is very clear and the systems receiving the water are generally very turbid, there is potential for the water to impact on aquatic environments. The action risk from this effect is currently unknown and needs further research. In general, management as per issue 2 will also address this issue if it exists.

Table 1. Comparison of the Public Health WQS to Aquatic Ecosystem Toxicant Triggers and typically levels found in CSG Water.

Chemical Compounds/ Parameters of concern	CAS Number	Interim Release Limits (µg/L)	Aquatic Ecosystem TTV*	TOXNET Hazardous Substances Data Bank	Found in CSG source water?	Comments
1,2 Dichloroethane (DI)	107-06-2	3	ID	EV	NNS	Industrial solvent - chlorination of water does not appear to contribute to 1,2-dichloroethane in drinking water - Ethane is a constituent in the paraffin fraction of crude oil and natural gas - <b>may be produced inadvertently by chlorination reactions which take place during the disinfection of wastewater effluents or drinking water sources</b>
1,1 Dichloroethene (DI)	75-35-4	30	-	EV	NNS	Used in polymers and organic synthesis - Ethene is a natural product emitted by fruits, flowers, leaves, roots, and tubers, and is released to the atmosphere from biomass combustion and volcanos, and photodegradation of dissolved organic material - <b>may be produced inadvertently by chlorination reactions which take place during the disinfection of wastewater effluents or drinking water sources.</b>

Bromochloromethane (DI)	74-97-5	40	-	NHTV	Unlikely	Bromochloromethane was found in remote ocean areas along with other naturally occurring bromo or chloro methanes produced by algae. Although it is possible

Chemical Compounds/ Parameters of concern	CAS Number	Interim Release Limits (µg/L)	Aquatic Ecosystem TTV*	TOXNET Hazardous Substances Data Bank	Found in CSG source water?	Comments
						that bromochloromethane was produced by this natural source, the author suggested that it may be due to long range transport from anthropogenic sources. Bromochloromethane was released from cultivated species of the brown algae, Phaeophyta. This may be a major source of biogenic emissions of bromochloromethane from oceans. Bromochloromethane's production and use as a fire extinguisher fluid, especially in aircraft and portable units.
Bromodichloromethane (DI)	75-27-4	6	-	EV	Unlikely	<p>Bromodichloromethane is biosynthesized and emitted to seawater (and eventually to the atmosphere) by various species of marine macroalgae which are abundant in the various locations of the world's oceans. Ice macroalgae from McMurdo Sound, Antarctic were found to contain and release to sea water bromodichloromethane.</p> <p>Bromodichloromethane's production and use in organic synthesis and as a solvent may result in its release to the environment through various waste streams. However, bromodichloromethane is not produced or used on a large commercial-scale indicating that large releases do not occur from these practices. <b>The predominant environmental release of bromodichloromethane results from its inadvertent formation during chlorination treatment processes of drinking, waste, and cooling waters.</b> The amount of bromodichloromethane which may</p>

Chemical Compounds/ Parameters of concern	CAS Number	Interim Release Limits (µg/L)	Aquatic Ecosystem TTV*	TOXNET Hazardous Substances Data Bank	Found in CSG source water?	Comments
						be produced during chlorination processes depends upon a variety of parameters which include temperature, pH, bromide ion concentration of the water, fulvic and humic substance concentration, and actual chlorination treatment practices.
Bromoform (DI)	75-25-2	100		EV	Unlikely	Bromoform is produced by macroalgae and microalgae.
Cadmium		2	0.2			
Chlorate	NA	0.8mg/L	-	EV	Unlikely	The chlorite ion (ClO <sub>2</sub> <sup>-</sup> ) is a <b>major degradation product resulting from the reaction of chlorine dioxide with inorganic and organic constituents in the water.</b> When free chlorine is used after the application of chlorine dioxide in the treatment process, chlorite is oxidized to chlorate. This conversion will continue over time as the water travels through the distribution system. Chlorate ion is also formed by photodecomposition of chlorine dioxide when treated water is exposed to bright sunlight in open basins. The rate at which chlorate forms affects the amount of chlorine dioxide or chlorite that remain in the finished drinking water.
Chlorine (DI)	7782-50-5	5 000	3	EV	Unlikely	The most important manmade emissions of chlorine are from processes involving the production, transportation, and use of chlorine.
Chlorine dioxide (DI)	10049-04-4	1000	-	EV	Unlikely	Chlorine dioxide is used as a disinfectant in water treatment plants in the USA.

Chemical Compounds/ Parameters of concern	CAS Number	Interim Release Limits (µg/L)	Aquatic Ecosystem TTV*	TOXNET Hazardous Substances Data Bank	Found in CSG source water?	Comments
Chlorite (DI)	NA	300	-	EE	Unlikely	Chlorite ion ( $\text{ClO}_2^-$ ) is present in drinking water and there are two possible ways it ends up in the drinking water: 1) chlorine dioxide is produced via sodium chlorite used as a starting material and incomplete conversion of sodium chlorite into chlorine dioxide leaves residual chlorite ion in water and 2) the chlorite ion is a major degradation product resulting from the reaction of chlorine dioxide with inorganic and organic constituents in the water. When free chlorine is used after the application of chlorine dioxide in the treatment process, chlorite is oxidized to chlorate. This conversion will continue over time as the water travels through the distribution system. Chlorate ion is also formed by <b>photodecomposition of chlorine dioxide when treated water is exposed to bright sunlight in open basins</b> . The rate at which chlorate forms affects the amount of chlorine dioxide or chlorite that remain in the finished drinking water.
Chloroacetic acid (DI)	79-11-8	150	-	EV	Unlikely	Chloroacetic acid's formation as a <b>chemical by-product of chlorination and chloramination of drinking water</b> , and its use as a herbicide and in the manufacture of various dyes and other organic chemicals.
Chlorobenzene (DI)	108-90-7	300	ID	EV	Possible	Chlorobenzene's production and use as a chemical intermediate, solvent, and heat transfer medium.
Chloroform (Trichloromethane) (DI)	67-66-3	200	ID	EV		Chloroform is produced by tropical red algae, and by red seaweed and has been reported

Chemical Compounds/ Parameters of concern	CAS Number	Interim Release Limits (µg/L)	Aquatic Ecosystem TTV*	TOXNET Hazardous Substances Data Bank	Found in CSG source water?	Comments
						<p>to be produced by micro algae, in peat bogs, was produced in spruce forest soil and was found in wood degrading areas.</p> <p>Chloroform's production and use in the synthesis of hydrochlorofluorocarbon 22 (HCFC-22), use as an extractant or solvent, chemical intermediate, dry cleaning agent, fumigant ingredient, synthetic rubber production. Its indirect production in the manufacture of ethylene dichloride and as a <b>disinfection by-product in the chlorination of drinking water</b>, municipal sewage, cooling water in electric power generating plants. Chloroform is produced during the atmospheric photodegradation of trichloroethylenes and is produced from auto exhaust.</p>

# Coal Seam Gas Water Feasibility Study

## About the study

In July 2008, the Council of Australian Governments signed an intergovernmental agreement on Murray-Darling Basin reform that establishes new governance arrangements for the Murray-Darling Basin. The Commonwealth also agreed in principle to provide around \$3.7 billion for significant water projects—called priority projects—in Murray-Darling Basin states.

Subject to agreement between the Commonwealth and Queensland governments, \$160 million will be provided over 10 years for Queensland's priority project, known as the Healthy HeadWaters Program. This program is being managed by the Queensland Department of Environment and Resource Management.

The Commonwealth has allocated five million dollars of the *Healthy HeadWaters Program* funding for a feasibility study to examine the use of coal seam gas (CSG) water in addressing water sustainability and adjustment issues in the Queensland section of the Murray Darling Basin (QMDB).

The Coal Seam Gas Water Feasibility Study will analyse the opportunities for, and the risks and practicability of, using CSG water to assist in achieving the long-term goals in the QMDB of transitioning irrigation communities to lower water use and securing viability of ecological assets.

Among other things, the study will consider the feasibility of using CSG water to relieve demand on groundwater for irrigation in heavily committed aquifer systems near the Condamine River.

## Background to the study

CSG is a natural gas, consisting primarily of methane, which is adsorbed onto coal. Production of CSG is increasing rapidly in Queensland and is set to increase even more dramatically as CSG producers seek new markets for their product by establishing a liquefied natural gas (LNG) industry. CSG resources in Queensland are located primarily in the Surat and Bowen basins.

CSG is produced by dewatering coal seams to reduce the pressure that keeps the gas in place. This process brings significant quantities of saline water to the surface.

Salinity of CSG water is variable. Total dissolved solids (TDS) values vary from 200 to over 10 000 milligrams per

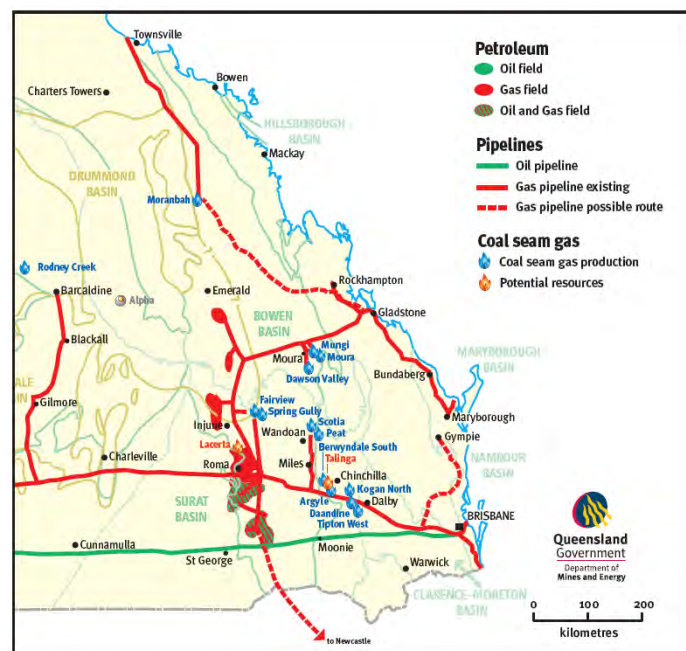

litre (mg/l), but are most commonly in the range of 1000–6000 mg/l. For comparison, good quality drinking water has TDS values of up to 500 mg/l; some plants are affected by water with TDS values as low as 1000 mg/l; and the TDS value of seawater is about 35 000 mg/l.

Queensland Government policy requires CSG producers to treat their CSG water unless it can be injected into suitable aquifers or used directly without treatment. This policy encourages beneficial use of the treated CSG water and minimises the ecological risks of CSG water disposal.

Notwithstanding this policy, there are ongoing concerns about the risks posed to surface streams and landscapes by the use and disposal of CSG water. In addition, there are concerns about the impacts that the extraction of CSG water from coal seams may have on groundwater resources, including reserves in the Great Artesian Basin and the Condamine River Alluvium.

There are also uncertainties surrounding the likely volumes and reliability of CSG water supply as well as the demand for water in the QMDB and nearby regions in the next few decades.

An improved understanding of these risks and uncertainties is needed in order to properly assess the feasibility of using CSG water to assist in addressing water sustainability issues in the QMDB.

## Design of the study

The study is being undertaken as a series of activities as shown in the diagram below.

Activities 1 to 7 consist of investigations to fill knowledge gaps relating to the risks of both extracting and using CSG water, as well as analyses of the likely supply of, and demand for, CSG water. Subject to the risks of using CSG water being acceptable, and the availability of reliable supplies, Activities 8, 9 and further will assess specific opportunities for large-scale beneficial use to assist in achieving objectives of the Healthy HeadWaters Program.

While the primary aim of the study is to determine how CSG water may contribute to the objectives of the Healthy HeadWaters Program, the findings will be invaluable for managing the environmental and resource management risks associated with the rapidly expanding CSG industry both within and outside the QMDB.

The Department of Environment and Resource Management will use the expertise of internal staff and external consultants for the study. It will also consult with industry and the community throughout the study.

The study is due to be completed in June 2012, with several activities scheduled to finish before then.

## Definitions and abbreviations

**ANZECC Guidelines** – Australian and New Zealand Water Quality Guidelines (2000).

**Associated water** – underground water taken or interfered with, if the taking or interference happens during the course of, or results from, the carrying out of another authorised activity under a petroleum authority, such as a petroleum well, and includes waters also known as produced formation water. The term includes all contaminants suspended or dissolved within the water (EPA, 2007).

**CSG** – coal seam gas.

**DO** – dissolved oxygen

**EVs** – Environmental values.

**Ephemeral streams** – streams which periodically or seasonally do not contain surface water.

**Permanent streams** – streams which continuously contain surface water.

**QMDB** - Queensland Murray-Darling Basin (Figure 1).

**QWQG** – Queensland Water Quality Guidelines (2009).

**Streams** – riverine wetlands - wetlands and deepwater habitats within a channel. The channels are naturally or artificially created, periodically or continuously contain moving water, or form a connecting link between two bodies of standing water. (Queensland Wetlands Program, <http://www.epa.qld.gov.au/wetlandinfo>).

**WQOs** – Water quality objectives.

# 1. Background

CSG is a natural gas, consisting primarily of methane, which is adsorbed onto coal. Production of CSG is increasing rapidly in Queensland and is set to increase even more dramatically as CSG producers seek new markets for their product by establishing a liquefied natural gas industry. CSG is produced by dewatering coal seams to reduce the pressure that keeps the gas in place. This process results in significant quantities of water being brought to the surface. Queensland Government policy requires CSG producers to desalinate their CSG water unless it can be injected into suitable aquifers or used directly without treatment. Once treated, CSG water may be supplied to other water users for beneficial use. Water in excess to that which can be injected or beneficially used is to be aggregated for disposal.

Demand for treated CSG water in beneficial uses is anticipated to fall short of production, resulting in surplus volumes requiring disposal. Release into existing surface streams is one option being considered for disposal of this water. Any release of associated water will require a discharge licence that stipulates flow and water quality criteria (Trigger Values) that must be met to protect the defined ecosystem values and water quality objectives.

CSG resources in Queensland are located primarily in the Surat and Bowen geological basins which underlie sections of the Queensland Murray-Darling Basin (QMDB) (Figure 1). The QMDB consists of the Border Rivers, Moonie, Balonne-Condamine, Warrego, Paroo and Bulloo drainage basins, and is located in the south west of the State. The majority of Queensland's CSG resource underlies the Balonne-Condamine drainage basin in the QMDB and the Fitzroy drainage basin which is located to the north of the QMDB.

Rivers in the QMDB support nationally significant wetlands with high conservation value. Surface waters in the region are also used for irrigation and feed into drinking water supplies. Locally relevant guidelines are therefore needed to assess the quality of CSG water that can be released into surface streams.

Many rivers in the QMDB exist as networks of ephemeral channels and waterholes that experience intermittent periods of high magnitude flooding. Untimely releases of CSG water could interrupt important natural cycles in aquatic ecosystems adapted to these conditions. Guidelines for the timing and quantities of CSG water released are therefore also needed to minimise environmental impacts of CSG water releases in the QMDB.

Under its *Water for the Future Program*, the Commonwealth Government has allocated \$5 million for a feasibility study to examine the use of CSG water in addressing water sustainability and adjustment issues in the QMDB. The *Coal Seam Gas Water Feasibility Study* will analyse the opportunities for, and the risks and practicability of, using CSG water to assist in achieving the long-term goals in the QMDB of:

- transitioning irrigation communities to lower long-term water availability; and
- securing viability of ecological assets.

Activity 4 of the coal seam gas feasibility study is investigating the stream ecosystem health response of CSG water releases and relates to securing the viability of assets. The current report represents Task 1 of Activity 4 and presents a conceptual understanding of the potential impacts of the release of CSG water into surface streams in the QMDB. The report collates existing data relevant to assessing the ecological risks posed to surface streams in the QMDB. This document is aimed at providing advice regarding the assessment of appropriate guidelines and should be considered preliminary as it will be updated throughout the life of Activity 4 of the coal seam gas water feasibility study (Figure 2).

## 2. Objectives

The key objectives of this report are:

1. To present a preliminary conceptual understanding of the potential benefits or risks posed to surface streams in the QMDB by the release of CSG water that will be further developed in Task 2 of this Activity;
2. To collate existing information that can be used to guide decisions regarding release of CSG water to surface streams in the QMDB; and
3. To construct an interim decision matrix describing the factors to be considered in assessing risks associated with the release of CSG water to surface streams in the QMDB.

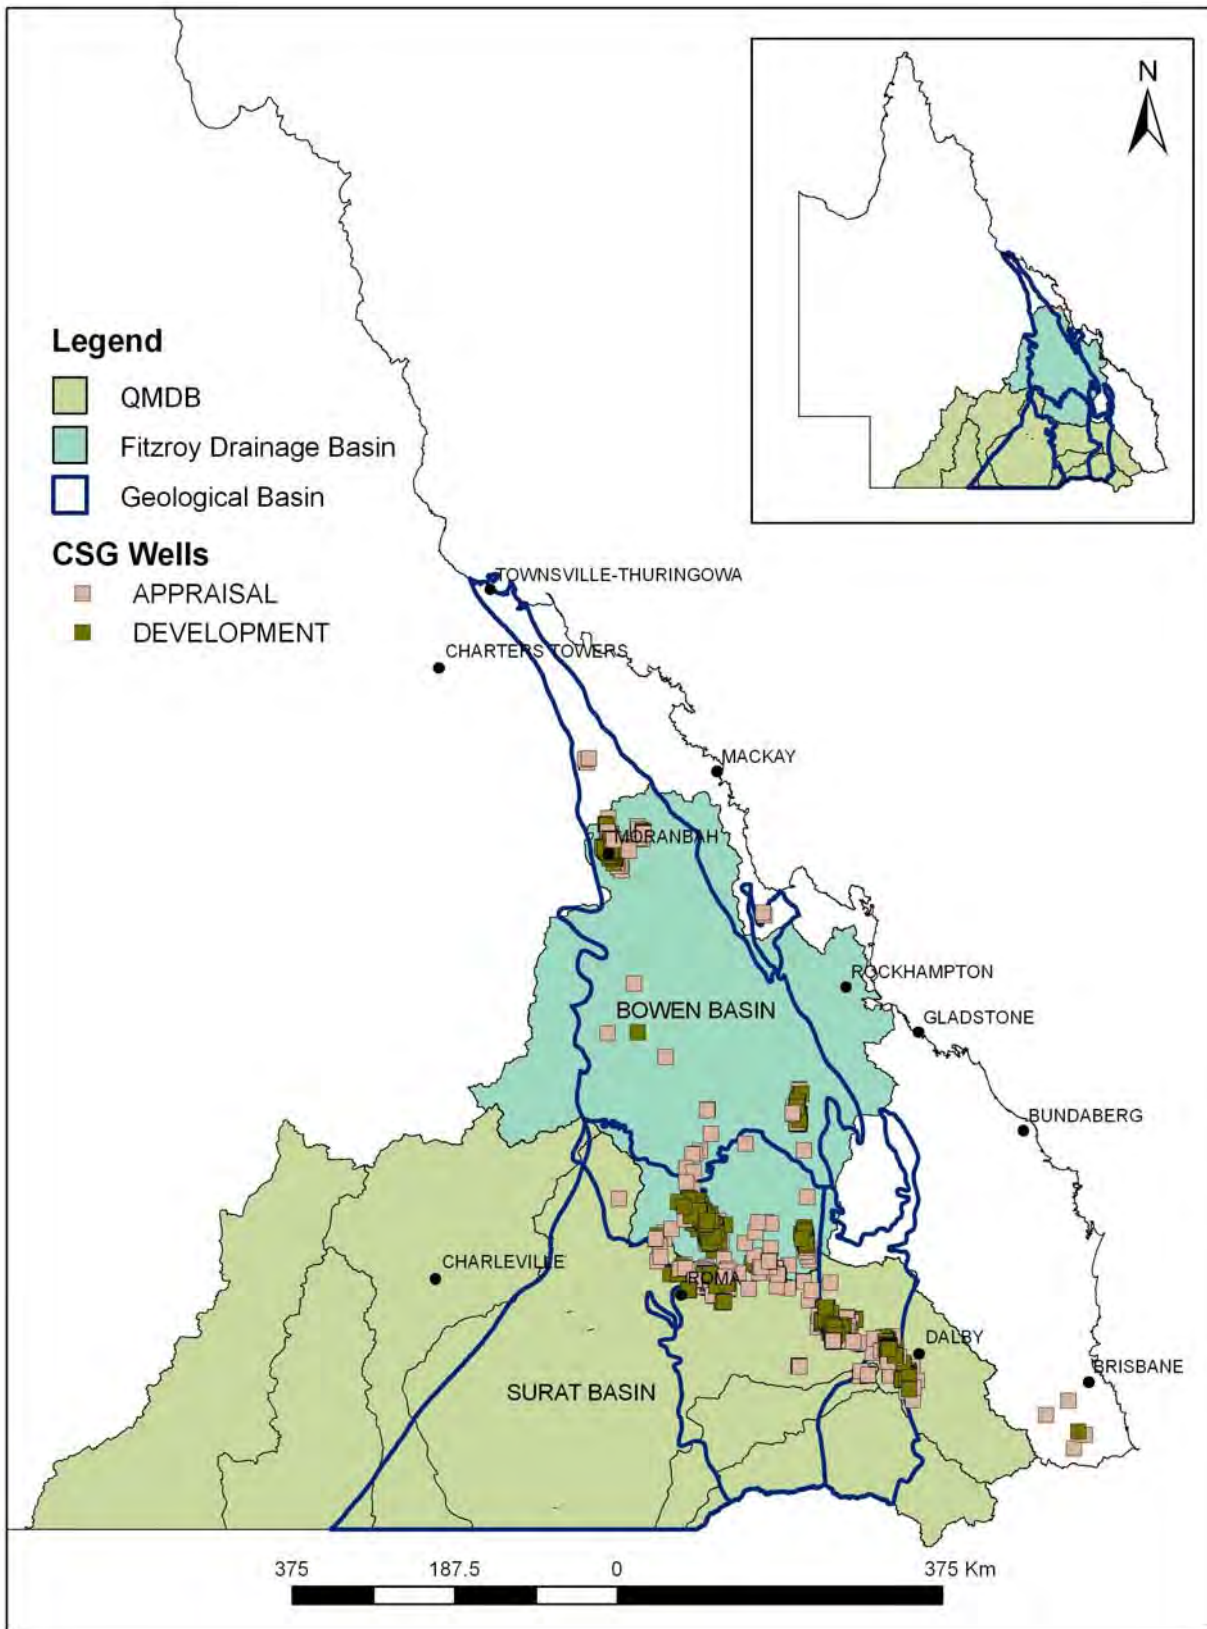

Figure 1. Coal seam gas wells under appraisal or in development in Queensland (DEEDI, 2009).

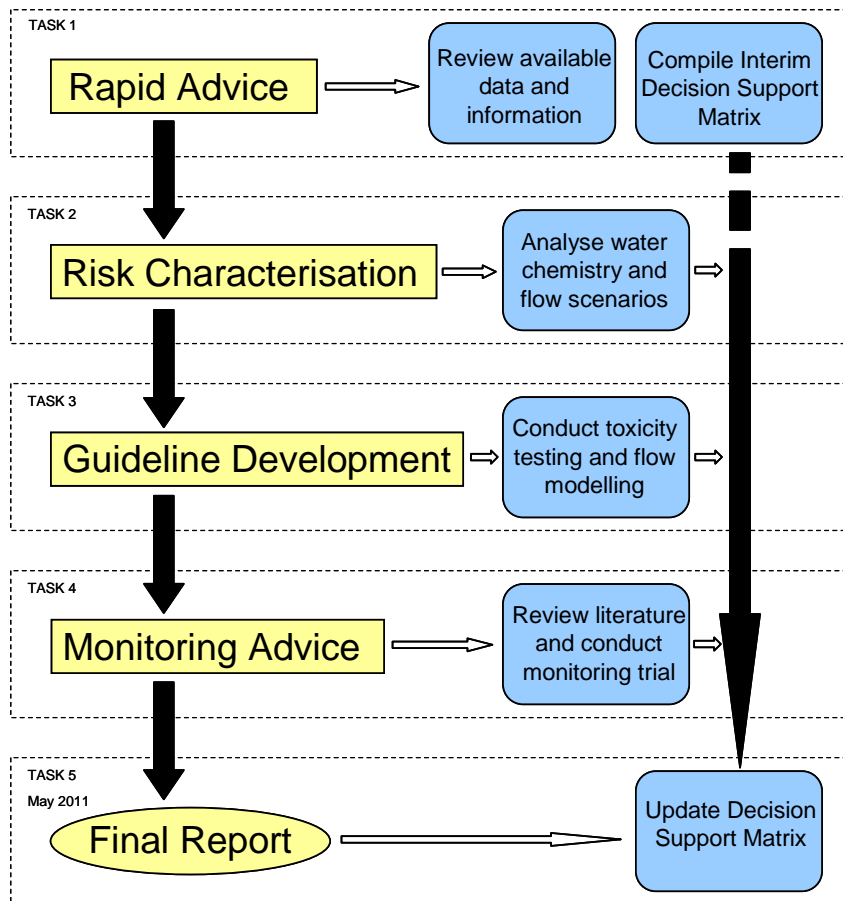

Figure 2. Coal seam gas beneficial reuse, Activity 4 (Stream Ecosystem Health response) study workflow.

## 3. Assessing environmental risk

### 3.1. Environmental risk assessment framework

The risks posed by the release of CSG water into surface streams are best assessed through application of an ecological risk assessment framework. A generalised risk assessment framework that can be applied to this scenario is outlined below. The risk assessment framework requires that conceptual models are developed to support a hazard identification phase. Tasks to be undertaken to apply this risk assessment framework to CSG water releases are outlined in the interim decision support matrix.

Ecological risk assessment is the process whereby risks posed by inherent hazards in processes or a particular situation are estimated either qualitatively or quantitatively. Risk assessment is a process that can be separated into the three major phases shown in the framework in Figure 3: problem formulation, risk analysis and risk characterisation. In the problem formulation phase the ecological issues and potential hazards are identified through the development of a conceptual understanding of the ecosystem of interest. The problem formulation phase should allow for identification of both potential detrimental and beneficial outcomes for aquatic ecosystems from a given process or situation. The current report is designed to inform the problem formulation phase of a risk assessment for the release of CSG water into surface streams in the QMDB. Data has been presented with a focus on the QMDB, however, the principles for assessing the risks posed to aquatic ecosystems by the release of CSG water may be applicable to all Queensland surface waters.

The second phase of the risk assessment process is risk analysis where data to characterise the likelihood of exposure to a hazard is collated/collected along with data on the potential consequences of exposure to that hazard. This data can be qualitative and based on expert judgement or, preferably, quantitative and based on modelled or measured values and as data is often limited, is often based on the available data. In the third phase of risk assessment the likelihood data is combined with the consequences data to provide a measure of risk. Quantitative risk assessment is favoured over a qualitative assessment as this reduces the level of potential subjective bias in the outcomes. It is important for all assumptions to be documented, regardless of whether a qualitative or quantitative assessment is conducted so that outputs can be revisited in an iterative process as new data becomes available. This risk assessment framework provides a structured and transparent process that can be used as a management tool in policy and regulatory decisions.

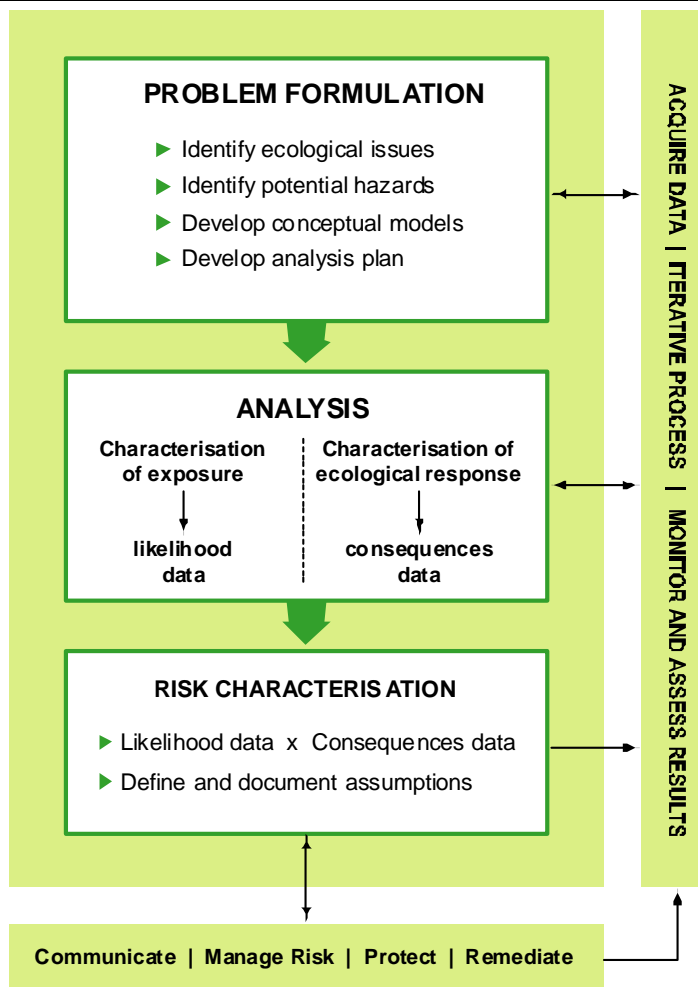

Figure 3. Environmental risk assessment framework (Dunlop et al. 2008).

## 3.2. Conceptual models

Conceptual models provide a representation of our current understanding of a system including its components and interactions. In the problem formulation phase of environmental risk assessment conceptual models are used to identify hazard sources, factors which mediate their distribution and effect, and the impact of their presence on ecological assets. Ecological assets include species, populations, ecosystem functions and locations (e.g. a wetland).

In Queensland, a causal chain or Pressure-Stressor-Response (PSR) framework has been used in the development of state-wide monitoring programs to model ecosystem interactions in an attempt to understand how ecosystem responses relate to the causative agents (Marshall et al. 2006). This approach has been adopted as the basis for monitoring in Queensland as outlined in the Integrated Waterways Monitoring Framework (Catchment Programs, 2009). The use of causal chain framework models also enables targeted management of specific impacts and aids in the selection of the most relevant indicators (Neimeijer & de Groot 2007, 2008). In a PSR framework *pressures* are defined as human activities that either directly or indirectly modify the biophysical conditions experienced by ecosystems and their constituents (i.e. release of CSG water releases to surface streams). *Stressors* are agents of the pressure which elicit the response by directly interacting with the ecosystem (i.e. physical-chemical properties of associated water, hydrological conditions etc.). Individual structural and functional components of ecosystems have both optimum (preference) and tolerance ranges for these biophysical attributes, and ecosystems respond to stressors because modification of these attributes either harm, benefit, or provide opportunities to ecosystem constituents. These *responses* can propagate through other ecosystem elements, e.g. via trophic cascade effects, and have the potential to significantly modify ecosystems.

Development of a whole ecosystem conceptual understanding of potential hazards posed by stressors and pressures requires the following steps to be followed:

- Classification of ecosystems by common characteristics
- Development of ecosystem models describing the important processes and linkages in each ecosystem type
- Development of individual stressor models that identify potential ecological consequences of a stressor and appropriate indicators of the pressures and/or condition.

The following three sections deal with each of these steps in turn.

### 3.2.1. Wetland classifications

The classification of wetlands into ecologically relevant groups that are more like each other than others is useful for the development of conceptual models as it enables identification of common processes and functions. Classifications allow reference or natural conditions to be inferred for wetlands of common types and can assist with identification of appropriate management actions. Wetlands can be classified according to a range of criteria including typology, flow regimes and water quality characteristics. The Queensland Wetlands Program has developed a typology building on the classification of wetlands into broad categories which include;

- Lacustrine (lakes and dams) wetlands
- Palustrine (marshes, swamps and bogs) wetlands
- Riverine (wetlands along rivers and streams) wetlands

Lacustrine and palustrine wetland types that have been identified through the Queensland Wetlands Program in the QMDB are shown in Table 1. Riverine wetlands in the QMDB have been classified through the Sustainable Rivers Audit (MDBC, 2001) into Upland (source), slope (transport) and lowland (deposition) regions.

**Table 1.** Lacustrine and palustrine wetland types present in the Queensland Murray-Darling Basin (Queensland Wetlands Program).

River Basin	Wetland Type
Border Rivers	Inland non-arid lakes
	Inland non-arid swamp wetlands
	Karst wetlands
Moonie	Inland non-arid swamp wetlands
Balonne-Condamine	Arid zone lakes
	Arid zone swamp wetlands
	Inland non-arid lakes
	Inland non-arid swamp wetlands
Warrego	Arid zone lakes
	Arid zone swamp wetlands
	Inland non-arid lakes
	Inland non-arid swamp wetlands
Paroo	Arid zone lakes
	Arid zone swamp wetlands
	Great artesian basin spring wetlands

### 3.2.2. Ecosystem models

Ecosystem models provide a mechanism for visualising the functions and processes important within an ecosystem and their interactions. Conceptual models for lacustrine and palustrine wetland types in the QMDB have been developed through the Queensland Wetlands Program (WetlandInfo, 2009). The conceptual model shown in Figure 4 represents a riverine or surface stream wetland with an adjacent floodplain in the QMDB. This model provides an example of the linkages that need to be understood within an ecosystem to develop an understanding of the potential impacts of a stressor on an ecosystem.

**Figure 4.** River ecosystem function model showing components and processes in a channel-floodplain ecosystem. Interactions between components are shown as arrows (modified from Davies et al. 2008). Purple circles indicate factors that may be directly affected by the release of CSG water into a surface stream. (DOM – dissolved organic matter, FRP – filterable reactive phosphorous, LWD – large woody debris, MPB – microphytobenthos, POM – particulate organic matter, TN – Total nitrogen).

## Hydrology in QMDB riverine systems

The headwaters of the QMDB rise in the Great Dividing Range, and the rivers flow across the Queensland/New South Wales border, to form one of the largest catchments in the world. The rivers are flat and shallow over much of their courses with extensive floodplains. Prolonged periods of low or no flow are typical, as are unpredictable high flow events that inundate the floodplains, ephemeral lakes and wetlands. Much of the QMDB can be considered arid or semi-arid, experiencing infrequent rainfall (Marshall et al. 2005).

General characteristics of hydrological conditions in the QMDB include (Marshall et al. 2005):

- There is low base flow with 90% of flood flow from rainfall.
- Flow is seasonal with wet season January-May and dry season June-December.
- Seasonal patterns have low repeatability between years so it can be wet when it is on average dry and dry when it is on average wet.
- Flow is intermittent with characteristic long periods without flow.
- No-flow spells occur all year round including wet season.

An Australia-wide classification of the hydrology of streams has been conducted to assist with prescribing management of environmental flows (Kennard et al. 2008). The classification system, based on 120 metrics describing ecologically relevant characteristics of the natural hydrologic regime resulted in 12 distinct classes of flow regime. These varied according to the seasonal pattern to discharge, the degree of flow permanence, variations in flood magnitude and other aspects of flow predictability and variability. The results of this classification for streams in the QMDB and Bowen and Surat geological basins are shown in Figure 5 and the classes identified described in Table 2. Only one perennial stream was identified in the QMDB with the others being characterised by unpredictable and intermittent flows. Streams were only included in the analysis if they were considered to have experienced minimal anthropogenic disturbance so these classifications intend to represent the natural or reference condition for the catchment.

The classification of rivers by hydrology was based on the premise that rivers that share similar hydrological characteristics should also share similarities in assemblage composition, species traits and community functioning and that it should then follow that ecological responses to given anthropogenic change in flow regime should be similar in rivers of a similar initial natural flow regime (Kennard et al. 2008). Rivers within the one flow regime class should therefore represent an environmental flow management unit.

**Table 2.** Flow regime classes identified in the Queensland Murray-Darling basin (Kennard et al. 2008)

Flow regime class	Description
4. Unpredictable baseflow	Perennial. Less predictable flows than other perennial streams with discharge spread uniformly throughout the year (i.e. not seasonal).
7. Unpredictable intermittent	Intermittent, rarely cease to flow. Intermediate baseflow and intermediate runoff magnitude. Variable flows with very low predictability. More uniform flows throughout the year than Class 8.
8. Unpredictable winter intermittent	Intermittent, rarely cease to flow. Intermediate baseflow and intermediate runoff magnitude. Variable flows with very low predictability. Winter flows dominant.
9. Predictable winter highly intermittent	Intermittent, regularly cease to flow. Usually 100-200 zero flow days per year. Winter runoff flows dominant.
11. Unpredictable summer highly intermittent	Intermittent, regularly cease to flow. Usually 100-200 zero flow days per year. Minimum and maximum monthly flows showed low predictability and weak seasonality.
12. Variable summer extremely intermittent	Intermittent, regularly cease to flow. More than 250 no flow days per year. Dominated by infrequent, large floods which could occur at any time of year.

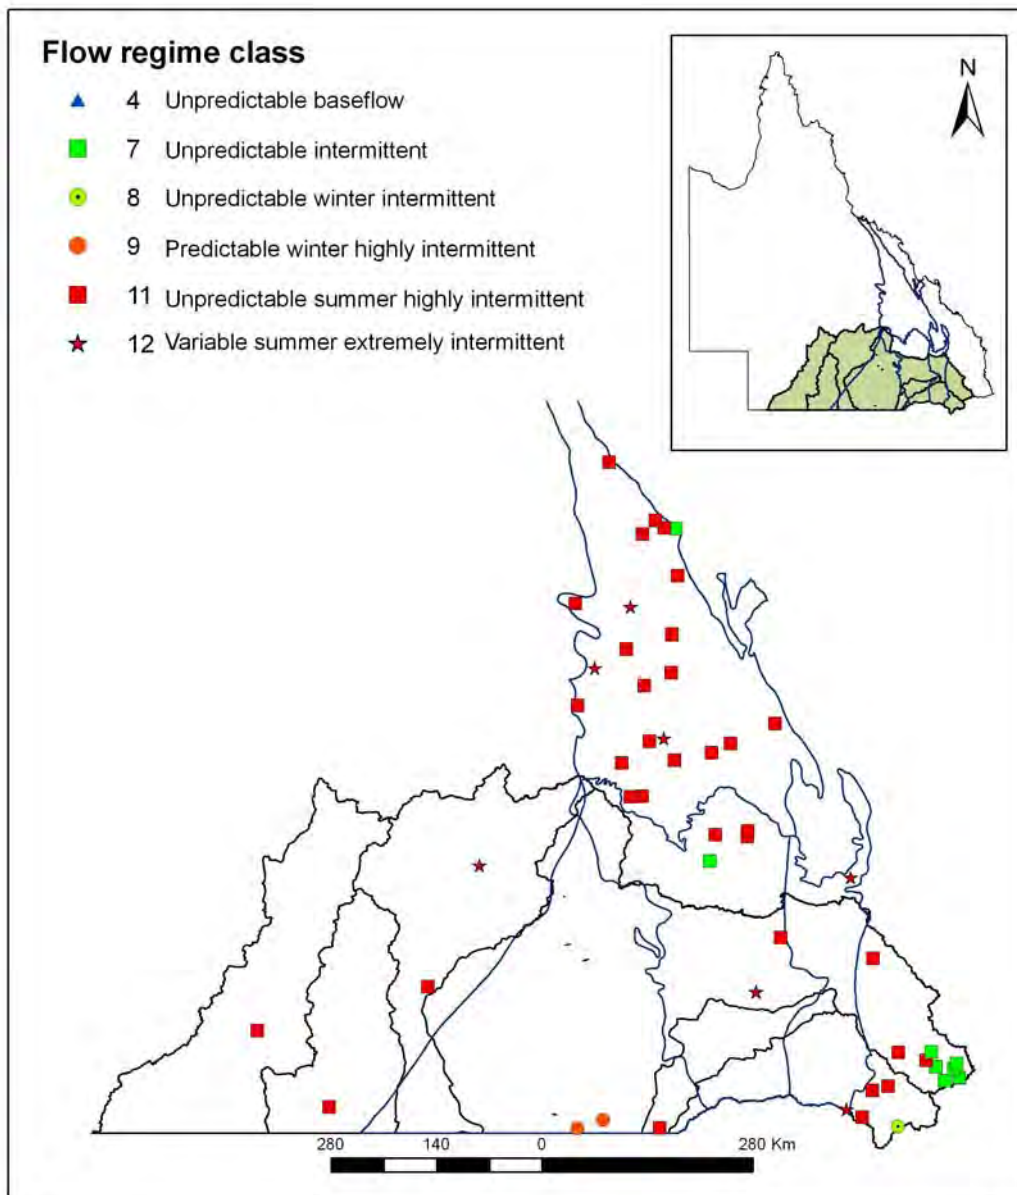

Geographic, climatic and some catchment topographic factors were generally strong discriminators of flow regime

classes (Kennard et al. 2008). Based on this outcome, a classification of streams using geographic data is currently being conducted for all streams across Australia (not only for streams considered to be at or near reference condition). The 30 group classification is based on a set of 48 attributes describing the climate, water balance, topography, substrate and vegetation cover of the reach and its catchment (Stein et al., 2008).

Hydrological conditions affect the physical habitat for aquatic and riparian biota, the availability of refuges, the distribution of food resources, opportunities for movement and migration, and conditions suitable for reproduction and recruitment (Naiman et al. 2008). Key ecological implications of the hydrological conditions in the QMDB include (Marshall et al. 2005);

- Many species have either flexible/opportunistic life histories or long life spans.
- Species may utilise annual cues for critical life history activities.
- Species utilize drought refugia, (especially water holes) and/or have traits for surviving drought, or rapidly recolonising afterwards.

**Figure 5.** Hydrological classifications of streams in the Queensland Murray-Darling Basin and the Surat and Bowen coal basins (Kennard et al. 2008). Each point represents a gauging station with flows considered to have little or no hydrologic modifications due to human activities.

### Water quality in QMDB riverine systems

Geologic and climatic patterns in Queensland determine water quality factors such as the proportions of major ions, although the stage of flow influences variability and overall concentration (McNeil et al 2005). General characteristics of water quality conditions in the QMDB include (Marshall et al. 2005);

- Cold minimum temperatures.
- Variable temperatures.
- Turbidity is generally high so light penetration is generally limited to <16 cm.
- pH values generally in the range of 6.8-8.5
- Dissolved oxygen levels range between 3.7-14.2 mg/L
- Salinity characteristics are summarised in Table 3 (Queensland water quality guidelines, 2006). Salinity in the Murray-Darling basin is managed through the Basin Salinity Management Strategy (MDBC, 2001).

**Table 3.** Salinity characteristics of water in surface streams of the Queensland Murray-Darling Basin (QWQG, 2009).

Area	Area description	Overall rating	Major cations	Major anions
Condamine Macintyre	Condamine River, excluding eastern tributaries between Warwick and Dalby, and Macintyre Brook	Moderate to high	Sodium Magnesium	Chloride Bicarbonate
Maranoa-Balonne-Border Rivers	Balonne-Maranoa-Culgoa to border, and border rivers excluding Macintyre Brook	Moderately low	All	Bicarbonate
Western Murray-Darling basin	MDB west of the Balonne-Culgoa, including the Mungallala Creek system, Warrego and Paroo	Appears to be low	Sodium Others	Bicarbonate Chloride Sulphate

Key ecological implications of the water quality conditions in the QMDB include (Marshall et al. 2005):

- Low diversity of aquatic macroinvertebrates due to fine substrates and low light penetration.
- Primary productivity limited to phytoplankton near water surface and shallow littoral benthic algal production.
- Food webs largely driven by littoral benthic production.
- Cold minimum temperatures limit productivity rates and may exclude some species.
- Diversity of temperatures may lead to high biodiversity.

### 3.2.3. Stressor models

Stressor models are used to outline the potential biological consequences of stressors present in the environment. These have been developed for a range of stressors under the Queensland Wetlands Program (WetlandInfo, 2009). In Figure 6, a stressor model has been developed to outline potential ecological impacts of releasing associated water to surface streams. The factors identified in the stressor model are discussed briefly below.

#### **Altered hydrology**

Altered hydrology could affect surface stream ecosystem health positively or negatively. Positive impacts may include:

- Beneficial flushing flows, if delivered at appropriate times
- Providing water to supplement environmental flows in areas where water resources are diverted from surface streams for human use. Environmental flows improve the persistence of waterholes as refugia during dry periods and could increase connectivity between refugia. Nationally significant wetlands in the QMDB identified as threatened due to limited natural flows are highlighted in Table 9 (Appendix I). However, it should be noted that CSG water availability (and therefore any potential positive impacts) will be temporary.

Negative impacts arising from altered hydrology may include:

- Increased flow rates leading to bank and/or bed erosion and subsequent loss of habitat.
- Increased flow rates selecting against species which inhabit low flow areas or boundary layers.
- Alteration of flow regime leading to changing cues of flow sensitive species (e.g. for migration and spawning).
- Increased water levels leading to water-logging of fringing and riparian vegetation which provide habitat for biota.
- Increased flow altering the suspended particle size distribution which could affect light penetration and subsequently affect productivity in the water body.
- Biota with critical life history links to flow having insufficient time to complete life cycles in an altered flow regime. Biota with identified critical links to flow in the QMDB and Fitzroy basin are listed in Table 11 (Appendix I).

#### **Altered water quality**

Release of CSG water to surface streams could alter water quality and affect surface stream ecosystem health through:

- Increasing temperatures and reducing natural variation. Increased temperatures can lead to higher productivity however less variable temperature regimes lead to reduced productivity.
- Salinity increases may cause local toxicity and also contribute to catchment salinity loads which are of concern in the QMDB.
- Toxicity of chemical toxicants in the water over acute or chronic exposures. In ephemeral systems, toxicants are likely to be concentrated in waterholes during dry periods. Toxicity may lead to biological responses such as altered reproductive success, growth inhibition, predatory effects, feeding inhibition, death of individuals and ultimately the loss of sensitive species. Toxic effects may also be a result of deficiencies in required compounds.

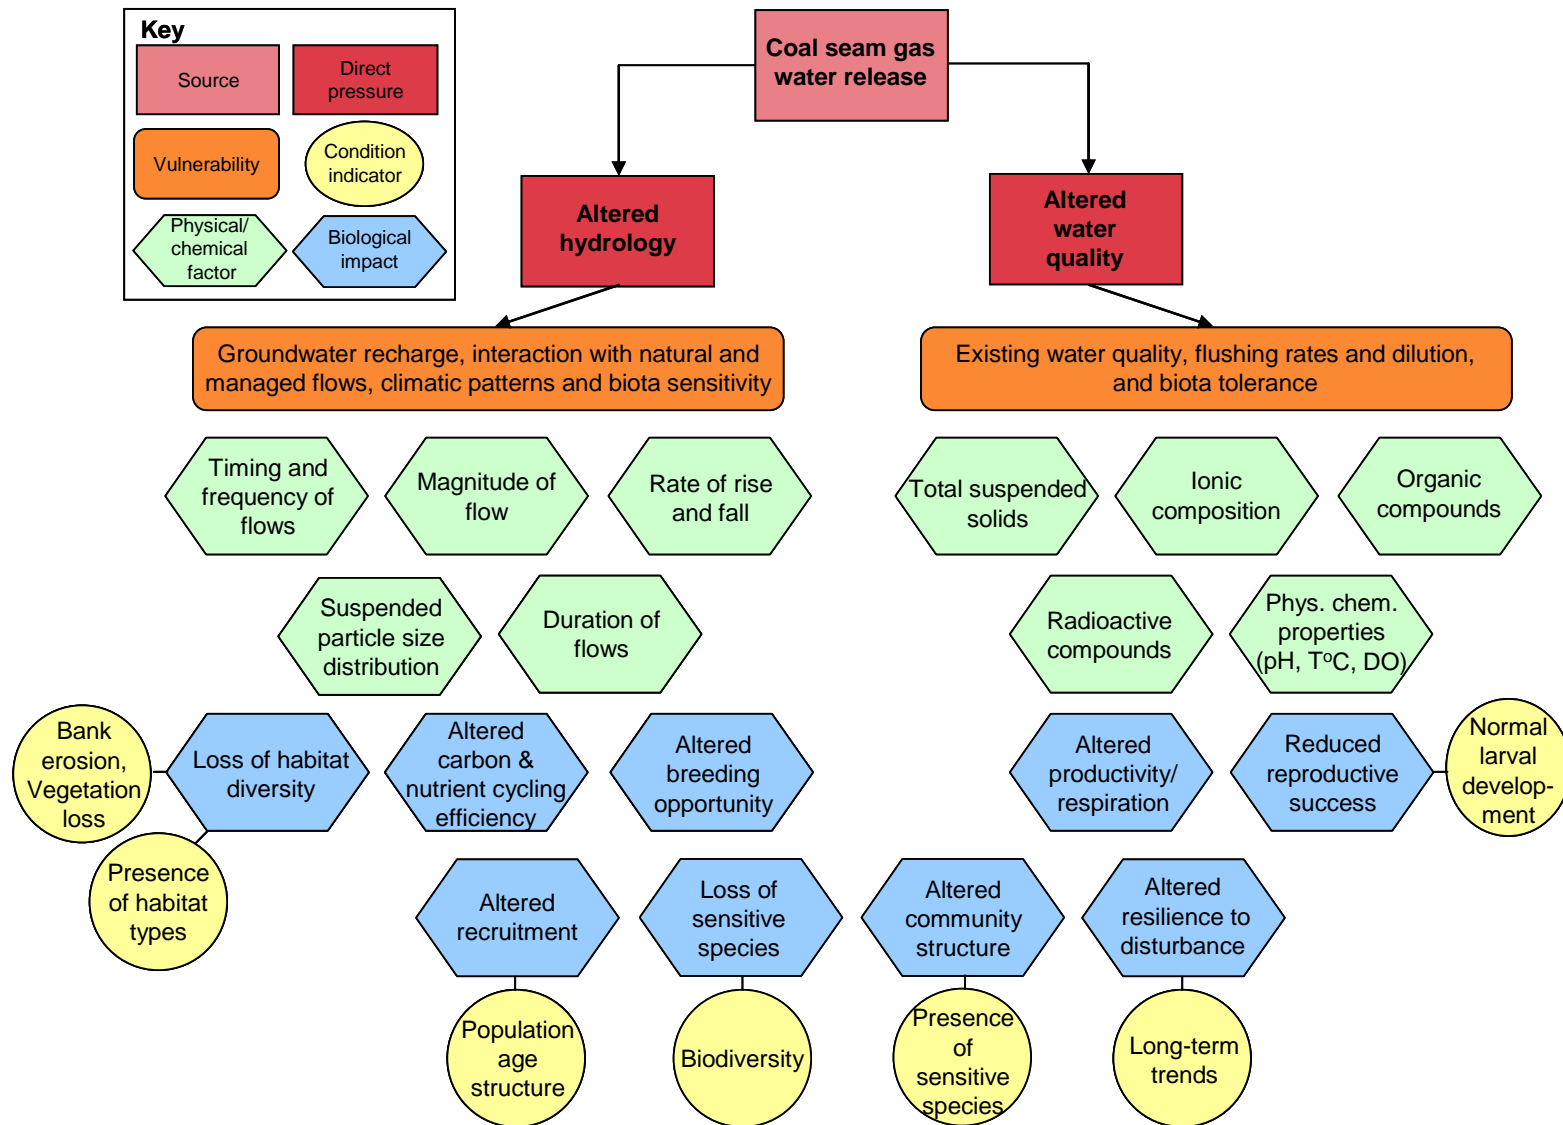

Figure 6. Stressor model for the release of coal seam gas water into surface streams (modified from WetlandInfo, 2009)

### 3.3. Ecological asset values

Environmental risk assessment requires the values provided by ecological assets to be identified. Ecological assets include species, populations, ecosystem functions and locations. Ecological assets that have been identified in the QMDB and other sources of this information are listed in Appendix I. The value of an asset is used to determine the level of risk that it is acceptable to expose the asset to. There are a number of approaches that assign ‘value’ to an asset and each should be considered when assessing risks posed to an asset. These include:

- “Environmental values” (EVs) and “water quality objectives” (WQOs) as defined in the Environmental Protection Policy (Water) (2009) and QWQG (2009);
- Identification of ecosystem benefits associated with the ecological assets;
- The degree of “naturalness” or existing degree of anthropogenic disturbance as defined in the ANZECC Guidelines (2000); and
- The conservation significance of an ecological asset.

The following four sections deal with each of these approaches to assigning value in turn.

#### 3.3.1. Environmental values and water quality objectives

Environmental values scheduled under the EPP Water are listed below. Each of these values may be relevant to the QMDB although all values would not apply to specific sites within the basin. The development of EVs and WQOs and the role of guidelines in this process are detailed in the Queensland EPA procedural guideline “Establishing draft environmental values and water quality objectives”, available at: <http://www.epa.qld.gov.au/register/p01551aa.pdf>.

- Aquatic ecosystems ✓
- Irrigating crops ✓
- Farm use ✓
- Stock watering ✓
- Aquaculture
- Human consumption ✓
- Primary recreation ✓
- Secondary recreation ✓
- Visual appreciation ✓
- Raw drinking water ✓
- Industrial use ✓
- Cultural and spiritual values ✓

#### 3.3.2. Ecological benefits

Benefits associated with aquatic ecosystems have been listed by the Queensland Wetlands Program (WetlandInfo, 2009) and include:

- Provisioning services – such as primary production
- Regulating services – including sediment and nutrient retention
- Supporting services – such as breeding/nursery habitat for waterbirds and fish, providing a source of water for other wildlife.

### 3.3.3. Naturalness

A commonly adopted approach for assigning conservation significance to an ecological asset is to determine the degree of “naturalness”. The Australian water quality guidelines define three levels of protection for aquatic ecosystems based on the degree of disturbance experienced at a site (Table 4).

**Table 4.** Australian water quality guideline “levels of protection” for waterways (ANZECC, 2000)

<b>High conservation value aquatic ecosystems</b>	Largely unmodified or have gone little change due to human activities and are often found within national parks, conservation reserves or inaccessible locations.
<b>Slightly to moderately disturbed aquatic ecosystems</b>	Have experienced some change from human activities but are not considered highly disturbed (see below). Aquatic biological diversity may have been affected to some degree but the natural communities are still largely intact and functioning.
<b>Highly disturbed aquatic ecosystems</b>	Degraded systems likely to have lower levels of naturalness but may still retain some ecological or conservation value.

The sustainable rivers audit collects information on several indicators of aquatic ecosystem condition which could be used as an indication of the “naturalness” of rivers in the QMDB. Table 5 lists ratings for each of the measured indicators for river basins in the QMDB in 2008. These assessments indicate that hydrology in QMDB rivers is largely in natural condition while fish and macro-invertebrate populations appear to be impacted by anthropogenic factors. Local assessment of condition would be required at sites potentially impacted by the release of CSG water.

**Table 5.** Condition of streams in the Queensland Murray-Darling Basin (MDBC, 2008).

River Valley	Fish	Macro invertebrates	Hydrology	Ecological health
Paroo	Moderate	Moderate	Good	Good
Warrego	Poor	Poor	Good	Poor
Condamine Balonne	Moderate	Poor	Good-Moderate	Moderate
Border Rivers	Moderate	Moderate	Good	Moderate

### 3.3.4. Conservation significance

Other criteria used to assign conservation significance are listed in Table 6. Some assets in the QMDB that have been assigned conservation significance under these criteria are highlighted in Appendix I.

**Table 6.** Criteria applied to determine the conservation significance of ecological assets (WetlandInfo, 2009).

Criteria	In the QMDB
Biodiversity	Biota that have been observed in the QMDB are listed in Appendix I.
Special features	
Distinct or unique species	Many fauna and flora species found the QMDB do not occur elsewhere in Queensland.
Representativeness and/or unique habitat	
Threatened species and ecosystems	Threatened species can be identified through the EPBC Act and through regional ecosystem mapping
Priority species and ecosystems	Priority species identified through Water Resource Planning in the QMDB are listed in Appendix II
Ecological connectivity	

## 4. Interim decision support matrix

The process that needs to be followed to assess the risk posed to surface stream ecosystems by the release of CSG water are outlined below in Figure 7 and the associated tasks are detailed with explanatory notes in Table 7.

This process begins with an assessment of the hazard or benefit posed by the CSG water discharge which requires detailed characterisation of the water quality and flow parameters of the CSG water discharge and modelling of the water quality and flow parameters of the receiving stream pre-development and following discharge.

Ecological assets that are likely to be impacted by the release of CSG water to a stream need to be identified and a conceptual understanding of the ecosystem in which the asset occurs and the assets water quality and hydrological requirements developed. Ecological assets identified as potentially affected by the release of CSG water to a stream need to be prioritised through consideration of the asset values. Prioritised, high value assets potentially impacted by CSG water releases require a detailed assessment to be conducted. Low priority assets require a less detailed assessment.

A stressor model would then need to be constructed which identifies potential interactions between stressors associated with CSG water releases (altered hydrology and altered water quality) and biological responses of the ecological assets. The conceptual understanding developed for the identified ecological assets is intended to inform the development of the stressor model by highlighting asset requirements and dependencies and interactions within an ecosystem.

The risk posed by the release of CSG water to a stream can be calculated by combining of the likelihood of exposure to a stressor and the consequences of that exposure. Knowledge of the critical links to both flow and water quality allows thresholds to be established for these parameters which, if exceeded, could be expected to represent a hazard/benefit to the ecological asset. Comparison of modelled pre-development conditions and conditions following CSG water discharge allows calculation of the increased likelihood of such a threshold being exceeded as a result of the discharge. Risk can then be estimated either quantitatively or qualitatively by combining this measure of likelihood with an assessment of the consequences of that hazard occurring. A detailed description of this approach to assessing risk which has been applied in water resource planning is provided in Cockayne et al (unpublished draft).

Both water quality and hydrological stressors should be incorporated in the risk assessment. In the absence of a conceptual understanding of the interactions between individual stressors, it is recommended that each stressor be considered additive so that the final risk estimate represents the sum of the risk posed by each stressor. Consideration of interactions between water quality and hydrology in terms of characterising risk will be further addressed in Task 2 of this Activity.

Once an estimate of risk has been derived, consideration needs to be given as to whether this risk is acceptable for the asset and management strategies to reduce the risk to an acceptable level identified. The level of risk that is considered acceptable for a given asset will be influenced by the value of the asset.

Key knowledge gaps that limit estimation of risks posed by CSG water releases into surface streams in the QMDB have been identified in the following section. It is intended that this decision support matrix will be updated throughout the life of this project as additional information becomes available.

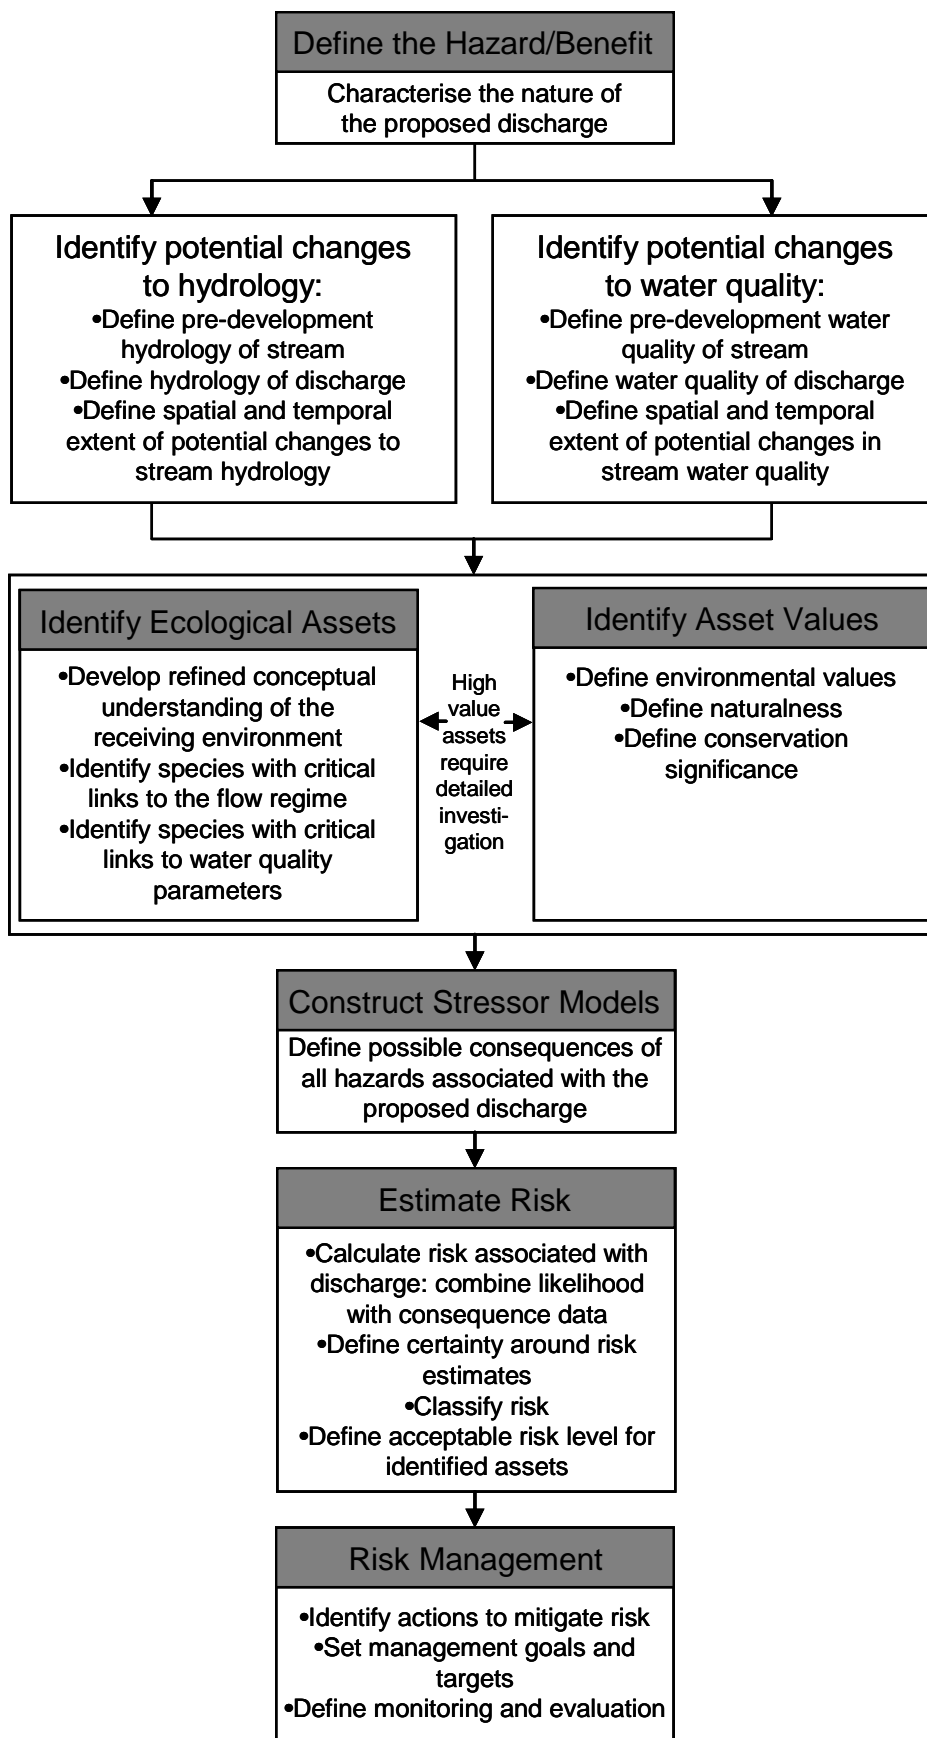

Figure 7. Interim Decision Support Matrix

**Table 7.** Explanatory table for the Interim Decision Support Matrix.

Process	Tasks	Notes
Defining hazard: Altered hydrology	Define pre-development conditions	Define background hydrological conditions at proposed discharge site. This will require modelling using available hydrological data. Table 2 lists ecologically relevant classifications of flow regime.
	Define flow parameters of the discharge relevant to stream ecosystems including: <ul style="list-style-type: none"> <li>▪ Timing of flows</li> <li>▪ Frequency of flows</li> <li>▪ Duration of flows</li> <li>▪ Magnitude of flows</li> <li>▪ Rate of rise and fall of flows</li> </ul>	The DERM operational policy regarding waste water discharge to Queensland waters states that; “As a general guide, modelling of flow characteristics should be considered where the waste water flow would exceed 10 percent of the natural minimum flow of the waterway.” In ephemeral streams all discharges will exceed 10 percent of the natural minimum flow. Discharge of water to temporary streams requires special consideration due to their unique hydrological and ecological characteristics.
	Define the spatial and temporal extent of discharge impacts to the stream flow regime	Flow parameters need to be managed in accordance with existing Water Resource Plan (WRP) Resource Operation Plans. Details of WRPs relevant to the QMDB and Fitzroy Basins are available at <a href="http://www.nrw.qld.gov.au/wrp/catchments.html">http://www.nrw.qld.gov.au/wrp/catchments.html</a>
Defining hazard: Altered water quality	Define pre-development water quality of the receiving environment	Define background water quality conditions at proposed discharge site
	Define water quality of the discharge including: <ul style="list-style-type: none"> <li>▪ Total suspended solids</li> <li>▪ Ionic composition</li> <li>▪ Metals and metalloids</li> <li>▪ Organic compounds</li> <li>▪ Radioactive compounds</li> <li>▪ Physical chemical parameters</li> </ul>	Refer to Appendix II for water quality parameters of relevance to CSG waters and the existing water quality concentration guideline values of relevance.  Both lower and upper limits of water quality parameters need to be defined.  The load of each water quality parameter that will be discharged through the life of a project, and in particular salts, needs to be defined.
	Define the spatial and temporal extent of discharge impacts to stream water quality	
Identifying water quality and flow requirements of ecological assets	Develop refined conceptual understanding of receiving environment	A generalised conceptual understanding of a riverine environment is presented in the current report that can be used to provide a basis for adaptation to locally specific conditions.  Specific conceptual models for wetlands in the QMDB are being developed through the Queensland Wetlands Program (WetlandInfo, 2009).  Ecological assets likely to be impacted by CSG water release at a specific location need to be carefully identified.  Assets with a high conservation value (see below) will require a detailed assessment of their ecological requirements.

Process	Tasks	Notes
	Identify species with critical links to the flow regime	Refer to Appendix I for flow dependencies identified through DERM water resource planning. Species may be grouped into guilds with common flow requirements when constructing stressor models.
	Identify species with specific water quality sensitivities	Limited information currently available for toxicants other than salinity.
Identifying asset values	Define environmental values	Characterise Environmental Values and Water Quality Objectives as defined in the Environmental Protection Policy (Water) (2009) and the Queensland Water Quality Guidelines (2006) for receiving waters.
	Define naturalness	Assess existing degree of anthropogenic disturbance in receiving waters as defined in the ANZECC Water Quality Guidelines (2000).
	Define conservation significance	Refer to Table 6 for criteria and Appendix I for ecological assets with conservation significance identified in the QMDB.
Stressor models	Construct stressor models	Identify potential consequences of hazard exposure to ecological assets in the receiving environment.  This step integrates the information collected through the “Defining hazard” and “Identifying ecological assets” processes described above.  Stressor models may need to be constructed for a number of discharge scenarios.
Estimating risk	Calculate risk associated with identified potential outcomes	Risk can be calculated either quantitatively or qualitatively by combining information on the likelihood of a hazard occurring (identified through the “defining hazard” phase) and the potential consequences of the hazard (identified through the stressor models).
	Analyse risk	Classify risk as high, medium or low.
	Set acceptable risk level	Determine the acceptable level of risk for the ecological assets identified.
	Define certainty around risk estimates	Uncertainty around asset information and guidelines increases risk. Certainty can be improved through research and data gathering.
Risk management	Mitigate risk	Determine management actions that can mitigate the risk posed to ecological assets.
	Set management goals and targets	Based on acceptable level of risk for identified assets.
	Monitoring and evaluation	Identify indicators of ecosystem impact and design a monitoring program that provides data on which to base ongoing management decisions.

## 5. Knowledge gaps

While the Murray-Darling is a relatively well studied system and industry involved in the production of coal seam gas in Queensland has directed considerable effort into local data collection, there remain a number of important knowledge gaps which impede assessment of the environmental risk of coal seam gas water releases to surface streams. Major knowledge gaps are described in Table 8 with aspects intended to be addressed through the current study highlighted.

**Table 8.** Data required for assessment of environmental risks posed by the release of coal seam gas water to surface streams in the Queensland Murray-Darling Basin.

Topic	Data required
Water Quality	Radionuclide concentrations in Queensland CSG water.
	Organic pollutant concentrations in Queensland CSG water. (Hydrocarbons have been reported for some discharges).
	Local species tolerance to toxicants and physical-chemical properties of CSG water.  (DERM has also collected salinity toxicity data some species collected from the QMDB with some additional data on the effects ionic composition from four typical water types in Queensland. This data will be used to create species sensitivity distributions to derive locally relevant salinity guidelines).
	Water quality guidelines derived using local reference condition data or local toxicity data.
	Potential for concentration of toxicants through evaporation in refuge waterholes during low-zero flow events and application of water quality guidelines in low flow streams.
	Guidelines for acceptable whole of catchment toxicant loads resulting from CSG water releases. This will be particularly relevant for salinity due to its importance for downstream catchments in the Murray-Darling.
	Potential for CSG water discharges to result in stratification of water quality in the receiving water bodies.
	Potential for contamination of shallow aquifers.
Hydrology	Hydrological classification for non-reference streams. Classification of streams will improve prediction of ecological risks posed by altered hydrological conditions. (Being addressed through the research of Janet Stein).
	Biota with critical links to flow. (Being addressed through water resource planning).
	Potential risks/benefits posed to biota with critical links to flow from CSG water releases, particularly with reference to surface waters with intermittent flow.
	Potential for increased flows to cause bed/bank erosion and to alter the particle size distribution of suspended sediments.
	Habitat changes that would result from increased flow and water logging due to CSG water releases.
	Potential benefits of utilising CSG water to supplement environmental flows and increase connectivity in wetlands.
Monitoring and Evaluation	Indicators of stream ecosystem health that respond to the stressors introduced by CSG water need to be identified for streams in the QMDB.

## Appendix I: Ecological assets identified in the QMDB and Fitzroy Basin

In addition to the assets listed in Tables 9-14, ecological assets in the QMDB can be identified through;

- WildNet database (DERM)
- Referable wetlands (DERM)
- Regional ecosystem mapping (DERM)
- AquaBAMM assessments, available at:  
<http://www.epa.qld.gov.au/wetlandinfo/site/SupportTools/AssessmentMethods/AquaBAMM/CondamineRivercatchmentriverineandnonriverine.html>

### Priority Assets in the QMDB

**Table 9.** Nationally and internationally important wetlands in the Queensland Murray-Darling Basin. Maps showing the location of the listed wetlands are available online through the Queensland Wetlands Program (<http://www.epa.qld.gov.au/wetlandinfo/site/MappingFandD.html>). Wetlands identified as being threatened due to limited natural flows are shaded (Davis et al. 2001)

River Basin	Wetland	Importance, Convention listing
Condamine Balonne	Murrawondah Lakes	Nationally important, DIWA
	Myola-Mulga Downs Salt Lake and Claypans	Nationally important, DIWA
	Balonne River Floodplain	Nationally important, DIWA
	Dalrymple and Blackfellows Creek	Nationally important, DIWA
	Lake Broadwater	Nationally important, DIWA
	The Gums Lagoon	Nationally important, DIWA
	Wyandra – Cunamulla Claypans Aggregation	Nationally important, DIWA
Warrego	“Old Bando” Swamp	Nationally important, DIWA
	Lake Dartmouth Area	Nationally important, DIWA
	Warrego River Distributary System	Nationally important, DIWA
	Warrego River Waterholes (Charleville-Wyandra)	Nationally important, DIWA
Paroo	Currawinya Lakes	Internationally important, Ramsar
	Eulo Artesian Springs Supergroup	Nationally important, DIWA
	Lake Numalla Aggregation	Nationally important, DIWA
	Lake Wombah – Kingie Lake Group	Nationally important, DIWA
	Lake Wyara	Nationally important, DIWA
	Lake Bindegolly and Toomaroo	Nationally important, DIWA
	Paroo River Waterholes (“Ciawarro” Area)	Nationally important, DIWA

**Table 10.** Priority ecological assets identified in water resource plan areas of the Queensland Murray-Darling Basin (provided by Water Accounting, DERM).

Top 10 priority assets for each WRP Area						
Asset	Priority					
	Moonie	Warrego	Border Rivers	Upper Condamine	Middle Condamine	Lower Balonne
Golden perch <i>Macquaria ambigua</i>	1	1	1	1 & 2	1	1 & 2
Permanent waterholes	1	1	1	1 & 2	1	1 & 2
River red gum <i>Eucalyptus camaldulensis</i>	2	2	3	3 & 4	2	3 & 4
Painted snipe <i>Rostratula benghalensis</i>	2		2			3 & 4
Freckled Duck <i>Stictonetta naevosa</i>	3		3			4 & 5
Purple spotted gudgeon <i>Mogurnda adspersa</i>	3			5		
Murray cod <i>Maccullochella peelii peelii</i>	4	3		5 & 6	3	
Hyrtl's tandan <i>Neosilurus hyrtlii</i>	4	3		5 & 6	3	
Black box <i>Eucalyptus largiflorens</i>	4	3		5 & 6	3	
Coolibah <i>Eucalyptus coolibah</i>	4	3		5 & 6	3	
Murrawondah Lakes: Vegetation		3				
Warrego Distributary System: Vegetation		3				
Spangled perch <i>Leiopotherapon unicolour</i>		4			4	
River blackfish <i>Gadopsis marmoratus</i>			3	4	2	
Sundown National Park: Vegetation			3			
Inundation of floodplain and benches			3 & 6		4	
Black Swan <i>Cygnus atratus</i>			4			
Brolga <i>Grus rubicundus</i>			4			
Lake Broadwater: Vegetation				4		
Narran Lakes: Vegetation & Waterbirds						3veg & 5wb

Task 1: *Interim decision support matrix – Release of water produced in association with CSG activities to surface waterways*

Culgoa River Floodplain: Vegetation & Waterbirds						3veg & 5wb
Culgoa Floodplain Nation Park: Vegetation & Waterbirds						3veg & 5wb
Culgoa National Park: Vegetation & Waterbirds						3veg & 5wb
Balonne River floodplain wetlands: Vegetation						4

\* Numbers represent the rank of the asset within the catchment. Similar scoring assets are ranked equally within a catchment. Shaded sections represent either those assets which do not occur in a catchment or those assets which score outside the top 10 assets in the catchment.

## Biota in the QMDB with identified critical links to flow

**Table 11.** Assets in Border Rivers Basin with critical links to flow identified through water resource planning (DERM, 2009).

Asset -scientific name	Asset - common name/ description	Current distribution in WRP area	Critical link to flow	Level of knowledge
<b>Birds</b>				
<i>Cygnus altratus</i>	Black swan	Reported from the Border Rivers WRP area.	Seasonal flooding acts as breeding cue	Moderate
<i>Ephippiorhynchus asiaticus</i>	Black-necked stork	Reported from the Border Rivers WRP area.	Breeding in wetlands but unknown links	Poor
<i>Anas castanea</i>	Chestnut teal	Reported from the Border Rivers WRP area.	Successful breeding related to wetlands remaining full for 3 to 6 months	Poor
<i>Stictonetta naevosa</i>	Freckled duck	Reported from the Border Rivers WRP area.	Successful breeding related to wetland filling and maintaining water for 4 months	Moderate
<i>Ardea alba</i>	Great egret	Reported from the Border Rivers WRP area.	Successful breeding related to inundation	Moderate
<i>Anas gracilis</i>	Grey teal	Reported from the Border Rivers WRP area.	Successful breeding related to wetlands remain filled for 3-6 months	Low
<i>Phalacrocorax sulcirostris</i>	Little black cormorant	Reported from the Border Rivers WRP area.	Successful breeding related to wetland inundation	Moderate
<i>Chenonetta jubata</i>	Maned duck	Reported from the Border Rivers WRP area.	Wetland inundation stimulates breeding	Moderate
<i>Anas superciliosa</i>	Pacific black duck	Reported from the Border Rivers WRP area.	Requires permanent water or wetland inundation	Poor
<i>Pelecanus conspicillatus</i>	Australian pelican	Reported from the Border Rivers WRP area.	Flooding acts as breeding stimuli	Poor
<i>Threskiornis molucca</i>	Australian white ibis	Reported from the Border Rivers WRP area.	Flooding acts as breeding stimuli	Poor
<i>Oxyura australis</i>	Blue-billed duck	Reported from the Border Rivers WRP area.	Flooding drives movement and later breeding	Poor
<i>Grus rubicundus</i>	Brolga	Reported from the Border Rivers WRP area.	Flooding is required as breeding stimuli	Moderate
<i>Plegadis falcinellus</i>	Glossy ibis	Reported from the Border Rivers WRP area.	Flooding is required as breeding stimuli	Poor

Task 1: Interim decision support matrix – Release of water produced in association with CSG activities to surface waterways

<i>Ardea intermedia</i>	Intermediate egret	Reported from the Border Rivers WRP area.	Breeding is usually dictated by flooding	Moderate?
<i>Phalacrocorax melanoleucos</i>	Little Pied Cormorant	Reported from the Border Rivers WRP area.	Flooding induces breeding	Moderate
<i>Rostratula benghalensis</i>	Painted snipe	Reported from the Border Rivers WRP area.	Breeding in wetlands but unknown links	Moderate
<i>Malacorhynchus membranaceus</i>	Pink-eared duck	Reported from the Border Rivers WRP area.	Flooding acts as breeding stimuli	Poor
<i>Platalea regia</i>	Royal Spoonbill	Reported from the Border Rivers WRP area.	Breeding is influenced by flooding	Moderate
<i>Nycticorax caledonicus</i>	Rufous Night Heron	Reported from the Border Rivers WRP area.	Breeding is usually dictated by flooding	Moderate
<i>Threskiornis spinicollis</i>	Straw-necked ibis	Reported from the Border Rivers WRP area.	Breeding is usually dictated by flooding	Moderate
<i>Chlidonias hybrida</i>	Whiskered tern	Reported from the Border Rivers WRP area.	Breeding depends on rainfall and flooding	Poor
<i>Biziura lobata</i>	Musk duck	Reported from the Border Rivers WRP area.	Season, rain and rising water act as breeding cues	Poor

**Fish**

<i>Macquaria ambigua</i>	Golden perch	Reported from the Border Rivers WRP area.	Any major rise in river level induces spawning	Good
<i>Maccullochella peelii peelii</i>	Murray cod	Reported from the Border Rivers WRP area.	Onset of upstream migration coincides with elevated water levels	Poor
<i>Bidyanus bidyanus</i>	Silver perch	Reported from the Border Rivers WRP area.	Assumed to require flooding to initiate spawning	Poor
<i>Leiopotherapon unicolour</i>	Spangled perch	Reported from the Border Rivers WRP area.	Flooding important stimuli for movement	Moderate
<i>Hypseleotris</i> spp.	Carp gudgeon	Reported from the Border Rivers WRP area.	Peak spawning coincides with low and stable flows	Low
<i>Melanotaenia fluviatilis</i>	Rainbowfish	Reported from the Border Rivers WRP area.	Likely to spawn during low flows	Low
<i>Galaxias olidus</i>	Mountain galaxias	Reported from the Border Rivers WRP area.	Adults of mountain galaxias move upstream into shallow riffle areas for spawning	Moderate
<i>Gadopsis marmoratus</i>	River blackfish	Reported from the Border Rivers	River blackfish requires slow flowing waters for spawning	Good

		WRP area.		
<i>Mogurnda adspersa</i>	Purple spotted gudgeon	Reported from the Border Rivers WRP area.	Sensitive to high current velocities	Good
<b>Amphibian</b>				
<i>Litoria wilcoxii</i>	Stony Creek Frog	Reported from the Border Rivers WRP area.	Stable low flows required during spawning	Moderate
<b>Vegetation</b>				
<i>Eucalyptus largiflorens</i>	Black box	Reported from the Border Rivers WRP area.	Flooding is important for maintenance and recruitment	Moderate
<i>Eucalyptus coolabah</i>	Coolibah	Reported from the Border Rivers WRP area.	Flooding is essential for maintenance	Moderate
<i>Muehlenbeckia florulenta</i>	Lignum	Reported from the Border Rivers WRP area.	Inundation is essential for maintenance	Moderate
<i>Eucalyptus camaldulensis</i>	River red gum	Reported from the Border Rivers WRP area.	Inundation is critical for maintenance and recruitment of seedlings	Moderate
<b>Waterholes</b>				
N/A	Permanent waterholes	Present in Border Rivers WRP area.	Important refugia during dry times	Good
<b>Wetland</b>				
N/A	Sundown National Park (Waterbirds, Vegetation)	Located within Stanthorpe shire boundary of the Border Rivers	Flows from the Severn River through the park provide important habitat for range of flora and fauna	Moderate
<b>Processes</b>				
N/A	Inundation of floodplain and benches	Occurs in Border Rivers WRP area on the floodplain and benches within river channel.	Inundation facilitates transport of sediments and nutrients	Moderate

**Table 12.** Assets in the Moonie Basin with critical links to flow identified through water resource planning (DERM, 2009).

<b>Asset -scientific name</b>	<b>Asset – common name/ description</b>	<b>Current distribution in WRP area</b>	<b>Critical link to flow</b>	<b>Level of knowledge</b>
<b>Waterbirds</b>				
<i>Cygnus altratus</i>	Black swan	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Seasonal flooding acts as breeding cue	Moderate
<i>Ephippiorhynchus asiaticus</i>	Black-necked stork	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding in wetlands but unknown links	Poor
<i>Anas castanea</i>	Chestnut teal	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Successful breeding related to wetlands remaining full for 3-6 months	Poor
<i>Stictonetta naevosa</i>	Freckled duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Successful breeding related to wetland filling and maintaining water for 4 months	Moderate?
<i>Ardea alba</i>	Great egret	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Successful breeding related to inundation	Moderate
<i>Anas gracilis</i>	Grey teal	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Successful breeding related to wetlands remain filled for 3-6 months	Low
<i>Phalacrocorax sulcirostris</i>	Little black cormorant	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Successful breeding related to wetland inundation	Moderate
<i>Chenonetta jubata</i>	Maned duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Wetland inundation stimulates breeding	Moderate

<i>Anas superciliosa</i>	Pacific black duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Requires permanent water or wetland inundation	Poor
<i>Pelecanus conspicillatus</i>	Australian pelican	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding acts as breeding stimuli	Poor
<i>Threskiornis molucca</i>	Australian white ibis	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding acts as breeding stimuli	Poor
<i>Oxyura australis</i>	Blue-billed duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding drives movement and later breeding	Poor
<i>Grus rubicundus</i>	Brolga	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding is required as breeding stimuli	Moderate
<i>Plegadis falcinellus</i>	Glossy ibis	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding is required as breeding stimuli	Poor
<i>Ardea intermedia</i>	Intermediate egret	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding is usually dictated by flooding	Moderate
<i>Phalacrocorax melanoleucos</i>	Little Pied Cormorant	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding induces breeding	Moderate
<i>Biziura lobata</i>	Musk duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Rising water can trigger breeding	Poor
<i>Rostratula benghalensis</i>	Painted snipe	Reported from the Moonie WRP area	Breeding in wetlands but unknown links	Moderate

		but breeding is likely to occur in Thallon wetland only.		
<i>Malacorhynchus membranaceus</i>	Pink-eared duck	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Flooding acts as breeding stimuli	Poor
<i>Platalea regia</i>	Royal Spoonbill	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding is influenced by flooding.*	Moderate
<i>Nycticorax caledonicus</i>	Rufous Night Heron	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding is usually dictated by flooding	Moderate
<i>Threskiornis spinicollis</i>	Straw-necked ibis	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding is usually dictated by flooding	Moderate
<i>Chlidonias hybrida</i>	Whiskered tern	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Breeding depends on rainfall and flooding	Poor
<i>Platalea flavipes</i>	Yellow-billed Spoonbill	Reported from the Moonie WRP area but breeding is likely to occur in Thallon wetland only.	Unknown	Poor

**Fish**

<i>Macquaria ambigua</i>	Golden perch	Reported from the Moonie WRP area.	Any major rise in river level induces spawning	Good
<i>Neosilurus hyrtl</i>	Hyrtl's tandan	Reported from the Moonie WRP area.	Rising water level stimulates spawning	Moderate
<i>Maccullochella peelii peelii</i>	Murray cod	Reported from the Moonie WRP area.	Onset of upstream migration coincides with elevated water levels	Poor
<i>Bidyanus bidyanus</i>	Silver perch	Reported from the Moonie WRP area.	Assumed to require flooding to initiate spawning	Poor
<i>Leiopotherapon unicolor</i>	Spangled perch	Reported from the Moonie WRP area.	Flooding important stimuli for movement	Moderate

		area.		
<i>Hypseleotris</i> spp.	Carp gudgeon	Reported from the Moonie WRP area.	Peak spawning coincides with low and stable flows	Low
<i>Mogurnda adspersa</i>	Purple spotted gudgeon	Reported from the Moonie WRP area.	Sensitive to high current velocities	Good
<i>Melanotaenia fluviatilis</i>	Rainbowfish	Reported from the Moonie WRP area.	Likely to spawn during low flows	Low
<b>Vegetation</b>				
<i>Eucalyptus largiflorens</i>	Black box	Reported from the Moonie WRP area.	Flooding is important for maintenance and recruitment	Moderate
<i>Eucalyptus coolabah</i>	Coolibah	Reported from the Moonie WRP area.	Flooding is essential for maintenance	Moderate
<i>Muehlenbeckia florulenta</i>	Lignum	Reported from the Moonie WRP area.	Inundation is essential for maintenance	Moderate
<i>Eucalyptus camaldulensis</i>	River red gum	Reported from the Moonie WRP area.	Inundation is critical for maintenance and recruitment of seedlings	Moderate
<b>Waterholes</b>				
N/A	Permanent waterholes	Present in Moonie WRP area.	Important refugia during dry times	Good
<b>Wetland</b>				
N/A	Thallon wetland	Present in Moonie WRP area (Thallon).	Magnitude, frequency and duration of inundation is important	Low
<b>Processes</b>				
N/A	Inundation of floodplain and benches	Occurs in Moonie WRP area on the floodplain and benches within river channel.	Inundation facilitates transport of sediments and nutrients	Moderate

**Table 13.** Preliminary draft list of assets in the Upper Condamine (Condamine and Balonne Basin) with critical links to flow identified through water resource planning (DERM, 2009).

<b>Asset - scientific name</b>	<b>Asset - common name/ description</b>	<b>Current distribution in WRP area</b>	<b>Critical link to flow</b>	<b>Level of knowledge</b>
<b>Birds</b>				
<i>Cygnus altratus</i>	Black swan	Reported from the Upper Condamine WRP area.	Seasonal flooding acts as breeding cue.	Moderate
<i>Ephippiorhynchus asiaticus</i>	Black-necked stork	Reported from the Upper Condamine WRP area.	Breeding in wetlands but unknown links.	Poor
<i>Anas castanea</i>	Chestnut teal	Reported from the Upper Condamine WRP area.	Successful breeding related to wetlands remaining full for 3 to 6 months.	Poor
<i>Stictonetta naevosa</i>	Freckled duck	Reported from the Upper Condamine WRP area.	Successful breeding related to wetland filling and maintaining water for 4 months.	Moderate?
<i>Ardea alba</i>	Great egret	Reported from the Upper Condamine WRP area.	Successful breeding related to inundation.	Moderate
<i>Anas gracilis</i>	Grey teal	Reported from the Upper Condamine WRP area.	Successful breeding related to wetlands remain filled for 3-6 months.	Low
<i>Phalacrocorax sulcirostris</i>	Little black cormorant	Reported from the Upper Condamine WRP area.	Successful breeding related to wetland inundation.	Moderate
<i>Chenonetta jubata</i>	Maned/wood duck	Reported from the Upper Condamine WRP area.	Wetland inundation stimulates breeding.	Moderate
<i>Anas superciliosa</i>	Pacific black duck	Reported from the Upper Condamine WRP area.	Requires permanent water or wetland inundation.	Poor
<i>Pelecanus conspicillatus</i>	Australian pelican	Reported from the Upper Condamine WRP area.	Flooding acts as breeding stimuli.	Poor
<i>Threskiornis molucca</i>	Australian white ibis	Reported from the Upper Condamine WRP area.	Flooding acts as breeding stimuli.	Poor
<i>Oxyura australis</i>	Blue-billed duck	Reported from the Upper Condamine WRP area.	Flooding drives movement and later breeding.	Poor
<i>Grus rubicundus</i>	Brolga	Reported from the Upper Condamine WRP area.	Flooding is required as breeding stimuli.	Moderate
<i>Plegadis falcinellus</i>	Glossy ibis	Reported from the Upper Condamine WRP area.	Flooding is required as breeding stimuli.	Poor
<i>Ardea intermedia</i>	Intermediate egret	Reported from the Upper Condamine	Breeding is usually dictated by flooding.	Moderate?

		WRP area.		
<i>Phalacrocorax melanoleucos</i>	Little Pied Cormorant	Reported from the Upper Condamine WRP area.	Flooding induces breeding.	Moderate
<i>Rostratula benghalensis</i>	Painted snipe	Reported from the Upper Condamine WRP area.	Breeding in wetlands but unknown links.	Moderate
<i>Malacorhynchus membranaceus</i>	Pink-eared duck	Reported from the Upper Condamine WRP area.	Flooding acts as breeding stimuli.	Poor
<i>Platalea regia</i>	Royal Spoonbill	Reported from the Upper Condamine WRP area.	Breeding is influenced by flooding.	Moderate
<i>Nycticorax caledonicus</i>	Nankeen/Rufous Night Heron	Reported from the Upper Condamine WRP area.	Breeding is usually dictated by flooding.	Moderate
<i>Threskiornis spinicollis</i>	Straw-necked ibis	Reported from the Upper Condamine WRP area.	Breeding is usually dictated by flooding.	Moderate
<i>Chlidonias hybrida</i>	Whiskered tern	Reported from the Upper Condamine WRP area.	Breeding depends on rainfall and flooding.	Poor
<i>Platalea flavipes</i>	Yellow-billed Spoonbill	Reported from the Upper Condamine WRP area.		Poor
<i>Biziura lobata</i>	Musk duck	Reported from the Upper Condamine WRP area.	Season, rain and rising water act as breeding cues.	Poor

### Fish

<i>Macquaria ambigua</i>	Golden perch	Reported from the Upper Condamine WRP area.	Any major rise in river level induces spawning.	Good
<i>Maccullochella peelii peelii</i>	Murray cod	Reported from the Upper Condamine WRP area.	Onset of upstream migration coincides with elevated water levels	Poor
<i>Bidyanus bidyanus</i>	Silver perch	Reported from the Upper Condamine WRP area.	Assumed to require flooding to initiate spawning.	Poor

**Table 15.** Assets in the Fitzroy Basin with critical links to flow identified through water resource plans (Cockayne, 2007; DERM, 2009).

<b>Asset-Scientific Name</b>	<b>Asset-Common name/description</b>	<b>Current distribution in WRP area</b>	<b>Critical link to flow</b>	<b>Level of knowledge</b>
<i>Ambassis agassizii</i>	Olive perchlet	Widespread	Requires stable low flows for spawning	Low
<i>Amniataba percooides</i>	Barred grunter	Widespread	Low flow spawning fish which requires longitudinal and lateral connectivity for access to habitat	Low-moderate
<i>Anguilla obscura and reinhardtii</i>	Glass eels		Changes to natural flow regime may impact possible cues for upstream recruitment	
<i>Bidyanus bidyanus</i>	Silver perch	Widespread	Migrate and spawn on high flows	Very good
<i>Eucalyptus camaldulensis</i>	Red river gum	Widespread but low abundance	Floods promote growth and benefit seedling establishment	Very good
<i>Eucalyptus coolabah</i>	Coolabah	Widespread	Floods promote growth and benefit seedling establishment	Low
<i>Hephaestus fuliginosus</i>	Sooty grunter	Widespread	Requires longitudinal connectivity for spawning migration, and riffle habitats for oxygenation of eggs. Flooding enhances recruitment	Low-moderate
<i>Lates calcarifer</i>	Barramundi	Mid to lower Fitzroy basin	1. Floods required for migration, growth and recruitment 2. Lateral connectivity required for upstream migrations of juvenile fish to freshwater habitats during migration period (Oct-Dec)	Moderate
<i>Macquaria ambigua</i>	Golden Perch	Widespread	Migrate and spawn on high flows	Very good
<i>Melanotaenia splendida splendida</i>	Eastern rainbowfish	Widespread	Low spawning fish	Good
<i>Mogurnda adspersa</i>	Purple spotted gudgeon	Widespread	Vulnerable to fluctuations in water levels that may impact on reproduction and recruitment by exposing fish eggs (Sept-Nov)	Moderate-good
<i>Mugil cephalus</i>	Striped mullet/sea mullet	Lower Fitzroy	Flows required for spawning migration (downstream_ and re-colonisation/dispersal (upstream))	Moderate
<i>Neosilurus ater</i>	Black catfish/black tandan	Limited	High flow events during the spawning period required for spawning migration and spawning.	Moderate-good
<i>Neosilurus hyrtlilii</i>	Hyrtls tandan/Hyrtl's catfish	Widespread	Migrate and spawn on medium to high flows	Moderate
<i>Notesthes robusta</i>	Bullrout	Limited to lower	Migrate on low winter	Low

Asset-Scientific Name	Asset-Common name/description	Current distribution in WRP area	Critical link to flow	Level of knowledge
<i>Rheodytes leukops</i>	Fitzroy River turtle	Fitzroy	flows Affinity for well-oxygenated riffles implies that river regulation would potentially affect this species via dietary ecology and respiratory physiology	
<i>Riffles as habitats</i>			Riffles are generally the most productive habitats and support a high diversity of plants and animals.	
<i>Scortum hillii</i>	Leathery grunter	Widespread	Migrate and spawn on high flows	Good
<i>Tandanus tandanus</i>	Eel tail catfish/freshwater catfish	Widespread	Stable low flows facilitate next construction, spawning and larval development during spring/early summer	Moderate
Waterholes as refugia	Waterholes	Widespread	Flows for persistence and connectivity	Good
Wetlands as water bird nesting sites	Wetlands	-Boggomoss springs (QLD010) -Fitzroy River Delta (QLD012) -Fitzroy River Floodplain (QLD013) -Callide - Lake Pleasant/Victoria -Callide - Tee Holes (approx. AMTD 27-Callide) -Dawson - Bears Lagoon (AMTD 152-Dawson) -Mackenzie - 10 Mile and associated floodplain (AMTD 335-383) -Lake Mary and Associated Flood Plain (AMTD 400-409.5-Mackenzie)	Flood flows for water bird nesting sites and connectivity for fish migration	Low

## Macroinvertebrate families present in the QMDB and Fitzroy Basin

**Table 16.** Macroinvertebrate families reported in Queensland Murray-Darling Basin and Fitzroy sites through DERM monitoring.

Family	Family	Family
Aeshnidae	Gerridae	Planorbidae
Ancylidae	Glossiphoniidae	Pleidae
Atriplectidae	Glossosomatidae	Protoneuridae
Aytidae	Gomphidae	Psephenidae
Baetidae	Gyrinidae	Ptilodactylidae
Belostomatidae	Haliplidae	Pyralidae
Bithyniidae	Hebridae	Sciomyzidae
Caenidae	Heteroceridae	Scirtidae
Calamoceratidae	Hydraenidae	Simuliidae
Carabidae	Hydridae	Sisyridae
Chaoboridae	Hydrobiidae	Sphaeriidae
Ceratopogonidae	Hydrobiosidae	Staphlinidae
Chironomidae (Tanypodinae)	Hydrometridae	Stratiomyidae
Chironomidae (Orthoclaadiinae)	Hydrophilidae	Tabanidae
Chironomidae (Chironominae)	Hydropsychidae	Temnocephalidae
Chyrosmelidae	Hydroptilidae	Thiaridae
Clavidae	Hygrobiiidae	Tipulidae
Coenagrionidae	Hyriidae	Veliidae
Conoesucidae	Isostictidae	Viviparidae
Corallanidae	Leptoceridae	
Corbiculidae	Leptophlebiidae	
Corduliidae	Libellulidae	
Corixidae	Lymnaeidae	
Culicidae	Mesoveliidae	
Curculionidae	Naucoridae	
Dolichopodidae	Nepidae	
Dugesiiidae	Noteridae	
Dytiscidae	Notonectidae	
Ecnomidae	Ochteridae	
Elmidae	Ornithobdellidae	
Empididae	Palaemonidae	
Ephydriidae	Parasthiacidae	
Erobdellidae	Physidae	

## Appendix II: Water quality guidelines

Water quality guidelines in Australia are intended to be applied in the following order of preference:

- Locally derived guidelines
- Queensland Water Quality Guidelines
- Australian Water Quality Guidelines

With the exception of salinity values, the Queensland Water Quality Guidelines (QWQG, 2009) have stated that although there is some information available for the Murray-Darling basin there is insufficient data to set reliable Queensland guidelines. The default guidelines in this case are the Australian ANZECC Guidelines (ANZECC, 2000) although it is noted that these are unlikely to be appropriate for the flood-plain reaches of the Murray-Darling rivers and local guidelines are needed. Water quality data collected through various monitoring programs in the QMDB is currently being collated by the Activity 4 project team with a view to assessing suitability for deriving locally relevant water quality guidelines.

Table 15 lists the water quality parameters that have been identified as of potential concern in CSG water. This includes parameters that have been reported for CSG waters in Australia as well as parameters identified through literature from CSG operations in the United States and New Zealand. The most appropriate water quality guidelines that are currently available are also listed. Due to fact that these guidelines have not been derived locally, and the uncertainty around applying these to QMDB, the guideline values presented here should be consulted conservatively, until locally derived guidelines can be set.

**Table 17.** Existing water quality guidelines for surface waters in the Queensland Murray-Darling Basin.

Water Quality Parameter	Available Guideline	Guideline Level	Comments
<b>Non-Metallic Inorganics</b>			
Arsenic	ANZECC	24 µg/L (ASIII) 13 µg/L (AsV)	Aquatic ecosystems, 95% protection
Bicarbonate	-		
Bromine	-		
Calcium	ANZECC	1000 mg/L	Stockwater
Carbonate	-		
Chloride	ANZECC	175 mg/L	Irrigation of sensitive crops
Fluoride	ANZECC	1 mg/L	Irrigation
Hydrogen Sulphide	-		
Hydroxide	-		
Nitrite	-		
Nitrate	ANZECC	700 µg/L	Aquatic ecosystems, moderate reliability, 95% protection
Potassium	-		
Selenium	-		
Silica	-		
Sodium	ANZECC	115 mg/L	Irrigation
Sulphate	ANZECC	400 mg/L	Recreation
Sulphide	-		
<b>Metals and Metalloids</b>			
Aluminium	ANZECC	55 µg/L, 0.8 µg/L if	Aquatic ecosystems, low reliability,

Water Quality Parameter	Available Guideline	Guideline Level	Comments
		pH<6.5	95% protection
Barium	-		
Boron	ANZECC	370 µg/L	Aquatic ecosystems, high reliability, 95% protection
Cadmium	ANZECC	0.2 µg/L 0.06 µg/L	Aquatic ecosystems, high reliability, 95% protection 99% protection
Chromium (III)	ANZECC	3.3 µg/L	Aquatic ecosystems, low reliability, 95% protection
Chromium (IV)	ANZECC	1 µg/L	Aquatic ecosystems, high reliability, 95% protection
Copper	ANZECC	1.4 µg/L	Aquatic ecosystems, high reliability, 95% protection
Iron	Canadian Guideline in ANZECC	300 µg/L	Aquatic ecosystems, low reliability
Lead	ANZECC	3.4 µg/L	Aquatic ecosystems, high reliability, 95% protection
Mercury (inorganic)	ANZECC	0.6 µg/L	Aquatic ecosystems, high reliability, 95% protection for slightly-moderately disturbed systems
Manganese	ANZECC	1700 µg/L	Aquatic ecosystems, moderate reliability, 95% protection
Magnesium	-		
Molybdenum	ANZECC	34 µg/L	Aquatic ecosystems, low reliability, 95% protection
Nickel	ANZECC	11 µg/L	Aquatic ecosystems, high reliability, 95% protection
Phosphorus	-		
Silver	ANZECC	0.05 µg/L	Aquatic ecosystems, high reliability, 95% protection
Strontium	-		
Tin	ANZECC	3 µg/L	Aquatic ecosystems, low reliability
Zinc	ANZECC	8 µg/L	Aquatic ecosystems, high reliability, 95% protection
<b>Radionuclides</b>			
Gross alpha and beta activity	ADWG	0.5 Bq/L	Recommended ‘screening’ level.
Potassium K40	ADWG		Refer to ADWG for dose response criteria. These guidelines have low applicability to current situation.
Radium Ra 228, Ra226	ADWG		
Radon Ra 222	ADWG		
Lead Pb-210	ADWG		
Polonium Pb-210	ADWG		
<b>Phenolic Compounds</b>			

Water Quality Parameter	Available Guideline	Guideline Level	Comments
Phenol	ANZECC	320 µg/L	Aquatic ecosystems, moderate reliability, 95% protection
2,4-dimethylphenol	ANZECC	2 µg/L	Aquatic ecosystems, low reliability, 95% protection
<b>Aromatic Hydrocarbons</b>			
Napthalene	ANZECC	16 µg/L	Aquatic ecosystems, moderate reliability, 95% protection
Anthracene	ANZECC	0.4 µg/L	Aquatic ecosystems, low reliability, 95% protection
Phenanthrene	ANZECC	2 µg/L	Aquatic ecosystems, low reliability, 95% protection
Fluoranthene	ANZECC	1.4 µg/L	Aquatic ecosystems, low reliability, 95% protection
Benzo(a)pyrene	ANZECC	0.2 µg/L	Aquatic ecosystems, low reliability, 95% protection
Benzene	ANZECC	950 µg/L	Aquatic ecosystems, low reliability, 95% protection
Toluene	ANZECC	180 µg/L	Aquatic ecosystems, low reliability, 95% protection
Total petroleum hydrocarbons	ANZECC	700 µg/L	Aquatic ecosystems, low reliability
<b>Treating Chemicals</b>			
Unknown	-		Any chemicals utilised in the extraction or treatment of the CSG water to treat or prevent operational problems
<b>Other Properties</b>			
Electrical Conductivity	QWQG	492 µS/cm	75 <sup>th</sup> percentile, Condamine-Macintyre River Basin
	QWQG	325 µS/cm	75 <sup>th</sup> percentile, Maranoa-Balonne-Border Rivers Basin
	QWQG	169 µS/cm	75 <sup>th</sup> percentile, Western Murray Darling Basin
Total Dissolved Solids	-		
Total Suspended Solids	QWQG	6 mg/L	Lowland streams
	QWQG	6 mg/L	Upland streams
	QWQG	nd	Freshwater lakes/ reservoirs
	QWQG	nd	Wetlands
Total Organic Carbon	-		
Total Nitrogen	ANZECC	lowland 500 µg/L upland 250 µg/L	Aquatic ecosystems, 95% protection
Dissolved Oxygen	ANZECC	lowland 85-100% upland 90-110% sat	Aquatic ecosystems, 95% protection

<b>Water Quality Parameter</b>	<b>Available Guideline</b>	<b>Guideline Level</b>	<b>Comments</b>
pH	ANZECC	lowland 6.5-8 upland 6.5-7.5	Aquatic ecosystems, 95% protection
Temperature	ANZECC	20 <sup>th</sup> -80 <sup>th</sup> percentile	Aquatic ecosystems, 95% protection

**Question 12- Details of any of the following that DERM is aware of occurring during the period 1 October 2010 and 23 August 2011 relating to the discharge of water from any mine site.**

ID number	Non-compliance/Incident - Title	Non Compliance /Incident Date (approx.)	Environmental Authority/ TEP number	Project Name	Name of operator (at time of non-compliance)	Adverse Effect					Additional Comments
						Drinking Water	Any plant or animal species	Any Industry or Agriculture	On the environm	On public health	
1	Accidental Discharge of Pit water	8-Jul-11	MIN1005551907	New Oakleigh	New Hope - New Oakleigh	Nil	Nil	Nil	Nil	Nil	Investigation ongoing
1	1	16-17/10/2010: Discharge from sed dam 1	MIN100395406	Commodore Coal Mine	Downer EDI/ Millmerran Power Partners				no evidence of harm		Discharged water to Back Creek from Sed dam 1 exceeded the EA Total Suspended Solids limits
2	2	26/12/2010: Discharge from sed dam 1	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		TEP Program notice submitted at this time and accepted by DERM
3	3	03/01/2011: Discharge from sed dam 2, A pit and Env Dam 1	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
4	4	04/02/2011: Discharge from Sed dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
5	5	06/01/2011: Discharge from Sed dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
6	6	07/01/2011: Discharge from Sed dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
7	7	08/01/2011: Discharge from Sed dam 2 and A pit	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
8	8	09/01/2011: Discharge from Sed dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
9	9	10/01/2011: Discharge from Sed dam 2 and A pit	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
10	10	11/01/2011: Discharge from sed dam 1 & 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
11	11	19/01/2011: Discharge from Env Dam 1 & Sed Dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
12	12	20/01/2011: Discharge from Env Dam 1 & Sed Dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
13	13	21/10/2011: Discharge from Env Dam 1 & Sed Dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids

14	14	22/01/2011: Discharge from Env Dam 1 & Sed Dam 2	MIN100395406	Commodore Coal Mine	Downer EDI/Millmerran Power Partners				no evidence of harm		Discharge water to Back Creek exceeded the EA limits for Total Suspended Solids
15	15	26-27/06/2011: Discharge from A pit to Wilkie Creek	MIN100580907	Wilkie Creek Coal Mine	Peabody (Wilkie Creek) Pty Limited				no evidence of harm		Discharge water to Wilkie Creek exceeded the EA limits for Total Suspended Solids. BN is recommending a PIN
16	16	13/07/2011: Monitoring of EC and Oil and Grease not conducted in accordance with EA conditions	MIN100580907	Wilkie Creek Coal Mine	Peabody (Wilkie Creek) Pty Limited				no evidence of harm		Warning notice will be issued when final decision on PIN is returned
17	17	16/05/2011: Failure to notify commencement of discharge under TEP	TEP- MAN12619	Wilkie Creek Coal Mine	Peabody (Wilkie Creek) Pty Limited				no evidence of harm		
18	18	19/01/2011: Discharge from A pit to Wilkie Creek	MIN100580907	Wilkie Creek Coal Mine	Peabody (Wilkie Creek) Pty Limited				no evidence of harm		Discharge water exceeded the EA limits for Total suspended solids
19	19	20/12/2010: Discharge from sed dam 2 to Lagoon Creek	MIN10050507	New Acland Coal Mine	New Acland Coal Pty Ltd				no evidence of harm		Evidence provided appears to support that no environmental harm was caused due to the release of water which was above the EA limit for total suspended solids
20	20	15-18/10/2010: Discharge of water from sed dam 3 to Lagoon Creek	MIN10050507	New Acland Coal Mine	New Acland Coal Pty Ltd				no evidence of harm		Evidence provided appears to support that no environmental harm was caused due to the release of water which was above the EA limit for total suspended solids
21	21	09/03/2011: Discharge of water from sed dam 3 to Lagoon Creek	MIN10050507	New Acland Coal Mine	New Acland Coal Pty Ltd				no evidence of harm		Warning notice issued for non compliance with EA release limits for EC
22	22	01/12/2010-01/02/2011: Waning Notice - non-compliance of Environmental Authority conditions	MIN100568007	Cameby Downs Coal Mine	Syntech Resources				no evidence of harm		exceedences and not making notification of exceedences of EA conditions for pH, TDS, and TSS
23	23	11/01/2011: Release of mine water at Kogan Creek Coal Mine	MIN100878709 / MAN11459	Kogan Creek Coal Mine	Aberdare Collieries Pty Ltd				no evidence of harm		TEP allowed the release of mine affected water above current EA release limits as a result of receiving major rainfall events leading to local and regional flooding.
24	24	24/01/2011: Release of mine water from Texas Silver Mine	MIM800395806	Texas Silver Mine	Texas Silver Mines Pty Ltd				no evidence of harm		Release of water from the Stormwater Dam (which had partially filled due to overflow of Barren Ponds) to allow construction and lining of dam to be completed.
25	CR50739: Fairview/Roma/ Arcadia	24/01/2011	Multiple	Multiple	Santos						Discharge: TEP - <b>Refused</b> 2/2/11. Proposal to discharge from 100 associated water dams into flood flows to maintain storage capacity for future water management

26	CR51018/MAN1 2439: Mt Kingsley/Arcadia	7/09/2010	PEN200039307/P EN200361209	ATP635P & PL235	Santos			under assessment. 50x50m exclusion of cattle		Discharge: TEP - Approved 21/3/11. Proposal to undertake assessment as to the reasons behind overtopping of mud and water dams at three sites in November 2010. Reports submitted 29 April 11. DERM response issued 17 May 11. Further TEP objective reports submitted 30 June 2011. DERM response issued 5 July 11. 29 Jul 11 - TEP objective report submitted. 4 Aug 11 - Compliance inspection conducted. Final report to be submitted by 20/8/11. Met with landholder Chris & David Benn. 24 Aug 11 - Further site inspection undertaken to confirm compliance with TEP. Assessing final report.
27	CR51096: Fairview	21/03/2011	PEN100178208	Fairview 129	Santos				no evidence of harm	Spills: FV 129 - 85,000L spill of associated water from coal seam gas well pump failure, in Hallet state forest. A spill of 85,000L of associated water was release to land (Hallet State Forest). Santos have advised that release was authorised by TEP (MAN10839). DERM samples indicate elevated levels of contaminants compared to background. DERM is of the view that this incident is not authorised by TEP (MAN10839). On 30 May 11, DERM issued Santos with a letter requesting Santos amend TEP. On 1 June 11, Santos advised that "they do not see it necessary to amend the TEP" as the FV129 has been identified as a lease requiring corrective action, which will be achieved as part of the TEP objectives. DERM is satisfied that Santos with proposed corrective actions and rehabilitation. On 11 July 11, DERM issued Santos with a letter advising that failing to amend the TEP will result in Santos still being liable for enforcement action at this site. DERM will inspect the site as part of the 2011/12 Annual Compliance Plan to ensure TEP objectives are met but will take no further enforcement action at this time. Nio further a
28	CR51317/MAN1 2700: Scotia	16/03/2011	PEN100046407	PL176	Santos					Discharge: TEP - Approved 28 April 2011. Amendment approved - 5 JUL 11. Proposal to discharge from site dam to avoid overtopping. Santos submitted an amendment to the current TEP as the contractor has not been able to supply an RO Plant within the required timeframe. No significant change to the objectives of the original TEP, other than extending the timeframe by 4 months to allow commissioning of the RO plant. First milestone in TEP: RO Plant to be commissioned on 8 SEP 11. 3 Aug 11 - TEP compliance inspection conducted. Santos appears to be progressing well in planning to manage the high salinity dam. Needs further inspections as possible to ensure company stays on track.
29	CR51400: Fairview	24/03/2011	PEN100178208	Adjacent to Fairview 163	Santos				no evidence of harm	Spills: FV163 - Truck Spill - Approximately 28000 litres of associated water was released The truck was bogged and tipping to one side so the operator assessed the situation and realising the safety concern decided to release the water to grade. Santos advised that no Environmental harm is expected as the water was approximately 2000 µs/cm to 3000 µs/cm and was localised. Santos conducted hand sampling of the water after the incident. The road was repaired to ensure that no other vehicles were bogged in the same area. Drivers were notified of soft edges and avoid getting close to the edges. No further action taken. Close out letter sent 11/7/11

30	CR51400: Fairview	24/03/2011	PEN100178208	Fairview 163	Santos					no evidence of harm	Discharge: FV163 - Cavitation sump failed and released to Hutton Creek. Approximately 81000 litres of associated water was released from the sump and a 450mm tunnel through the wall of the sump. Water from this spill potentially reached Hutton Creek. Water quality was reported at approximately 2000µs/cm. On 20 May 11, Santos lodged monitoring results but have failed to provide interpretation or outcomes of action taken, in accordance with EA conditions. On 23 May 11, DERM informally requested this information but was not provided until 7 June 11. DERM has reviewed monitoring results and EC levels of the water pooled outside of the sump are not extreme (1090uS/cm) and there is no significant difference in water quality between upstream and downstream at Hutton Creek. DERM issued a Warning Notice for failing to comply with notification conditions (11/7/11) and will issue a PIN for breach of discharge conditions. Show cause and updated Incident Alert has been prepared prior to issuing PIN and is being reviewed. 29 Aug 11 - Show cause notice issued to Santos. PIN briefing Note drafted for approval.
31	CR50532: Daandine	13/01/2011	PEN100070507	PL230	Arrow	reports to Condamine river. High quality discharge					TEP MAN11540 Approved 18/1/11 Expired 28/2/11. Final report submitted on 21/04/2011. Discharge of RO permeate to flood flows – Wilkie Ck
32	CR51207/MAN1 2639: Daandine	15/02/2011	PEN100449509	PL230	Arrow						Discharge: Draft TEP submitted. Request for further information sent– response due 7 March. Response received from Arrow on 11 March. Assessment completed but not yet granted as Arrow requested DERM extends its decision making period to allow Arrow time to comply with requests from OWSR. s555 notice to extend decision making period issued on 1 April 2011. New decision date is 30 April 2011. Second extension to decision date as requested by Arrow. New decision date is 17 May 2011. Third extension granted - new decision date is 16 June 2011. No approval was given before 16 June 2011 meaning that the TEP is considered refused. No further action required.
33	CR51431: Tipton	15/02/2011	PEN100449509	PL198	Arrow					no evidence of harm	Spills: Oil/Water Dam. Further information requested due 31 March 2011. Time extended to 29 April 2011. 3 May : Arrow verbally advised that a formal report will be submitted by end of week. Any changes to the operation of the oil water dam must consider the DXP approval which is currently in a review process by DERM. It is anticipated that a new dam will be constructed and the bunding which trapped water during the Jan flood period will be removed during construction of the new dam. 27/5 Arrow reminded that final report has not been submitted and expectation is that this should be finalised. Letter received from Arrow 6/6 indicating that bunding had been removed. LN spoke with Graham Cordingley regarding size of pond. Graham to investigate further re this matter. Letter sent on 16 June requesting additional information on the oily water dam, focus on undersized capacity and poor management practices. Report is due 31 July 2011. Received on 2 August 2011. All questions raised in the initial DERM letter have now been answered. Arrow intend to upgrade the management of the d

34	CR51424: Tipton	15/02/2011	PEN100449509	PL198	Arrow				no evidence of harm	Spill: HCl spill. Further information requested due 31 March 2011. Time extended to 29 April 2011. 3 May; Arrow verbally advised formal report will be submitted by end of week. A consultant is currently undertaking a flood study which will be used to identify future chem storage sites. In the interim, chemical storage at the Tipton RO site has been relocated to higher ground at the Daandine ROP plant. 27/5 Arrow reminded that final report has not been submitted and expectation is that this should be finalised.
35	CR51240: Tipton	28/03/2011	PEN100449509	PL198	Arrow				no evidence of harm	Spill: Spill of approximately 25,800L of CSG associated water from Tipton Production Water Pipeline. Incident alert prepared. Further information received. Warning notice and PIN may be issued. Additional lab results received - backs up in-situ sampling. Warning notice issued, no further action required.
36	CR52129: Peat	1/01/2011	PEN100389309	Peat Evaporation Pond	APLNG				no evidence of harm	Discharge: TEP - Emergency release during flood events. 15 July 11 - Origin submitted draft TEP for comment. TEP offered little reduction in environmental harm. 29 July 11 - DERM emailed comments to APLNG. 3 Aug 11 - Site inspection conducted at Peat. No further response has been submitted by Origin. Site Inspection report and response letter being reviewed.
37	CR52127: Ramyard	1/01/2011	PEN100395209	Ramyard	APLNG				no evidence of harm	Spills: Origin advised DERM that there may have been minor flooding of dams at their Ramyard Field site. DERM has identified that flooding occurred at Ramyard 4 well lease. Site inspection proposed for July 2011 to investigate compliance with EA conditions. DERM has been trying to organise a site inspection for several months but due to wet weather and the landholder access issues a site inspection has not occurred. DERM requested an inspection in June but due to the landholder not allowing Origin on the site, the inspection was postponed. 3 Aug 11 - DERM conducted site inspection without Origin present at the request of landholder. Contact landholder to discuss concerns before issuing post inspection letter.
38	Denison	1/01/2011	PEN100240608 (previously EA150036)	Denison Evaporation Pond	APLNG					Discharge: TEP - Emergency release during flood events. 15 July 11 - Origin submitted draft TEP for comment. TEP offered little reduction in environmental harm. 29 July 11 - DERM emailed comments to APLNG.
39	CR50981: Lauren 4	9/03/2011	PEN100020207	PL180	QGC				no evidence of harm	Spill: Estimated 800 – 1000L of associated water spilt to ground via flare line on a CSG well, on QGC land. Incident alert prepared. Currently assessing further action and QGC report. Warning letter sent 5 April 2011.
40	CR51025: Glen Eden	13/03/2011	PEN100020207	PL247	QGC				no evidence of harm	Spill: 2000L associated water spilt to land owned by QGC via faulty pump. Incident alert prepared. Warning letter sent 5 April 2011
41	CR51150: Various	10/01/2011	PEN100020207		QGC				no evidence of harm	Spill: Overtopping of 4 trac ponds from incident rainfall. Report received by DERM 31/1/11. Further information requested due 25 March 2011. Received, no further action required. Letter sent to QGC on 19 April 2011 detailing breach of conditions and NFA.
42	CR51279: JenBroadwater Field Gathering System	24/03/2011	PEN100020207	ATP648	QGC				no evidence of harm	Discharge: Incident - Pumping from bell holes to land adjacent to the Moonie Highway. Incident Alert prepared. Letter issued to QGC requesting erosion protection measures be out in place. Written response from QGC received on 29 March 2011 outlining remedial actions taken. Louisa drove past site on 30 March 2011, verified that stormwater exclusion measures will in place.

43	CR51360: Taloona	22/04/2011	PEN100070307	Taloona Gas Plant	APLNG				no evidence of harm	Spills: Over 200L of emulsion and water from the oily water separator was released due to a pump failure at Taloona. Further enforcement action considered once sample results received; however, unlikely to result in further action. On 27 May 11, DERM issued APLNG a Warning Notice for not meeting notification conditions. On 3 June 11, APLNG submitted an incident report and water and soil sample analysis. Metals were above NEPM Investigation levels, so APLNG has indicated that further sampling will be undertaken and submitted to DERM once available. DERM is satisfied with the response and corrective measures. Follow up background monitoring results have been received 11/7/11 with further report to follow from APLNG
44	CR51373: Talinga Gas Plant	29/04/2011	PEN100067807	PL226	APLNG	high quality discharge			minimal env impact	Exceedance of Release limits: Results of monitoring conducted on 12/04/2011 for Talinga RO permeate releases to the condamine river showed exceedances for two parameters. Incident Report identifies analysis methodologies and an unidentified plant issue resulting in a decline in plant performance, as the cause of the exceedances. Warning Notice issued 27-May-11 for not meeting notification conditions. Water Sciences advised minimal impact to Environmental Values. On 25-May-11, issued letter requesting further monitoring data and results of investigations. On 30 June 11, APLNG held a meeting with DERM to resolve the matter. APLNG advised that they would amend EA to address the matter. 13/7/11 - Emailed APLNG to advise a timeframe for lodgement. 18/7/11 - DERM have given APLNG until 29/7/11 to lodge amendment application. 1 Aug 11 - APLNG have requested an administrative amendment to Sulphate limits in EA. P&G Unit considering application.
45	CR51394: Fairview	30/04/2011	PEN100178208	Fairview 186	Santos				no evidence of harm	Spills: FV186 - Approximately 500,000L of rain water, potentially mixed with cavitation water, was released to ground from two Turkey's Nest dams. Santos stated to DERM that no water has reached Hutton Creek, however Santos are undertaking both upstream and downstream monitoring when weather permits. On 26 May 11, Santos submitted monitoring results and a report on the incident. DERM has reviewed the investigation report and there is no evidence to suggest surrounding waters have been impacted. Preparing a PIN for breach of EA condition, Show cause and updated incident alert will be prepared prior to issuing PIN. 5 Aug 11 - Compliance inspection conducted. No visible adverse effects on impacted soil and vegetation. 29 Aug 11 - Show cause notice issued to Santos. PIN briefing Note drafted for approval.

46	CR51530: Daandine #80 Well	22/05/2011	PEN100449509	PL230	Arrow					potential low level salt issue	no enduring harm.	Spills: Lot 122 SP204689. During routine operations to install pump on well, the well unexpectedly kicked in causing an uncontrolled release of CSG and CSG water to flow. From the time the incident occurred at 8:15am 22/5/11, the well flowed uncontrollably. Approx 400L/min of CSG water may have been released during the event. The discharge occurred on a well pad and was located adjacent to a paddock sown with Rhodes grass. The Pollution Hotline was notified at 5:30pm 22/5. Written notification was sent to Louisa nicolson 8:33am 23/5. Arrow activated their Emergency Response Unit and commenced plans to cap the well and stop the flow. A number of initial attempts to cap the well failed. The well was closed at 11:35am 23/5 by placement of a dense KCl/Water solution and the installation of a check valve which allowed the well to be closed. ES staff attended the site at 11:15am 23/5 and collected soil and wate samples. In-situ monitoring of pooled water was undertaken by Arrow on 23/5 pm and submitted to DERM. Arrow collected soil and water samples. 2:30pm DERM directed Arrow to install bundir
47	CR51539: Fairview	22/05/2011	PEN100178208	Fairview #77	Santos						under investigati on	Discharge: Santos lodged Program Notice regarding holes in sump liner - potential environmental harm. Refused prog notice. On 30 May 11, DERM issued refusal of Program Notice because 'act or omission' had not yet occurred. On 30 May 2011, letter issued to Santos requesting dam be decommissioned in accordance with EA conditions.
48	CR51549: Pipeline WO3	24/05/2011	PEN100020207	PL247	QGC						no evidence of harm	Spills: Spill of approx 500 L of assoc water from pipeline. Spoke with Brad Kitchen. Incident happened along WO3 pipeline at a point close to the Condamine Power Station end. A breather valve on pipe was blocked (maybe some HDPE) and caused a flow of water to be forced out at pressure through the blocked valve. No ponding or runoff was identified. Workers noticed the leak and isolated the pipeline straight away. Valve has been replaced. incident occurred on QGC land. A wet patch of ground was noted under the pipeline. Rain has fallen on-site since incident. Written report was received on 7 June 2011. Close out letter senton 7 June 2011. Letter requested QGC communicate any final outcomes following internal review of the design of high point breather valves.
49	CR51616: Lauren 48	6/06/2011	PEN100020207	PL180	QGC						no evidence of harm	Spills: Spill of approximately 2,000L of associated water when the braided line b/w the well head and the separator split with a small hole. The water was contained to the well pad. Spoke to Brad Kitchen. Line has since been replaced and testing of the water from the well has been undertaken. Preliminary tests indicate a TDS of 2100mg/L and a pH of 6.2. The release limits of water to roads for dust suppression are between 6 and 8.5 pH and <2000mg/L. Minimal impacts are expected. QGC will send in updated report within 14 days. Information received on 30/6 (dated 17/6) concerning this incident. Recommend no further action due to quality of the water.

50	CR51699: Kogan North	20/06/2011		PL194	Arrow				no evidence of harm	Spills: Contacted Kate Jackson of Arrow regarding the spill. Faulty rubber valve is to blame. Observed at approx 7pm on 20 June 2011, valve replaced that night. Additional observations on 21 June indicated about 20KL associated water was released. Pooling in a nearby gully - this water to be pumped out into water trucks. Initial testing indicates EC of 7.89mS/cm. Incident notification completed. Letter sent to Graham Cordingley (Arrow) requesting info. Arrow's Report should be completed by 22 July 2011. Discussions with Graham on 12 July revealed that all information has been collated and that a report will be forthcoming before the due date. The statement that water had been released during repairs was not accurate. The pipeline was backtracked to the nearest well where it was emptied into an existing flarepit. The water was then able to be removed from the pit. Repairs were undertaken on the valve and no additional water was released from this point. Photos will be supplied by Arrow in the final report. Report received on 22 July 2011. Letter sent to Arrow on 1 August stating no further action req
51	CR49728: Fairview	18/06/2011	PEN100178208	Fairview 179	Santos					Discharge: FV 179 - Approx., 52,000L of CSG water, with an electrical conductivity of approx 2700µS/cm and a pH 8.7, overflowed from the water transfer tank on FV179. DERM has approved a Transitional Environmental Program (TEP) MAN10839, authorising the release of water from this well (see attached TEP – Certificate of Approval). It should be noted that DERM has issued a new environmental authority on 2 June 2011, for the Fairview Project Area, which does not correlate with the conditions mentioned in the certificate of approval. An increase in pressure within the water gathering system prevented the transfer pump operating and allowed water to accumulate within the tank. The tank discharged via the emergency overflow discharge line. The release was to ground directly adjacent to the cleared CSG Well lease. Vegetation in the area consists of sparse scrubby buffel grass. The release appeared to cause some minor water logging. However, the CSG water did not appear to reach the closest waterway (approximately 300m east of the incident area.) Operator first discovered the incident Sunday
52	CR51677: Hopeland #1	14/06/2011	PEN100052007	ATP676	Arrow				no evidence of harm	Spill: Minor spill, primarily gas, resulted during drilling works at this exploratory well. The small amount of water that was spilled was captured in the nearby flare pit. Primarily a safety issue - DEEDI. Minimal if any environmental impact. No further action required from DERM.
53	CA23064: Daandine	17/06/2011	PEN100449590	PL230	Arrow			high quality discharge		Discharge: TEP MAN13080 for release of 8ML/day to Wilkie Creek in order to meet DSA reporting levels by November 1 2011. Information request issued on 29 June 2011. The new application date (and due date for request) was been agreed upon with Arrow to be 18 July 2011. An inspection of the East Theten BUA site on Wednesday indicated significant progress. TEP may not be warranted but this will depend on timeframes for completion of works at Theten and pumping limit of 10ML/day to the Theten site. Info request provided on 18 July, decision to be made based on what has been received. Extension provided to 19 August for decision. Decision to approve the TEP subject to conditions.

54	CR51829: Talinga	7/07/2011	PEN100067807	Talinga Gathering System (Lot 7 on SP109131)	APLNG					Spills: Origin have advised that due to the flooding of a separator a low point drain has released 500 litres of associated water to land. Initial field measurements indicate that the water has a pH 8.8 and an electrical conductivity on 3570µS/cm. The EA authorises the extraction of associated water from low point drains; however, it must meet release limits, including electrical conductivity 2000µS/cm (Maximum) and a pH 6.5 – 8.5 (range). Water was contained within an area 18 square metres. Origin believes that the incident occurred within or near the boundary of PL226. Origin has shut in the well and adjusted level control to stop any more spills. DERM has required Origin submit further information in accordance with EA conditions, which has been supplied by origin 11/7/11. DERM is proposing to conduct an investigation commencing with a site inspection. 13/7/11- Emailed APLNG to provide monitoring and operational plans for low point drains. Further written notice required by 22 July 11. 28 Jul 11 - Site inspection conducted of LPD discharges. APLNG advised that they were finalising report. 1
55	CR51831: Talinga	8/07/2011	PEN100067807	Talinga Water Treatment Facility	APLNG	minor exceedence of high quality discharge				Exceedance of Release Limits: Brad O'Reiley of Origin advised that the on-site monitoring results of the Reverse Osmosis permeate from the Talinga Wastewater Treatment Plant (WTF) was outside Environmental Authority (EA) release limits for chloride. The EA states that the chloride concentration of the discharge from the Talinga WTF must be within 22-120 mg/L. The actual chloride concentration measured at the facility was 136 mg/L. Origin has advised that the plant has ceased discharging to the Condamine River and will not resume discharging until the chloride exceedence issue has been resolved. Under Investigation. UPDATE: Origin advised that the likely cause of the Chloride exceedence was due to a membrane failure. Full report due 13/7/11. 18/7/11 - APLNG have advised RO membranes will be replaced. 28 Jul 11 - Site inspection conducted. APLNG advised that membrane installation had been delayed until 6 Aug 11. 1 Aug 11 - Letter issued to APLNG requesting status update of corrective measures by 13 Aug 11.
56	CR51844: McNulty	6/07/2011		ATP676 McNulty Pond, Lot 67 on BWR96	QGC					Discharge: 6/7/11 - During a site inspection (for a different matter) Ryan Wagner was asked to view a QGC pond which has a torn lining. Ryan viewed one large tear in the lining and three smaller holes near the bottom of the pond. The water level was lower than the tears and no water was discharging through the lining during the inspection. The western dam wall was affected by significant erosion issues. The landholder (MR Ian Kerr, 4689191, 0429 658 188) was not present during the inspection - he had asked a third party to show Ryan the pond on his behalf. Photos of the lining and erosion were taken, they are stored in the electronic file. 11/7/11 - Contacted Brad Kitchen (Ph 3024 7889). QGC has recently attended the site at the request of Mr Kerr and viewed the pond. The torn lining was noted. QGC do not know when the lining was torn and if any water had discharged through the tears. The pond is old and contains associated water mainly from exploration and appraisal works. A water tanker was used to pump water from the pond to allow repairs to the lining. Enough water was retained

57	CR51748: Codie	27/06/2011	PEN100020207	Codie 2 Well, Lauren Gathering System, Lot 15 RG36	QGC				no evidence of harm	Spills: Approx 1000L of associated water released on to the ROW from the Lauren gathering system. The water was contained in the pipeline after being isolated in the system due to the failure to remove the cap from a high point valve during construction. The isolated water was released on to the ROW while the valve cap was being removed. Codie #2 well water has been previously sampled - pH 8.2 and TDS 2500mg/L. The spill occurred on QGC property. Weather at time of incident was fine. QGC assessment is that no significant env harm has occurred. Written notification received on 11 July 2011. Close out letter to be sent.
58	CR51735: Cam	27/06/2011	PEN100020207	Cam #1 Well, PLA277 Lot 56 on FT264	QGC				no evidence of harm	Spills: Discharge of approx 11,200L of associated water via flare line and pressure safety valve on to well pad. Incident caused by coal fines blocking the metering system on the separator. Spill appears to have been contained to lease pad, where water ponded. Weather conditions at time of incident were fine. Landholders were notified. Remote monitoring of well assisted in prompt identification and action by QGC to address the incident. QGC notified pollution hotline on 27 June. Incident alert prepared 27/6 and updated 28/6. DERM contacted QGC on 28 June 2011. Written report submitted to DERM on 11 July 2011. QGC advise that meter unit was replaced with larger unit and blockage removed. Close out letter to be sent. ES spoke with landholder who advised that he was informed of incident and had no concerns.
59	CR51937: Spring Gully	16/07/2011	PEN100070307	Strathblane Gas Plant	APLNG				no evidence of harm	Spills: Due to a pipeline collar weld failure at the Spring Gully production water pipeline tie-in point, associated water was released to land. Based on an estimated discharge rate of 90-100L/hour once the pipe was exposed, it is estimated approx 3300 litres of production water leaked from the pipeline. Approximately 1/3 of this water has been recovered from the open bell hole. It is believed the discharge commenced on the 14 July 11. However, Origin operations staff only identified the discharge at approximately 8:00am on the 16 July 2011 during routine maintenance duties. The pipeline is located 1.5m below ground. The leak saturated the surrounding soil and eventually reached the surface and seeped to the shoulder drain of the unsealed access track where it was absorbed into the soil within 25m. The discharge was contained to the access track and drain. Since the leak was identified, water collecting in the open excavation has been removed by sucker truck. The pipeline is likely to take several days to repair. APLNG have advised that there was no evidence of any immediate environmental c
60	CR51976: Kenya	25/07/2011	PEN100020207	Between Turners pond and Kenya Well 124	QGC				no evidence of harm	Spills: Contractor delivering water to Kenya Well #124 from Turners pond failed to disconnect pipe from the dam to the truck. Contractor drove away from the dam, tearing the pipe from the dam connection and travelled several kms with CSG water discharging from truck via pipe. CSG water was spilt to land on QGC property and along Van Renans Road. Incident occurred late at night. Approximately 10,000L (1/2 of truck load) was discharged. This value was increased to approx 12,000L in subsequent notification. Truck travelled for approx 6.5kms while associated water was discharged. TDS levels between 2800 - 3000ppm (4375 - 4688 uS/cm). Upon inspection next morning, QGC could not identify any areas where water had left road where it was spilt. Further info regarding water quality is to be provided to DERM. Written notification from QGC was provided on 9 Aug 2011. Letter 18/8 - DERM NFA action required

61	CR52063: Daandine	6/08/2011	PEN100449509	Kumbarilla Lane	Arrow				no evidence of harm	<p>personnel observed water on the ground surface which was flowing from a ruptured HDPE pipe weld located approx 2m below ground surface. Prior to this, treated water (RO permeate) had been introduced to the pipeline in preparation for pressure testing. Pressure testing was not undertaken prior to the spill being observed. The pipeline transfers water from the Daandine Treated Water Dam to the Theten Irrigation Dam. Arrow field staff initially reported (internally) that the 2500L of permeate discharged. Consequently, Arrow did not notify DERM (in accordance with Condition K3). Water flowed from the Arrow landholding on to Kumbarilla Lane and then to a neighbouring property. A DERM employee observed the incident and reported that a significant amount of water was bubbling to the surface and travelling along Kumbarilla Lane and on to an adjacent property. 8 Aug 11: Arrow contacted Env Services - SW to advise that an incident had occurred on Sat and that it did not trigger notification requirements. Later on the same day, Arrow management identified that the discharge was much la</p>
62	CR51360: Spring Gully - Talooona	22/04/2011	PEN100070307	PL195	APLNG					<p>Spills: On 22nd of April 2011, the humeceptor (an oil separation unit) at the Talooona Gas Plant had overtopped. Hydrocarbon contaminated water was observed for 200 m. The volume of the hydrocarbon emulsion released was estimated ~50-100L. 29 Apr 2011: DERM Requested photos and further information on spill. 3 May 2011: Received photos and further information on spill. 18 May 2011: received interim update on spill with the sampling results and summary report from APLNG. 3 Jun 2011: received report with the corrective actions from APLNG. Remediation by APLNG involved the removal of oil contaminated material, deployment of hale bales and application of a commercial bioremediation treatment to the affected soils for a period of 4 weeks. 5 Aug 2011: received final close out report from APLNG. 24 Aug 2011: DERM reviewed all the results and reports and sent letter to APLNG requesting further sampling should carried out before 22 October 2011. continuing investigation</p>
63	CR52122: Fairview - Strathblane between Injune & Taroom	17/08/2011	PEN200911210	Spring Gully	APLNG					<p>Spills: 20 000 litres of associated water spilt, with an area size of 10m x 150 m. Release was due to a weld break on a steel pipe, the pipe was 10 years old and had not been wrapred in geo mesh this would have prevented it from corroding. Spill occurred on land owned by Origin. Water is understood to have been contained, by erosion barriers. The spill was stopped 100m away from a local creek. The pipeline will be fixed and is non- operation until then . A field water sample has been taken and results indicate Ph was 8.3 and EC is 8081uS/cm. Soil Samples of the effected area have been taken; pending these results in 2 weeks Origin will undertake rehabilitation once results are received. Origin to undertake rehabilitation pending soil test in 2 weeks</p>

84	Mount Moss receiving water contamination detected in April 2011 compliance inspection	Apr-11	MIN102513411 (formerly MIN100501907)	Mount Moss	Mount Moss Mining Pty Ltd		X		X	DERM conducted a compliance inspection of the Mount Moss mine site in April 2011 and undertook water quality sampling. The sampling results showed non compliances with the environmental authority water quality contamination limits. The receiving waters are not known to be associated with drinking water or primary or secondary contact or aesthetic uses. The contaminant levels detected are below ANZECC 2000 livestock drinking water levels. The contaminant levels detected are above ANZECC 2000 95% species protection levels for freshwater aquatic ecosystems (see Attachment 4 of 'Compliance Inspection Plan Report_FA_MtMoss 110411_Final')
85	Big Rush receiving water contamination detected in April 2011 compliance inspection	Apr-11	MIN100881109 (formerly MIM800214803)	Big Rush	Alphadale Pty Ltd		X	X	X	DERM conducted a compliance inspection of the Big Rush mine site in April 2011 and undertook water quality sampling. The sampling results showed non compliances with the environmental authority water quality contamination limits, particularly for Arsenic. The receiving waters are not known to be associated with drinking water or primary or secondary contact or aesthetic uses. The contaminant levels detected are above ANZECC 2000 livestock drinking water levels. The contaminant levels detected are above ANZECC 2000 95% species protection levels for freshwater aquatic ecosystems (see Attachment 3 of 'Big Rush_TSV604_Compliance Inspection Plan & Report_200511_DraftA')
86	Amanda Bell receiving water contamination detected in April 2011 compliance inspection	Apr-11	MIN200872709	Amanda Bell	Golden Ant Mining Pty Ltd		X	X	X	DERM conducted a compliance inspection of the Amanda Bell in April 2011 and undertook water quality sampling. The sampling results showed non compliances with the environmental authority water quality contamination limits, particularly for Arsenic. The receiving waters are not known to be associated with drinking water or primary or secondary contact or aesthetic uses. The contaminant levels detected are above ANZECC 2000 livestock drinking water levels. The contaminant levels detected are above ANZECC 2000 95% species protection levels for freshwater aquatic ecosystems (see Attachment 3 of 'Amanda Bell_TSV573_Compliance Inspection Plan & Report_200511_DraftC')

12. Procedural Guide – Use of official note books
13. Monitoring and Sampling Manual 2009 - Water

## **Project Scope**

The Water Management Proactive Compliance Program form part of the department's proactive inspection program for Central West Region and is a requirement of the regions wet season preparedness plan. The inspections undertaken by regional officers will form part of the data set required to meet the programs objectives.

## **Objectives**

### *Principal Objective*

1. To identify high risk water management systems in coal mines prior to the commencement of the 2011-12 Wet Season (1 November).

### *Focus*

1. To identify the wet season storage capacity at each Priority Site.
2. To identify any potential water contamination issues at each Priority Site.
3. To identify the quality of water contained on each Priority Site.
4. To identify the water management contingencies for the next wet season at each Priority Site.
5. To identify infrastructure upgrades that have been undertaken at each Priority Site over the previous 12 months.
6. To identify potential non-compliances with Environmental Authority conditions.

## **Priority Sites**

The criteria for determining which sites are priorities for inclusion within the 2011-12 FY Mine Water Management Proactive Compliance Program is:

- Required a Transitional Environmental Management Program (TEP) during the 2010-11 wet season; AND
- Had non compliances with environmental approvals (environmental authority, TEP, emergency direction) during the 2010-11 wet season; OR
- Have been identified as high risk by the project manager due to on-going water management issues.

The priority sites are identified in *Table 1: Priority Inspection Sites*.

**Table 1: Priority Inspection Sites**

1. Baralaba	11. Ensham	21. Moranbah North
2. Blackwater	12. German Creek	22. Newlands
3. Burton	13. Gregory Crinum	23. Oaky Creek
4. Callide	14. Hail Creek	24. Peak Downs
5. Carborough Downs	15. Isaac Plains	25. Poitrel <sup>2</sup>
6. Cook	16. Jellinbah <sup>1</sup>	26. Rolleston
7. Coppabella	17. Kestrel	27. Saraji
8. Curragh	18. Lake Vermont	28. Sonoma
9. Dawson Central/North	19. Millennium <sup>2</sup>	29. South Walker
10. Dawson South	20. Moorvale	30. Yarrabee <sup>1</sup>

1. Boonal Joint Venture is linked to the water management of the Jellinbah and Yarrabee Coal Mines and will be inspected during this process but will not form part of final reporting. Boonal Joint Venture is a coal load out facility, managed through a development approval and authorised under a Registration Certificate.
2. Red Mountain Joint Venture is linked to the water management of the Poitrel and Millennium Coal Mines and will be inspected during this process but will not form part of final reporting. The Red Mountain Joint Venture is a Coal Handling and Preparation Plant and coal load out facility located on a mining lease and authorised under an EA.

**Resources External to Central West Region**

Central West Region requires additional resources to complete the proposed inspection program prior to 1 November 2011. The resources are identified as:

- 6 weeks of a PO4/PO5 level position; and
- 3 weeks of a PO3 level position.

South East Region has offered staff to assist with this inspection program. The volunteers and the period of time they will be required in Central West Region are identified in *Table 2: South East Region – Support Staff*.

**Table 2: South East Region – Support Staff**

<b>Week Commencing (Sunday)</b>	<b>Week Ending (Friday)</b>	<b>Position Level Required/Officer's Name</b>	<b>Central West Region Office Location</b>

## Roles/Expectations

### Project Managers

It is anticipated that project complete the pre-inspection preparation. Project managers will have approximately half to one day with support officers prior to the inspection so the majority of the work will be required to be completed prior to their arrival. Pre-inspection preparation will involve:

- review of EA conditions;
- review of Water Management Plan;
- review of Environmental Management Plan commitments relating to water;
- review of Plan of Operations action program relating to water;
- review of any non-compliances had within the previous 12 months relating to water management; and
- review of any Transitional Environmental Programs issued or current within the previous 12 months relating to water management.

Project Managers are expected to lead the on-site inspection.

Following the inspection, project managers will be required to either (1) assist Support Officers from South East Region with completing inspection reports; or (2) complete inspection reports where the support officer is from Central West Region, as per normal inspection procedure.

Project Managers are required to enter and finalise all compliance actions in EcoTrack and the regional inspection program.

Project Managers are required to liaise with support officers regarding any site safety inductions required to be completed prior to the inspection.

Project Managers are required to ensure:

- vehicles are booked;
- equipment is available;
- accommodation for overnight travel is organised and confirmed.

### Support Officers from South East Region

It is requested that Officers travelling from South East Region bring:

- laptop; and
- personal Protective Equipment.

*Personal Protective Equipment:* You will be required to have (1) Steel capped lace up boots – some sites require above ankle, if your boots are lower than your ankle please let the project manager know and they can advise the individual sites requirements; (2) Long cotton drill pants – DERM approved safety; (3) Long sleeved DERM approved safety shirt (either chambray or high viz).

It is preferable if you have (but not necessary as you can be supplied with) (1) Safety glasses/sunglasses or overglasses; (2) Hard Hat with sun protection brim; (3) Safety gloves; (4) Ear Plugs; (5) High viz vest; (6) sun screen; (7) personal water bottle (you will need a couple of litres per day); (8) ID/Authorised Officer Cards; and (9) Official Note Books..

Some sites have safety inductions to be completed prior to attending the site. The project manager will advise you if you will be required to complete a safety induction prior to attending the site.

It is anticipated that during your time with Central West Region, you will be able to:

- assist with pre inspection preparation prior to attending the site;

- assist the Project Manager with undertaking the site inspection; and
- take responsibility for completing the post inspection write up (i.e. compiling the inspection report), with the assistance of the project manager.

During the lead up to the wet season Project Managers will be undertaking amendments to the majority of their Environmental Authorities, following the approval of the updated Model Water Conditions for coal mines within the Fitzroy basin, and assessing Water Management Transitional Environmental Program. Your assistance in completing the inspection reports prior to heading home would be greatly appreciated.

#### Support Officers from Central West Region

As per normal inspection procedure, it is anticipated that support officers from Central West Region assist the project manager with pre-inspection preparation, on site inspection work and the final inspection report.

#### **Project Finalisation**

All inspection reports will be summarised into an overall report detailing high risks/priorities identified for the upcoming wet season. This will form part of the regions wet season preparedness plan.

# COAL SEAM GAS DISCHARGE RESPONSE PLAN

## Regional Service Delivery South West and Central West Regions

### SITUATION

Petroleum and gas activities are regulated under Chapter 5A of the *EP Act 1994*. Operators must have an Environmental Authority (EA) in order to carry out Chapter 5A activities. An EA sets out the strict conditions by which a proponent must operate.

Coal Seam Gas (CSG) activities are classified as either level 1 or level 2 based on the risk of environmental harm being caused by the activities. The assessment processes for level 1 CSG activities are more comprehensive than level 2 activities

CSG operators must consider and detail:

- impacts on air quality
- CSG water management, treatment storage and disposal
- mapping and protection of remnant vegetation and other important areas of habitat for native wildlife
- nuisance noise impacts
- impacts on the local communities
- management and disposal of wastes
- a rehabilitation program for any areas disturbed by the proposed activity.

The Petroleum and Gas sector is expanding at a significant rate as multinational proponents prepare to establish themselves in the lucrative liquefied natural gas (LNG) export market.

CSG is extracted from primarily within the Surat, Bowen and Galilee basin gas fields where it is then transported via gas transmission pipelines to Curtis Island (Gladstone) to be converted to LNG for later export.

Both South West and Central West Regions encompass a broad range of industrial operations that include heavy industry, large mining operations including **Coal Seam Gas operations**, each of which can be located in or near populated areas or in the more remote areas of the state.

The valuable sub-terranean CSG reserves can only be accessed by first relieving water pressure from within the underground aquifer in which it is held.

This process generate a considerable volume of what is referred to as “production” or “associated” CSG water and may vary considerably in composition and quality (see *attached CSG water fact sheet*) although is has typically high in salts and bicarbonates.

This chemical composition of CSG water has the potential to cause environmental harm if released into the surrounding environment so CSG operators store the water in large onsite “regulated” dams to mitigate that risk.

In the majority of environmental and operational circumstances, regulated dams are very effective for the containment of CSG water, however there may be instances where there may be, for one reason or another, a discharge of CSG dam water to land or water ways.

Regions experiencing unusually high rainfall are at a greater risk of a potential release or discharge from the CSG regulated dams.

Discharge situations may occur at any time and therefore a plan is required to ensure a 24 hour response capability by this division.

To determine whether the response to a contamination event triggers this plan, the criteria for a Coal Seam Gas Contamination Event (CSG CE) are outlined in **Action 4** in execution.

The criteria listed under the CSG CE will determine whether this CSG Discharge Response Plan is activated. If activated the response to the CSG CE will be in accordance with CSG Discharge Response Plan.

### **Area of operation:**

The area of the South West Region includes the area designated by Map - **Appendix A**.

The area of the Central region includes the area designated by Map **Appendix B**.

### **Staffing:**

RSD has staff based at Roma, Dalby and Toowoomba. A full contact list including each person's role / expertise is attached as **Appendix C**

### **Resources:**

The primary response staff are:

- Regional Manager, Regional Services, Central West and South West Regions
- Manager – Environmental Services Central West and South West Regions
- Team Leaders across (Roma, Toowoomba)
- An On Call Environmental Officer is available to provide initial response to calls 24 hours a day.
- A list of emergency contacts for internal departmental teams as well as key external stakeholders is also detailed in **Appendix C**.

## **MISSION**

**To ensure a professional, consistent and timely initial response by DERM to major CSG discharge events from project sites in the South West and Central West Regions.**

## EXECUTION

The response to any large scale situation of reported CSG contamination event / discharge shall be executed as outlined below.

This document sets out the roles and responsibilities when responding to a **major CSG discharge event**. These roles may be altered based on operational requirements. Additionally, several roles may be undertaken by a single officer.

### **Action 1: Initial information/ First notification** (Duty of Receiving Officer)

- Please refer to interim LNG Enforcement Unit procedure relating to incident notification, escalation and reporting. (Attached)

### **Action 2: Information** (Duty of Receiving Officer)

Confirm initial information along with the following where practicable:-

- Other Government agencies involved
- Company / persons directly involved (operators)
- Witnesses (to confirm their observations, involvement and details)

**Note:** *If situation has the potential for immediate serious harm, and on scene resources and urgent actions can avoid or reduce the harm, take immediate reasonable steps to implement those actions. – Advise manager as soon as practicable of actions.*

### **Action 3: Notify Management of CSG Discharge** (Duty of Receiving Officer)

- Brief the following RSD personnel:
  - Team Leader
  - Manager and
  - Regional Manager (Management Team)

### **Action 4: Assess information against criteria for CSG Discharge** (Duty of Management Team)

- Determine whether the incident meets the CSG discharge criteria.

*Note: While an event may not initially meet the criteria to activate this plan, as further information becomes available, it may be appropriate to revisit the discharge plan. The plan may be activated at any time.*

### **CSG discharge event criteria**

For a contamination event to trigger a response under this plan, the event must meet the following criteria:

1. Originate from an active or abandoned CSG Chapter 5A EP Act activity; and
2. Have an actual or potential release of CSG water or brine through a collapse, overtopping or pumping from dam infrastructure or failure of pipe infrastructure;
  - Release to waters of any volume of brine
  - Release to waters of approx 1000L of CSG water

- Release to land of 1000L of brine
- Release to land of greater than 500,000L of CSG water

Note – The volumes above are a guide only and need to be considered with regard to risk to or potential risk to human health, property, livestock, an environmental value, or a community value; and Environmentally Sensitive Area's (ESA's) Categories A,B,C in conjunction with the -

- Available information about the water/brine composition
- If the water/brine contains "fracking" or drilling chemicals
- If the water is known to be of a poor quality in regards to metals, hydrocarbons, EC, pH, etc or other serious contaminants
- Has releases occurred across several CSG sites requiring a co-ordinated response

3. Response to the event solely by the CSG company is inappropriate.

### **Action 5: Activation of CSG Discharge Response Plan**

(Duty of Regional Manager)

- RSD may immediately or at any time in the response to the incident, activate the CSG Discharge Response Plan if the CSG CE criteria is met

## CSG Discharge Response Plan Activation Procedures

1. Regional Manager to be briefed on situation.
2. Regional Manager to determine incident should be dealt with under CSG Discharge Response Plan
3. Regional Manager to Activate Response Plan
4. Regional Manager to advise Regional Service Director in writing (e.g. email) of CSG Discharge Response Plan Activation
5. Regional Manager to meet with Management Team (Environmental Services Team Leaders and Environmental Services Manager) to form Incident Management Team (IMT).

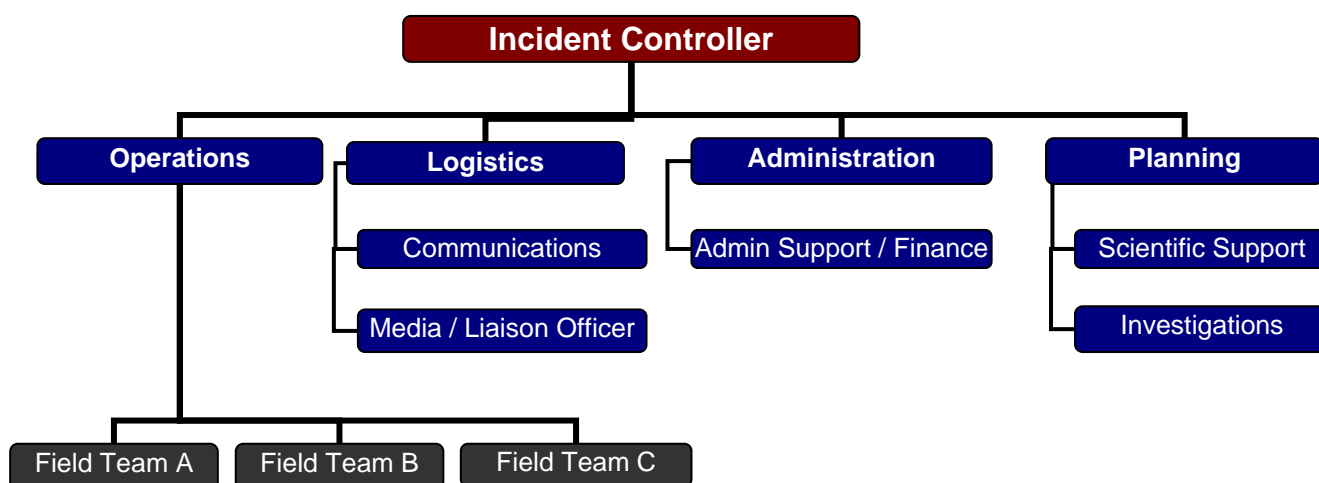

### **Action 6: Form Incident Management Team** (Duty of Regional Manager)

1. Upon activation of the CSG Discharge Response Plan, the Regional Manager will then appoint an incident controller (which can be any staff member including the Regional Manager).
2. The Incident Controller will then form an Incident Management Team (IMT) in consultation with the Regional Manager.

Note: the IMT may consist of as many or as few staff as required by the Incident Controller, largely dependant on the scale and nature of the CSG CE. Additionally, one officer may conduct more than one functional role.

The IMT (shown in blue) may consist of any officers, but it is recommended that Team Leaders and/or Managers are involved in the IMT.

### **Incident Management Team Structural Command**

### **Action 7: Develop Action Plan** (Duty of Incident Management Team)

- IMT to develop Action Plan
- Action Plan may include Sampling Plan
- IMT to appoint Field Team(s) as required
- Action Plan to be carried out / reviewed / amended in accordance with structural command.
- Refer to Action Plan Template – **Appendix H**

### **Action 8: Implementation of the plan** (Duty of all Personnel)

The Field Team(s) shall be responsible for the implementation of the plan on site and report to Operations Commander.

This responsibility will include:-

#### **PRIOR TO TRAVEL:-**

- Liaising with IMT on required actions and briefing rest of field response team
- Organising response kit / field equipment (Refer to check list **Appendix E**)
- Organizing flights / transport to and from the site for staff and equipment. (In conjunction with Administration and Logistics teams in IMT)
- Organizing accommodation where required (In conjunction with Administration and Logistics teams in IMT)

#### **ON SITE:-**

- Evaluate the situation – determine the extent of the issue
- Brief on ground staff – allocate specific duties
- Ensure Staff Safety (WPH&S)
- Provide regular Sit Reps to Manager - as previously arranged – **Appendix I**
- Exercising of provisions under the *Environmental Protection Act 1994* – refer to **Appendix F** – Field guide.
- Record Keeping – notes/records/ photographs/ logs. (running sheet – **Appendix G**)
- Sampling - **Appendix J** - Sampling point guides

### **Action 9: Review of Action Plan and Situation Report**

(Duty of Incident Management Team)

- IMT to review Situation Reports provided by Field Team(s) to determine if Action Plan is achieving prescribed outcomes.
- IMT to amend Action Plan if planned outcomes are not achieved
- If outcomes not achieved – IMT to refer back to Action 7.
- If outcomes are achieved, IMT to continue to Action 10.

### **Action 10: Deactivation** (Duty of Incident Management Team)

- Regional Manager may deactivate the plan if:
  - (a) The incident no longer meets the CSG CE criteria; or
  - (b) The initial response phase to the incident is completed.

## **CSG Discharge Response Plan Deactivation Procedures**

1. Regional Manager to be briefed on implementation of action plan and success of response
2. Regional Manager to assess whether the goals of the action plan were achieved and whether the Department's immediate response has concluded.
3. Regional Manager to Deactivate Response Plan
4. Regional Manager to advise Regional Service Director in writing (e.g. email) of CSG Discharge Response Plan Deactivation
6. Team Leader (Mining) advised on Deactivation and to coordinate remaining response and investigations as per standard Departmental procedures.

### **Action 11: Demobilisation and Debrief**

- Field Team(s) to liaise with Operations of demobilisation from the field
- Operations to liaise with logistics and administration on:
  - re-stocking used equipment;
  - sending samples to lab;
  - cleaning and calibration of equipment.
- Incident Controller to hold a debrief within 5 working days of the CSG Discharge Response Plan being deactivated. The debrief should address:
  - Success of initial response;
  - Identification of further actions / response required (e.g. Med-Long term response plans / remediation plans);
  - Identification of responsible officer(s) / team(s) for management of the response / incident following the deactivation of the Mine Discharge Response Plan.
  - Nomination of officer(s) / team(s) responsible for ensuring that the actions under the Mine Discharge Response Plan are appropriately documented.

## ADMINISTRATION AND LOGISTICS

### Administration -

#### Staffing:

The selection of staffing to respond to a matter shall be the responsibility of the Incident Controller and IMT. The approval to recall staff back to duty will lie with the Regional Manager.

#### Expenditure approvals:

All expenditure must be approved by the Regional Manager prior to purchase unless circumstances exist that would make the approval unreasonable at the time.

#### Travel:

All travel must be approved by the Manager or Regional Manager prior to commencement unless circumstances exist that would make the approval unreasonable at the time. In that case the Team leader may provide initial approval.

#### Equipment and vehicle use:

All users must hold the relevant qualifications, training and approvals to operate the equipment and vehicles used by them.

#### Flights/ Air Travel:

All flights must be approved by the Manager or Regional Manager prior to commencement. Refer to Logistics Section for arrangement details.

#### Work Hours:

Work hours shall be conducted in line with the award and response needs. Weekend work and work after 6pm and before 6am will be with the approval of the Regional Manager.

#### On Call staff:

An on-call officer shall be available to respond to phone calls 24 hours a day as per existing on-call regional arrangements.

### Logistics

#### Vehicles:

Sargents (1800 077 353) hire vehicles with remote site equipment in case Departmental vehicles are unavailable. The Sargents offices/depots in Roma, Blackwater and Chinchilla are the most convenient for CSG site visits.

#### Air Travel:

- Domestic Travel is to be arranged through the Travel Management System during Business Hours on 1300 729 912 and After Hours on 1300 474 287
- Other flights (Helicopter) to be arranged by the Travel Management System

#### Remote operations:

Remote travel requires the possession and use of equipment designed to support this type of operation – Car Kits and Field Kits are to be utilised.

Field and Sampling Equipment:

Refer to the RSD on-call roster for appropriate field equipment and safety equipment.

\* It is the responsibility of the Team Leader to ensure that their office have equipped vehicles, safety kits, and CSG discharge response kits available and up to date prior to the wet season.

# COMMAND AND COMMUNICATIONS

## Command

### INCIDENT CONTROLLER

- Overall Incident Command and lead the IMT
- Approve action plans
- Brief Regional Service Director

### OPERATIONS

- Responsible for carrying out approved action plans
- Brief Incident Controller
- Coordinate actions of Field Team(s)

#### Field Teams

- Responsible for carrying out action plan on ground
- Brief Operations
- Sampling and evidence collection as detailed in action plan
- Provide situation reports on regular basis

### LOGISTICS

- Responsible for providing logistical support to carry out action plan
- Brief Incident Controller
- Coordinate transport, food, equipment and accommodation for Field Team(s)
- Responsible for communication systems between Field Team(s), Incident Management Team and other stakeholders
- Notification of incident to appropriate stakeholders and government departments
- Coordinate Media responses

#### Communications

- Establish lines of communication between field teams, mining operators, IMT, stakeholders and within the Department
- Record and track communications and develop / track briefings

#### Media / Liaison

- Engage with stakeholders external to the IMT and provide briefings to stakeholders
- Operate as a single point of contact for all incoming enquires from external stakeholders
- Liaise with Media Unit on development of media releases and response to media enquires

## ADMINISTRATION

- Brief Incident Controller
- Track expenditures
- Provide support to operations, logistics and planning
- Track staff movements and administer call-in safety procedures

### Admin Support / Finance

- Support administration and IMT through provision of documents, record keeping etc.
- Track expenditures and liaise with finance department as appropriate.

## PLANNING

- Responsible for development of action plan
- Brief Incident Controller
- Coordinate support from sciences, investigations, litigation as required
- Arrange mobilisation / demobilisation of Field Team(s)

### Scientific Support

- Provide scientific advice on the nature of the incident, sampling plan development or remediation

### Investigations

- Provide advice on powers of officers, or how to ensure evidence collection is appropriate in the event of offences being investigated under the *Environmental Protection Act 1994*.

## Communications

### Primary communications:-

Telephone: - Use of telephone for the receipt and relay of information will be the primary means of communication between the parties where face to face capability does not exist. A full list of phone numbers is provided on **Appendix B**.

### Secondary Communications:-

Email and Fax: - Shall be used as Secondary means of communications only and a response from the receiver should be requested to ensure receipt of information. A list of email addresses and Fax numbers are listed in **Appendix B**.

### Satellite Telephones:-

Sat Phones may be the only source of communications in remote areas. The Field Response Coordinator will ensure the serviceable operation of the phone prior to departure. Ensure the contact number is advised on the Response Plan. Sat Phone Numbers also listed on **Appendix B**.

### Reporting Requirements - Field Operations

Reporting times, Sit Reps and protocols will be adhered to whilst conducting the field response. The reporting times will be as per policy and incorporated as part of the Response Plan. The Field Team(s) will ensure reporting times and procedures are adhered to.

## APPENDIX D – RESPONSE NOTIFICATION PROMPT SHEET

<p>Date, Time and Location of discharge</p> <p>Tenure number?</p> <p>Production / Exploration?</p>	
<p>Name, position, and contact number of the person notifying of the incident?</p>	
<p>What is the cause of the discharge (if known)?</p>	
<p>Is the discharge ongoing?</p>	
<p>Can we access the discharge site, CSG site and receiving environment?</p>	
<p>What is the company involved?</p> <p>Who is the appropriate contact person and his/her details?</p>	
<p>What actions have the CSG taken to date?</p>	
<p>Are there any Safety Hazards?</p>	
<p>What is the quantity of discharge?</p> <p>What is the water quality of the discharging water?</p> <p>If no water samples have been taken of the actual discharge, has the water been previously sampled? If so, what is the water quality.</p> <p>Will the company sample (at point of discharge, upstream and downstream)</p>	
<p>What type of material was discharged (e.g. hydrocarbons, CSG Water, Brine, RO permeate, sewage, chemicals, stormwater)?</p>	
<p>What Creeks / Rivers / Watercourses have been affected or have potential to be affected?</p>	

What is the current flow rate of the creek/watercourse?	
Is there any drinking, recreational or livestock water points downstream?	
What are the environmental values of the receiving environment?  Are there any sensitive downstream values?	
Who are the potentially impacted landholders or stakeholders?	
Has these landholders / stakeholders been notified?  What are their contact details?  Has the local council been notified?	
What immediate actions are proposed by the company?	
Is this a potential breach of the companies EA?  If so, what condition?	

# APPENDIX E – INITIAL RESPONSE KIT

## Minimum Personal Protective Equipment

- Hard Hat
- High Visibility Vest
- Steel Cap Boots
- Qld Government Long Sleeve Shirt and Trousers

## Minimum Safety Equipment

- UHF Radios
- Satellite Phone
- Emergency Beacon
- 4WD vehicle
- GPS
- Fresh Water
- Batteries
- Orange Flashing Light
- Torch
- Camera
- Pens
- Official Notebook
- Paper / Maps

## Basic Sampling Equipment Kit (*to be refined*)

- Sampling Pole
- TPS / YSI (in-situ field measurements)
- pH strips
- Minimum 1L of Distilled Water
- 10 x sediment jars
- 10 x metal analysis bottles (water quality)
- 10 x standard physical unpreserved bottles (water quality)
- 2 x oil / grease / hydrocarbon bottles
- 2 x Ammonia / Nitrogen / phosphorous bottles (sewage)
- 1 x box gloves
- 20 x syringes
- 1 x box of 0.45 µm syringe filters

# APPENDIX F - COMPLIANCE ACTIVITY FIELD GUIDE

Preface: This field guide is formulated to provide basic information to field officers in relation to assessing activities for compliance and to provide information on procedures to follow when making inquiries or investigation into suspected non-compliance.

This guide relates to the provisions of the *Environmental Protection Act 1994*. Field Officers must be familiar of the provisions of the *Environmental Protection Act 1994* (the 'Act') so that they can carry out their duties effectively and lawfully.

Whilst the enforceable provisions of the Act for Petroleum and Gas activities relate to Chapter 5A of the *Environmental Protection Act 1994*, the field staff will be designated as Authorised Persons under the Act and therefore knowledge of their obligations and the provisions of the Act is crucial.

## **Topics covered by this guide:**

- Part 1. Authorised Persons - Section 445 *Environmental Protection Act 1994***
- Part 2. Powers of Authorised Persons - Chapter 9**
- Part 3. Offences that relate to the powers of Authorised Persons**
- Part 4. Records and Record Keeping requirements**
- Part 5. Exhibit Handling- Sect's 461-462**
- Part 6. Interviewing/ Witness Statements**
- Part 7. Field Equipment – Types and Use**
- Part 8. Flow Charts - Compliance Management Guide/ Compliance Actions**

## **PART 1 AUTHORISED PERSONS**

All field staff will be required to be appointed as an Authorised Person under the provisions of Section 445 of the *Environmental Protection Act 1994*. To exercise any of the powers under the legislation the person must be an Authorised Person in possession of an Identity Card.

## **PART 2. POWERS OF AUTHORISED PERSONS**

### **Chapter 9 of the *Environmental Protection Act 1994*, Investigation and Enforcement.**

This chapter outlines the general powers of authorised persons and all field staff should be familiar with the contents of that chapter of the legislation.

#### **Section 449 *Production of identity card.***

*(1) An authorised person may exercise a power in relation to someone else only if the authorised person—*

*(a) first produces his or her identity card for the person's inspection; or*

*(b) has his or her identity card displayed so that it is clearly visible to the person.*

*(2) If, for any reason, it is not practicable to comply with subsection (1), the authorised person must produce the identity card for inspection by the person at the first reasonable opportunity.*

#### **Section 452 *Entry of place—general***

*(1) An authorised person may enter a place if—*

*(a) its occupier consents to the entry and, if the entry is for exercising a power under chapter 7, part 5B or 8, its owner consents; or*

*(b) it is a public place and the entry is made when the place is open to the public; or*

*(ca) it is a place to which an Agricultural ERA, a registration certificate, a development approval subject to a development condition or a code of environmental compliance relates and the entry is made when—*

*(i) the chapter 4 activity to which the certificate, approval or code relates is being carried out; or*

*(ii) the place is open for conduct of business; or*

*(iii) the place is otherwise open for entry; or*

**Note:** In relation to the Environmental Services staff it is expected that entry to places will be primarily conducted as outlined in Section 452(1)(a) with the owner / occupier having knowledge of the visit and providing consent for the visit.

Where consent is given, consideration should be given to obtaining confirmation of that consent either in writing from the owner/ occupier or by corroboration of such consent. Section 485 refers to content of consent form.

#### **Section 455 *Entry of land for access***

*(1) This section applies if—*

*(a) an authorised person may enter land (the **primary land**) under section 452 or 454; and*

*(b) it is necessary or desirable to cross other land (the **access land**) to enter the primary land.*

Note: This section provides for the access across other property to obtain entry into the primary land. There is provision for such access with consent of the occupier and this would be the preferred method. The section further outlines the actions required if that consent is not obtained.

**Sections 456 and 457** relate to the **authority to apply for Warrants** and how applications may be made. It should be noted that any application and subsequent entry

via the execution of a Warrant should only be done with the approval of the Regional Service Director and Director of the Compliance and Investigations Branch .

**Section 458 Order to enter land to conduct investigation or conduct work**

This section states that an authorised person may apply to a magistrate for an order to enter land to carry out work on the land to secure compliance with an accredited ERMP. Application for any order under this section should only be done with the approval of the Manager of the Reef Unit.

**Section 459 Entry or boarding of vehicles**

- (1) An authorised person may enter or board a vehicle if the authorised person has reasonable grounds for suspecting—*
  - (a) the vehicle is being, or has been, used in the commission of an offence against this Act; or*
  - (b) the vehicle, or a thing in or on the vehicle, may provide evidence of the commission of an offence against this Act; or .....*
- (2) If the vehicle is moving or about to move, the authorised person may signal the person in control of the vehicle to stop the vehicle or not to move it.*
- (3) To enable the vehicle to be entered or boarded, the authorised person may—*
  - (a) act with necessary and reasonable help and force; and*
  - (b) require the person in control of the vehicle to give reasonable help to the authorised person.*

**Section 471** creates the offence for failing to comply with a signal under section 459(2) to stop or not to move a vehicle.

**Note:** The power outlined in Section 459(2) and (3) should be carried out with care taking into account the options available to achieve the same outcome. Consider the assistance of Police where the vehicle is not on the occupiers/ owners property or on a roadway and the need exists to stop the vehicle.

**Section 460 General powers for places and vehicles**

This section provides broad powers to Authorised Persons who lawfully enters a place or boards a vehicle to conduct their duties.

Authorised Persons should be familiar with the content of this section as the powers apply to all entries and boarding's and are not confined only to enforcement actions

**Section 461 Power to seize evidence**

This Section applies to the power to seize evidence where lawful entry has been gained with the intent of seizing evidence to a place either with warrant or by occupiers consent.

Any entry done with the intent of seizing evidence should be carried out as per this section and with the assistance of an investigator and/or supervisor where practicable.

Approval for such entry and seizure should, where practicable, be approved by the manager of the Reef Unit.

**Section 462 Procedure after seizure of evidence**

Outlines the requirement that an authorised person must give a receipt for a thing seized to the person from whom it was seized.

The section also outlines the procedure and associated requirements for dealing with the receipt and seized property. Subsections 5 to 7 relates to the retention of the seized material/ item and the return of it to the owner.

Any material or item seized should be dealt with as an exhibit. Refer to Compliance Investigations Manual Chapter 8 which refers to Exhibit Management.

**Section 464 Power to require name and address**

*(1) An authorised person may require a person to state the person's name and address if the authorised person—*

*(a) finds the person committing an offence against this Act; or*

*(b) finds the person in circumstances that lead, or has information that leads, the authorised person to suspect on reasonable grounds that the person has committed an offence against this Act.*

*(2) When making the requirement, the authorised person must warn the person that it is an offence against this Act to fail to state the person's name and address, unless the person has a reasonable excuse.*

*(3) The authorised person may require the person to give evidence of the correctness of the person's name or address if the authorised person suspects on reasonable grounds that the name or address given is false.*

**Section 475** creates the offence for failing to comply with name and address requirement.

**Section 465 Power to require answers to questions**

*(1) This section applies if an authorised person suspects, on reasonable grounds, that—*

*(a) an offence against this Act has happened; and*

*(b) a person may be able to give information about the offence.*

*(2) The authorised person may require the person to answer a question about the offence.*

*(3) When making the requirement, the authorised person must warn the person it is an offence to fail to comply with the requirement, unless the person has a reasonable excuse.*

**Section 476** creates the offence for failure to comply with requirement under Section 465.

**Section 466 Power to require production of documents**

*(1) An authorised person may require a person to produce to the authorised person for inspection a document required to be held or kept under this Act or a development condition of a development approval.*

*(2) The authorised person may keep a produced document to take an extract from, or make a copy of, the document.*

*(3) The authorised person must return the document to the person as soon as practicable after taking the extract or making the copy.*

### **PART 3. OFFENCES THAT RELATE TO THE POWERS OF AUTHORISED PERSONS**

Part 5 of the *Environmental Protection Act 1994* deals with multiple offences that relate to the compliance powers of Authorised Persons. Appropriate offences are outlined hereunder.

Note: The provisions mentioned in this guide are limited and referral to the Act should occur and assistance sought where suspicion of non compliance occurs.

#### **Section 471 Failure to comply with signal**

This section provides an offence for failing to obey a signal under section 459(2) to stop or not to move a vehicle, unless the person has a reasonable excuse for not obeying the signal. Defences apply (E.g. safety, first opportunity)

#### **Section 475 Failure to give name and address etc.**

This section relates to where a person is required by an authorised person under section 464(1) to state the person's name or address or is required by an authorised person under section 464(3) to give evidence of the correctness of a name fails to comply with the requirement, unless the person has a reasonable excuse for not complying with it.

Subsection (3) states; *The person does not commit an offence against this section if—*  
(a) *the authorised person required the person to state the person's name and address on suspicion of the person having committed an offence against this Act; and*  
(b) *the person is not proved to have committed the offence.*

#### **476 Failure to answer questions**

This section applies if an authorised person requires a person under section 465 to answer a question, the person must comply with the requirement unless the person has a reasonable excuse for not complying with it.

Reasonable excuse – “might tend to incriminate the person”.

No offence committed if the information sought by the authorised person is not in fact relevant to the offence.

#### **477 Failure to produce document**

This section creates the offence for a person who was required under section 466 to produce a document and failed to comply with the requirement, unless the person had a reasonable excuse for not complying with it.

#### **482 Obstruction of authorised persons**

This section creates the offence for a person who obstructs an authorised person in the exercise of a power under this chapter, unless the person has a reasonable excuse for obstructing the authorised person. In this section **authorised person** includes a person who is—

- (a) acting under an authorised person's direction under section 363K; or
- (b) authorised by an authorised person to take action under section 467(2)(b); or
- (c) helping an authorised person under this chapter.

## **PART 4 RECORDS and RECORD KEEPING**

Environmental Services staff are required to keep accurate records to ensure monitoring of progress against Service Delivery requirements is achievable and the content is of a standard that would pass judicial review.

Records are for two purposes;

- Compliance Monitoring and Service Delivery
- Compliance Enforcement

### **Compliance Monitoring and Service Delivery**

Records for this purpose will be kept for;

- Statistics
- Performance delivery
- Service delivery
- Enforcement/ compliance actions

Records for this purpose will be by way of ;

- Diary Entries
- Field Inspection reports
- Ecotrack data entry

### **Compliance Enforcement**

Records for this purpose will be kept for;

- Statistics
- Compliance History
- Investigation process
- Court Proceedings
- Evidence

Records for this purpose will be by way of;

- Diary entries
- Official Note Book entries
- Field Inspection reports
- Ecotrack data entry

**PART 5 EXHIBIT HANDLING – (Including Sections 461 and 462(EPA))**  
(Includes extracts from Departmental Compliance Investigation Manual)

**Introduction**

Failure to control an exhibit lawfully may result in the exclusion of the exhibits as evidence and jeopardize the final outcome of the prosecution case, and subsequent repercussions to the investigator personally.

**Continuity of Evidence**

Continuity of possession is required to ensure any material that may be used as evidence is kept in a manner that ensures originality. This includes the need to keep the material secure, ensure no alterations are made and to have a record of the place kept and in whose possession it has been. The Compliance Investigation Manual Chapter 8 refers to Exhibit Management.

**Property Receipt**

If a thing is taken or seized, a property receipt must immediately be given to the person in control of the thing (normally the owner or custodian of the thing). If it is impossible to immediately give the person a property receipt then it must be given as soon as practicable after the seizure or the receipt may be left at the place of seizure in a conspicuous and reasonably secure place.

The following information must also be completed on the property receipt:

- name and address of the person from whom the property was seized or taken.
- Authorised Officer's name – name of the investigator's taking or seizing the property;
- the location the exhibit was taken from – this also includes a description of the location within the property from where it was seized or taken.
- a brief description of the exhibit including any serial number and/or identification marks;
- comment on its condition and value (if known) at the time of seizure;
- date and time taken; and
- CIRaM number (If known).

The property receipt is to have the following distribution:

- Investigator's brief/ Reef Unit File - Original
- Person from whom thing taken or seized - Copy 1
- Attached to the thing - Copy 2
- Remaining in book - Copy 3

**Exhibit Registers**

The Exhibit Register is an official and auditable document in which all physical exhibits (other than original documents) that cannot be satisfactorily controlled by the investigator are to be entered. It records all ingress and egress of exhibits at property point, and identifies the custodian of the exhibit should it be removed from the property point for analysis or further investigation purposes. Each exhibit must be labelled securely so that the label will not become detached in packing or handling. Details of the exhibit must be recorded in an exhibit register so its whereabouts can be tracked. The exhibit itself should be appropriately secured.

## **PART 6 INTERVIEWING/ WITNESS STATEMENTS**

(Includes extracts from Departmental Compliance Investigation Manual)

### **Interviews**

Whilst the following information primarily relates to interviews associated with suspected offences, the day to day field inquiries may wish to adopt the general standard so that progression to enforcement actions is supported by previous field records and practices.

Chapter 9 of the Compliance Investigation Manual provides detail for Interviewing.

A Record of Interview with a suspected offender should be conducted using electronic recording devices (Video/ Audio). Where practicable assistance should be sought from supervisors and/or investigators prior to conducting this type of interview.

Interviews should be conducted in a courteous and sensitive manner with an emphasis on portraying a professional image of the investigator and the Department.

#### **Location**

The location chosen to conduct an interview may set the tone for an interview. Whilst it is best practice to conduct any interview in a private area free from distractions and interruptions, it is recognised that some interviewees may request or insist on the interview occurring at a location set by themselves (e.g. in their home or at their workplace)

For any interview consider interference factors including interjection by other persons, machinery or electronic noises and comfort.

### **Witness Statements**

As part of day to day field operation staff will become involved with potential witnesses and also be witnesses to offences.

As a result field staff should be familiar with the process of taking or making a statement to a standard that is suitable for production in a criminal proceeding. Seek assistance from a supervisor or investigator if necessary.

Chapter 9 of the Compliance Investigation Manual provides detail for Statement taking and making

#### **A statement may be made:**

In an Official Notebook

Handwritten on paper

Typewritten (Most preferred for court)

Electronic Recording (Audio/ Video)

#### **If requested to obtain or make a formal statement the following should occur:**

- Seek advice from the Supervisor/ Manager
- Gather all known facts relevant to the incident,
- Understand the elements to be proved regarding the offences alleged to have been committed,
- Identify the best venue to interview the witness,
- Identify what information the witness may be able to provide and remember the 'who, what, where, when and how' questions that underpin an interview

- Preliminary inquiries with the witness will determine what the person knows about the incident.
- Evaluate this information to determine if it is relevant to the investigation.
- Record the information formally as a statement.

#### Guide to Validating Witness' Observations

A witness' observations may be critical in describing an offence or proving a particular element of an offence. To assist in assessing a witness' observations the ADVOKATE acronym is valuable:

**A** - Amount of time the witness observed the incident or offender

**D** - Distance between the offence and witness

**V** - Visibility including atmospheric conditions, lighting etc

**O** - Obstructions to the witness' line of sight

**K** - Knowledge with regard to the witness having previously known the offender

**A** - Any special reason for the witness to remember the incident or offender

**T** - Time lapse between the incident and when the witness made their statement

**E** - Errors or discrepancies

## **PART 7 FIELD EQUIPMENT**

To ensure continuity of evidence and quality of evidence it is necessary to have personalised field equipment.

### **Equipment to be carried**

Camera- Digital  
Voice Recorder- digital  
Diary  
Official Note Book  
Field forms  
Receipt Book.  
Bags and Containers

Note: Personal issue allows users to maintain the equipment to a high standard and also provides a high standard of knowledge of use.

### **Procedures when working with field equipment.**

Note: All records made and kept by this department may be subject to audit, public access or production in court.

#### Camera.

For evidence purposes the person who takes the photo should be the person who downloads the photo and subsequently prints the photo or copies the photo to another medium. The person who takes the photo must be the person who produces the photo (exhibit) to a court.

#### Voice Recorder

For evidence purposes the person who makes the recording should be the person who downloads the recording and subsequently copies the recording to another medium. The person who makes the recording must be the person who produces the recording (exhibit) to a court.

#### Diary

To be used for day to day compliance monitoring and management. Records should briefly include;

- Dates and times (in and out)
- Place visited
- Persons Spoken to
- Outline of matters discussed
- Observations including positive matters
- Non Compliance activities

Note: This record may be subpoenaed for court or be required to be produced under RTI legislation. Avoid opinion or derogatory statements.

#### Official Note Book

To record any official information regarding compliance activities. Records should include;

- Dates, times
- Place
- Details of suspects and witnesses
- Observations of suspected non compliance

- Corroborators endorsements
- Witness statements
- Details of actions taken.

Note: These notes are primarily made with consideration that they may be produced in a court proceeding. Notes should be factual and should not include irrelevant information and opinion.

### Field Forms

To be completed for every field inspection in relation to Level A and B inspections. These are notes made at the time and should be signed by the person making the entries and adoption sought by initial from the property occupier/ owner.

### Receipt Book

Section 462 *Environmental Protection Act 1994- Procedure after seizure of evidence*  
 Outlines the requirement that an authorised person must give a receipt for a thing seized to the person from whom it was seized.

Where property / documents are voluntarily provided by the owner/ occupier in relation to monitoring day to day compliance, consideration should be given to making a record in the Official Note Book and have the owner/ occupier acknowledge the supply and return of the items in that book. A receipt may be issued from the Receipt Book and an acknowledgement (Indemnity Receipt) of the items return should be kept in that book or other place of record.

### Bags and Containers

- Preservation of all items and material taken into the possession of DERM staff is required to ensure;
- The item is identifiable.
- The item can be returned to the owner in the condition that it was taken.
- The item is maintained in its condition for court purposes.
- The item is not contaminated – when taken for further tests/ examination.
- The item is properly identified without the need to mark the actual item.

### Examples of use:

- Plastic envelopes to preserve documents- can be marked with details
- Plastic Bags to preserve items from external contamination- identified and sealed
- Plastic bags and containers suitable to hold soil/chemicals for further testing. (Of a kind that does not affect the contents) – Can be identified and sealed.
- Boxes/ Larger Containers- To house large items or to maintain all items in one location.

# SAMPLING PLAN

Ecosystems potentially impacted  Take Filtered Samples

Livestock drinking water potentially impacted  Take unfiltered Samples

Sediment Sampling  Consider taking composite mixed samples

## Sampling Checklist

Water Sampling Metals Unfiltered	Water Sampling Metals Filtered	Water Sampling General	Water Sampling – Specific analyte	Sediment Samples (Grab samples)	Sediment Samples (Composite samples)
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

## Sampling Locations

Sample ID	Location Details	Site Justification
<b>Reference Sites</b>		
<b>Point Source Release Sites / Discharge Points</b>		
<b>Impacted Sites</b>		

## SAMPLING REGIME FOR CSG SPILLS:

### SPILL TO LAND:

#### Soil samples:

- EC (1:5 soil:water),
- pH (1:5 soil:water),
- chloride
- SAR (as a measure of ESP)
- Samples should be a depth intervals 0-10 cm, 20-30cm and 50-60 cm and ideally, 3 replicates taken. A brief description of the soil, vegetation and land use should be also be provided.

PAH	TPH	Metals (total and dissolved)
Naphthalene	Naphthalene	Arsenic
Acenaphthylene	Nitrobenzene	Beryllium
Acenaphthene	2,4-dinitrotoluene	Barium
Fluorene	2,4,6-trinitrotoluene	Cadmium
Phenathrene	Phenol	Chromium [3, 6, total]
Anthracene	2,4-dinitrophenol	Cobalt
Fluoroanthene	<b>Benzene</b>	Copper
Pyrene	<b>Toluene</b>	Lead
Benz(a)anthracene	<b>Ethylbenzene</b>	Manganese
Chrysene	<b>Xylenes [o-xylene and p-xylene]</b>	Molybdenum
Benzo(b)fluoranthene		Nickel
Benzo(k)fluoranthene		Selenium
Benzo(a)pyrene		Strontium
		Vanadium
		Zinc
		Boron
		Sodium

**Liquid samples of ponded water :** Sample as table above including TDS, SAR, EC, pH, chloride, fluoride, major Anions, Major Cations and anions.

### SPILL TO WATERS [if it actually made it that far]:

#### Waters:

- Samples as table above including physical analytes pH, EC, DO, Turbidity or suspended solids, chloride, fluoride, major Anions, major Cations and anions.

**Sediment sample:** Sample as table above including EC and pH.

# **MINE DISCHARGE RESPONSE PLAN**

## **Regional Services - North Region - DERM**

### **SITUATION**

The Department of Environment and Resource Management administers the *Environmental Protection Act 1994* and has a responsibility to address environmental issues associated with that legislation.

The North Region encompasses a broad range of industrial operations that include heavy industry and large mining operations each of which can be located in or near populated areas or in the more remote areas of the state. The conduct of the mining operations may result in environmental issues that require urgent actions by departmental staff.

Seasonal factors such as excessive rainfall often place a higher risk on the potentiality of mine releases / discharges.

Mine discharge situations may occur at any time and therefore a plan is required to ensure a 24 hour response capability by this division.

To determine whether the response to a contamination event triggers this plan, the criteria for a Mine Contamination Event (MCE) are outlined in **Action 4** in execution.

The criteria under the MCE will determine whether this Mine Discharge Response Plan is activated. If activated the response to the MCE will be in accordance with Mine Discharge Response Plan.

#### **Area of operation:**

The area of the North Region includes the Mount Isa, Cairns, and Townsville Districts which incorporates Cape York, North Queensland Coastline, Gulf Areas and North West Queensland – **Appendix A**.

#### **Staffing:**

Regional Services Division has staff based at Townsville, Cairns and Mt Isa. A full contact list including each person's role / expertise is attached as **Appendix B**

#### **Own Resources:**

The primary response staff are:

- Regional Manager, Regional Services, North Region
- Manager (Mining)
- 3 Team Leaders (Mining) across Townsville, Cairns, and Mount Isa
- An On Call Environmental Officer/ Project Officer is available to provide initial response to calls 24 hours a day. On call roster is attached as **Appendix C**.
- A list of emergency contacts for internal departmental teams as well as key external stakeholders is also detailed in **Appendix C**.
- The Mining and Heavy Industry team have staff in Townsville, Cairns and Mount Isa available to respond to incidents

## MISSION

To ensure a professional, consistent and timely initial response by the Department of Environment and Resource Management to major contamination events resulting from mines in North Queensland.

## EXECUTION

The response to any situation of reported mine contamination event / discharge shall be executed as outlined hereunder.

This document sets out the roles and responsibilities when responding to a contamination event. These roles may be altered based on operational requirements. Additionally, several roles may be undertaken by a single officer.

### **Action 1: Initial information/ First notification** (Duty of Receiving Officer)

- Obtain particulars of informant:-
  - Name
  - Contact details (phone, address)
  - Determine role of informant (employee/ manager/ witness etc)
- Obtain all available information about environmental issue from informant:-
  - Refer to prompt sheet – **Appendix D.**
  - What other agencies / stakeholders have been alerted
- Obtain from the informant details of other:-
  - Witnesses
  - Persons involved
  - Assistance available (human and physical resources)
  - On site expertise that is present
  - Action that has taken place since the incident to rectify/ address the matter

### **Action 2: Information / Communications search** (Duty of Receiving Officer)

Confirm initial information along with the following where practicable:-

- Other Government agencies involved
- Company / persons directly involved (operators)
- Witnesses (to confirm their observations, involvement and details)

**Note: If situation has the potential for immediate serious harm, and on scene resources and urgent actions can avoid or reduce the harm, take immediate reasonable steps to implement those actions. – Advise manager as soon as practicable of actions.**

**Action 3: Notify Management of Mine Discharge** (Duty of Receiving Officer)

- Brief the Team Leader (Mining), Manager (Mining) and Regional Manager on situation (Management Team)

**Action 4: Assess information against criteria for Mine Contamination Event (MCE)** (Duty of Management Team)

Determine whether the incident meets the criteria for an MCE considering the information from:-

- The information received from the initial informant
- The additional information from other agencies and witnesses
- The records, files and local knowledge within the Department

*Note: While an event may not initially meet the criteria to activate this plan, as further information becomes available, it may be appropriate to revisit the MCE. The plan may be activated at any time.*

**Mine Contamination Event Criteria (MCE Criteria)**

For a discharge(s) to trigger a response under this plan, the event must meet the following criteria:

1. Originate from an active or abandoned mining activity; and
2. Have an actual or potential impact footprint outside of the mine's boundaries; and
3. There is actual or potential risk to human health, property, livestock, an environmental value, or a community value; and
4. Response to the event under the Department's Standard Operating Procedures is not sufficient to manage the event.

When considering the applicability of MCE criteria 4, the following may trigger the criteria:

- a) The scale of the impact is excessive; or
- b) The concentration of the contamination is high; or
- c) The event involves hazardous substances or dangerous goods; or
- d) Contamination events have occurred across several mines requiring a coordinated approach; or
- e) The receiving environment is highly sensitive.

**Action 5: Activation of Mine Discharge Response Plan**

(Duty of Regional Manager)

- Regional Manager may immediately or at any time in the response to the incident, activate the Mine Discharge Response Plan if the MCE criteria is met

**Mine Discharge Response Plan Activation Procedures**

1. Regional Manager to be briefed on situation.
2. Regional Manager to determine incident should be dealt with under Mine Discharge Response Plan
3. Regional Manager to Activate Response Plan
4. Regional Manager to advise Regional Service Director in writing (e.g. email) of Mine Discharge Response Plan Activation
5. Regional Manager to meet with Management Team (Mining Team Leaders and Mining Manager) to form Incident Management Team (IMT).

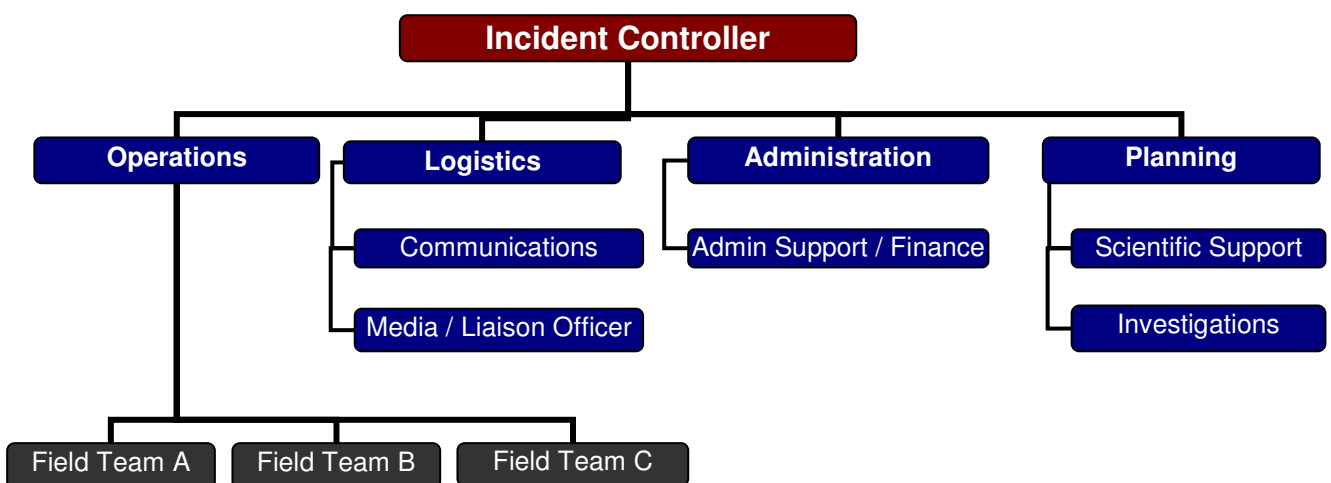

**Action 6: Form Incident Management Team** (Duty of Regional Manager)

1. Upon activation of the Mine Discharge Response Plan, the Regional Manager will then appoint an incident controller (which can be any staff member including the Regional Manager).
2. The Incident Controller will then form an Incident Management Team (IMT) in consultation with the Regional Manager.

Note: the IMT may consist of as many or as few staff as required by the Incident Controller, largely dependant on the scale and nature of the MCE. Additionally, one officer may conduct more than one functional role.

The IMT (shown in blue) may consist of any officers, but it is recommended that Team Leaders and/or Managers are involved in the IMT.

**Incident Management Team Structural Command**

**Action 7: Develop Action Plan** (Duty of Incident Management Team)

- IMT to develop Action Plan
- Action Plan may include Sampling Plan
- IMT to appoint Field Team(s) as required
- Action Plan to be carried out / reviewed / amended in accordance with structural command.
- Refer to Action Plan Template – **Appendix H**

**Action 8: Implementation of the plan** (Duty of all Personnel)

The Field Team(s) shall be responsible for the implementation of the plan on site and report to Operations Commander.

This responsibility will include:-

**PRIOR TO TRAVEL:-**

- Liaising with IMT on required actions and briefing rest of field response team
- Organising response kit / field equipment (Refer to check list **Appendix E**)
- Organizing flights / transport to and from the site for staff and equipment. (In conjunction with Administration and Logistics teams in IMT)
- Organizing accommodation where required (In conjunction with Administration and Logistics teams in IMT)

**ON SITE:-**

- Evaluate the situation – determine the extent of the issue
- Brief on ground staff – allocate specific duties
- Ensure Staff Safety (WPH&S)
- Provide regular Sit Reps to Manager - as previously arranged – **Appendix I**
- Exercising of provisions under the *Environmental Protection Act 1994* – refer to **Appendix F** – Field guide.
- Record Keeping – notes/records/ photographs/ logs. (running sheet – **Appendix G**)
- Sampling - **Appendix J** - Sampling point guides

**Action 9: Review of Action Plan and Situation Report**

(Duty of Incident Management Team)

- IMT to review Situation Reports provided by Field Team(s) to determine if Action Plan is achieving prescribed outcomes.
- IMT to amend Action Plan if planned outcomes are not achieved
- If outcomes not achieved – IMT to refer back to Action 7.
- If outcomes are achieved, IMT to continue to Action 10.

**Action 10: Deactivation** (Duty of Incident Management Team)

- Regional Manager may deactivate the plan if:
  - (a) The incident no longer meets the 4 MCE criteria; or
  - (b) The initial response phase to the incident is completed.

**Mine Discharge Response Plan Deactivation Procedures**

1. Regional Manager to be briefed on implementation of action plan and success of response
2. Regional Manager to assess whether the goals of the action plan were achieved and whether the Department's immediate response has concluded.
3. Regional Manager to Deactivate Response Plan
4. Regional Manager to advise Regional Service Director in writing (e.g. email) of Mine Discharge Response Plan Deactivation
6. Team Leader (Mining) advised on Deactivation and to coordinate remaining response and investigations as per standard Departmental procedures.

**Action 11: Demobilisation and Debrief**

- Field Team(s) to liaise with Operations of demobilisation from the field
- Operations to liaise with logistics and administration on:
  - re-stocking used equipment;
  - sending samples to lab;
  - cleaning and calibration of equipment.
- Incident Controller to hold a debrief within 5 working days of the Mine Discharge Response Plan being deactivated. The debrief should address:
  - Success of initial response;
  - Identification of further actions / response required (e.g. Med-Long term response plans / remediation plans);
  - Identification of responsible officer(s) / team(s) for management of the response / incident following the deactivation of the Mine Discharge Response Plan.
  - Nomination of officer(s) / team(s) responsible for ensuring that the actions under the Mine Discharge Response Plan are appropriately documented.

## ADMINISTRATION AND LOGISTICS

### **Administration -**

#### Staffing:

The selection of staffing to respond to a matter shall be the responsibility of the Incident Controller and IMT. The approval to recall staff back to duty will lie with the Regional Manager.

#### Expenditure approvals:

All expenditure must be approved by the Regional Manager prior to purchase unless circumstances exist that would make the approval unreasonable at the time.

#### Travel:

All travel must be approved by the Manager or Regional Manager prior to commencement unless circumstances exist that would make the approval unreasonable at the time. In that case the Team leader may provide initial approval.

#### Equipment and vehicle use:

All users must hold the relevant qualifications, training and approvals to operate the equipment and vehicles used by them.

#### Flights/ Air Travel:

All flights must be approved by the Manager or Regional Manager prior to commencement. Refer to Logistics Section for arrangement details.

#### Work Hours:

Work hours shall be conducted in line with the award and response needs. Weekend work and work after 6pm and before 6am will be with the approval of the Regional Manager.

#### On Call staff:

An on-call officer shall be available to respond to phone calls 24 hours a day as per existing on-call regional arrangements.

### **Logistics**

#### Vehicles:

Remote Area 4WD vehicles are available in Cairns, Townsville and Mount Isa. Cairns and Townsville have available an on call vehicle with remote field equipment for response. Mount Isa has 2 vehicles equipped with remote area field equipment and mining safety equipment. Sargents (1800 077 353) hire vehicles with mine site equipment in case Departmental vehicles are unavailable.

#### Air Travel:

- Domestic Travel is to be arranged through the Travel Management System during Business Hours on 1300 729 912 and After Hours on 1300 474 287
- Helicopters or other chartered aircrafts are to be book in accordance with the Department's policy for chartering aircrafts - <http://ggov.independentaviation.com.au/login?return>
- In an emergency, it may be necessary to directly arrange helicopter services with local providers.

Remote operations:

Remote travel requires the possession and use of equipment designed to support this type of operation – Car Kits and Field Kits are to be utilised.

Field Equipment:

Field equipment and safety equipment is available for use, located at Cairns, Townsville and Mt Isa offices. Each office must prepare and maintain field equipment ready for use during the wet season.

Sampling Equipment:

Sampling equipment is located at Cairns, Townsville and Mt Isa Offices.

\* It is the responsibility of the Team Leader (Mining) to ensure that their office have equipped vehicles, safety kits, and mine discharge response kits available and up to date prior to the wet season.

## COMMAND AND COMMUNICATIONS

### Command

#### INCIDENT CONTROLLER

- Overall Incident Command and lead the IMT
- Approve action plans

#### OPERATIONS

- Responsible for carrying out approved action plans
- Brief Incident Controller
- Coordinate actions of Field Team(s)

#### Field Teams

- Responsible for carrying out action plan on ground
- Brief Operations
- Sampling and evidence collection as detailed in action plan
- Provide situation reports on regular basis

#### LOGISTICS

- Responsible for providing logistical support to carry out action plan
- Brief Incident Controller
- Coordinate transport, food, equipment and accommodation for Field Team(s)
- Responsible for communication systems between Field Team(s), Incident Management Team and other stakeholders
- Notification of incident to appropriate stakeholders and government departments
- Coordinate Media responses

#### Communications

- Establish lines of communication between field teams, mining operators, IMT, stakeholders and within the Department
- Record and track communications and develop / track briefings
- Brief RSD as required

#### Media / Liaison

- Engage with stakeholders external to the IMT and provide briefings to stakeholders
- Operate as a single point of contact for all incoming enquires from external stakeholders
- Liaise with Media Unit on development of media releases and response to media enquires

## ADMINISTRATION

- Brief Incident Controller
- Track expenditures
- Provide support to operations, logistics and planning
- Track staff movements and administer call-in safety procedures

### Admin Support / Finance

- Support administration and IMT through provision of documents, record keeping etc.
- Track expenditures and liaise with finance department as appropriate.

## PLANNING

- Responsible for development of action plan
- Brief Incident Controller
- Coordinate support from sciences, investigations, litigation as required
- Arrange mobilisation / demobilisation of Field Team(s)

### Scientific Support

- Provide scientific advice on the nature of the incident, sampling plan development or remediation

### Investigations

- Provide advice on powers of officers, or how to ensure evidence collection is appropriate in the event of offences being investigated under the *Environmental Protection Act 1994*.

## Communications

### Primary communications:-

Telephone: - Use of telephone for the receipt and relay of information will be the primary means of communication between the parties where face to face capability does not exist. A full list of phone numbers is provided on **Appendix B**.

### Secondary Communications:-

Email and Fax: - Shall be used as Secondary means of communications only and a response from the receiver should be requested to ensure receipt of information. A list of email addresses and Fax numbers are listed in **Appendix B**.

### Satellite Telephones:-

Sat Phones may be the only source of communications in remote areas. The Field Response Coordinator will ensure the serviceable operation of the phone prior to departure. Ensure the contact number is advised on the Response Plan. Sat Phone Numbers also listed on **Appendix B**.

### Reporting Requirements - Field Operations

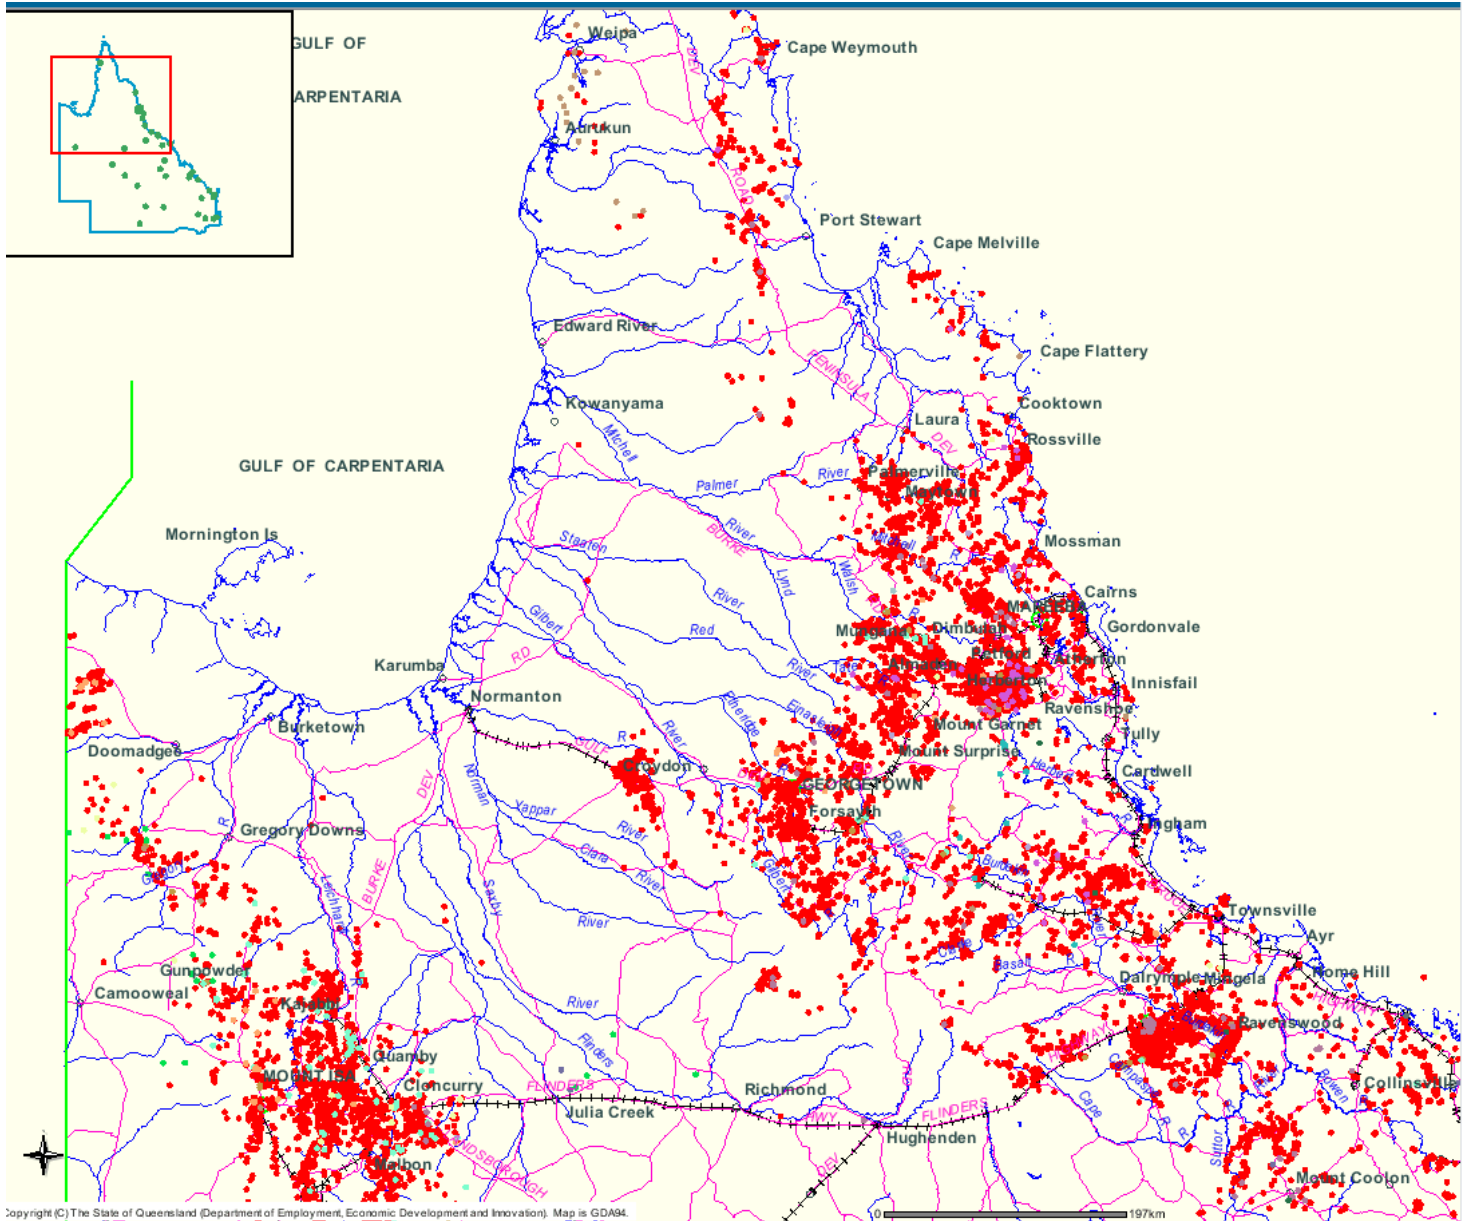

Reporting times, Sit Reps and protocols will be adhered to whilst conducting the field response. The reporting times will be as per policy and incorporated as part of the Response Plan. The Field Team(s) will ensure reporting times and procedures are adhered to.

## APPENDIX D – RESPONSE NOTIFICATION PROMPT SHEET

Date, Time and Location of discharge	
Name, position, and contact number of the person notifying of the incident	
What is the cause of the discharge (if known)?	
Is the discharge ongoing?	
Can we access the discharge site, mine site and receiving environment?	
What is the company involved? Who is the appropriate contact person and his/her details?	
What actions have the mine taken to date?	
Are there any Safety Hazards?	
What is the quantity of material discharged?	
What type of material was discharged (e.g. oil, sewage, concentrate, stormwater)?	
What Creeks / Rivers / Watercourses have been affected or have potential to be affected?	
Is there any drinking, recreational or livestock water points downstream?	
What are the environmental values of the receiving environment? Are there any sensitive downstream values?	
Who are the potentially impacted landholders or stakeholders?	
Has these landholders / stakeholders been notified? What are their contact details?	
What immediate actions are proposed by the mine?	

## APPENDIX E – INITIAL RESPONSE KIT

### Minimum Personal Protective Equipment

- Hard Hat
- High Visibility Vest
- Steel Cap Boots
- Qld Government Long Sleeve Shirt and Trousers

### Minimum Safety Equipment

- UHF Radios
- Satellite Phone
- Emergency Beacon
- 4WD vehicle
- GPS
- Fresh Water
- Batteries
- Orange Flashing Light
- Torch
- Camera
- Pens
- Official Notebook
- Paper / Maps

### Basic Sampling Equipment Kit

- Sampling Pole
- TPS / YSI (in-situ field measurements)
- pH strips
- Minimum 1L of Distilled Water
- 10 x sediment jars
- 10 x metal analysis bottles (water quality)
- 10 x standard physical unpreserved bottles (water quality)
- 2 x oil / grease / hydrocarbon bottles
- 2 x Ammonia / Nitrogen / phosphorous bottles (sewage)
- 1 x box gloves
- 20 x syringes
- 1 x box of 0.45 µm syringe filters

## APPENDIX F - COMPLIANCE ACTIVITY FIELD GUIDE

Preface: This field guide is formulated to provide basic information to field officers in relation to assessing activities for compliance and to provide information on procedures to follow when making inquiries or investigation into suspected non-compliance.

This guide relates to the provisions of the *Environmental Protection Act 1994*. Field Officers must be familiar of the provisions of the *Environmental Protection Act 1994* (the 'Act') so that they can carry out their duties effectively and lawfully.

Whilst the enforceable provisions of the Act for the mining activities are primarily focused on Chapter 5 of the *Environmental Protection Act 1994* the field staff will be designated as Authorised Persons under the Act and therefore knowledge of their obligations and the provisions of the Act is crucial.

### Topics covered by this guide:

- Part 1.        **Authorised Persons - Section 445 *Environmental Protection Act 1994***
- Part 2.        **Powers of Authorised Persons - Chapter 9**
- Part 3.        **Offences that relate to the powers of Authorised Persons**
- Part 4.        **Records and Record Keeping requirements**
- Part 5.        **Exhibit Handling- Sect's 461-462**
- Part 6.        **Interviewing/ Witness Statements**
- Part 7.        **Field Equipment – Types and Use**
- Part 8.        **Flow Charts - Compliance Management Guide/ Compliance Actions**

### PART 1 AUTHORISED PERSONS

All field staff will be required to be appointed as an Authorised Person under the provisions of Section 445 of the *Environmental Protection Act 1994*. To exercise any of the powers under the legislation the person must be an Authorised Person in possession of an Identity Card.

## **PART 2. POWERS OF AUTHORISED PERSONS**

### **Chapter 9 of the *Environmental Protection Act 1994*, Investigation and Enforcement.**

This chapter outlines the general powers of authorised persons and all field staff should be familiar with the contents of that chapter of the legislation.

#### **Section 449 *Production of identity card.***

*(1) An authorised person may exercise a power in relation to someone else only if the authorised person—*

- (a) first produces his or her identity card for the person's inspection; or*
- (b) has his or her identity card displayed so that it is clearly visible to the person.*

*(2) If, for any reason, it is not practicable to comply with subsection (1), the authorised person must produce the identity card for inspection by the person at the first reasonable opportunity.*

#### **Section 452 *Entry of place—general***

*(1) An authorised person may enter a place if—*

- (a) its occupier consents to the entry and, if the entry is for exercising a power under chapter 7, part 5B or 8, its owner consents; or*
- (b) it is a public place and the entry is made when the place is open to the public; or*
- (ca) it is a place to which an Agricultural ERA, a registration certificate, a development approval subject to a development condition or a code of environmental compliance relates and the entry is made when—*
  - (i) the chapter 4 activity to which the certificate, approval or code relates is being carried out; or*
  - (ii) the place is open for conduct of business; or*
  - (iii) the place is otherwise open for entry; or*

**Note:** In relation to the Environmental Services staff it is expected that entry to places will be primarily conducted as outlined in Section 452(1)(a) with the owner / occupier having knowledge of the visit and providing consent for the visit.

Where consent is given, consideration should be given to obtaining confirmation of that consent either in writing from the owner/ occupier or by corroboration of such consent. Section 485 refers to content of consent form.

#### **Section 455 *Entry of land for access***

*(1) This section applies if—*

- (a) an authorised person may enter land (the **primary land**) under section 452 or 454; and*
- (b) it is necessary or desirable to cross other land (the **access land**) to enter the primary land.*

Note: This section provides for the access across other property to obtain entry into the primary land. There is provision for such access with consent of the occupier and this would be the preferred method. The section further outlines the actions required if that consent is not obtained.

**Sections 456 and 457** relate to the **authority to apply for Warrants** and how applications may be made. It should be noted that any application and subsequent entry via the execution of a Warrant should only be done with the approval of the Manager of the Reef Unit and under the control of staff from the Regional Investigation Unit.

#### **Section 458 *Order to enter land to conduct investigation or conduct work***

This section states that an authorised person may apply to a magistrate for an order to enter land to carry out work on the land to secure compliance with an accredited ERMP.

Application for any order under this section should only be done with the approval of the Manager of the Reef Unit.

**Section 459 Entry or boarding of vehicles**

*(1) An authorised person may enter or board a vehicle if the authorised person has reasonable grounds for suspecting—*

*(a) the vehicle is being, or has been, used in the commission of an offence against this Act; or*

*(b) the vehicle, or a thing in or on the vehicle, may provide evidence of the commission of an offence against this Act; or .....*

*(2) If the vehicle is moving or about to move, the authorised person may signal the person in control of the vehicle to stop the vehicle or not to move it.*

*(3) To enable the vehicle to be entered or boarded, the authorised person may—*

*(a) act with necessary and reasonable help and force; and*

*(b) require the person in control of the vehicle to give reasonable help to the authorised person.*

**Section 471** creates the offence for failing to comply with a signal under section 459(2) to stop or not to move a vehicle.

**Note:** The power outlined in Section 459(2) and (3) should be carried out with care taking into account the options available to achieve the same outcome. Consider the assistance of Police where the vehicle is not on the occupiers/ owners property or on a roadway and the need exists to stop the vehicle.

**Section 460 General powers for places and vehicles**

This section provides broad powers to Authorised Persons who lawfully enters a place or boards a vehicle to conduct their duties.

Authorised Persons should be familiar with the content of this section as the powers apply to all entries and boarding's and are not confined only to enforcement actions

**Section 461 Power to seize evidence**

This Section applies to the power to seize evidence where lawful entry has been gained with the intent of seizing evidence to a place either with warrant or by occupiers consent.

Any entry done with the intent of seizing evidence should be carried out as per this section and with the assistance of an investigator and/or supervisor where practicable.

Approval for such entry and seizure should, where practicable, be approved by the manager of the Reef Unit.

**Section 462 Procedure after seizure of evidence**

Outlines the requirement that an authorised person must give a receipt for a thing seized to the person from whom it was seized.

The section also outlines the procedure and associated requirements for dealing with the receipt and seized property. Subsections 5 to 7 relates to the retention of the seized material/ item and the return of it to the owner.

Any material or item seized should be dealt with as an exhibit. Refer to Compliance Investigations Manual Chapter 8 which refers to Exhibit Management.

**Section 464 Power to require name and address**

*(1) An authorised person may require a person to state the person's name and address if the authorised person—*

*(a) finds the person committing an offence against this Act; or*

*(b) finds the person in circumstances that lead, or has information that leads, the authorised person to suspect on reasonable grounds that the person has committed an offence against this Act.*

*(2) When making the requirement, the authorised person must warn the person that it is an offence against this Act to fail to state the person's name and address, unless the person has a reasonable excuse.*

*(3) The authorised person may require the person to give evidence of the correctness of the person's name or address if the authorised person suspects on reasonable grounds that the name or address given is false.*

**Section 475** creates the offence for failing to comply with name and address requirement.

**Section 465 Power to require answers to questions**

*(1) This section applies if an authorised person suspects, on reasonable grounds, that—*

*(a) an offence against this Act has happened; and*

*(b) a person may be able to give information about the offence.*

*(2) The authorised person may require the person to answer a question about the offence.*

*(3) When making the requirement, the authorised person must warn the person it is an offence to fail to comply with the requirement, unless the person has a reasonable excuse.*

**Section 476** creates the offence for failure to comply with requirement under Section 465.

**Section 466 Power to require production of documents**

*(1) An authorised person may require a person to produce to the authorised person for inspection a document required to be held or kept under this Act or a development condition of a development approval.*

*(2) The authorised person may keep a produced document to take an extract from, or make a copy of, the document.*

*(3) The authorised person must return the document to the person as soon as practicable after taking the extract or making the copy.*

### **PART 3. OFFENCES THAT RELATE TO THE POWERS OF AUTHORISED PERSONS**

Part 5 of the *Environmental Protection Act 1994* deals with multiple offences that relate to the compliance powers of Authorised Persons. Appropriate offences are outlined hereunder.

Note: The provisions mentioned in this guide are limited and referral to the Act should occur and assistance sought where suspicion of non compliance occurs.

#### **Section 471 Failure to comply with signal**

This section provides an offence for failing to obey a signal under section 459(2) to stop or not to move a vehicle, unless the person has a reasonable excuse for not obeying the signal. Defences apply (E.g. safety, first opportunity)

#### **Section 475 Failure to give name and address etc.**

This section relates to where a person is required by an authorised person under section 464(1) to state the person's name or address or is required by an authorised person under section 464(3) to give evidence of the correctness of a name fails to comply with the requirement, unless the person has a reasonable excuse for not complying with it. Subsection (3) states; *The person does not commit an offence against this section if—*  
(a) *the authorised person required the person to state the person's name and address on suspicion of the person having committed an offence against this Act; and*  
(b) *the person is not proved to have committed the offence.*

#### **476 Failure to answer questions**

This section applies if an authorised person requires a person under section 465 to answer a question, the person must comply with the requirement unless the person has a reasonable excuse for not complying with it.  
Reasonable excuse – “might tend to incriminate the person”.  
No offence committed if the information sought by the authorised person is not in fact relevant to the offence.

#### **477 Failure to produce document**

This section creates the offence for a person who was required under section 466 to produce a document and failed to comply with the requirement, unless the person had a reasonable excuse for not complying with it.

#### **482 Obstruction of authorised persons**

This section creates the offence for a person who obstructs an authorised person in the exercise of a power under this chapter, unless the person has a reasonable excuse for obstructing the authorised person. In this section **authorised person** includes a person who is—  
(a) acting under an authorised person's direction under section 363K; or  
(b) authorised by an authorised person to take action under section 467(2)(b); or  
(c) helping an authorised person under this chapter.

## **PART 4 RECORDS and RECORD KEEPING**

Environmental Services staff are required to keep accurate records to ensure monitoring of progress against Service Delivery requirements is achievable and the content is of a standard that would pass judicial review.

Records are for two purposes;

- Compliance Monitoring and Service Delivery
- Compliance Enforcement

### **Compliance Monitoring and Service Delivery**

Records for this purpose will be kept for;

- Statistics
- Performance delivery
- Service delivery
- Enforcement/ compliance actions

Records for this purpose will be by way of ;

- Diary Entries
- Field Inspection reports
- Ecotrack data entry

### **Compliance Enforcement**

Records for this purpose will be kept for;

- Statistics
- Compliance History
- Investigation process
- Court Proceedings
- Evidence

Records for this purpose will be by way of;

- Diary entries
- Official Note Book entries
- Field Inspection reports
- Ecotrack data entry

**PART 5 EXHIBIT HANDLING – (Including Sections 461 and 462(EPA))**  
(Includes extracts from Departmental Compliance Investigation Manual)

**Introduction**

Failure to control an exhibit lawfully may result in the exclusion of the exhibits as evidence and jeopardize the final outcome of the prosecution case, and subsequent repercussions to the investigator personally.

**Continuity of Evidence**

Continuity of possession is required to ensure any material that may be used as evidence is kept in a manner that ensures originality. This includes the need to keep the material secure, ensure no alterations are made and to have a record of the place kept and in whose possession it has been. The Compliance Investigation Manual Chapter 8 refers to Exhibit Management.

**Property Receipt**

If a thing is taken or seized, a property receipt must immediately be given to the person in control of the thing (normally the owner or custodian of the thing). If it is impossible to immediately give the person a property receipt then it must be given as soon as practicable after the seizure or the receipt may be left at the place of seizure in a conspicuous and reasonably secure place.

The following information must also be completed on the property receipt:

- name and address of the person from whom the property was seized or taken.
- Authorised Officer's name – name of the investigator's taking or seizing the property;
- the location the exhibit was taken from – this also includes a description of the location within the property from where it was seized or taken.
- a brief description of the exhibit including any serial number and/or identification marks;
- comment on its condition and value (if known) at the time of seizure;
- date and time taken; and
- CIRaM number (If known).

The property receipt is to have the following distribution:

- Investigator's brief/ Reef Unit File - Original
- Person from whom thing taken or seized - Copy 1
- Attached to the thing - Copy 2
- Remaining in book - Copy 3

**Exhibit Registers**

The Exhibit Register is an official and auditable document in which all physical exhibits (other than original documents) that cannot be satisfactorily controlled by the investigator are to be entered. It records all ingress and egress of exhibits at property point, and identifies the custodian of the exhibit should it be removed from the property point for analysis or further investigation purposes. Each exhibit must be labelled securely so that the label will not become detached in packing or handling. Details of the exhibit must be recorded in an exhibit register so its whereabouts can be tracked. The exhibit itself should be appropriately secured.

## **PART 6 INTERVIEWING/ WITNESS STATEMENTS**

(Includes extracts from Departmental Compliance Investigation Manual)

### **Interviews**

Whilst the following information primarily relates to interviews associated with suspected offences, the day to day field inquiries may wish to adopt the general standard so that progression to enforcement actions is supported by previous field records and practices.

Chapter 9 of the Compliance Investigation Manual provides detail for Interviewing.

A Record of Interview with a suspected offender should be conducted using electronic recording devices (Video/ Audio). Where practicable assistance should be sought from supervisors and/or investigators prior to conducting this type of interview.

Interviews should be conducted in a courteous and sensitive manner with an emphasis on portraying a professional image of the investigator and the Department.

### **Location**

The location chosen to conduct an interview may set the tone for an interview. Whilst it is best practice to conduct any interview in a private area free from distractions and interruptions, it is recognised that some interviewees may request or insist on the interview occurring at a location set by themselves (e.g. in their home or at their workplace)

For any interview consider interference factors including interjection by other persons, machinery or electronic noises and comfort.

### **Witness Statements**

As part of day to day field operation staff will become involved with potential witnesses and also be witnesses to offences.

As a result field staff should be familiar with the process of taking or making a statement to a standard that is suitable for production in a criminal proceeding. Seek assistance from a supervisor or investigator if necessary.

Chapter 9 of the Compliance Investigation Manual provides detail for Statement taking and making

### **A statement may be made:**

In an Official Notebook

Handwritten on paper

Typewritten (Most preferred for court)

Electronic Recording (Audio/ Video)

### **If requested to obtain or make a formal statement the following should occur:**

- Seek advice from the Supervisor/ Manager
- Gather all known facts relevant to the incident,
- Understand the elements to be proved regarding the offences alleged to have been committed,
- Identify the best venue to interview the witness,
- Identify what information the witness may be able to provide and remember the 'who, what, where, when and how' questions that underpin an interview
- Preliminary inquiries with the witness will determine what the person knows about the incident.
- Evaluate this information to determine if it is relevant to the investigation.
- Record the information formally as a statement.

Guide to Validating Witness' Observations

A witness' observations may be critical in describing an offence or proving a particular element of an offence. To assist in assessing a witness' observations the ADVOKATE acronym is valuable:

- A** - Amount of time the witness observed the incident or offender
- D** - Distance between the offence and witness
- V** - Visibility including atmospheric conditions, lighting etc
- O** - Obstructions to the witness' line of sight
- K** - Knowledge with regard to the witness having previously known the offender
- A** - Any special reason for the witness to remember the incident or offender
- T** - Time lapse between the incident and when the witness made their statement
- E** - Errors or discrepancies

## **PART 7 FIELD EQUIPMENT**

To ensure continuity of evidence and quality of evidence it is necessary to have personalised field equipment.

### **Equipment to be carried**

Camera- Digital  
Voice Recorder- digital  
Diary  
Official Note Book  
Field forms  
Receipt Book.  
Bags and Containers

Note: Personal issue allows users to maintain the equipment to a high standard and also provides a high standard of knowledge of use.

### **Procedures when working with field equipment.**

Note: All records made and kept by this department may be subject to audit, public access or production in court.

#### Camera.

For evidence purposes the person who takes the photo should be the person who downloads the photo and subsequently prints the photo or copies the photo to another medium. The person who takes the photo must be the person who produces the photo (exhibit) to a court.

#### Voice Recorder

For evidence purposes the person who makes the recording should be the person who downloads the recording and subsequently copies the recording to another medium. The person who makes the recording must be the person who produces the recording (exhibit) to a court.

#### Diary

To be used for day to day compliance monitoring and management. Records should briefly include;

- Dates and times (in and out)
- Place visited
- Persons Spoken to
- Outline of matters discussed
- Observations including positive matters
- Non Compliance activities

Note: This record may be subpoenaed for court or be required to be produced under RTI legislation. Avoid opinion or derogatory statements.

#### Official Note Book

To record any official information regarding compliance activities. Records should include;

- Dates, times
- Place
- Details of suspects and witnesses
- Observations of suspected non compliance
- Corroborators endorsements
- Witness statements
- Details of actions taken.

Note: These notes are primarily made with consideration that they may be produced in a court proceeding. Notes should be factual and should not include irrelevant information and opinion.

#### Field Forms

To be completed for every field inspection in relation to Level A and B inspections. These are notes made at the time and should be signed by the person making the entries and adoption sought by initial from the property occupier/ owner.

#### Receipt Book

Section 462 *Environmental Protection Act 1994- Procedure after seizure of evidence*

Outlines the requirement that an authorised person must give a receipt for a thing seized to the person from whom it was seized.

Where property / documents are voluntarily provided by the owner/ occupier in relation to monitoring day to day compliance, consideration should be given to making a record in the Official Note Book and have the owner/ occupier acknowledge the supply and return of the items in that book. A receipt may be issued from the Receipt Book and an acknowledgement (Indemnity Receipt) of the items return should be kept in that book or other place of record.

#### Bags and Containers

- Preservation of all items and material taken into the possession of DERM staff is required to ensure;
- The item is identifiable.
- The item can be returned to the owner in the condition that it was taken.
- The item is maintained in its condition for court purposes.
- The item is not contaminated – when taken for further tests/ examination.
- The item is properly identified without the need to mark the actual item.

#### Examples of use:

- Plastic envelopes to preserve documents- can be marked with details
- Plastic Bags to preserve items from external contamination- identified and sealed
- Plastic bags and containers suitable to hold soil/chemicals for further testing. (Of a kind that does not affect the contents) – Can be identified and sealed.
- Boxes/ Larger Containers- To house large items or to maintain all items in one location.

### Residents & Landowners

**Cloncurry Residents.** Coppermine Creek runs along the southern side of Cloncurry and is used by the local population for swimming and drinking purposes. There is at least one resident living along Coppermine creek that extracts water for use on her garden.

**No directly affected Landowners/Graziers.** Coppermine Crk flows into the Cloncurry River which is a major river system for graziers in the gulf.

# LADY LORETTA PROJECT

## Lease Boundaries, Directions to Site, Surface Water Monitoring Points & Local Drainage

## Catchment Boundaries

## MINE CONTACTS

### Lady Loretta Project

██████████ (Xstrata Zinc)

Ph: ██████████ Mob: ██████████

E: ██████████@xstratazinc.com.au

#### **Mine Site Address:**

Lady Loretta lease (ML5568) is located approx. 140km northwest of Mount Isa. The site is accessed via the Lady Annie Mine Haul Road.

#### **Registered Business Address:**

Lvl 9, 123 Eagle St  
GPO 1433  
BRISBANE QLD 4001

### Directions to Site

- It's advisable to contact the Lady Annie Mine site to let them know you will be travelling along their haul road to access the Lady Loretta site. The general Lady Annie Mine site number is 4748 0000.
- Head north out of Mt Isa on the Barkly Highway toward Camooweal.
- 22kms past the Gunpowder/Birla Mine turnoff (on the right) is the May Downs Road turnoff (on the left)
- Travel a further 4 kms past the May Downs Road turnoff, & then turn right at the Lady Annie/Paradise Phosphate Project sign
- Travel approx. 40kms along the road to the Lady Annie mine site. Heed the Lady Annie Mine radio call in signs on the Lady Annie access road.
- At the T intersection turn left toward Lady Annie mine. (note, right turn takes you to the camp)
- Travel past the rail loadout & several km's along, **before the main admin office**, take the **right turn** to the Lady Annie Mine (Pit). This is a major turnoff & is well signed.

<b>On Site Storage</b>					
WRD Leachate Management Dam*	297412	12186940			

Datum: All AMG84, Zone 54 except for \* which is in GDA94

The only storage currently on site is the small WRD leachate management dam which is designed to store a 1 in 100, 72 hr storm event. The WRD is designed so that the majority of runoff is directed to the exploration shaft, with the dam intercepting a smaller amount of runoff from the northern side of the WRD. The dam is generally dry, however if required, the dam contents are pumped to the shaft to ensure sufficient wet season storage capacity.

BUNDALL Qld 4217

### Surrounding land users

Halifax Bay (Great Barrier Reef Marine Park).

The community of Saunders Beach is located to the north of the refinery.

### WATER QUALITY & SEDIMENT SAMPLING LOCATIONS

Release Point W1 - to waters described as Halifax Bay at a location described as the outlet of the existing submerged outfall approximately 1.8km from the shoreline, as shown in Schedule 4B – Figure 3 titled site plan 410-0000-024. Condition 1D7 states:

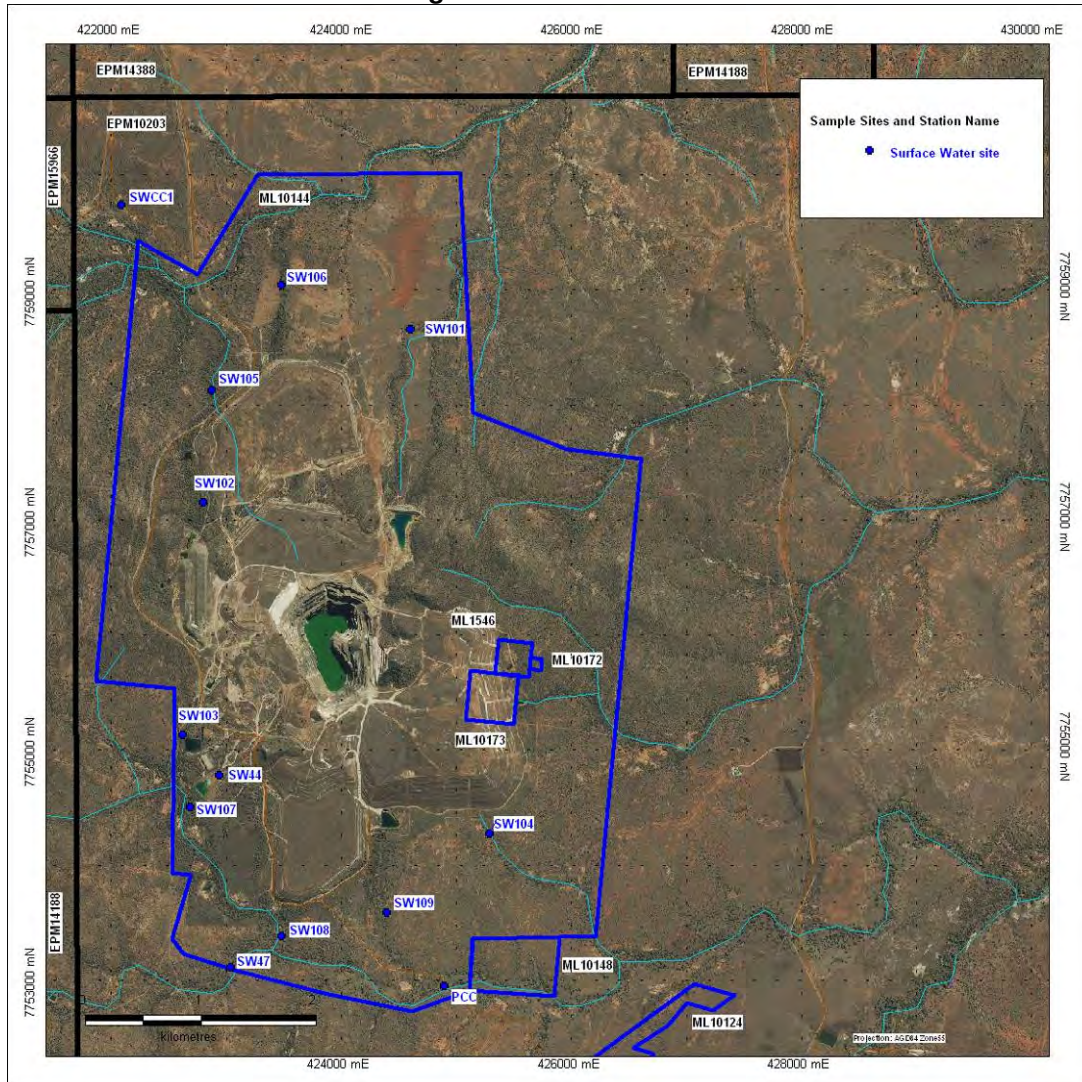

Bypassing of the stormwater storage pond must only occur:

- (a) when stormwater runoff from the plant area exceeds the capacity of the stormwater storage pond and the total pumping capacity of the stormwater storage pond pumps; or
- (b) if bypassing does not cause stormwater contained in the levee bank area when measured at the sampling point as described Schedule 4B Figure 3 site plan 410-0000-024 to leave the boundary of the premises unless the following quality criteria are met:
  - (i) the concentration of total ammonia must be less than 2mg/L.
  - (ii) the concentration of dissolved nickel must be less than 1mg/L.
  - (iii) the concentration of dissolved cobalt must be less than 1mg/L.
  - (iv) the concentration of suspended solids must be less than 30mg/L.

**Receiving Water Monitoring Locations and Frequency**

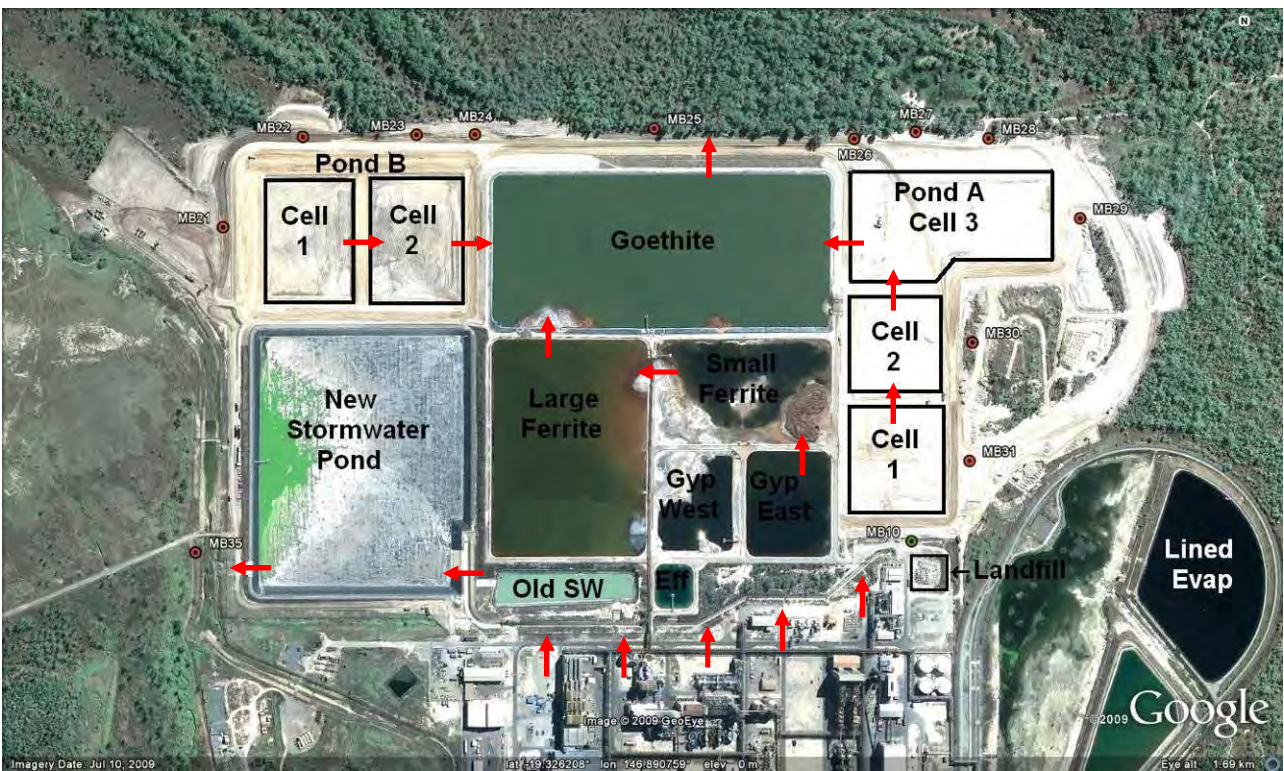

Monitoring point		Northing (GDA 94)	Easting (GDA 94)	Monitoring frequency
Clarke Creek upstream	SW CC1	7759031	422728	Determined by rainfall events (1)
Puddler Creek upstream	SW 47	7753116	423038	Determined by rainfall events (1)
Puddler Creek Crossing	PCC	7752951	424896	Determined by rainfall events (1)
New North Tailings Facility	SW101 SW105 SW106	7758659 7758130 7759047	424600 422872 423479	Determined by rainfall events (1)
Plant area and Heap Leach area	SW110 SW107 SW103	7754704 7754503 7755136	423113 422687 422623	Determined by rainfall events (1)
Scats Dump	SW102	7757152	422802	Determined by rainfall events (1)
Southern Tailings Facility	SW108 SW109	7753388 7753590	423474 424394	Determined by rainfall events (1)
East Waste Rock Dump	SW104	7754279	425284	Determined by rainfall events (1)
Northern Boundary	RSSCC	7760004	424230	Each flow event
Eastern Boundary	RSSMM	7755211	426315	Each flow event
Southern Boundary	RSSPC	7752978	425650	Each flow event

A Flow Event is defined as measurable flow or water body at the monitoring point.

(1) Sample to be collected that reflects the water quality associated with the first rainfall event after November 1 that is of sufficient volume to result in a flow that can be sampled at the majority of sampling points. A further sampling event for all sampling points is also required following any rain event that results in a discharge from a water containment structure (other than Borefields Dam and Stormwater Dams). A majority is defined as 10 of the 16 monitoring points.

### Surrounding Landholders/ Landuse

The project is located adjacent to the town of Ravenswood. The residents of Ravenswood live adjacent to the North and West of the mine. The local water ways are ephemeral creeks, the main creek is Sandy Creek that eventually reports to the Burdekin river upstream of the Burdekin Dam. Adjacent areas are primarily used for cattle grazing.

### **Site address:**

Off Herveys Range Road

## Landowners

The site is wholly situated within the catchment of Boghole creek, an ephemeral stream. Boghole creek drains into Keelbottom creek which has permanent water holes. Keelbottom creek drains into the Burdekin river approx 55km downstream.

ML1399 is wholly contained within real property Lot 110 on Unallocated State Land (USL) Plan number 42207. With the exception of its eastern extremity, which is on an adjacent grazing property (lot 35 on CP894595), ML1419 is contained within Lot 110. Apart from its border with the grazing lease, Lot 110 is completely surrounded by Australian Department of Defence Property known as Townsville Field Training Area ("High Range").

 10km South of Charters Towers

### Landowners

The local water ways are ephemeral creeks, small properties with minor grazing livestock surround the site. The drainage around the Plant site flows down Balls Gully into the Broughton River. Any flows to the west of the site enter 6 Mile creek, then into Stannet creek then into the Broughton river.

[REDACTED] (c/- Citigold) owns the freehold immediately under the plant site.

[REDACTED] ([REDACTED]) owns land under and downstream of the plant site.

[REDACTED] ([REDACTED]) owns land downstream of the plant site before any discharge enters the Broughton River.

## WATER QUALITY SAMPLING LOCATIONS

No water monitoring locations are specified in the environmental authority. The majority of the area covered by the mining leases is within steep valleys of south draining creek systems that drain to the Robertson River, a bend of which is in the southern portion of ML3418. The western portion of ML3417 encompasses north draining creek systems that drain to the north flowing Goldsmith Creek.

## **Purpose and Scope**

This document is designed to assist the Central West Region identify regulated water storage facilities which pose a risk of potential spillages during a summer season. Secondly, the document aims to identify what type of response is needed should an unauthorised discharge occur in order to best protect any surrounding water courses, population centres and land from pollution.

## **Background**

Mackay averages 942mm, Rockhampton 395mm and Emerald 270mm during the traditional summer wet season (based on data from the BoM website).

The highest recorded rainfall over the last 100 years in January alone has been 2027mm for Mackay, Rockhampton received 807mm and there was 605mm in Emerald (based on data from the BoM website).

Rainfall in the Fitzroy region results in stream flow in several large catchments, including the Comet, Nogoia, MacKenzie, Connors, Isaac and Dawson.

In the Mackay region, catchments include the Pioneer, Whitsunday and Burdekin. The Mackay and Whitsunday region produces higher rainfall figures during this season, and is also prone to flooding events. Unexpected major rainfall events can push storage facility capabilities to their limits, whether they involve industry, population centres or agriculture.

Hence it is necessary to have a two tiered approach to unplanned discharges from storage facilities, to organise some preparatory work which take place before the summer season occurs (called the Preparedness Plan) and then what the department is required to do should there indeed be an unauthorised discharge due to the increased water level during the summer season (called the Response Plan).

## **Preparedness Plan**

Prior to each summer season a priority list of sites is identified that would be of concern to the department should a discharge occur. This includes specific details that would assist the department in determining what pre-emptive action is needed to ensure the site managers are aware of their responsibilities.

The risk posed by waste storage facilities is assessed by consideration of a range of factors including but not limited to:

- The size of the storage and current levels
- The proximity to areas of environmental value such as water courses
- The preparedness plan of the organisation operating the facility
- The potential magnitude of the disaster should there be a discharge
- The ability of the local environment to absorb such discharges

Each site is assessed using a desktop model and categorised, in order of priority. Depending on the outcome, regional staff can then plan inspections deemed necessary to establish the operators' contingency plans in preparation for the summer season. Details of the sites identified are shown in Appendix 1.

Due to the impact of the flooding events of 2008, the department regards mining facilities are at a greater risk of unauthorised discharges, therefore a proactive system of communications is put in place. The owners of the identified sites are sent a letter (Appendix 6) to bring to their attention that their site will be visited by the department in

order to assess their preparedness for the summer season. The departmental representatives then coordinate the following to ensure that the site is fully aware of its responsibilities:

### **Pre-inspection**

Review Environmental Authority (EA), Water Management Plan and the Receiving Environment Management Plan to gain a basic understanding of the water management arrangements on site.

### **Inspection Focus: Water management**

Environmental Services Mining Staff:

- Water storage monitoring locations – water storages associated with release points, as defined in the Environmental Authority, Table W5
- All release points on sites – water levels in associated dams (Regulated dams MRL's), discuss water quality and review available data,
- All water monitoring locations – accessible in summer weather, requirement for stream flow gauges, telemetry systems, automatic samplers
- All receiving waters (upstream and downstream) as defined in the Environmental Authority

Assistance Staff:

- Identify water storages that may have the potential for uncontrolled discharges through the failure to contain water and embankment failure.
- Identify spillway capacity for water storages and determine appropriateness of capacity.

### **Post Inspection**

Environmental Services Mining Staff:

- Develop brief inspection report
- Correspondence to Mines identify areas of concern/outcomes of inspection

Assistance Staff:

- Provision of technical information to facilitate the drafting of a brief inspection report.

Inspection Schedule:

This is determined following the desktop risk assessment, an example of which is shown in Appendix 7.

## **Response Plan**

The aim of the Response Plan is to enable the department to respond with minimum delay and put in place a plan of action to respond to any unplanned discharge from a waste water storage facility within our region

This includes:

- Contact details of site
- Location
- Identification of possible hazards
- Contact details of rostered Environmental Services team members (Appendix 3)

## **Roles and Responsibilities during the summer season**

The roles and responsibilities will depend on the incidents which are scaled up/down depending upon the type of incident. In virtually all cases the relevant Manager is the primary contact; however it may be co-ordinated by the State Incident Response Network member for a major environmental incident.

Central West Region Environmental Services operates a 24 hour, seven day a week on-call system that allows the department to respond to any environmental incident that may occur. The on-call system and responsibilities of the on-call officer are detailed in Appendix 5.

## **Communications Plan in the event of an incident**

The responsibility of communicating any unauthorised discharge lies with a number of stakeholders as detailed below:

Mining Companies

- Responsible to ensure compliance with conditions of the environmental authority relating to notification of release events.

Notification of Release Event

The authority holder must notify the administering authority as soon as practicable (no later than 6 hours of having commenced releasing mine affected water to the receiving environment). Notification must include the submission of written verification to the administering authority of the following information:

- a) release commencement date/time;
- b) expected release cessation date/time;
- c) release point/s;
- d) release volume (estimated);
- e) receiving water/s including the natural flow rate; and
- f) any details (including available data) regarding likely impacts on the receiving water(s).

Note: Notification to the administering authority must be addressed to the Manager and Project Manager of the local Administering Authority via email or facsimile.

The authority holder must notify the administering authority as soon as practicable, (nominally within twenty-four (24) hours after cessation of a release) of the cessation of a release notified under Condition W12 and within 28 days provide the following information in writing:

- a) release cessation date/time;
- b) natural flow volume in receiving water;
- c) volume of water released;

- d) details regarding the compliance of the release with the conditions of Department Interest: Water of this environmental authority (i.e. contamination limits, natural flow, discharge volume);
- e) all in-situ water quality monitoring results; and
- f) any other matters pertinent to the water release event.

#### Notification of Release Event Exceedance

If the release limits defined in Table W2 are exceeded, the holder of the environmental authority must notify the administering authority within twenty-four (24) hours of receiving the results.

The authority holder must, within twenty-eight (28) days of a release that exceeds the conditions of this authority, provide a report to the administering authority detailing:

- a) the reason for the release;
- b) the location of the release;
- c) all water quality monitoring results;
- d) any general observations;
- e) all calculations; and
- f) any other matters pertinent to the water release event.

#### DERM

- The department has developed an interim template for notification of discharges to ensure that information received is consistent.
- The ES Mining team has developed a database to collate the submitted information.
- Regional Manager- Mining is responsible for informing the Fitzroy Water Quality Advisory Group (FWQAG).

# Standard Operating Procedure

## Proactive Compliance Inspection – B Water

1. Always check that the SOP is current with the latest amendments to the *Environmental Protection Act 1994* (the Act).
2. Always check that the SOP is current with the latest amendments to EcoSteps as procedural guidelines/policies and checklists are often updated without notice.

### 1.0 OUTLINE

‘Water’ B level inspections are an assessment of compliance against statutory documents issued/approved by DERM for an activity OR the legislation in general. The assessment will focus on site Water Management Systems to:

- Identify the wet season storage capacity;
- Identify any potential contamination issues;
- Identify the quality of water contained on site;
- Identify contingencies for the wet season.

This SOP provides guidance to DERM staff to assess the environmental compliance for mining projects administered under the Act. The primary objective is to determine whether the mining activities are complying with conditions of the environmental authority and to assess the general level of environmental protection being achieved.

Section 18 of the EP Act includes mining activities as an Environmentally Relevant Activity (ERA). This means it will require an environmental authority under the EP Act and must comply with the relevant environmental authority conditions and in addition to the responsibility of all persons to take all reasonable and practicable measures to minimise the likelihood of environmental harm (general environmental duty).

When assessing a mining operation it is recommended that a site inspection be undertaken in conjunction with a review of the environmental conditions contained within the environmental authority and the current Plan of Operations for the project. The purpose of the plan of operations is to supply information on the relevant mining leases, activities to be undertaken during the period of the plan, provide an action program for implementing the relevant conditions from the environmental authority (EA) and provide a calculation of financial assurance for the total area disturbed during the period of the plan.

During the ‘Water’ inspections, Project Managers will be required to consider:

- Environmental Authority Conditions;
- Environmental Management Plan Commitments;
- Plan of Operations Action Programs; and
- Water Management Plans.

### 2.0 ACTIONS

1. Forward the client a letter to notify of the programmed inspection, at a minimum, **3 weeks** prior to the inspection programmed date. Text is saved on EcoSteps/N Drive SOP file. *Note: the project manger should contact the site representative ASAP to advise of the inspection date.*
2. ‘Water’ B level inspections are focusing on the Department Interest – Water and Regulated Dams components of Environmental Authorities. Project Managers are required to consider the interaction of the EA conditions, EM Plan commitments and PoO action program when conducting inspections. Complete the template ‘Form – Compliance Program Audit Plan’ and ‘Form - Compliance Program Inspection.doc’ located within the N Drive SOP file for pre inspection matters. *If sampling will be required, the project manager must consider what sampling equipment/methodology is required, how the samples will be submitted to a laboratory that is NATA accredited for the sampling required and chain of custody requirements.*

3. Undertake field inspection. Complete 'Form - Compliance Program Inspection.doc' during the inspection. Complete an entry in official notebook. Please view the departmental procedural guide 'Use of official note books'.
4. Complete an inspection report and ensure all documents/photo's are saved correctly. Inspection report documentation is located in EcoSteps/N Drive SOP File.  
Inspection Report – the following documents need to be completed, compiled into one document and pdf'd in colour:
  - 'Form – Compliance Program Audit Report'
  - 'Checklist – Attach to Audit Report'
  - 'Form – Compliance Program Audit Report – Photo Attachment';
  - 'Form – Compliance Program Audit Report – Document Register';
  - 'Form – Compliance Program Audit Plan'; and
  - 'Form – Compliance Program Inspection'.
5. Forward the client a letter to notify the outcomes of the programmed inspection within **4 weeks** of the inspection being completed.
6. If the inspection has generated enforcement action, proceed with enforcement as per required legislative and procedural guidelines.

### 3.0 ECOTRACK

All compliance inspections are required to be recorded in EcoTrack. Project managers should follow the departmental procedural guide 'How to record Annual Compliance Plan Inspections in EcoTrack' also see the Central West Region help document 'EcoTrack Proactive Compliance Guide' located within the N Drive SOP file.

Running sheets should be entered for each action undertaken, including:

1. sending the letter to notify of the programmed inspection,
2. undertaking the compliance inspection, and
3. sending correspondence after the programmed inspection.

Any enforcement actions generated from the inspection continue to be entered against the EcoTrack compliance entry.

Ensure the EcoTrack compliance entry is set to finalised at completion of all actions.

### 4.0 COMPLIANCE PROGRAM REPORTING

The department implements a number of strategies to improve business and industry's environmental performance and promote sustainable development. One of the ways it does this is through a proactive, modern and innovative compliance program.

Programmed compliance inspection numbers are set for each region annually (each financial year) by the Compliance and Investigations Branch. Central West Regions, Environmental Services – Mining section then translates these numbers into a targeted program.

Complete the details for the inspection within the Regional Compliance Program located at N:\Mines\Compliance\2011-12.

A	B	C	D	E	F	G	H	I	J
Mine	Inspection Level/Type	Lead Officer	Support Officer	Proposed Date	Completed	CA	Finalised	Comments	Inspection Program
Gregory Creek	1 July - 30 September	Justin Gagnier	Terrie Neilson	July					2011-12/Mining/PGC/Environmental Services

Enter that the Compliance Action has been finalised and enter any comments you may have regarding the inspection.

Compliance program outputs are regularly reported to management and the government, and include the number of proactive inspections by inspection type, enforcement measures issued and the client expenditure required to comply with those enforcement measures.

## 5.0 IN THE FIELD

1. Have you got:
  - Water Compliance Inspection Package;
  - lap top;
  - mobile phone,
  - camera,
  - GPS,
  - water sampling equipment;
  - chain of custody documentation;
  - Sampling Manual;
  - official notebook;
  - general notebook
  - caution card,
  - authorised officer/identification card.
2. Have you established a call in procedure with the office?
3. Have you completed the Work Place Health and Safety checklist and are you aware of procedures for operating in remote locations?

## 6.0 RECORDING DOCUMENTATION/PHOTOS

### Documentation

Water Management Plans received prior to the inspection are required to be recorded in Corro and placed on the file.

Any reports receipted while on inspection are required to be recorded in 'Ortex Correspondence Management System' (Corro) and placed on file. Electronic copies of documentation are required to be saved within the electronic file system and a printed copy be recorded in Corro and placed on file. These documents also need to be recorded within the 'Form – Compliance Program Audit Report – Document Register' located on the N Drive SOP File.

Copies of any 'Chain of Custody' documentation are required to be recorded in Corro and placed on file.

Documentation viewed during the inspection is required to be recorded within 'Form – Compliance Program Audit Report – Document Register' and, where possible, photo copies of the cover, contents and critical information attached.

### Photos

All photographs must be recorded in the official note book, recording the date, time, place, image number and a brief description of the photo. Do not delete photos on the camera during an inspection. If a photo is blurry, attempt to take the photo again and leave the blurry image in sequence.

Photos should be saved to a CD or DVD without editing the photo or changing the file name as recorded within the camera. All photos are saved on the camera with an individual number and include details of the date and time the photo was taken. The disc needs to then be recorded in Corro and placed on file.

When writing the inspection report, select photo's that demonstrate the matters discussed. Photos are attached to the inspection report within the 'Form - Compliance Program Audit Report - Photo Attachment.doc' located on the N Drive SOP file. An example is provided on how to describe photos.

### GPS Tracking

The coordinates for all:

- photo locations; and
- critical water management infrastructure (dams, spillways, valves, release points),

are to be written down and recorded in the official note book for the inspection.

Upon returning to the office, record all locations into a spreadsheet and forward the spreadsheet to the Manager with a Work Request for the GIS unit to develop a map/aerial photograph of the mining lease with all points clearly identified. This is required to be attached to the inspection program.

## 7.0 ENFORCEMENT

When undertaking an inspection be aware of your rights as an authorised officer. The department has many procedural guides available on EcoSteps detailing the powers of an authorised person and how and when to implement various enforcement measures.

Ensure notes have been made within the official notebook. An official notebook is issued to an authorised person for use for Departmental matters. Official note books are to be used only for the purpose of recording notes about the person's official duties and must not be used to record notes or private matters. An incident that may not seem like a compliance or investigation issue at the time may become an issue at a later date. Authorised persons should, whenever in doubt, record information in the official notebook. For the purpose of accuracy of references and admissibility of the notes as evidence, notes should be made at the time the events being recorded are taking place, or as soon as possible afterwards so that the facts are still fresh in the memory of the person making the notes. For more information regarding the use of official notebooks please see the departmental procedural guide 'Use of Official Note Books'.

When attending an inspection, as an authorised officer, the project manager should be aware of when to issue a caution. For more information please see the departmental procedural guide 'How and When to Issue a Caution'.

### Caution

*"At this stage I warn you that you are not obliged to answer any more questions or make any statements. Any questions you do answer or any statement you do make will be recorded and may later be given in evidence. Do you clearly understand what I have just said to you?"*
